It hath a trailing Stalk, emitting Claſpers, whereby it faſtens itſelf to whatever Plant it ſtands near. The Calyx (or Flower-cup) conſiſts of three Leaves. The Flowers conſiſt of eight Leaves, and are of an anomalous Figure. The Ovary becomes a Fruit, which is like a Bladder, and divided into three Cells, in which are contain'd round Seeds, in form of Peas, of a black Colour, having the Figure of a Heart, of a white Colour, upon each.

Boerhaave mentions two Species of this Plant.

1. Corindum; folio ampliori; fructu majore. *T.* 431. *Piſum; veſicarium, fructu nigro, albâ maculâ notato.* C. B. P. 343. *Halicacabum peregrinum multis, ſive Cor Indum.* J. B. 2. 173. *Halicatabus peregrina.* Dod. p. 455. *Piſum cordatum.* H. Eyſt. Æſt. o. 13. F. 11. 1. *& vulgo. a.* HEART-PEA, WITH LARGE LEAVES AND FRUIT.

2. Corindum; folio, & fructu, minore. *T. a.* HEART-PEA, WITH SMALL LEAVES AND FRUIT, CALL'D BY THE INHABITANTS OF THE WEST-INDIES WILD PARSLEY. *Boerh. Ind. alt. Plant. Vol.* 1.

The *Corindum* is ſaid to be uſed as an emollient Herb, boil'd as Food. The Seeds, which are a ſort of Pea, are alſo boil'd and eaten.

CORINTHIACÆ UVÆ. See UVÆ PASSULÆ MINORES.

CORIS, Offic. *Coris lutea*, C. B. Pin. 280. *Coris Matthioli*, Ger. Emac. 544. Park. Theat. 570. *Coris legitima Cretica Belli*, Ejuſd. *Hypericoides, Coris quorundam, & Coris legitima, Cretica*, J. The Dung of the Carrion Crow, taken in Wine, is recommended for the Cure of a Dyſentery.

CORNU. A Horn. That of the Male Deer, commonly call'd *Hartſhorn*, is moſt frequently uſed in Medicine; the Uſes of which are ſpecify'd under the Article CERVUS, together with the Analyſis of Horns in general; which, under the Article ALCALI, is, by Miſtake, promiſed under the Article CORNU.

For an Account of the Analyſis of Hartſhorn, by Boiling, ſee ALIMENTA.

CORNU MONOCEROTIS. See MONOCEROS.

CORNU RHINOCEROTIS. See RHINOCEROS.

CORNU CERVI, in Chymiſtry, is the Beak of an Alembic.

CORNU CERVI, in Botany, is a Name of ſome Plants. Thus,

CORNU CERVI ALTERUM REPENS is the *Naſturtium ſylveſtre*; *capſulis*; *criſtatis*.

CORNU CERVINUM is a Name for the *Coronopus hortenſis*.

CORNUA *Uteri*. In comparative Anatomy, the Horns of the Womb; for the Womb is ſo divided in ſome Quadrupeds, as to form Corners reſembling Horns.

CORNUA alſo imports horny Excreſcences, which ſometimes ariſe on ſome Parts of the Body.

CORNUE, in *French*, is a Retort.

CORNUMUSA. A Retort.

CORNUS. The Name of a Tree.

The Characters are,

The Calyx (or Flower-cup) conſiſts of four ſmall rigid Leaves, which are expanded in form of a Croſs; from the Centre of which are produced many ſmall yellowiſh Flowers, each conſiſting of four Leaves, which are diſpoſed almoſt in form of an Umbrella. Theſe Flowers are ſucceeded by Fruit, which are oblong, or of a cylindrical Form, ſomewhat like an Olive, containing a hard Stone, which is divided into two Cells, each containing a ſingle Seed.

Cornus; hortenſis; mas. *C. B. Pin.* 447. *Tourn. Inſt.* 641. *Elem. Bot.* 502. *Boerh. Ind. A.* 2. 256. *Jonſ. Dendr.* 88. CORNUS, Offic. Chab. 14. *Cornus mas*, Ger. 1282. Emac. 1466. Park. Theat. 1520. Raii Hiſt. 2. 1537. *Cornus hortenſis mas*, C. B. Pin. 447. Tourn. Inſt. 641. Elem. Bot. 502. Boerh. Ind. A. 2. 256. Jonſ. Dendr. 88. *Cornus vulgaris*, Rupp. Flor. Jen. 72. *Cornus ſativa ſive domeſtica*, J. B. 1. 210. THE CORNELIAN CHERRY.

This Tree is uſually of the Bigneſs of an ordinary Cherry-tree, with Leaves ſomewhat alike; but broader, ſmoother, and not ſerrated about the Edges. The Flowers grow in Cluſters, being ſmall and yellow. The Fruit is longiſh, of a cylindrical Shape, about as big as a *Lucca* Olive, of a red Colour when ripe, including a long hard Stone. It is of a ſweet, but ſomewhat aſtringent Taſte. It grows in Gardens, and flowers in *March* and *April*; but the Fruit is not ripe till *September*.

The Fruit of the Cornel-tree is cooling, drying, and aſtringent, ſtrengthens the Stomach, ſtops all kinds of Fluxes and Looſeneſs, and is good in Fevers, eſpecially if attended with a Diarrhœa.

The only officinal Preparation of this Fruit is the *Rob de Cornis*. *Miller's Bot. Off.*

The Leaves of the Cornelian-cherry are very bitter: The Fruit is ſour, ſtyptic, and gives as lively a Red to blue Paper as Alum, which gives us room to think, that it contains a Salt analogous to it. Thus it is no Wonder, that *Hippocrates*, *Dioſcorides*, and *Pliny*, believed this Fruit to be good to ſtop a Looſeneſs. *Ruellius* ſays, that they preſerve it, for this Diſorder, in Bottles of Honey or Syrup. An Electuary is made of the ſtrain'd Pulp for a Dyſentery, and to reſtore the Appetite. To make a Wine of Cornelian-cherries, *J. Baubine* adviſes to put ten Pounds of theſe Fruits into fifty Quarts of good red Wine, mix'd with ſix Quarts of Steel Wine: Let the Whole ferment a Fortnight; after which draw it out, and keep it in Bottles for a Looſeneſs. The dry'd Cornelian-cherries are uſed in cooling and aſtringent Ptiſans. They are preſerved with Sugar; and a Marmelade is made of them. *Martyn's Tournefort.*

ROB DE CORNIS: *Rob of Cornelian-cherries.*

Take one Pound of wild Cherries, and macerate them in a ſufficient Quantity of Spring-water, till the Pulp can be paſs'd thro' a Sieve: Then evaporate the ſuperfluous Humidity; and, with half a Pound of fine Sugar, boil it up to a due Conſiſtence.

2. Cornus; fœmina. *C. B. P.* 447. *Lob. Ic.* 169. THE DOG-BERRY, OR GATTEN-TREE.

The Fruit of the *Cornus fœmina* is very bitter, ſtyptic, and gives a pretty deep-red Colour to blue Paper. *Tournefort.*

3. Cornus; fœmina; foliis variegatis. *H. L.* THE STRIPED DOGBERRY-TREE.

Beſides theſe, *Miller* takes notice of the

Cornus; fœmina, Laurifolia, fructu nigro cœruleo, officulo compreſſo, Virginiana. *Pluk. Almag.* THE VIRGINIAN DOGBERRY-TREE. And the

Cornus; mas; odorata, folio trifido, margine plano Saſſafras dicta. See SASSAFRAS. And five other Species in the ſecond Volume of his Dictionary.

CORNUTA. A Retort, ſo call'd on account of its Shape.

CORNUTIA. A Plant, ſo call'd from *Cornutus*, a Phyſician of *Paris*, who publiſh'd a Hiſtory of *Canada* Plants. We have no *Engliſh* Name for this Plant.

The Characters are,

It hath a monopetalous perſonated Flower, whoſe upper Lip ſtands erect, but the under Lip is divided into three Parts; from the Flower-cup ariſes the Pointal, which is fixed like a Nail in the hinder Part of the Flower, which afterward becomes a ſpherical ſucculent Berry, including Seeds, which are, for the moſt part, Kidney-ſhap'd.

There is but one Species of this Plant yet known; which is,

Cornutia flore pyramidato cœruleo, foliis incanis. *Plum.* CORNUTIA WITH A PYRAMIDAL FLOWER, AND HOARY LEAVES. *Miller's Dictionary, Vol.* 2.

COROCRUM. A Ferment.

COROLLA. The Petals of Flowers.

CORONA. A Crown, in Botany, is a Series of ſmall Beards, or Rays, in Diſcoide Flowers. *Rieger.*

CORONA IMPERIALIS.

The Characters are.

The Flower is Bell-ſhap'd, and hexapetalous; the Petals being furniſhed on the Inſide of the Unguis with a Cavity, containing a Liquor as ſweet as Honey; it is alſo pendulous, naked, provided with ſix Stamina, contains an Ovary, and is diſpoſed into the Form of a Crown, under a foliaceous Crown and *Coma*. The Ovary becomes an oblong winged Fruit, containing flat Seeds, placed upon one another: From the Centre of the Apex proceeds a long Tube, furniſhed with a trifid Top: The Leaves are like thoſe of the Lily, and grow in Circles round the Stalk; the Root conſiſts of Coats, and is furniſhed with Fibres at the Bottom.

Boerhaave take notice of thirteen Species of this Plant.

1. Corona Imperialis major. *T.* 372. *Lilium, ſive Corona Imperialis, per omnia major.* H. R. Par. 106. THE GREATER CROWN IMPERIAL.

2. Corona

2. Corona Imperialis. *Dod. p.* 202. *H. Eyst. Vern.* 0. 5. *F.* 2. *Fig.* 1. *Lilium, sive Corona Imperialis.* C. B. P. 79. M. H. 2. 406. *Tusai, sive Lilium Persicum.* Clus. H. 127. THE COMMON CROWN IMPERIAL.

3. Corona Imperialis; folio vario. *T.* 372. *Lilium, sive Corona Imperialis, Sinensium, seu folio vario.* H. R. Par. 107. *Lilium Imperiale, seu Corona Imperialis, foliis variegatis.* M. H. 2. 407. STRIP'D-LEAV'D CROWN IMPERIAL.

4. Corona Imperialis; folio vario ex viridi & argenteo. SILVER STRIP'D-LEAV'D CROWN IMPERIAL.

5. Corona Imperialis; duplici Coronâ. *T.* 372. *Lilium sive Corona Imperialis, duplici Coronâ.* C. B. P. 79. M. H. 2. 407. CROWN IMPERIAL WITH A DOUBLE CROWN.

6. Corona Imperialis; triplici Coronâ. *C. H. L. Schuyl.* CROWN IMPERIAL WITH A TRIPLE CROWN.

7. Corona Imperialis; multiflora; latoque caule. *T.* 372. *Lilium, sive Corona Imperialis, multiflora, latoque caule.* C. B. P. 79. M. H. 2. 407. *Tusai πολυανθὲς.* Clus. CROWN IMPERIAL WITH MANY FLOWERS, AND FLAT STALKS.

8. Corona Imperialis; flore pleno. *T.* 373. *Lilium, sive Corona Imperialis, flore pleno.* H. R. Par. CROWN IMPERIAL WITH A DOUBLE FLOWER.

9. Corona Imperialis; flore pulchrè luteo. *T.* 372. *Lilium, sive Corona Imperialis per omnia major, flore luteo.* H. R. Par. CROWN IMPERIAL WITH A BEAUTIFUL YELLOW FLOWER.

10. Corona Imperialis; flore luteo pleno. CROWN IMPERIAL WITH A DOUBLE YELLOW FLOWER.

11. Corona Imperialis; flore luteo striato. *T.* 372. & *H. Edinb.* CROWN IMPERIAL WITH A YELLOW STRIP'D FLOWER.

12. Corona Imperialis pulcherrima; flore ex aureo & aurantio striato.

13. Corona Imperialis; ramosa. *T.* 373. *Lilium, sive Corona Imperialis, ramosa.* C. B. P. 79. M. H. 2. 407. *Tusai πίκλωσις.* Clus. H. 128. BRANCH'D CROWN IMPERIAL. *Boer. Ind. alt. Plant. Vol.* 2.

The Whole of the Corona Imperialis is poisonous.

Upon the inferior Part of the Petals, certain white limpid Drops of Liquor are found, which resemble a Pearl, and are sweet. These are used by the *Turks* as an Emetic; and by others, as an Ecbolic.

CORONA REGIA. The Herb Melilot. *Blancard.*

CORONA TERRÆ. The HEDERA TERRESTRIS. Ground-ivy. *Blancard.*

CORONA SOLIS.

The Characters are,

The Flower is radiated like that of the After, but is larger; the Cup is squamous; the Embryos of the Seeds are distinguished by little imbricated Leaves in the Disk; the Top of the Ovary is crown'd with two small Leaves, betwixt which the Flower grows upon the Ovary; the Seeds are push'd out from the Bottom of the Flower, leaving a Vacuity, which appears very like a Honey-comb.

Boerhaave mentions eighteen Species of this Plant; which are,

1. Corona Solis, Tabernæmontani. *Elem. Bot.* 391. *Tourn.* 489. *Boerh. Ind. A.* 102. *Flos Solis.* Offic. Raii Hist. 1. 314. *Flos Solis major.* Ger. 612. Emac. 751. *Chrysanthemum Peruvianum sive Flos Solis.* Park. Parad. 295. *Chrysanthemum Indicum, Flore & semine maximis annuum.* Herm. Hort. Lugd. Bat. 142. Pluk. Almag. 98. *Chrysanthemum Indicum maximum annuum, non ramosum.* Hist. Oxon. 3. 19. *Helenium Indicum maximum.* C. B. 276. *Herba maxima.* J. B. 3. 107. *Herba maxima, Sol Indianus.* Chab. 360. *Chimalath Peruviana, Flos Solis.* Hern. 228. SUN-FLOWER. *Dale.*

It is a Native of *Peru*, and other Countries of *America*, but is cultivated with us in Gardens for the sake of Ornament. What are its Virtues, says *Cæsalpinus*, was never yet declared; though we may conjecture, that it is of a heating Quality, and of fine Parts, and therefore effectual to the same Purposes as Helenium; but its Tear is by far the most efficacious Part of it. *Fragoso*, in *Clusius*, speaks more fully of its Uses; where he says, "It is a kind of Olus, or esculent Green, and "tastes well; the Leaves, therefore, being cleared of their "Pedicle, and their rough Hairs deterged with a Cloth, may "be eaten; for which Purpose they are first cut, then sprinkled "with Oil, Salt, and Spices, and afterwards boiled in an "earthen Pot, making a Dish not ungrateful to the Palate. "The Fruit also, or the Head, while it is tender, having its "downy Part taken off, which covers the Seed, as it is in a "Artichoke, is much more pleasant Food than any Carduus. "It is proved, by Experience, that this Plant, especially the "Head, is a potent Incentive to Venery. It is highly to be "valu'd, as it produces a resinous Tear, and delicate Gum, "and is both Meat and Drink. It is so full of Moisture, that "the little tender Pedicles, which sustain the Leaves, being "chewed, afford a copious Juice, and the thick and knotty "Stalk serves very well for Firing; for its resinous Liquor; "and ferulaceous Hollowness, make it burn like a Torch." Because the Stalk is very soon cover'd with a Callus after it is broken, it is conjectur'd to be of the Number of vulnerary Plants, on account of the terebinthinaceous balsamic Liquor with which it abounds. *Ettmullerus*, *T.* 1. says, that the Seed-vessel, taken when the Seeds are almost ripe, and cut, and boiled, affords a copious Gum, which, reduced into the Form of a Plaister, is extol'd as a most singular Vulnerary: The Pulp of the Seeds is sweet, and greedily coveted by Birds, which are fatten'd by it. According to *Hernandez*, the Seeds, though they excite an Head-ach, when eaten too freely, yet they are lenitive to the Breast, and extinguish burning Heats. In some Countries they are bruised, and made into Bread, serving instead of Corn; though some say they prove Incentives to Venery. *Rieger.*

2. Corona Solis; maxima; semine albo, cinereo, & striato. *T.* 489. GREAT ANNUAL SUN-FLOWER, WITH ASH-COLOUR'D STRIP'D LEAVES.

3. Corona Solis; maxima; flore pallidè sulphureo, fere albo; semine nigro. *An Chrysanthemum, majus, alterum, sulphureo magno flore.* H. R. Par? a. GREAT ANNUAL SUN-FLOWER, WITH PALE BRIMSTONE-COLOUR'D FLOWERS, AND BLACK SEEDS.

4. Corona Solis; maxima; flore pleno, aureo; semine nigro. *a.* GREAT ANNUAL SUN-FLOWER, WITH DOUBLE YELLOW FLOWERS, AND BLACK SEEDS.

5. Corona Solis; maxima; flore pleno, aureo; semine albo. *a.* GREAT ANNUAL SUN-FLOWER, WITH DOUBLE YELLOW FLOWERS, AND WHITE SEEDS.

6. Corona Solis; maxima; flore pleno, sulphureo; semine nigro. *a.* GREAT ANNUAL SUN-FLOWER, WITH DOUBLE BRIMSTONE-COLOUR'D FLOWERS, AND BLACK SEEDS.

7. Corona Solis; maxima; flore pleno, sulphureo; semine albo. *a.* GREAT ANNUAL SUN-FLOWER, WITH DOUBLE BRIMSTONE-COLOUR'D FLOWERS, AND WHITE SEEDS.

8. Corona Solis; ramosa; perennis. *Helenium, Indicum, ramosum.* C. B. P. 277. *Chrysanthemum, Indicum, perenne, flos solis, minor.* Flor. 2. 45. *Flos Solis, prolifer.* H. Eyst. Æst. 0. 5. F. 2. Fig. 1.

9. Corona Solis; parvo flore; tuberosa radice. See BATATA CANADENSIS.

10. Corona Solis; latifolia; altissima. *T.* 489.

11. Corona Solis; latifolia; humilior; Canadensis.

12. Corona Solis; Rapunculi Radice. *T.* 490. *Helenium Canadense, altissimum, Vesacan dictum.* H. R. P. 85.

The Roots of this are bitterish, but not ungrateful. They are used in *Canada* as Food.

13. Corona Solis; altissima; Virgæ aureæ foliis. *T.* 490. TALLEST PERENNIAL SUN-FLOWER, WITH GOLDEN-ROD-LEAVES.

14. Corona Solis; arborea; folio latissimo platani. *Doronicum, maximum, Americanum, latissimo angulose folio, radice transparente.* H. L. 222. TREE-LIKE PERENNIAL SUN-FLOWER, WITH A BROAD PLANE-TREE-LEAF.

15. Corona Solis; foliis amplioribus laciniatis. *T.* 490. *Doronicum, Americanum, laciniato folio.* C. B. P. App. 516. PERENNIAL SUN-FLOWER, WITH LARGE DIVIDED LEAVES.

18. Corona Solis; salicis folio; alato caule. *T.* 490. WILLOW-LEAV'D PERENNIAL SUN-FLOWER, WITH WINGED STALKS. *Boerh. Ind. alt. Plant. Vol.* 1.

CORONALIS SUTURA. The Coronal Suture. See CAPUT.

CORONALE OS. The *Os Frontis*, according to *Bartholine.*

CORONARIA VASA. The Coronary Vessels. These are certain Vessels, which furnish the Substance of the Heart with Blood. See COR.

Certain Vessels in the Stomach are call'd Coronary Vessels. See CORLIA.

CORONE, *κορώνη*. The Carrion Crow. This Name is also given to the anterior Apophysis of the lower Jaw. See CAPUT.

CORONILLA.

The Characters are,

In Habit and Leaves it resembles the Emerus (Scorpion Sena); the Pod is composed of many Parts, join'd, as it were, by a sort of Articulation; each of which is turgid, with an oblong Seed.

Boerhaave mentions eight Species of this Plant; which are,

1. Coronilla; five Colutea minima. *Lob. Ic.* 87. *T.* 650. *Polygala, Valentina.* Cluſ. H. 98. *Colutea ſive Polygala.* 1. *Valentina, Cluſii.* M. H. 2. 122. *Polygala, altera.* C. B. P. 349. *Colutea, parva Species, Polygala Valentina, Cluſii.* J. B. 1. 383. H.

I find no medicinal Virtues attributed to any of theſe.

CORONOPUS.

The Characters are,

It agrees in Flower and Fruit with the Plantain, from which it differs in its Leaves, which are deeply cut in on the Edges; whereas the Leaves of Plantain are either entire, or but ſlightly indented.

1. Coronopus; hortenſis. *C. B. Pin.* 190. *Tourn. Inſt.* 128. *Elem. Bot.* 104. *Boerh. Ind. A.* 2. 101. *Coronopus.* Offic. *Coronopus vulgaris ſive Cornu Cervinum.* Park. Theat. 501. Raii Hiſt. 1. 879. *Coronopus ſive Cornu Cervinum vulgò ſpicâ Plantagineâ.* J. B. 3. 509. *Coronopus, Herba ſtella, Cornu Cervinum.* Chab. 509. *Cornu Cervinum.* Ger. 340. Emac. 427. Mer. Pin. 30. Merc. Bot. 1. 30. Phyt. Brit. 31. *Plantago foliis laciniatis Coronopus dicta.* Raii Synop. 3. 315. *Plantago Coronopus dicta ſativus in acetariis utilis.* Pluk. Almag. 298. *Stella terræ vulgo.* BUCKSHORN-PLANTAIN.

This Plantain has pretty long, ſlender, whitiſh Roots, which run deep into the Ground, having many Leaves lying flat on the Earth, in a round Compaſs; whence it is call'd *Stella Terræ*, or the Star of the Earth: The Leaves differ from all other Plantains, in that they are long, and very narrow, having about ſix ſlender Jags or Laciniæ on each Leaf. They are ſomewhat downy and hairy: The Spikes are narrow, compoſed as in other Plantains, of ſmall, irregular, four-leav'd Flowers, growing on hoary Stalks, three or four Inches long. The Seed is ſmall, of a dark-brown ſhining Colour. It grows in ſandy Ground, and upon Heaths, and flowers in *June*.

Buckſhorn Plantain is much of the Nature of other Plantains, being moderately drying and binding, and a good vulnerary Herb, uſed both inwardly and outwardly; beſides which, it is particularly commended againſt the Bitings of all kind of venomous Creatures, and more eſpecially for the Bite of a mad Dog. *Miller's Bot. Off.*

2. Coronopus; maritima; major. *C. B. P.* 190. *Plantago anguſtifolia.* Dod. p. 108. a.

Miller mentions two more Species of Coronopus.

CORONOPUS RUELLII. See AMBROSIA CAMPESTRIS.

The Name is derived from κορώνη, a Carrion Crow, and πούς, a Foot. The Plant being ſaid to reſemble a Crow's Foot.

COROS, κόρος. Satiety.

COROZONE CELIO. A Name for the *Sedum*; *Canarinum*; *foliis omnium maximis.*

CORPORA NERVOSA, or NERVEOSPONGIOSA, PENIS. The nervous or nerveo-ſpongeous Bodies of the Penis. See GENERATIO.

CORPORA OLIVARIA. Two Protuberances of the Medulla oblongata. See CEREBRUM.

CORPORA PYRAMIDALIA. Two other Protuberances near the preceding. See CEREBRUM.

CORPORA STRIATA. Two Prominences in the lateral Ventricles of the Brain. See CEREBRUM.

CORPORATIO. Incorporation.

CORPULENTIA. Corpulence.

CORPUS CALLOSUM. A medullary Part of the Brain, which covers the two lateral Ventricles. See CEREBRUM.

CORPUS GLANDULOSUM. The *Proſtatæ.*

CORPUS PAMPINIFORME, PYRAMIDALE, or VARICOSUM. A Body form'd a little above the Teſticles, by the Diviſion and Reunion of the ſpermatic Veins. See GENERATIO.

CORRAGO. The Plant call'd BORRAGO, Borrage.

CORRÆ, or CORSÆ, κόρραι, or κόρσαι. The Temples. *Gorræus.*

CORRECTIO, Correction. This Word in Pharmacy has ſeveral peculiar Senſes: And, firſt, draſtic Medicines, or ſuch as operate with Violence, are ſaid to be corrected, when, in their Compoſition, ſome Ingredient is added, which proves a kind of Check or Balance to their violent Operation, or prevents the Misfortunes which they generally bring on without ſuch a correcting Ingredient. Thus, for Inſtance, ſome Carminatives, ſuch as the Seeds of Fennel or Aniſe, are added to Sena-leaves, which, when exhibited alone, generally produce Flatulences and Gripes. The Subſtances or Ingredients thus added, with an Intention to render the Medicines ſafer and leſs dangerous, are call'd *Corrigentia* or *Correctoria*; as alſo *Caſtigantia*, and *Infringentia.* According to *Wedelius*, in his Treatiſe *de Medicamentorum Compoſitione extemporanea*, CORRECTORS have a Reference either to the noxious Quality, the Viſcidity and Toughneſs, the Coldneſs, the narcotic Nature, the emetic Virtue, and the violent Operation, of the Medicines to which they are added. 'Tis, therefore, obvious, that Correctors muſt conſiſt of ſuch Parts, as are of an oppoſite Nature to thoſe which prevail in the Subſtance to be corrected. Thus, for Inſtance, Alcalis are corrected by Acids; Acids by Alcalis; and Subſtances, of any given Nature, by thoſe of directly contrary Qualities. The univerſal *Correctors* of Medicines, which operate too violently, are, firſt, Water, which dilutes Acrimony; and, ſecondly, mild and balſamic Oils, which obtund and ſheath up the ſtimulating and irritating Spicula of any Medicine. To this Species of Correction belongs alſo ſuch a Preparation of Medicines as weakens or impairs their violent and draſtic Operation; when, for Inſtance, the Root of Arum is render'd milder and leſs violent in its Operation, by being macerated in ſome Liquor, or by being dry'd. But *Corrections* are ſometimes boaſted of in conſequence of the Ignorance, in which Perſons remain, with reſpect to the Natures of the Medicines to which they are added; when, for Inſtance, Opium is thought to be corrected by Caſtor, and an Addition of other healing and aromatic Subſtances; becauſe the Antients imagin'd, that Opium prov'd prejudicial by its exceſſive Coldneſs. Thus alſo ſome Corrections are made, which rather deſerve the Name of Caſtrations; when, for Inſtance, the Seeds of Coriander or Cumin are macerated in Vinegar. In like manner, according to *Helmont*, ſome boil Scammony in acid Liquors with a View to correct, or render it more mild in its Operation. But every one, who is in the leaſt verſed in medicinal Affairs, knows, that when Scammony is expoſed to the acid Steam of Sulphur, it is entirely diveſted of its Properties, and recedes from the Nature of Scammony, in proportion to the Quantity of the Acid it has imbib'd. With reſpect, therefore, to ſuch Corrections, we may, with that Author, affirm, that they are made without any Knowledge of the Qualities, Parts, and mutual Relations between the Correctors, and the Subſtances to be corrected. It is pretty ſurpriſing, that ſome Subſtances, by Correction, ſhould have their Qualities and medicinal Virtues directly inverted and reverſed, which happens to Aſarabacca, upon being boiled. The genuine and peculiar Correctors of each Medicine are ſpecified under its reſpective Article.

Secondly, Medicines which operate in a ſlow and languid Manner, are ſaid to be corrected, when they are ſo prepared as either to accelerate or augment their Operation; when, for Inſtance, Salts are mixed with evacuating Medicines of a gummous and reſinous Nature, that, by this means, being more reſolv'd or attenuated, they may operate more powerfully. Thus, with this very Intention, Salt of Tartar, or Sal Polychreſtus, are added to Infuſions of Sena. Ingredients, added with this View, are call'd *Adjuvantia*: And, when more draſtic Subſtances, of the ſame Virtues, are added, in order to augment the Operation of the Compoſitions, theſe additional Ingredients are call'd *Acuentia.*

Thirdly, Nauſeous and ungrateful Medicines are ſaid to be corrected, when they are prepared in ſuch a manner as to become more acceptable and agreeable to the Palate. But, as the Senſe of Taſte is not the ſame in all Mankind, the Correctors of this Sort muſt neceſſarily vary according to the peculiar Taſte of different Patients. Medicines, intended for Children, are generally corrected, or rendered grateful, by an Addition of Sugar. In like manner, Subſtances of an ungrateful and diſagreeable Smell are to be corrected by an Addition of fragrant and well-ſcented Ingredients.

CORRIGIOLA. According to *Fuchſius*, in his Commentaries upon *Nicolaus Myrepſus*, is the ſame as *Polygonum Mas.*

COR-

CORROBORANTIA. Corroborative Medicines, or Remedies which impart Strength.

CORROBORATIO. Corroboration, or Strengthening.

CORRODENTIA, or CORROSIVA. Corrosives, or corroding Medicines.

These are Medicines of much Use in Surgery, which corrode whatever Part of the Body they are applied to. They consist of acrid Substances, and may properly enough be thus divided:

First, Into mild Corrosives; among which may be reckon'd burnt Alum; the Ashes of green Wood; Mercurius Dulcis; white Precipitate of Mercury, and white Vitriol.

Secondly, Into strong Corrosives; as red Precipitate of Mercury; Colcothar of Vitriol; and the *Trochisci de Minio Vigonis*, made of red Lead, half an Ounce; Corrosive Sublimate, an Ounce; Crums of Bread, four Ounces; with Rose-water, a sufficient Quantity, to make the Ingredients into Troches.

Thirdly, The strongest Corrosives, as Butter of Antimony; the Infernal Stone; Corrosive Sublimate of Mercury; Oil of Tartar *per Deliquium*, and Oil of Vitriol. With respect to these, it must be observed, that the stronger they are, the greater Caution is required in their Use.

Corrosives act by their Acrimony, by which they destroy not only foreign Substances adhering to animal Bodies, but also the Solids themselves, provided they meet with any Moisture, when apply'd to them; and particularly when confined upon the Part by any adhesive Plaister, so as to have their Action excited by the Heat of the Body. In the two first Cases they are call'd Catheretics; in the last, potential Caustics. See CAUSTICA.

Corrosives are used for opening Abscesses; for making Issues, or artificial Ulcers; for consuming Tubercles, and callous Excrescences; for separating and extirpating corrupted Parts; and cleansing sordid Ulcers; and sometimes for stopping Hæmorrhages.

Relative to the Use of Corrosives, the following Cautions are laid down by various Authors:

First, When the Disorder is not so great but that it may be subdu'd by the milder Corrosives, the stronger are never to be used, lest too much Pain should be excited, and a Flux of Humours invited to the Part affected.

Secondly, Corrosives are not proper for such Constitutions, nor such Parts of the Body, as may too readily receive an Injury by their Application; nor are they equally well adapted to all Ages. Thus they are attended with Danger, when applied to Bodies whose Humours are easily irritated; to nervous and tendinous Parts; and to Infants.

Thirdly, Corrosives are most proper in Disorders which admit of Delay.

Fourthly, When the Root or Source of the Disorder subsists within, and Corrosives are more likely to irritate and augment than to diminish it, in such Cases Corrosives are never to be used.

Fifthly, The Action of Corrosives is to be so limited, as not to injure, consume, or exulcerate the sound Parts.

CORROSIO. Chemical Corrosion is what we have call'd *Calcination* by potential Fire, under the Article CALX, which see. *Barchusen* defines it, a total or particular Solution of any Body by some acrid Salt.

CORROSIVA. Corrosives. In Chymistry, saline Menstruums. *Rieger*. See CORRODENTIA.

CORRUDA. See ASPARAGUS PETRÆA.

CORRUGATIO. Corrugation, or Wrinkling of the Skin, or any other Part.

CORRUGATOR COITERI, or

MUSCULUS FRONTALIS VERUS.

This Muscle arises fleshy from the Process of the Os Frontis, next the inner or great Angle of the Orbit, above the Joining of the Os Nasi and superior Process of the Os Maxillare with this Bone; from thence it runs obliquely outwards and upwards, and

Is inserted into the fleshy Part of the Occipito-frontalis, some of its Fibrillæ passing through into the Skin, a little higher than the middle Region of the Eyebrows.

Its Use is to smooth the Skin of the Forehead, by pulling it down after the Action of the Occipito-frontalis; and, when it acts more forcibly, it serves to wrinkle the Skin of the Front, between the Supercilia, as it happens when we frown, or knit the Brows. *Douglas*. See CAPUT.

CORSÆ. See CORRÆ.

CORSOIDES. A Name for the AMIANTHUS LAPIS.

CORTALON, in *Myrepsius*, is the same as the *Senecio*, Groundsel.

CORTEX CARDINALIS DE LUGO. See QUINQUINA.

CORTEX CARYOPHYLLATUS. See CARYOPHYLLUS.

CORTEX CULITLAVVAN, Mont. Exot. 8. *Culilavvan*, *Ephem.* Ger. Dec. II. Anno. I. p. 55.

This is a hot aromatic Bark, said to be found in *New Guinea*, but a Stranger to the *European* Shops. The same Virtues are attributed to it, as to the CORTEX MASSOY. *Dale* from *Monti*.

CORTEX ELATERII. See CASCARILLA.

CORTEX MAGELLANICUS. See CORTEX WINTERANUS.

CORTEX MASSOY, Mont. Exot. 8. Ephem. Ger. Dec. II. Ann. I. 55.

This is a warm aromatic Bark, said to be found in *New Guinea*, but is not known in our Shops. It is alexipharmic, opening, carminative, cephalic, cordial, and stomachic. The Inhabitants of the Country where it grows use it powder'd, and made up into a kind of Pulp with Water, for anointing their Bodies in cold and rainy Weather. It is said to warm them very much, to ease pungent Pains and Gripes, and to be of a very grateful Fragrance. *Dale* from *Rumphius* and *Monti*.

CORTEX PERUVIANUS. See QUINQUINA.

CORTEX WINTERANUS SPURIUS. See CANELLA ALBA.

CORTEX WINTERANUS, Offic. Park. Theat. 1652. *Cortex Winteranus*, *Cortex Magellanicus*, Mont. Exot. 8. *Cortex Winteranus acris sive Canella alba*. J. B. 460. *Cortex Winteranus Clusii*, Chab. 34. *Laurifolia Magellanica cortice acri*, C. B. Pin. 461. Raii Hist. 2. 1801. WINTER'S CINNAMON.

This Bark is now hardly to be met with, we making use of the *Canella alba*, which is generally call'd *Winter's Bark* in the Shops, in its stead. *Miller's Bot. Off.*

Capt. *Winter*, who went out with Sir *Francis Drake*, when he went round the World, at his Return, brought with him, from the Streights of *Magellan*, an aromatic Bark, which had been very useful to those of his Ship, both used instead of other Spices with their Meat, and as a Medicine very powerful against the Scurvy. *Clusius*, from this Captain's Name, call'd it *Cortex Winteranus*, and the Tree *Magellanica Aromatica Arbor*. The Writer of the Journal of the *Dutch* Ships, which went to the Streights of *Magellan* about 1599. calls it *Lauro similis Arbor, licet procerior, Cortice Piperis modo acri & mordenti*: And *Sebald de Weert*, who was there, says, that both Leaves and Bark were used with their Meat and Muskles, to correct them in so cold a Climate. *Caspar Bauhine* calls it *Laurifolia Magellanica Cortice acri*; *Johnston*, *Arbor Laurifolia Magellanica*.

But Mr. *George Handyside*, who came from thence some little time since, gives the best Account of it, having brought with him a Specimen or Sample of its Leaves and Flowers on the Twig, and its Seed; by which I cannot reduce it to any of our kind of Plants so well as the *Periclymenum*; and therefore I shall call it, tho' it differs in many things from the Honeysuckle, *Periclymenum rectum Foliis Laurinis*, *Cortice acri aromatico*.

He assured me, that this Tree rose to be higher and larger than an Apple-tree, spreading very much both in Root and Branches. The Twigs had on them Leaves of a light-green Colour on their upper Side, standing on half Inch long Foot-stalks; are an Inch and half long, and an Inch broad in the Middle, where broadest, and whence they decrease to both Ends, ending blunt. The Flowers come from the Alæ of the Leaves, standing on Stalks a Quarter of an Inch long; two, three, or more of them together, something like those of the *Periclymenum*; each of them are milk-white, pentapetalous, and smell like Jessamine; to which succeeds an oval Berry, made up of two, or three, or more Acini, or little Berries, standing together on the same common Foot-stalk, of a light-green Colour, with some black Spots; and in these Berries are contained several black aromatic Seeds, something like the Stones in Grapes.

It grows in the Middle of the Streights of *Magellan* very plentifully.

The Leaves of this Tree were used with other Herbs, by Mr. *Handyside*, for Fomentations in several Cases, with very good Success; but he admired most the Use of the Bark inwardly, boiling half a Dram of it with some carminative Seeds, and giving it to those of the Ship who were under his Care, very much afflicted with the Scurvy. It usually sweated them, and they were very much relieved. The same Medicine he likewise administered to a great many of the Ship, who were very ill by eating a poisonous sort of Seal, found in those Parts, call'd a Sea Lion; with which they had a very great Amendment, altho' they had been so ill with feeding on this Creature, as to lose most of their Skins, which peel'd off their Bodies by degrees, and in large Pieces; so that the Antidote to this strange Poison was to be had very near it, and was very much extol'd by this Gentleman, who was put to a stand to know what to do in this strange Case, altho' he very well understood the Materia Medica.

By the Description of this Tree, and that of wild Cinnamon, it appears, that the *Cortex Winteranus*, commonly sold in the Shops, is not the true *Cortex Winteranus*: But I must needs say, tho' they are the Barks of two very different Trees, and growing in very different Places, and appear quite another thing in their outward Faces, yet their Taste is much the same, and I believe they may be used as a Succedaneum, one for another; tho'

tho' the true be much to be valu'd beyond the falſe, being much more aromatic. *By Sir Hans Sloan, in the Phil. Tranſ. abr. Vol. 2.*

In order more effectually to inveſtigate the Qualities, and diſcover the genuine Nature, of *Winter's Cinnamon*, we ſhall now take a View of the ſeveral Experiments inſtituted with it by *Antonius de Heide*, as related in his *Obſervationes Medicæ*. "Rectify'd Spirit of Wine," ſays he, "when pour'd upon this "Bark, is immediately ting'd with an intenſely red Colour, "and impregnated with the Taſte of the Bark; but Rain-"water, when poured upon it, only acquires a faint-yellow "Colour. A large Quantity of the Oil of Vitriol, added to "the ſpirituous Tincture of this Bark, as yet not poured off "from it, excited a violent Heat, and an Agitation of the "Pieces of the Bark, which were before lying at Reſt in the "Bottom of the Veſſel, and which had aſſumed a blackiſh "Colour. Aqua-fortis, dropt into the Tincture poured off "from the Bark, gave it a whitiſh kind of Colour, which Ef-"fect ſeems rather to be aſcribed to the aqueous Nature, than "to the Acidity of the Aqua-fortis; for Rain-water produc'd "a milky Colour with this Tincture, whilſt, at the ſame time, "white Flakes ſubſided to the Bottom of the Veſſel. Oil of "Tartar *per Deliquium* ſeemed to produce no Change in the "ſpirituous Tincture, except that by its means it aſſumed a "brighter Colour. Salt of Tartar renders the aqueous Tin-"cture of this Bark turbid, and precipitates a ſmall Quantity "of white Flakes to the Bottom of the Veſſel. Aqua-fortis "ſeems to render the Colour of this Tincture more deep than "it was before." According to *Boecler*, in Diſtillation it affords a large Quantity of Oil, which, like that of Cinnamon, partly floats, and partly ſubſides, in the Water with which it is yielded. As this Bark is an Aromatic, we may reaſonably conclude, that it is poſſeſſed of aromatic Qualities, and conſequently that it is ſtimulating, corroborating, inciding, aperient, and antiacid. It is highly extol'd as a Specific in the Scurvy; and, in *England*, it is ſometimes preſcrib'd under the Name of *Cortex antiſcorbuticus*, or the antiſcorbutic Bark. "In *Eng-*"*land*," ſays *Ettmuller*, "it is frequently and ſucceſsfully "exhibited with Crabs-eyes, in ſcorbutic and hypochondriac "Diſorders." The Powder of it is given from one Scruple to half a Dram; and, according to others, a whole Dram. When infuſed in ſome proper Liquor, two Ounces of the Infuſion may be exhibited for a Doſe. According to *Valentini*, the Powder of it may be exhibited from ten to fifteen Grains; but, in Infuſions or Decoctions, a Dram or two of it may be us'd. The ſame Author informs us, "That this Bark is poſſeſſed of a "heating and diſcutient Quality, whereby it corroborates the "Stomach, attenuates thick and ſcorbutic Blood, and conſe-"quently preſerves its Circulation: Hence 'tis highly benefi-"cial in Diſorders ariſing from too copious an Uſe of Sea Salt, "the Scurvy, and others of a like Nature. For this very "Reaſon it is, by *Willis*, highly extol'd in a Palſy, and Impo-"tency of the Joints; for ſtrengthening and corroborating "which it is calculated, in conſequence of its volatile Acri-"mony, and its oleous penetrating Parts. From this Bark is "diſtil'd a Water, on which floats an Oil, which, when tritu-"rated with Sugar, makes an excellent Elæoſaccharum "for the above-mentioned Diſorders. Externally it is uſed in "Clyſters intended for Apoplexies, Lethargies, and other Diſ-"orders of a like Nature. Some, who ſmoke Tobacco, add a "little of it in a Pipe, by which means it diffuſes a fragrant "Odour, reſembling that of Cloves. *Apinus* makes it a Suc-"cedaneum to the *Peruvian* Bark, and by its means cur'd not "only erratic, but alſo petechical Fevers." According to the celebrated *Juncker*, in his *Conſpectus Therapiæ Generalis*, this Bark is reſolvent, diſcutient, and ſubaſtringent; for which Reaſon it is ſucceſsfully preſcrib'd in Diſorders of the Stomach, Crudities, Nauſeas, Diarrhœas, exceſſive Vomitings, Colics; as alſo in the Declenſion and End of intermittent Fevers, with a View to corroborate the Stomach. It is alſo ſaid to be highly beneficial to ſcorbutic Patients, and ſuch as labour under Obſtructions of the Viſcera, Cachexies, and Irregularities of the Menſes; but it neither cures quartan nor petechical Fevers, nor affords any conſiderable Relief to paralytic Patients.

CORTICALIS SUBSTANTIA. The cortical Subſtance of the Brain and *Cerebellum*. See CEREBRUM.

CORTUSA. This Plant is ſo call'd from *Cortuſus*, a famous Botaniſt, who firſt brought it into Uſe.

The Characters are,

It hath a perennial Root: The Leaves are roundiſh, rough, and crenated on the Edges, like thoſe of Ground-ivy: The Cup of the Flower is ſmall, and divided into five Parts: The Flowers are ſhaped like a Funnel, are cut at the Top into many Segments, and are diſpoſed in an Umbel: The Fruit is roundiſh, terminating into a Point, and is cloſely fixed in the Cup, in which are contained many ſmall angular Seeds.

1. Cortuſa. *J. B.* 3. 409. *Boerh. Ind. A.* 206. *Cortuſa, Sanicula montana*, Offic. Mont. 41. *Cortuſa Sanicula Alpina quibuſdam*, Chab. 490. *Sanicula Alpina ſive Cortuſa Matthioli*, Park. Theat. 533. Parad. 240. Raii Hiſt. 2. 1084. *Sanicula Alpina Cluſii ſive Cortuſa Matthioli*, Ger. 645. Emac. 788. *Sanicula montana latifolia ſinuata*, C. B. Pin. 243. Hiſt. Oxon. 2. 558. *Auricula Urſi laciniata ſeu Cortuſa Matthioli flore rubro*, Tourn. Inſt. 121. BEARS-EAR SANICLE.

It grows in mountainous Places, and flowers in the Spring. The Leaves promote Expectoration. *Dale* from *Monti*.

CORU *Canarica, Arbuto vel Malo Aureæ ſimilis.* J. B. *Coru Foliis Mali Aureæ, flore luteo Acoſtæ.* C. B. *Coru.* Park. *Luſitanis Herba Malabarica.*

It is a dwarf Tree, like the Quince-tree, with Leaves very like it, and a yellow Flower, with little or no Smell; but *Garcias* makes it have Leaves like thoſe of the Peach-tree, and a white Flower, ſmelling much like the Periclymenum. The Bark of the Root is of a Watry-green, light and thin; and, if broken or wounded, diſtils a copious milky Juice, more ropy and viſcid than what flows from the *Macer*; inſipid, if not a little bitteriſh, cold, and drying, but more drying than cold.

The Inhabitants of *Malabar*, both Pagans and Chriſtians, make very much Uſe of the Liquor of the green Bark, tho' it be very ungrateful to the Taſte, on account of its ſurpriſing Effects in all manner of Fluxes, as in the Lientery, Diarrhœa, and Dyſentery, from whatever Cauſe they proceed. The Doſe is ſeven Ounces in the Morning, and as many in the Evening, if Neceſſity require it; but becauſe the Juice is bitter and unſavoury, they waſh their Mouths with Whey after taking it.

The *Portugueſe* diſtil the Bark of the Root, and prepare it in the following Manner:

> Take of the Bark pulveriz'd, eight Ounces; of Ammi, Apium, Coriander dry'd, black Cumin ſomewhat roaſted and pulveriz'd, each three Ounces; of the Rinds of Chebule Myrobalans, ſeven Ounces; of freſh Butter, made of Cows Milk, two Ounces; ſour Milk, a ſufficient Quantity to dilute the Powders: Diſtil them in a proper Veſſel.

The common Doſe, for ſuch as labour under a Flux of the Belly, is four or five Ounces of the diſtil'd Liquor, with two Ounces of Water of *Indian Filberd*, commonly call'd *Areca*, or Water of the Pedicles of Roſes, to be taken once a Day, or twice, if it be neceſſary. Sometimes, upon a preſſing Occaſion, they mix with it Troches of Amber, or Terra Lemnia. Immediately after taking it, the Cuſtom is to exhibit Rice with Oxygala, or ſour Milk, and, toward Night, they adminiſter a Clyſter prepared of the ſaid diſtil'd Liquor.

Tho' *Garcias* had always good Succeſs in the Uſe of this Water, yet he confeſſes, that the Herba Malavarica, prepar'd by the *Malavarians* themſelves, was a more preſent Remedy. This is made of the ſame Ingredients as the Water before deſcrib'd, very finely pulveriz'd, and macerated in Whey, or a ſtrong Decoction of Rice. *Acoſta* prefers the green Bark of the Macer, tho' much more ungrateful, and difficult to be taken, far before this Liquor. The Medicine before deſcrib'd is alſo effectual in Weakneſs of the Stomach, and, taken with Water of Mint, and Powder of Maſtich, reſtrains Vomiting. *Raii Hiſt. Plant.*

CORVINUS LAPIS. A Stone ſaid to be found in *India*, called by the Inhabitants *Cocaote*. It is remarkable for making a Noiſe like Thunder when heated.

CORUSCUS. The Auricula Muris. *Rulandus.*

CORVUS, Offic. Schrod. 5. 317. Aldrov. Ornith. 1. 694. Bellon. des Oyſe. 280. Geſn. de Avib. 294. Jonſ. de Avib. 23. Charlt. Exer. 75. Mer. Pin. 171. Schw. 244. Will. Ornith. 82. Raii Ornith. 121. Ejuſd. Synop. A. 39. THE RAVEN.

This is a Bird too well known to require a Deſcription. Young Ravens, calcin'd to Aſhes, are recommended againſt the Epilepſy, Gout, and that Species of Leproſy call'd *Alphus*. The Brain is alſo taken notice of among the Remedies for an Epilepſy. The Fat and Blood are ſaid to render the Hair black. The Dung, ſuſpended about the Necks of Children, is reported to eaſe their Coughs, and procure them an eaſy Dentition. *Dale* from *Schroder*.

CORYCUS, κόρυκος. A ſort of Ball among the Antients, probably made of Leather, and ſtuffed with the Acini or Grains of the Fig, or Bran, or Meal, for weak Perſons, but with Sand for thoſe who were ſtrong and robuſt, as *Oribaſius* informs us from *Antillus*. The Size of this Ball is not determin'd, but probably it was pretty large: It was, however, more or leſs ſo, according to the Age and Strength of the Perſon whom it was deſign'd for. This was ſuſpended from the Ceiling, in ſuch a manner as to reach as far as the Navel of the Perſon who was to uſe it, who took it in both Hands, and, puſhing it from him, receded as it return'd. Then throwing it from him, in its Return he either caught it in his Hands, or ſuffered it to meet his Body. This Exerciſe was call'd *Corycomachia*, κορυκομαχία, and was recommended for extenuating too groſs Bodies.

CORYDALUS, κορυδαλός. The Lark. See ALAUDA.

CORYLUS. See AVELLANA.

CORYMBIA, CORYMBAS, or CORYMBE. The Ivy-tree. *Blancard.*

CORYM-

CORYMBUS, κόρυμβος. See the Explication of botanical Terms under the Article BOTANY.

Corymbiferous Plants are such as have a compound discous Flower, but their Seeds have no Down adhering to them. The Name is taken from the Manner of bearing their Flowers in Clusters, and spreading round in the Form of an Umbrella, as Onions, &c. Of this Kind is the Corn-marygold, common Ox-eye, the Daisy, Chamomile, Mugwort, Feverfew, &c.

Mr. *Ray* distinguishes them into such as have a radiate Flower, as the Sun-flower, the Marygold, &c. and such as have a naked Flower, as the Lavender, Cotton, Agrimony, and Tansey; and also those that are akin to them, as Scabious, the Teasel, Carduus, and others. *Miller's Dict. Vol.* 1.

CORYPHE, κορυφή. The Vertex, or Top of the Head.

CORYZA, κόρυζα. *Celsus* translates this by *Gravedo*, and *Cœlius Aurelianus* by *Catarrhus ad Nares*. It imports such a Distillation of Humours from the Nose as happens in a Cold. See CATARRHUS.

COS, Offic. Worm. 41. Chart. Foss. 17. Aldrov. Mus. Metall. 718. *Cotes*, Boet. 52. *Cotes*, Kentm. 35. *Cotes, Novaculæ*, Mer. Pin. 211. *Lapis Naxius*, Matth. 1390. THE WHETSTONE.

Dioscorides informs us, that the Grit which is worn off the Whetstone, by sharpening Iron, causes Hair to grow upon the Parts affected with an *Alopecia*; that it restrains the Growth of the Breasts in Virgins; and that, drank with Vinegar, it consumes the Spleen, and is good for an Epilepsy.

There are three different Sorts of Whetstones, the Hone, the Gritstone, and the black Whetstone. It is not easy to determine which is meant by *Dioscorides*.

COSCINOS, κόσκινος. A Sieve, or Sierce.

COSCULIA, κοσκύλια. The Grains of *Chermes*.

COSMET, Antimony. *Johnson*.

COSMETICA ARS. That Part of Medicine, which is employ'd in preserving or improving the natural Beauty. See COMMOTICA.

COSMETORGES. A Word coin'd by *Dolæus*, to express the sensitive Soul. *Gastellus*.

COSMIANA ANTIDOTUS. The Name of an Antidote in *Marcellus Empiricus*, *Cap.* 29.

COSMOS, κόσμος. This, in *Hippocrates*, is the Order and Series of critical Days.

COSSI. Hard Tubercles in the Face. The same as VARI. See VARUS.

COSSUM. A malignant Ulcer of the Nose, mention'd by *Paracelsus*.

COSSUS. A small Worm, which eats into Wood. See TEREDO.

COSTÆ. In Botany, the Nerves of Leaves. These are long tough Strings, which run either across or lengthways in the Leaves of Plants.

COSTÆ, in Anatomy, signifies the Ribs. These are so united with the *Sternum*, in the Formation of the Thorax, that it will be necessary to describe them under the same Article, in order to avoid Confusion. See, therefore, THORAX.

COSTUS, Offic. Comm. Flor. Mal. 90. *Costus Arabicus Dioscoridis*, C. B. Pin. 36, 37. *Iridem redolens ejusdem, amarus Officinarum, seu Helenium, & Comagenium Dioscoridis ejusdem, dulcis Officinarum, Centaurio magno cognatus ejusdem*, Raii Hist. 2. 1347, 1348. *Costus Helenii facie Officinarum*, J. B. 2. 749. Chab. 246. *Costus dulcis Officinarum*, Ejusd. *Indicus odoratus*, Ger. Emac. 1620. *Indicus Clusii*, Park. Theat. 1582. *Costus Indicus Violæ Martis odore*, Herm. Mus. Zeyl. 58. *Tsjana Gua*, Hort. Mal. 11. 15. Tab. 8. SWEET AND BITTER COSTUS.

Tho' these were antiently esteem'd to be two different Roots, yet they are now generally believed to be both of them the Roots of the same Plant, differing only in Age; the freshest being only the *Costus dulcis*, and the oldest and stalest the bitter; and, indeed, so long ago as *Garcias ab Horto* and *Clusius*, they began to be of this Opinion. This is a pretty thick Root, brown on the Outside, and of a yellow White within, appearing a little spongy in the Middle. 'Tis of a somewhat hot bitterish Taste, and of a Smell pretty much resembling the Orris-root. The *Costus* is describ'd in the 11th Volume, and 15th Table, of the *Hortus Malabaricus*, by the Name of *Tsjana Cua*.

It is accounted to be hot and dry, comforting the Head and Stomach, and helping vertiginous Disorders. It is likewise a good Deobstruent, opening Obstructions of the Womb, and procuring the Catamenia. It is one of the Ingredients in the *Theriaca*.

It bears a Part in naming the *Electuarium Caryocostinum*. *Miller's Bot. Off.*

It is also esteem'd as a good Hepatic; and is said to be of Service in Obstructions of the urinary Organs, Colic, Dropsy, and Palsy.

That Costus is best which is recent, dense, odorous, bitterish, and not carious.

Geoffroy says, we are still ignorant of the Costus of the Antients, of which the *Greeks* had three Kinds. *Pliny* distinguishes two Kinds, the white and black; and the *Arabians* had likewise two Kinds, one sweet, the other bitter. The Dose of our Costus is from twelve Grains to half a Dram; and, in Infusion, from two Drams to half an Ounce. It was antiently used as a Perfume.

It was likewise employ'd in Sacrifices.

COSTUS HORTORUM. See BALSAMITA MAS.

COSTUS NIGRA. See CINARA.

COTARONIUM. A Word coin'd by *Paracelsus*. It implies a Liquor, into which all Bodies, and even their Elements, may be dissolved.

COTHON, χαθων. A kind of large earthen Cup, used to drink out of; or an earthen Vessel, wherein Flowers, Leaves, and Roots, were kept, being press'd down in it. In *Galen*, it imports an earthen Vessel for burning Cadmia.

COTINUS, κότινος, among the Antients, imported the *Oleaster*, or wild Olive-tree. But

COTINUS, among the modern Botanists, implies a Shrub of another Kind.

The Characters are,

The Leaves are round, and sustain'd by long Pedicles. The Flower-cup is small and quinquefid; the Floscules are rosaceous and pentapetalous, disposed in capillary Branches; the Ovary becomes an orbicular Fruit, which contains a triangular Seed, under a hard indivisible Shell.

There is but one Species of the *Cotinus*, which is the

Cotinus; coriaria. *Jonst. Dendr.* 293. *Elem. Bot.* 483. *Tourn. Inst.* 610. *Boerh. Ind. A.* 2. 228. COTINUS, Offic. Rupp. Flor. Jen. 80. *Cotinus Matthioli*, C. B. Pin. 415. *Coccigria, Cotinus coriaria nonnullis dicta*, Chab. 37. *Coccigria, sive Cotinus putata*, J. B. 1. 494. Raii Hist. 2. 1696. *Coggygria Theophrasti vel Cotinus coriaria Plinii*, Ger. 1293. Emac. 1476. *Cotinus Coriaria*, Park. Theat. 1451. VENICE OR RED SUMACH.

This Shrub flowers in *May*, and produces ripe Fruit in *July* and *August*. The Wood is used, in the Southern Parts of *France*, to dye Woollen Cloth yellow. The Leaves are used by the Tanners for preparing their Leather.

The whole Plant is thought to be extremely drying and astringent. Of a Decoction of the Leaves, Gargarisms are prepared, which are good for Ulcers of the Mouth and Tongue; and are used against Relaxations of the Uvula, and Glands in the Fauces. The Fruit is particularly serviceable in Ulcers of the Fauces and Pudenda; and restrains Diarrhœas, and a too copious menstrual Discharge.

The Leaves, dry'd and powder'd, and then sprinkled on the Belly, after anointing it with Vinegar of Roses, stop any Flux of the Belly, according to *Matthiolus*.

COTIS, κοτίς. The posterior Part of the Head. Some take it for the Hollow of the Neck, near its Articulation with the Head. *Hippocrates* uses this Word in his Treatise *de Morbis*, *L.* 2.

COTONASTER. A Name for the *Cratægus*; *folio oblongo*; *serrato*, *utrinque virente*.

COTONEA. See CYDONIA.

COTONEASTER. A Name for the *Mespilus*; *folio subrotundo*; *fructu rubro*.

COTONIUM. See BOMBAX.

COTTYPHUS, κόττυφος, or κότυφος. The Name of a Fish mention'd by *Oribasius*, in his medicinal Collections, *L.* 2. *C.* 58. It is the *Merula*, or Cook-fish. See MERULA.

COTULA.

The Characters are,

The Leaves are small, like those of Chamomile; the Flower is crown'd, or naked; the Seeds are flat, in the Shape of a Heart, and winged. The Flower-cup is generally squamous.

Boerhaave mentions six Species of this Plant, which are,

1. Cotula; flore luteo, radiato. See BUPHTHALMUM.

2. Cotula; flore pallido, radiato. *Chrysanthemum, folio Cotulæ, flore albo.* Triumfett. *Chrysanthemum, fruticosius, subcandidum.* C. B. P. 135. *a.*

3. Cotula; floris radiis sulphureis, disco luteo. *a.*

4. Cotula; flore albo, pleno. *a.*

5. Cotula; flore luteo, nudo. *T.* 495. *Chrysanthemum, Valentinum.* Clus. H. 332. *Buphthalmo tenuifolio simile, Chrysanthemum Valentinum Clusii.* J. B. 3. 125.

6. Cotula; Cretica; minima; folio Chamæmeli; capitulo inflexo. *T. Cor.* 37. *a. Boerhaave's Index alter Plant. Vol.* 2.

COTURNIX, Offic. Schrod. 5. 317. Bellon. des Oyse. 264. Aldrov. Ornith. 2. 150. Will. Ornith. 121. Raii Ornith. 169. Ejusd. Synop. A. 58. Gesn. de Avib. 310. Mer. Pin. 173. Schw. A. 247. Charl. Exer. 184. Jonst. de Avib. 47. THE QUAIL.

You are to chuse those which are young, tender, and well fed. They are very nourishing, create an Appetite, and produce good Juice.

Several Authors look upon Quails to be very bad Food, tho' they are not so much so, as they would have them to be. Indeed, they are somewhat hard of Digestion, especially when old.

They contain much Oil, and volatile Salt.

They agree at all times with any Age and Conſtitution, provided they are moderately uſed.

REMARKS.

The Quail is a ſmall Bird, ſomewhat bigger than a Thruſh, finely feather'd, and has a pleaſant Note. It uſually feeds upon Millet, Corn, and other Grains. It is ſuch tender and delicious Food, that it is ſerved to the beſt Tables.

Moſt Authors do not agree about the Effects produced by the Quail. *Averrhoes* ſays it has good Juices; and that it is good for Perſons recovering from Sickneſs, and ſuch as enjoy perfect Health; which we willingly agree to, becauſe, in the firſt Place, we have not experienced any ill Effects produced by the Quail: Secondly, becauſe we find its Fleſh to conſiſt of a Subſtance, which is a little compact in the Parts thereof; and that it contains a convenient Proportion of oily and balſamic Principles, and of volatile Salts. Indeed, it is ſometimes not ſo eaſy of Digeſtion, and this proceeds from its Over-fatneſs, which makes it ſit heavy on the Stomach; but when it is uſed moderately, there is none of this ſmall Inconvenience to be met with from it.

Galen, *Pliny*, and *Avicenna*, on the contrary, aſſure us, that the Quail is very dangerous Food; and *Galen* ſays, he had ſeen ſeveral Perſons in *Phocis*, *Bœotia*, and *Doris*, who fell into Convulſions and Epilepſies, that had eaten thereof; and this, as he imagines, was produced from the Quails of this Country feeding upon Hellebore; tho', on the contrary, this Plant ſeems to me to be more likely to cure, than to cauſe the Epilepſy; for this, working by Stool and Vomit, may expel the ſharp and pungent Humours which cauſe it: But tho' Hellebore, of itſelf, were proper for the producing of Epilepſies, and that Quails very frequently feed upon it, it would not from thence follow, that Quails cauſe Epilepſies; ſince the Hellebore, by aſſimilating itſelf with the ſolid Parts of the Quails, muſt have loſt a certain Diſpoſition of its inſenſible Parts, wherein alone this pretended Malignity might conſiſt.

Thoſe who are of *Galen*'s Opinion, in reſpect to a Quail, further ſay, for the maintaining of it, that Quails, being very liable to epileptical Motions, may impart the ſame to thoſe that eat them; but it would follow from hence, that Goats, Sheep, Capons, Turtles, and ſeveral other Animals, commonly eat by us, and that are often ſubject to Epilepſies, muſt communicate the ſame to us, which we have not yet experienced. Some of the Antients, following the falſe Reaſoning of *Galen*, with reſpect to the Effects of the Quail, will have it eaten with Coriander-ſeed, Vinegar, and ſeveral other Ingredients, which will make it loſe its good Taſte, and ſo pretend hereby to diveſt it of its ſuppoſed Malignity; but as we are not yet ſo well convinced of its being ſo pernicious, we ſhall hold ourſelves free to ſeaſon the Quail with what we ſhall deem moſt proper to improve its pleaſant Taſte; and we ſhall not trouble ourſelves about correcting a pretended ill Quality, of which we have no manner of Experience.

The Quail does not riſe high above the Earth, and flies heavily; for which Reaſon *Pliny* calls it rather a terreſtrial than aereal Bird; but Nature has made it Amends, by the great Agility of its Feet, whereby it runs extremely ſwift. It is a wanton and laſcivious Bird.

The Fat of the Quail is good to take away Specks on the Eyes; as its Dung, when dried and reduced to Powder, is for the Falling-ſickneſs. *Lemery on Foods.*

As the Aliment of Quails is principally Vegetables and Water, and the habitual Exerciſe not very great, it does not ſeem likely, that the Salts ſhould be very much exalted; and yet the Lewdneſs of this Bird inſinuates the contrary.

Boerhaave claſſes the Quail amongſt alcaleſcent Aliments, and ſays it feeds on Inſects.

COTYLA. See CHAMÆMELUM.

COTYLE, κοτύλη. This properly ſignifies any deep Cavity in a Bone, in which any other Bone is articulated; but it is generally uſed to expreſs the Acetabulum, or Cavity, which receives the Head of the Thigh-bone. It alſo imports a deep Sinus, ſurrounded with large Lips.

Cotyle, *Cotyla*, *Cotula*, among the Antients, ſignify'd not only a Drinking-cup, of a wide and deep Capacity, but any thing which had a Cavity; for Inſtance, the Hollow of the Hand, as we learn from *Athenæus*, *Lib.* 11. *Cap.* 8. But it is alſo a Meaſure of Capacity among the *Greeks* for Things liquid as well as dry, and is the ſame with the Hemina of the *Romans*, containing half a Sextary, or four Acetabula: Hence it appears, that it contains ten Ounces of Wine, and nine of Oil. See *Galen*, *de Ponderibus & Menſuris*, where he alſo determines its Capacity of Honey, which is thirteen Ounces and a half. *Philander*, on *Vitruvius*, makes the Cotyla conſiſt of ten *Unciæ menſurales*. It will help us, for the better underſtanding of Authors, to read what *Pitiſcus* has written on this Subject in his Lexicon: "The Cotyla, ſays he, which is alſo call'd *Tri-*
"*blion*, is half a Sextary, and the twelfth Part of a Chœus. It
"contains two Quarteries and ſix Cyathi: Its Capacity, full
"of Oil, weighs ſeven Ounces and a half, or ſixty Drams;
"and it holds, of Wine or Water, eight Ounces two Drams
"two Scruples. The *Attic* Cotyle was nine *Italic* Ounces,
"which, as they are mark'd by the Sections of the Horn,
"weigh ſeven Ounces and a half; ſo that the *Unciæ menſura-*
"*les* differ from the *ponderales*; and hence it is, that the
"medicinal *Unciæ*, and *Libræ menſurales*, are the ſame as the
"*Attic* and *Roman*. The *Cotyla Georgica* is larger than the
"*Libralis*, as containing thirteen *Unciæ menſurales* and a half,
"that is, a *Roman* Pound, beſides an Ounce and a half. The
"*Cotyla hippiatrica libralis* is twelve *Roman* Ounces. That
"of *Paris* is, indeed, a Pound; but more than the *Roman*
"Pound, in the ſame Proportion as the *Paris* Foot is larger
"than the *Roman* Foot; that is, by nine Drams, or an Ounce
"and a Dram, which we may call the Depth of an Inch and
"a half, if we compare lineal with ſolid Meaſures." *Rieger.*

It is neceſſary, for underſtanding the above Quotation, to obſerve, that there was amongſt the *Romans* a *Libra menſuralis*, which the *Greeks* call'd λίτρα μετρικὴ, and diſtinguiſh'd from the λίτρα ϛαθμικὴ, or the *Libra ponderalis*. This conſiſted of twelve Ounces, and was divided likewiſe as the *As*. It was made commonly of Horn, and divided by twelve Lines marking the Ounces; from whence it was call'd by *Galen* κέρας μετρεῖον, *Cornu menſurale*. According to *Galen*, *Lib.* 6. *de Compoſ. Medicament.* this *Libra menſuralis* weigh'd ten Ounces of Oil, and, of Wine, eleven Ounces two Scruples one Obolus and one Siliqua, according to the ponderal *Libra*; that is, in the Proportion of Nine to Ten, which the Antients all along ſuppoſed to be that of the ſpecific Gravities of Oil and Wine. According to the Weight of Wine aſſign'd by *Galen*, the *Libra menſuralis* contain'd 19. 085 ſolid Inches, ſomewhat leſs than three Quarters of our Pint, Wine-meaſure.

COTYLEDON. Certain glandular Bodies, adhering to the Chorion of ſome Animals, are call'd by the Name of *Cotyledons*; but no ſuch Subſtances are obſervable in the Human Chorion.

COTYLEDON, in Botany, is that Part wherein the nutritious Juices of the new Plant are prepared. In ſome Plants there is but one Cotyledon, but in moſt there are two, which become the ſeminal Leaves: Hence the Diſtinction betwixt monocotyledonous and dicotyledonous Plants. *Rieger.*

COTYLEDON is alſo the Name of a Plant.

The Characters are,

In Root, Leaves, Stalk, and the whole Appearance, it reſembles the *Sedum*, Houſeleek. The Flower-cup is multifid. The Flower is monopetalous, quinquefid, and tubulated. The Fruit is like that of the *Sedum*.

Boerhaave takes notice of ten Species of this Plant.

1. Cotyledon; major. *C. B. Pin.* 285. *Tourn. Inſt.* 90. *Elem. Bot.* 76. *Boerh. Ind. A.* 287. *Umbilicus Veneris*, Offic. Ger. 423. Emac. 528. Mer. Pin. 126. Merc. Bot. 1. 77. Phyt. Brit. 131. *Umbilicus Veneris vulgaris*, Park. Theat. 740. *Cotyledon vera, radice tuberoſa*, J. B. 3. 683. Raii Hiſt. 2. 1878. Synop. 3. 271. *Cotyledon, Umbilicus Veneris*, Chab. 537. *Cotyledon Dioſcoridis, Umbilicus Veneris vulgaris*, Rupp. Flor. Jen. 31. *Sedum luteum murale Spicatum, folio umbilicato rotundo*, Hiſt. Oxon. 3. 470. NAVELWORT.

This Plant has a thick knotted Root, with many Fibres at the Bottom, from which ſpring ſeveral fat ſucculent Leaves; the lowermoſt of which have their Foot-ſtalks ſet on upon the Side of the Leaf, which is roundiſh, and crenated about the Edges; but the upper Leaves have the Foot-ſtalk inſerted into the Middle. They are round, and ſomewhat hollow. The Flowers grow on the Tops of the Branches, in long Spikes, of a whitiſh-green Colour, hollow, and of an oblong cylindrical Shape, each of which is ſucceeded by two little horn'd Veſſels, in which are contain'd many ſmall Seeds. It grows upon old Stone-walls and Buildings in divers Parts of *England*, and flowers in *May*. The Leaves only are uſed.

Navelwort is gently cooling and moiſtening, refrigerating and aſtringent, uſeful in hot Diſtempers of the Liver: It provokes Urine, and takes off the Heat and Sharpneſs thereof. The Juice, outwardly applied, helps the Shingles, St. *Antony*'s Fire, the Pain and Inflammation of the Piles. It is likewiſe uſeful againſt Kibes and Chilblains. It is an Ingredient in the *Unguentum Populeon*; tho' the Herb-gatherers too frequently impoſe the *Nymphæa minima*, or Frog-bit, or, which is worſe, the *Cotyledon paluſtris*, or Marſh-penywort, for this Herb, on their unwary Cuſtomers.

Cotyledon; Africana; fruteſcens; foliis orbiculatis, limbo purpureo cinctis. *T.* 90. *Sedum, Africanum, fruteſcens, incanum, foliis orbiculatis.* H. L. 349. M. H. 3. 474. *Sedum, majus, arboreſcens, Africanum, alterum, foliis rotundioribus, glaucis, limbo purpureo cinctis.* Breyn. Prodr. 1. 47. *Sedum, majus, arboreſcens, Africanum, foliis rotundioribus, glaucis, flore rubente.* Breyn. Prodr. 2. 89. H. SHRUBBY AFRICAN NAVELWORT, WITH ROUND LEAVES EDG'D WITH A PURPLE RIM.

3. Cotyledon; Afra; arboreſcens; major; foliis glaucis, oblongioribus; flore luteo. *Sedum, majus, arboreſcens, Africanum, foliis oblongioribus, flore luteo.* Breyn. Prodr. 2. 88. *Sedum, arboreſcens, Promontorii Bonæ Spei.* Stapel. 335. Breyn. Prodr. 1. 47. *Sedum, maximum, arboreſcens, latifolium, flore flavo.* Dn. ten. Rhyne. Breyn. Cent. 1. 179. H. GREATER TREE-LIKE AFRICAN NAVELWORT, WITH OBLONG SEA-GREEN LEAVES, AND A YELLOW FLOWER.

4. Cotyledon; major; arboreſcens; Afra; foliis orbiculatis, glaucis, limbo purpureo, & maculis viridibus, ornatis. *H.* GREATER TREE-LIKE AFRICAN NAVELWORT, WITH ROUNDER SEA-GREEN LEAVES, HAVING PURPLE EDGES, AND SPOTTED WITH GREEN.

5. Cotyledon; major; arboreſcens; Afra; foliis minoribus, craſſiſſimis, viridioribus, minutiſſimè punctatis. *Sedum, Africanum, folio rotundo, minori.* Ind. 121. H. GREATER AFRICAN TREE-LIKE NAVELWORT, WITH SMALL THICK LEAVES.

6. Cotyledon; major; arboreſcens; Afra; foliis minoribus, oblongis, atro-viridibus. H. GREATER AFRICAN TREE-LIKE NAVELWORT, WITH SMALL OBLONG DARK-GREEN LEAVES.

7. Cotyledon; Africana; fruteſcens; folio longo & anguſto; flore flaveſcente. *Commel. Rar.* 23. *H. R. D.* SHRUBBY AFRICAN NAVELWORT, WITH A LONG NARROW LEAF, AND A YELLOWISH FLOWER.

8. Cotyledon; Africana; fruteſcens; flore umbellato, coccineo. *Commel. Rar.* 24. *H. R. D.* SHRUBBY AFRICAN NAVELWORT, WITH SCARLET FLOWERS GROWING IN AN UMBEL.

9. Cotyledon; Afra; arborea; craſſo caudice; folio auriculæ Urſi anguſtiore.

10. Cotyledon; Afra; folio craſſo, lato, laciniato, floſculo aureo. *Telephium, maximum, Africanum, flore aurantio.* Ex Cod. Bent. 1. Plukn. Phyt. 228. 3. H. R. D. AFRICAN NAVELWORT, WITH A BROAD THICK DIVIDED LEAF, AND SMALL YELLOW FLOWERS. *Boerh. Ind. alt. Plant. Vol.* 1.

Beſides the foregoing Species of the Cotyledon, *Dale* mentions the following:

COTYLEDON. Offic. *Cotyledon radice tuberoſa longa repente.* Mor. Hort. Bleſ. 257. Chomel. 807. Tourn. Inſt. 90. Elem. Bot. 76. Raii Hiſt. 2. 1878. *Cotyledon flore luteo radice repente.* Dodart. Mem. 73. *Cotyledon flore luteo maxima.* Hort. Lugd. Bat. 191. *Sedum luteum umbilicatum ſpicatum radice repente majus.* Hiſt. Oxon. 3. 471. CREEPING NAVELWORT.

The Leaves are uſed in the ſame Intentions as thoſe of the firſt Species mention'd above.

COVALAM. The Name of a Plant which grows in the *Eaſt Indies*, otherwiſe called, *Cucurbitifera trifolia Indica fructus pulpâ Cydonii æmula. Cydonia exotica.* C. B. *An Malum Cydonium Indicum.* Bontii? *Beli ſeu Serifole Bengalenſium, Cydonia eorundem Garciæ.* J. B.

This is a tall Tree, which grows in *Malabar*, and the Iſland of *Ceylon*; the Fruit of which reſembles a round Apple in Shape; it is cover'd with a greeniſh thin Rind, under which lies another, which is hard and woody, incloſing a viſcid, yellowiſh, moiſt Subſtance, of a ſweetiſh acid Taſte, in which are plac'd flat, oblong, white Seeds, turgid with a gummy pellucid Juice.

This Fruit, whilſt tender, is preſerv'd in Sugar or Vinegar; when ripe, they are eaten by the Inhabitants of the Country, and eſteem'd delicious; whilſt unripe, they ſtop a Diarrhœa, or Dyſentery. A Decoction is prepared of the Bark, and ſmall Roots, with common Water, which cures hypochondriac Melancholy, Palpitations of the Heart, and Faintings. An Electuary, made of the Bark in Powder with Honey, promotes the Digeſtion of the Aliment, and takes away Head-achs, and Vertigos. A Decoction of the Leaves cures an Aſthma. From the Flowers a Water is diſtil'd, poſſeſſed of cardiac and alexipharmic Virtues.

The Phyſicians of the Country, where this Tree grows, uſe the immature Fruit, preſerv'd in Honey or Vinegar, to ſtop a Diarrhœa; and employ it for the Cure of a Dyſentery with great Succeſs, prepared in any Manner. *Raii Hiſt. Plant.*

COUHAGE. Offic. *Phaſeolus Zurratenſis, ſiliquâ hirſutâ, Couhage dicta.* Raii Hiſt. 1. 887. Flor. Mal. 212. Rivin. Irr. Tetr. *Phaſeolus ſiliquâ hirſutâ.* Park. Theat. 1056. *Phaſeolus pruritum excitans hirſutie ſiliquarum.* Ger. Emac. 1215. *Phaſeolus Zurratenſis ſiliquâ hirſutâ pungente.* Hiſt. Oxon. 2. 69. Herm. Hort. Lugd. Bat. 492. *Phaſeolus utriuſque Indiæ lobis villoſis, pungentibus, minor.* Par. Bat. Prod. 365. Cat. Jam. 69. Hiſt. Jam. 1. 37. *Phaſeolus Braſilianus ſiliquis durante lanugine obſitus, Ricini fructu.* Hor. Par. 140. *Phaſeolus Suratenſis villoſus ſiliquâ hirſutâ, pungente.* Hort. Boſ. 27. *Nai Corona.* Hort. Mal. 8. 61. COUHAGE, OR STINKING BEANS.

This is a Sort of Kidney-bean imported from the *Eaſt Indies*, where they are uſed as a Cure for the Dropſy.

Infuſe twelve Pods of this Plant in two Pints of Beer, and exhibit a Quarter of a Pint of this Infuſion every Morning to one labouring under a Dropſy, and you will experience it to be a moſt certain Remedy. This Receipt was communicated by Sir *Samuel Husbands*, who lived ſome Years in *Barbadoes*, and had often tried it on his Negro Slaves. *Raii Hiſt. Plant.*

This is call'd *Siliqua hirſuta*, and, by a Corruption of the Word, *Cowitch*. The Down, growing on the Outſide of the Pod, is ſo pointed, as, like a Nettle, to ſting the Fleſh, but not with ſo painful a Senſation; this cauſing only to itch; which continues ſo long, and at laſt will grow ſo troubleſome, as to excite much Pain in rubbing to allay it; ſo that it frequently occaſions a Flux of Humours to the Parts.

COUM is a Name for the Colchicum; Chionenſe; floribus Fritillariæ inſtar teſſellatis; foliis undulatis. See COLCHICUM.

COURAP. The *Indian* Name for a Diſtemper, which, as *Bontius* informs us, is very common in *Java*, and other Parts of the *Eaſt Indies*. It is a Sort of Herpes, or Itch, which generally breaks out on the Arm-pits, Breaſt, Groins, and Face, with ſuch an intolerable Itching, that the Perſons affected cannot forbear ſcratching themſelves perpetually, both in the Day, and during the Night: But they pay very dear for the Diverſion which this gives them; for an inſufferable Pain ſucceeds in thoſe Parts which are rendered bare, and denudated of the Cuticula, by the Nails; theſe diſcharging an acrid Humour, which vellicates the Parts, and cauſes the Linen to adhere ſo faſt to the raw Parts, as that it cannot be ſeparated from them without tearing the Cruſt form'd thereon. *Courap* is a general Name for any Sort of Itch; but the Inhabitants call this Diſtemper thus, by way of Eminence. It is ſo extremely contagious, that very few eſcape it. Though it is an unſeemly Diſorder, cauſing a Roughneſs of the Skin, with Scales or *Furfures*, yet the Inhabitants imagine, that it is attended with one Advantage; which is, that, whilſt a Perſon is affected with this, he is ſure to be troubled with no other dangerous Diſtemper; and look upon the Diſappearing of this, as a Prognoſtic of ſome worſe Diſorder. They are, therefore, very eaſy under it for many Years together, without being very ſolicitous about curing it. It is remarkable, that the Vulgar in *Scotland* are poſſeſſed of the ſame Opinion with reſpect to the Itch, and even carry it ſo far, as to affirm, that the Catching this Diſtemper proves a Cure for any other previous to it, conſidering it in the ſame Light as others do the Gout, perhaps with juſt the ſame Foundation.

The Cure, according to *Bontius*, is to be begun by repeated Purges of the following Powder:

Take of clean Sena-leaves, fourteen Ounces; of the beſt Rhubarb, and white Turbith, each eight Ounces; of white Tartar, and the beſt Scammony, each four Ounces: Mix together.

The Doſe is half a Dram.

As for Topics, *Bontius* recommends the following, which, he informs us, was communicated to him by *Juſtus Heurnius*:

Take of the Ruſt of Iron, an Ounce; of Sulphur, half a Dram: Let theſe be finely powder'd in a Mortar, adding as much of the Juice of the Baſilicon, which grows in the *Indies*, as is ſufficient to make the Powder into Paſtils, which are to be diſſolv'd in Vinegar, and applied to the Part affected at Night, waſhing it off the next Morning.

If this is not ſufficient to perform a Cure,

Take of Opium, half a Scruple; of Lime prepared of Shells calcin'd, two Scruples: Let theſe be rub'd together in a Mortar, with the Juice of Love-apples. When the Cruſt is abraded, and the Ichor well abſterg'd from the Part affected, let it be anointed with this Compoſition.

Bontius adds, that Oil of Benzoin, with a little Nitre, Sal Prunellæ, or a very ſmall Quantity of Sublimate, makes a good Topic in theſe Caſes; and that the Juice of Lemons may be commodiouſly added to theſe Applications. He farther informs us, that he cured himſelf, when affected by this Diſorder in the Arm-pits, and upon the Breaſt, by once purging, and then anointing the Part affected with prepar'd Tutty, or Ceruſs alone. The Diet ſhould be moderate, and of Aliments which afford a good Juice. *Bontius, de Medicina Indorum.*

COURBARIL. This is the *American* Name, by which the *Indians* call the Tree which produces the Gum Anime.

The Characters are,

It hath a papilionaceous Flower, from whoſe Calyx ariſes the Pointal, which afterwards becomes an unicapſular hard Pod, including roundiſh hard Seeds, which are ſurrounded with a fungous ſtringy Subſtance.

It is thus diſtinguiſhed by Authors:

Arbor Braſilienſis ſiliquoſa & gummifera, Gummi Animæ ſimili. Ejuſd. 1760. *Arbor ſiliquoſa ex Virginia, Lobo fuſco, Scabro.* C. B. Pin. 404. *Arbor ſiliquoſa, ex qua Gummi Animæ elicitur.*

elicitur. Ejuſd. *Animifera Arbor Braſiliana*. Herm. Par. Bat. Prod. 312. *Anime, Cancamum Græcorum*. Mont. Exot. 11. Ind. Med. 10. *Acaciæ quodammodo accedens, Arbor Anime Gummi fundens, Americana, foliis magnis acuminatis in pediculo binis, lobo magno, craſſiſſimo, eduli*. Breyn. Prod. 2. 8. *Ceratia diphyllos Antegoana, Ricini majoris fructu, oſſea ſiliqua grandi incluſo*. Pluk. Almag. 96. Phytog. Tab. 82. *Jetaiba Arbor*. Piſon. (Ed. 1648.) 60. (Ed. 1658.) 123. Jonſ. Dendr. 313. *Jetaiba Braſilienſibus*. Marcg. 101. *Courbaril*. Plum. Nov. Gen. 49. Tab. 36. *Lobus ex Wingandecaouw*. J. B. 1. 436. *Lobus Peregrinus cartilaginoſus Phaſeolo nigro puniceo annulo cincto*. Chab. 138. *Locus vulgo*. THE LOCUST-TREE. *Dale*.

It is a large Tree, growing in many Parts of the *Weſt Indies*, bearing two Leaves at a Joint, which are about the Bigneſs and Shape of Bay-leaves, but having the middle Rib bending towards one Side of the Leaf, which makes one Half appear bigger than the other. It bears large Lobes or Pods, three or four Inches long, and two Inches over, of a flattiſh round Shape, very thick and hard, and full of ſmall Aſperities, making them feel like Shagreen, of a browniſh yellow Colour, containing in the Inſide ſeveral hard ſtony Kernels.

COURONDI. H. M. P. 4. T. 50. *Arbor Indica fructu rotundo, cortice molli nucleum unicum nudum Glandi ſimilem continente*.

This is a tall evergreen Tree, which grows about *Paracaro*, in the *Eaſt Indies*. The Juice expreſs'd from the Leaves, taken in warm Whey, cures a Diarrhœa and Dyſentery; as do the Kernels of the Fruit, taken any way. *Raii Hiſt. Plant*.

COUROU-MOELLI. H. M. P. 5. T. 39. p. 77. A Shrub about four or five Foot high, which grows about *Baypin*, and other ſandy Places near *Cochin*, in the *Eaſt Indies*. The Bark, together with the Root, boil'd in Cows Milk, is eſteem'd an Antidote againſt the Bites of Serpents. Of the Bark bruiſed, with Oil, a Liniment is prepared, which is ſaid to be good in the Gout. The Fruit, which is a black, ſhining, ſucculent, acid Berry, is eſteem'd very delicious. *Raii Hiſt. Plant*.

COUTON. The Name of a Tree which grows in *Canada*, like the Walnut-tree, call'd *Arbor Vinifera Couton, Juglandi ſimilis*. J. B.

This Tree is remarkable for affording, from Inciſions made in it, a Juice in great Quantities, of a very agreeable Taſte, like that of *Orleans* Wine.

COXÆ OSSA. The ſame as Oſſa Innominata. See INNOMINATA.

COXENDIX. The Iſchium. Some call the *Oſſa Innominata* by the Name of *Oſſa Coxendicis*. See INNOMINATA.

CRABRO. Offic. Aldrov. de Inſect. 225. Jonſ. de Inſect. 22. Charlt. Exer. 38. *Crabro vulgaris*. Raii Inſect. 250. *Crabro, Tenthredo*. Mer. Pin. 196. Mouff. Inſect. 49. THE HORNET.

I don't know that the Hornet is uſed as a Medicine; but their Combs are recommended in a Drench for that Diſorder in Horſes, which *Vegetius, L. 2. C. 23.* calls *Scrofula*, meaning, I believe, what we call the Strangles.

The Sting of the Hornet is very troubleſome, making the Part affected to ſwell very much, with an exceſſive Pain. I ſhould apprehend, that anointing it with Oil of Olives would be the moſt effectual Remedy.

CRADE, κράδη. In *Hippocrates* it imports the Branch of a Fig-tree.

CRÆPALE, κραιπάλη. According to *Galen*, in his Commentary on the third Aphoriſm of the fifth Section of *Hippocrates*, it ſignifies every Diſorder of the Head, produced by exceſſive drinking of Wine.

CRAMA, from κεράννυμι, to mix. Any ſort of Mixture.

CRAMBE, in general, ſignifies a Cabbage; but the modern Botaniſts diſtinguiſh it from the *Braſſica*. According to *Boerhaave*, the Characters are,

The Seed-veſſel is unicapſular, divides into two Parts, and contains a ſingle oblong Seed.

The Species are,

1. Crambe; maritima; folio Braſſicæ. *Tourn. Inſt.* 211. *Elem. Bot.* 181. *Boerh. Ind. A.* 2. 1. *Raii Synop.* 3. 307. *Braſſica ſylveſtris*. Offic. *Braſſica Maritima*. Raii Hiſt. 1. 838. *Braſſica Maritima monoſpermos*. C. B. Pin. 112. *Braſſica Marina Anglica*. Ger. 248. Emac. 315. Mer. Pin. 16. *Braſſica Marina monoſpermos*. Park. Theat. 270. Merc. Bot. 1. 24. Phyt. Brit. 16. *Braſſica monoſpermos Anglica*. J. B. 2. 830. Chab. 270. *Braſſica major repens, multiflora, alba, monoſpermos*. Hiſt. Oxon. 2. 209. SEA-COLEWORT, or CABBAGE.

This is uſed as an Aliment, like other Cabbage, when very young; but is eſteem'd more hot and dry. *Dale* informs us, that the Leaves heal Wounds, and diſcuſs inflammatory and other Tumors.

2. Crambe; Orientalis; dentis leonis folio; erucaginis facie. *T. C.* 14. *Boerh. Ind. alt. Vol.* 2.

I don't know, that the ſecond Species has any medicinal Virtues aſcribed to it.

CRAMBEION, κραμβεῖον, according to *Erotian*, is the old *Sicilian* Name for the *Cicuta*, Hemlock; and κράμβιον is, by *Heſychius*, interpreted the ſame. But

CRAMBION, κράμβιον, in *Hippocrates*, imports a Decoction of Cabbage.

CRAMPUS. The Cramp. *Helmont*.

CRANEIA, κράνεια. The *Cornus*. Cornelian Cherry-tree.

CRANGON. Offic. *Squilla Crangon*. Aldrov. de Exang. 150. 149. Rondel. de Piſc. 1. 547. Geſn. Aquat. 906. Jonſ. Exang. 17. *Alia Squilla*. Bellon. de Piſ. 359. THE PRAWN.

This is a Sea Shell-fiſh, too well known to require a Deſcription. It is eſteem'd an extremely nouriſhing Food, and therefore proper in Conſumptions. *Dale*.

CRANIUM. The Skull. See CAPUT.

The human Skull has been much celebrated for the medicinal Virtues it is ſaid to exert, in the Cure of Epilepſies, Apoplexies, Dyſenteries, Fevers, and arthritic Diſorders; and has, on this Account, not only been employ'd as an Ingredient in ſome Shop-Compoſitions, but has alſo been recommended by the Superſtitious, as an Amulet againſt Conſumptions, Hæmorrhages, and Incontinence of Urine. But, becauſe the Uſe of this Remedy was likely very often to diſappoint the Patient who try'd it, certain Circumſtances, not very eaſy to be comply'd with, were ſaid to be neceſſary to its producing the ſalutary Effects intended, which might ſerve as an Excuſe for the Preſcriber, in caſe of Failure. Thus the Skull was to be that of a young healthful Man, who died of a violent Death; it was, moreover, to have been expoſed to the Air for many Years, and never to have been buried; beſides, it was to be very clean, and free from Filth. A Female Skull only, as was ſaid, could produce the deſir'd Effects in Women, and that of a Male in Men. And the anterior Part was preferr'd to the poſterior. Some attributed the greateſt Efficacy to the triangular Bone, which, in ſome Skulls, is found at the Juncture of the lambdoidal and ſagittal Sutures. In order to increaſe the Eſteem, and, conſequently, the Price, of Medicines prepared of the human Skull, ſome Dealers in Medicines endeavoured to poſſeſs People with a Notion, that, upon diſtilling or calcining it, various ſupernatural Noiſes were heard, as if ſome evil Spirit was inclin'd to frighten the Artiſt from procuring a Medicine of ſuch extraordinary Virtues. Some grave Authors, however, preſcribe it: Thus, *Angelus Sala* directs it to be taken uncalcin'd, in the Form of a very fine Powder, for the Epilepſy. And *Lemery* orders it, with the ſame View, dry'd and powder'd, from ten Grains to two Scruples; and, upon a Suppoſition that it is poſſeſs'd of ſome Virtues againſt an Epilepſy, accounts for them from the volatile Salts it contains: Therefore, ſays he, it muſt not be calcin'd, becauſe, by that means, it is depriv'd of its volatile Salts, the Part wherein its Efficacy reſides. *Riverius* orders the Shaving of a Skull, in the Quantity of a Dram, to be taken in Broth, or any other proper Liquor, for the Cure of a Dyſentery. And *Hartman* carries the Affair ſo far, as to aſſert, that even drinking frequently out of a Skull cures the King's-evil. What *Ettmuller* relates, is too ridiculous to mention ſeriouſly; which is, that ſome Soldiers imagine, that drinking out of a Skull renders them invulnerable.

Notwithſtanding the Reputation of the human Skull as a Medicine, *Galen*, and, ſince him, many other Authors, have been of Opinion, that the human Skull is poſſeſſed of no more Virtues than any other Bones, either of Man or Beaſt, or Hartſhorn; and that it is nothing more than an Abſorbent.

Rieger cautions the Phyſician, who preſcribes this Medicine uncalcin'd, to take care, that the Skull, which is uſed, did not belong to a Perſon who was infected with the Pox, which frequently attacks this Part. *Fuller* is of Opinion, that a Skull is deſtitute of all manner of medicinal Virtues. And *Eraſtus* affirms, from Experience, that calcin'd Hartſhorn is preferable to it in every medicinal Intention. *Junker* ſays, that when exhibited with other Ingredients, it is ſometimes found of ſome Efficacy in Epilepſies, but very ſeldom when given alone: Hence he juſtly concludes, that the ſalutary Effects are owing to the other antiepileptic Drugs adminiſter'd with it.

It is not found, by chymical Analyſis, to differ from other Bones: The Water, therefore, Spirit, Oil, and volatile Salt, of a human Skull do not perceptibly differ from thoſe of other Bones. The principal Shop-compoſition, in which a Skull is an Ingredient, is the *Pulvis ad Guttetam*.

The Earth found in a human Skull, after being expoſed for many Years, is ſaid, by *Pliny*, to be a Depilatory of the Eye-lids.

For an Account of the Moſs which grows on the Cranium, ſee USNEA.

CRANOCOLAPTES, κρανοκολάπτης. The Name of a venomous Spider, which is the fourth of the ſix Species mentioned by *Aetius, Tetrabib. 4. Serm. 1. C. 18.*

CRANTERES, κράντηρες. A Name for thoſe Teeth which grow laſt of all, and are call'd otherwiſe *Dentes Sapientiæ*.

CRAPAUDINA. The Toad-ſtone. See BUFONITES.

CRAPULA. The ſame as CRÆPALE.

CRASIS, κρᾶσις, from κεράννυμι, to mix. A Mixture, as of Wine and Water. But it is uſed by Phyſicians to expreſs a Mixture of *Galen*'s firſt Elements, or Qualities. In this Senſe it is the ſame as TEMPERAMENTUM.

CRASPEDON, κράσπεδον. A Diſorder of the *Uvula*, when it hangs down in the Form of a thin, oblong Membrane. *Aretæus de Cauſis & Signis Acut. Lib.* 1. *Cap.* 8.

CRASSA INTESTINA. The large Inteſtines. See COELIA.

CRASSENA. A Term coined by *Paracelſus*, to expreſs certain ſaline, putrefactive, and corroſive Particles, which produce Ulcers, and Tumors of various Forms.

CRASSULA. The ſame as *Anacampſeros*, Orpine.

CRATÆGUS. The Wild-ſervice-tree.

The Characters are,

The Leaves are ſingle, and not pinnated; the Flower is roſaceous and pentapetalous; the Ovary like that of the Pear; the Fruit is in Shape like a Pear, of the Size of a Berry, containing callous Seeds in membranous Cells.

Boerhaave mentions four Species of this Plant.

1. Cratægus; folio ſubrotundo, ſerrato, ſubtus incano. See ARIA.

2. Cratægus; folio oblongo, ſerrato, utrimque virente. *T.* 633. *Chamæmeſpilus.* J. B. 1. 72. *Cotonaſter, folio oblongo, ſerrato.* C. B. P. 452. *Cotonaſter forte Geſneri.* Cluſ. H. 63. *Meſpilus, humilis, folio Mali Cydoniæ oblongo, ſerrato.* H. L.

3. Cratægus; Virginiana; foliis Arbuti. *T.* 633. *Sorbus, Virginiana, foliis Arbuti.* Breyn. Prodr. 1. H. L. 609. THE VIRGINIAN WILD-SERVICE, WITH LEAVES LIKE THE STRAWBERRY-TREE.

4. Cratægus; folio laciniato. *Tourn. Inſt.* 633. *Boerh. Ind. A.* 2. 248. *Sorbus torminalis*, Offic. Ger. 1288. Emac. 1421. Mer. Pin. 115. Aldrov. Dendr. 618. *Sorbus torminalis Plinii*, Chab. 2. Merc. Bot. 71. Phyt. Brit. 117. *Sorbus torminalis ſeu vulgaris*, Park. Theat. 1420. *Sorbus torminalis & Cratægus Theophraſti*, J. B. 1. 63. *Meſpilus Apii folio, ſylveſtris non ſpinoſa, ſeu Sorbus torminalis.* C. B. Pin. 454. Raii Hiſt. 2. 1457. Synop. 3. 453. Elem. Bot. 503. *Cratægus, Sorbus torminalis*, Mont. 41. *Sorbus Apii folio ſylveſtris, non ſpinoſa, aliis Sorbus torminalis, Cratægus Theophraſti*, Jonſ. D. THE WILD-SERVICE OR SORB-TREE. *Dale.*

The common Service-tree will, in good Ground, grow conſiderably tall, having a whitiſh Bark, and Leaves that differ from thoſe of the true *Sorbus*, in not being winged, but ſomewhat like the Maple, tho' larger and longer, being cut into ſeven ſharp-pointed and ſerrated Segments, the two next the Stalk being cut in deepeſt, of a Pale-green above, and whitiſh underneath. The Flowers grow in Cluſters like the true *Sorbus*, of a yellowiſh-white Colour; and the Fruit is ſet in the ſame manner on long Foot-ſtalks, more than as big again as the common Haws: They are likewiſe umbilicated at the Top, of a harſh reſtringent Taſte when green, but, when mellow'd, ſweet and pleaſant, having a ſtony Subſtance in the Middle, including two Seeds. It grows frequently in Woods and Thickets, and flowers in *May*, the Fruit being ripe in *September*.

The Fruit is ſubſtituted for the *Sorbus ſativa*, or true *Sorbus*, being of the ſame Nature, or rather more aſtringent and binding: It is good for all Kinds of Fluxes, either of Blood or Humours: When ripe, it is pleaſant and grateful to the Stomach, promoting Digeſtion, and preventing the too haſty Paſſage of the Food out of the Bowels, and is commended in Fevers attended with a Diarrhœa.

CRATÆGONUM. See MELAMPYRUM.

CRATER, κρατήρ. A large Drinking-cup. But *Rulandus* defines it a Braſs Kettle, wide at the Bottom, and narrow at the Top.

CRATERION, κρατήριον. A ſmall Cup, Pot, or Veſſel.

CRATIBULA, or CRATICULA. The Iron Bars, or Grate, which cover the Aſh-hole in Chymical Furnaces.

CRAUROS, κραῦρος. Friable.

CREA, according to *Blancard*, is the anterior Part of the *Tibia*.

CREBER. Frequent. It is applied to Reſpiration, and to the Pulſe, when the Intervals betwixt each Inſpiration, or each Pulſation of the Artery, are very ſhort.

CREGYON, κρήγυον. Good. In *Hippocrates* it is apply'd to Symptoms.

CREMASTER, from κρεμάω, to ſuſpend. The Name of a Muſcle of the Teſticle, of which there is one on each Side. It ariſes fleſhy from the loweſt and fore Part of the Spine of the Os Ilium, and upper Part of the *Ligamentum Pubis*, its Fibres running parallel with thoſe of the *Obliquus Aſcendens*, (not with the *Tranſverſalis*, as *Bartholin* objects againſt *Riolan*) and, almoſt encompaſſing the Proceſs of the Peritonæum, deſcends with it, and is inſerted into the *Tunica Vaginalis*, upon which it is ſpread in ſeveral diſtinct Portions.

Its Uſe is to draw up and ſuſpend the Teſtis.

CREMER. The Name of a Diſtemper which is ſaid to be endemial in *Hungary*, which, by the Deſcription, ſhould be a ſort of *Crapula*. It is cured by drinking a ſmall Quantity of any cordial Water.

CREMNOI, κρημνοί. The Lips of Ulcers, and the *Labia* of the Female Pudenda.

CREMOR, χυλὸς, or χυμὸς, in *Greek*. It ſignifies, firſt, the expreſſed Juice of any Grain. Secondly, the ſtrain'd Juice of any Grain, particularly Barley, boil'd till it be ſo ſoft as to paſs thro' a Strainer. See PTISANA. Thirdly, it imports the Cream of Milk.

CREMOR *Tartari* is a Preparation of Tartar thus call'd, becauſe properly it is the Cream or Scum of a Decoction of Tartar in Water. See TARTARUS.

CRENÆ, in Botany, imports Inciſures on the Edges of the Leaves of Plants. Hence Leaves with theſe Inciſures are call'd crenated Leaves, which differ from ſerrated Leaves, in which the Inciſures are more acute.

CREPATIO, or CREPATURA. In Pharmacy *Crepatura* implies the Cracking or Breaking of any Seed in boiling; and this is to be underſtood, when Seeds are directed to be boil'd *ad Crepaturam*.

CREPATURA, in *Paracelſus*, ſignifies an inteſtinal Hernia.

CREPINUM, in *Paracelſus*, is Tartar.

CREPITATIO. The ſame as DECREPITATIO, which ſee.

CREPITUS. A Diſcharge of Air from the Anus, attended with a Noiſe.

CREPITUS LUPI, in Botany, is that Fungus, which in *Engliſh* is call'd Puff-ball. See LYCOPERDON.

CRESERA, κρησέρα. A Sieve for the ſeparating the Bran from Meal.

CRESPULUM, κρίσπυλα, in *Myrepſus*, is the Herb call'd *Buphthalmum*, Ox-eye.

CRESSIO, according to *Blancard*, is a Name for the CARDAMON.

CRETA. Chalk, call'd by the *Greeks* Κρητικὴ γῆ, *Cretan Earth*, becauſe the beſt Sort was brought from *Crete*, now *Candia*. *Kentman* takes notice of fifteen different Sorts of Chalk. *Geoffroy* defines Chalk a denſe, brittle, earthy Subſtance, which readily ſtains the Fingers, and ſticks to the Tongue, without any Aſtringency. Many kinds of Earth come under the Denomination of Chalk. Thoſe mention'd by *Dale* are, the *Creta Alba*; *Terra Melitæa*; *Plumbum Nigrum*; and *Terra Selinuſia*.

The white Chalk, or *Cretan* Earth, is thus diſtinguiſh'd:

Creta, Offic. Mer. Pin. 218. Schrod. 320. Worm. Muſ. 3. Charlt. Foſſ. 2. Worm. 3. Agricol. 580. *Terra Creta*, Aldrov. Muſ. Metall. 241. *Creta alba, ſeu Candida*, Dougl. Ind. 28. CHALK.

This is now found in many Countries beſides *Crete*. It raiſes an Efferveſcence with acid Liquors, and is therefore deſervedly looked upon as an Alcaline, or abſorbent Earth. It is us'd with Succeſs to allay the too great Acidity of the Juices of the Stomach, particularly in the Diſeaſe commonly known by the Name of the Heart-burn; and alſo in Coughs, that ariſe from a ſharp Phlegm. It is likewiſe ſerviceable in Hæmorrhages, and is ſaid to kill Worms. In a Word, the Property of all alcaline Earths is not only to abſorb Acids, but to allay the Acrimony of the Fluids, and eſpecially to reſtrain the violent Motion of the Bile, by detaining the Salts and Sulphurs thereof in their fixed Parts. White Chalk is given alone, from ten Grains to a Dram. It is likewiſe uſed in the *Decoctum Cretaceum* of *Bates*, which is thus prepared:

> Boil half a Pound of powder'd Chalk in three Pints of Water to a Quart; and, when the thicker Parts have ſubſided, pour off the clear milky Liquor, and add to it a proper Quantity of Sugar of Roſes, or of any other proper Syrup.

An Emulſion may likewiſe be made of this Decoction, by pouring it by degrees on two Drams of each of the Four greater cold Seeds, bruiſed in a Mortar, and then adding to the ſtrain'd Liquor two Drams of Chalk, finely powder'd, and five Ounces of the Syrup of Colt's-foot, Comfrey, or any other ſuitable to the Intention. The Patient is to drink plentifully of either of theſe Liquors.

Powdered Chalk is likewiſe given with Milk, to prevent its turning acid in the Stomach; and, externally, it is commended for drying Wounds, Ulcers, and Fiſſures in the Nipples. *Geoffroy.*

Chalk, when calcin'd, becomes a Lime, and differs extremely in Virtues from Chalk uncalcin'd. See CALX.

Chalk, in large Quantities, put into Springs or Wells of hard Water, is ſaid to render it ſoft.

Dr. *Slare*, from Experience, affirms, that Chalk abſorbs Acids ſooner, and more powerfully, than Crabs-eyes, calcin'd Hartſhorn, or Coral; and he therefore judges it to be a better Remedy than either of theſe for deſtroying Acids in the Stomach.

It is applied externally to running Puſtules, *Achors*, and Excoriations; and has been recommended for ſtopping Hæmorrhages, if apply'd to Wounds by way of Tent. It is farther ſaid to do Service, when applied to an Eryſipelas, or to Parts affected with gouty Pains.

Chalk, however, if taken in conſiderable Quantities, and without proper Cathartics to carry it thro' the inteſtinal Tube, when it has exerted the Effects intended, is known by Experience to be productive of great Miſchiefs, by plaiſtering, as it were, the Inteſtines, obſtructing the Lacteals, and the Orifices of the inteſtinal Glands, and thereby cauſing Cachexies, Indigeſtions, and various Diſorders.

TERRA MELITEA, Offic. Schrod. 317. *Terra Melitenſis*, Charlt. Foſſ. 4. Worm. 6. Aldrov. Muſ. Metall. 253. *Terra ex Melita Inſula effoſſa*, Calc. Muſ. 130. *Terra Melitenſis. Gratia Sancti Pauli*, Mont. Exot. 14. *Terra Sigillata Sancti Pauli vulgo.* EARTH OF MALTA.

This is a cretaceous ponderous Subſtance, of a whitiſh Colour, and aſtringent Taſte. It is brought from *Malta* in ſmall Cakes, ſealed with the Effigies of St. *Paul*, with a Viper. It agrees in Virtues with the *Creta alba* above-mention'd. The Earth of *Malta* is ſaid to have received a Benediction from St. *Paul*, when ſhipwreck'd upon that Iſland; and hence alexipharmic Virtues are attributed to it, which it is not likely to be poſſeſſed of on that account.

PLUMBUM NIGRUM, Offic. *Nigrica fabrilis*, Mer. Pin. 218. Charlt. Foſſ. 2. *Meſſa nigra ad Pnigitem referenda.* Worm. 5. *Ochra nigra*, Phil. Tranſ. No. 240. p. 183. *An Creta nigra mollis & dura.* Kentman. 7? BLACK LEAD. WADT, KELLO.

This is accounted refrigerating, drying, and repellent; and is ſometimes applied to ſtrumous and cold œdematous Tumors.

CRETA SELINUSIA, Offic. Aldrov. Muſ. Metal. 248. *Terra Selinuſia*, Matth. 1392. Calc. Muſ. 126. EARTH OF SELENUSIA.

That is in moſt Eſteem, which is reſplendent, white, friable, and readily diluted with a Fluid. It is drying and aſtringent, and is recommended as a good Topic for Ulcers.

CRETHMON, κρηθμόν. Samphire. See CRITHMUM.

CRIBRATIO. Cribration, in Pharmacy, is the paſſing any Subſtance thro' a Sieve or Searce, in order to ſeparate the finer Particles from the coarſe, whether the Body cribrated be dry, and in Powder, or moiſt, as the Pulps of Seeds, Fruits, or Roots.

With reſpect to Cribration, *Quincy*, a very good Judge of Pharmacy, makes the following Remark, in order to obviate the Miſchiefs and Inconveniences, which, thro' Inadvertency or Haſte, frequently happen in the practical Shops; which is, that whatſoever is powder'd, the whole Ingredient or Ingredients, with all their Parts to be uſed, ſhould paſs the Sieve, and be all mixed equally together, before any is uſed; for, thro' Neglect of this, ſeveral Medicines, which come under this Management, will be, in their different Parts, of different Efficacies; according as that Part of moſt Virtue, being more or leſs friable, may paſs thro' firſt, which will make that much too ſtrong; or remain behind, to the ſame Prejudice. In Compoſitions likewiſe of Ingredients of different Textures and Coheſions, ſome run thro' much ſooner than others; ſo that there is an abſolute Neceſſity of mixing the Whole carefully, after 'tis all paſs'd.

This Admonition may appear ſuperfluous in ſo obvious a Matter; but I have often found great Miſchiefs from a Neglect herein, eſpecially in the powdering ſuch things as Jalap, Ipecacuanha, and the like, whoſe Virtues lie in the more reſinous Parts, which, being the moſt brittle, break in the Mortar, and paſs thro' the Sieve firſt: And nothing is more common in ſuch things, than to put at once into the Mortar two or three times the Quantity of what preſent Uſe calls for, which, perhaps, is only a Doſe juſt then to be made up, or enough to fill a ſmall Glaſs, which ſtands to be in Readineſs; whereby the firſt Patients are over-doſed, and the latter, by having only the woody and fibrous Part of the Ingredient, are cheated in their Expectations. *Quincy's Diſpenſ.*

CRIBRATORIUM, or CRIBRUM. A Sieve, or Sierce.

CRIBRIFORME, or CRIBROSUM, or *Os Ethmoides.* The Name of one of the Bones in the Head. See CAPUT.

CRICELASIA, κεικελάσια, according to the Etymology, ſignifies driving a Ring, or Circle; from κείκος, a Ring or Circle, and ἐλαύνω, to drive. This was a Species of Exerciſe in Uſe among the Antients. *Oribaſius*, in his *Medicinal Collections*, *Lib.* 6. *Cap.* 26. deſcribes it, but not very diſtinctly, from *Antyllus.* It ſhould ſeem to be little more than the Diverſion of driving a Hoop, which the Boys in *England* take great Delight in. The Hoop was made ſo large, as to reach as high as the Breaſt of the Perſon who uſed it. The Inſtrument, with which it was driven along, was of Iron, with a Wooden Handle; and ſmall Rings (κείκις) were faſten'd to the large Hoop, in order to jingle, and divert the Perſon who exerciſed himſelf with it, which *Oribaſius* conſiders as of Importance. This Exerciſe was recommended for rendering the Limbs pliable, and ſtrengthening the Nerves which were weak. By Nerves, I ſuppoſe, Tendons or Muſcles were meant.

CRICOARYTÆNOIDÆI MUSCULI. Muſcles whoſe Office it is to open the *Glottis.* See LARYNX.

CRICOIDES. The Name of an annular Cartilage belonging to the LARYNX, which ſee.

CRICOS, κείκος. A Ring or Circle. *Hippocrates* calls the annular Cartilages, which form the Aſpera Arteria, by this Name.

CRICOTHYROIDÆI. Certain Muſcles which ſhut, or cloſe up, the *Glottis.* See LARYNX.

CRIDONES. Worms which breed in the Skin.

CRIMNODES, κεμνώδης, of κέμνον, Bran. An Epithet for Urine which depoſits a branny Sediment.

CRIMNON, κέμνον. *Dioſcorides*, *Lib.* 2. *Cap.* 112. deſcribes κέμνον (*Crimnon*) as a coarſe Sort of Meal, produced of Zea and Wheat, of which they make Puls, πολτός. *Galen*, in his *Exegeſis*, expounds κέμνα by τὰ ἀδρομερέστερα τῶν ἀλφίτων, "the coarſer or groſſer Part of the Polenta;" and, *Comm.* 2. *in Progn.* he ſays the *Crimna* (κέμνα) are the larger Particles of the roaſted or torrefy'd Barley, which have eſcaped the due Contuſion of the Mill. *Hippocrates* often preſcribes for Drink τὸ ἀπὸ τῦ κέμνα ὕδωρ, "Water in which *Crimnon* has been macerated;" and, *Lib.* 3. *de Morbis*, he orders a refrigerant Potion to be thus prepared:

> Take half a Chœnix (about three Quarters of a Pint) of the coarſe *Crimna* of Barley; pour thereon a Congius or Chœas (about ſix Pints) of Water, and, when the *Crimna* are ſwell'd, work them with the Hands till the Water becomes white; and then, after putting in it a Pugil of Adiantum, and expoſing it for ſome time to the open Air, exhibit the ſame.

Κεμνώδεις ὑποστάσεις, in *Hippocrates*, are Sediments in Urine reſembling *Crimna*, *Progn.* where *Galen*, on the Place, condemns ſuch a Sediment as proceeding from thick Blood highly aduſt, and an unequal Colliquation of the carnous Parts. *Hippocrates*, in another Place, ſays, that ſuch a Sediment, in Fevers, portends a long Illneſs; on which *Galen* writes, that ſuch Hypoſtaſes in Urine are found by Experience to prognoſticate the worſt of Events; for all who made ſuch Urine dy'd, or recovered very ſlowly, and with much Difficulty. The ſame Author, in his firſt Book of *Criſes*, ſays, that this Hypoſtaſis indicates two Affections, which are, a Colliquation of the more ſolid Parts, and a violent Eſtuation, and high Aduſtion, of the Blood. Again, *Com.* 3. *in Lib.* 6. *Epid.* he ſays, that *Crimnodes Hypoſtaſes* indicate a Colliquation of the Parts of the Body, and eſpecially of the Liver; if they are of a remarkable Thickneſs and Hardneſs, but not whitiſh, they ſignify a Colliquation of the Fleſh; but, when black, they rather indicate a Waſting of the Spleen.

CRINATUM, κρινάτον, from κρίνον, a Lily. An Epithet of a Thymiama, or Suffumigation, in *P. Ægineta*, *Lib.* 7. *Cap.* 22.

CRINES, τρίχες. The Hair. See CAPILLUS.

CRINITUS, from *Crinis*, a Hair, κεκτημένος. An Epithet of Plants, whoſe Roots abound with Capillaments, or ſmall Fibres, like Hairs.

CRINOMYRON, κρινόμυρον, from κρίνον, a Lily, and μύρον, Ointment. Ointment of Lilies, conſiſting of Lilies with ſome Aromatics. It was alſo call'd *Ægyptium album* and *Suſinum.* See ÆGYPTION.

CRINON, κρίνον. A Lily.

CRINONES. Worms which breed in the Fleſh. See DRACUNCULI.

CRIOGENES, κριογενής. An Epithet for certain Troches mentioned by *Paulus Ægineta*, *Lib.* 7. *Cap.* 12. and by him recommended for cleanſing ſordid Ulcers.

CRIOMYXUS, κριόμυξος. An Epithet for Perſons abounding with Mucus in the Noſe.

CRISIMOS, κρίσιμος. Critical.

CRISIS.

The Doctrine of *Criſes*, critical Days, and their various Effects, is not only uſeful, but abſolutely neceſſary, in the Practice of Medicine. Of this *Hippocrates* gave us not only the firſt, but, at the ſame time, the moſt full and rational Account. Many, and, among the reſt, *Galen* and his Followers, have made Attempts of the ſame Kind; but they have been ſo far from enriching and improving this uſeful and important Piece of Knowledge by Experiments and Obſervations, that they rather ſeem in ſome reſpects to have perverted and corrupted it. For this Reaſon we ſhall have recourſe to *Hippocrates* himſelf, draw the Doctrine of *Criſes* from its original Source, and confirm it by Reaſon and Experience. By this means we ſhall be the better able to diſcover the Superfluities, the Defects, and the Errors, of the ſeveral Hypotheſes advanced with reſpect to *Criſes.*

But it ſeems neceſſary to premiſe, that the Word *Criſis* is uſed in different Senſes both by the Antients and the Moderns; for ſome frequently mean no more by a *Criſis*, than the Excretion of any noxious Subſtance from the Body. Thus *Hippocrates*, in his

Book *de Arte*, calls the Excretion of a corrupted Bone a *Criſis*: Others, with *Galen*, take the Word *Criſis* for a Secretion of the noxious Humours made in a Fever; for the Word κρίνειν ſignifies to ſeparate, or, as it were, to paſs thro' a Sieve: Others uſe the Word *Criſis* for the critical Motion itſelf, and the violent Perturbation produced in the Actions of the human Body; or, as they chooſe to call it, the Conteſt or Struggle of Nature with the Diſeaſe, in which the Period when the Diſeaſe arrives at its greateſt Height, is the critical and important Moment, which decides with reſpect to the Death or Recovery of the Patient.

Galen, in his *Commentary* on *Aph.* 13. *Sect.* 2. defines a *Criſis* in Fevers a ſudden and inſtantaneous Change, either for the better or the worſe, productive of Recovery or Death: But Phyſicians often confound the Criſis itſelf with the critical Day or Time.

But, as *Hippocrates* was the firſt who made mention of *Criſes*, and critical Days, we ſhall here inquire, in what Senſe he uſed this Word. From his Writings 'tis therefore obvious, that by the Word *Criſis* he generally meant the Judgment which is, or at leaſt ought to be, formed, with reſpect to the lucky or unlucky Termination of the Diſeaſe, from the Symptoms of the Diſeaſe itſelf, and the particular Habit and Conſtitution of the Patient. Hence ariſe good and bad, lucky and unlucky Criſes. And, in his Book *de Affect.* he uſes theſe Words: "A *Criſis* "is ſaid to happen in Diſeaſes, when they are either increaſed "or diminiſh'd, changed into others, or totally removed." By the Word *Criſis* he alſo frequently means the Solution of a Diſeaſe: Hence, in his *Præceptiones*, he uſes theſe Words; κρίσις ἐστὶν ἀπόλυσις νόσου, "a Criſis is the Solution of a Diſ-"eaſe." Every-where alſo, in the Writings of *Hippocrates*, the following Methods of Speaking occur to the Reader: *A perfect Criſis happen'd to ſuch a Patient, or ſuch a Diſeaſe, on the ſeventh or fourteenth Day*; that is, there was a Solution of the Diſeaſe, and the Patient recover'd.

But, that we may be enabled to form a juſt and adequate Idea of the *Criſis* of acute Diſtempers, it is neceſſary to recount all the Circumſtances requiſite to a Criſis. In the firſt Place, therefore, a Criſis has only a Reference to acute Diſorders, and more eſpecially continual Fevers; for a λύσις, or Solution, is applied to thoſe Turns which chronical Diſeaſes take. Secondly, a Criſis only happens on certain Days of the Diſeaſe; the moſt uſual of which are, the ſeventh, or the Time approaching neareſt to the Half of that Number, from the Beginning of the Diſeaſe; for the other Days contribute little or nothing to a *Criſis*. Thirdly, on theſe Days the Phyſician is to judge of the Change of the Diſeaſe, whether it is like to terminate in a Recovery, Death, or ſome other Diſeaſe. Fourthly, on the critical Days the Phyſician is to form a Prognoſtic, or Judgment, from certain Signs; among which not only the Urine and Excrements, but alſo the Pulſe and Strength, of the Patient are to be adverted to. Theſe are the Things which, in my Opinion, complete the Notion of a *Criſis* in acute Diſtempers, and explain what the ſkilful Antients meant by it. Of how great Importance, therefore, the Doctrine of *Criſes* is in Practice, is ſufficiently obvious; for what can be of more Uſe, than that, according to the Directions of provident Nature, certain ſtated Days ſhould be obſerved by the Phyſician, in which he is to have an Eye to paſt, preſent, and future Circumſtances, and from them form a Judgment or Prognoſtic of the Diſeaſe?

We ſhall, firſt of all, quote the moſt plain and unexceptionable Paſſages from the Works of *Hippocrates*, which point out, evidently and diſtinctly, on what Days the Criſes of Fevers happen. The firſt of theſe is in his Treatiſe *de Diebus Judicatoriis*. "Criſes, ſays he, happen to Fevers on the fourth "Day, the ſeventh, the eleventh, the fourteenth, the ſeven-"teenth, and the twenty-firſt. But, even in theſe acute Diſ-"orders, the *Criſis* ſometimes happens on the thirtieth, the "fortieth, and the ſixtieth Day." In his *Aphor. Sect.* 2. *Aph.* 23. and 24. he uſes the following Words: "Criſes happen to "acute Diſeaſes in fourteen Days. The fourth is the Index "of the ſeventh; the eighth Day is the Beginning of the "ſecond Week: The eleventh is alſo to be adverted to, be-"cauſe it is the fourth of the ſecond Week. The ſeven-"teenth is alſo to be conſider'd, becauſe it is the fourth from "the fourteenth, and the ſeventh from the eleventh." The ſame Author, in his *Coacæ Prænot.* tells us, "That the moſt "gentle Fevers, and ſuch as are accompanied with the ſafeſt "Signs, terminate on the fourth Day, or ſooner; but thoſe "which are highly malignant, and accompanied with the "worſt Signs, remit on the fourth Day, or ſooner: Their firſt "Attack, therefore, ends thus; but their ſecond is protracted "to the ſeventh, and their ſixth to the twentieth Day." In his third Book *de Præſagiis*, he informs us, "That we muſt "advert to the Diſeaſe from the firſt Day, and obſerve every "fourth Day, by which means we may evidently perceive "what Turn the Diſeaſe will take." According to this Author, a regular *Criſis* happen'd, in burning epidemical Fevers, in ſeventeen Days. Thus, in his Treatiſe *de Partu Septimeſtri*, he uſes the following Words: "In moſt Diſeaſes the "moſt conſiderable Days are the firſt and ſeventh; for theſe "are of great Importance, not only in Diſeaſes, but alſo with "reſpect to the Fœtus; for moſt Abortions happen on theſe "Days." And, a little after, he has the following Words: "The Phyſician, who intends to prognoſticate with Judgment "and Certainty, muſt obſerve and contemplate all Days; but, "of thoſe which are even, the fourteenth, the twenty-eighth, "and the forty-ſecond. The Phyſician muſt alſo calculate by "Ternaries and Quaternaries; that is, by the Number of "three and of four Days."

The Opinion of *Hippocrates*, therefore, is, as is obvious from what has been ſaid, that acute and continual Fevers terminate by Septenaries, if their Solution or Termination is to be ſalutary. But this Solution happens by ſufficient Evacuations, either by Sweat, Urine, Stool, Hæmorrhages, or Spit, on the above-mention'd critical Days; for, if they happen on any other Days, they are accounted leſs ſalutary, and are generally ſymptomatical. Accordingly, *Hippocrates* informs us, in *Aph.* 36. *Sect.* 4. "That Sweats in Fevers are beneficial, if "they begin upon the third, fifth, ſeventh, ninth, eleventh, "fourteenth, ſeventeenth, twenty-firſt, twenty-ſeventh, thir-"tieth, or thirty-fourth Days; for theſe Sweats determine the "Diſeaſe: But thoſe which happen otherwiſe, import a great "deal of Trouble, that the Diſeaſe will be of long Conti-"nuance, and Relapſes." *Hippocrates* is back'd in this Sentiment by *Galen*, who has the following Words in his Treatiſe *de Diebus Judicat.* "Thoſe Sweats which ariſe on the indi-"cating Days, which are not critical, prognoſticate much "Trouble, and the Protraction of the Diſorder; for thoſe "Evacuations, which are not critical, are either fatal, or af-"ford a very bad Prognoſtic." In the ſame Book he informs us, "That he never ſaw a *Criſis* happen on the twelfth or "ſixteenth Day; and that *Criſes*, happening on the ſixth Day, "are imperfect, attended with unlucky Symptoms, and im-"minent Danger." But *Hippocrates* pronounces that Sweat moſt ſalutary, which, on the critical Days, determines the Diſeaſe, as he informs us in his *Coacæ Prænot.* and that the Sweat is bad, which, appearing in a Fever, does not alleviate, but protract it. This is alſo confirm'd by the fifty-ſixth Aphoriſm of the fourth Section: "If, ſays he, Sweats happen in a "Fever, without cauſing a Remiſſion, the Sweat is bad; for "the Diſeaſe is protracted, and ſuperfluous Humidity indi-"cated."

But, according to *Hippocrates*, the *Criſis* is ſalutary, and the Diſeaſe determined, if, on the critical Day, the Urine is well concocted; that is, neither white, nor thin, nor copious, but deep-colour'd, of a proper Conſiſtence, and ſuch as depoſits a Sediment. There is a memorable Paſſage, relating to this, in *Lib.* 1. *Epid.* where he uſes theſe Words: "Urine which, in "Fevers, is crude, unconcocted, and whoſe Sediment is bad, "indicates either a Removal of the Criſis, Pains, Protraction "of the Diſtemper, Death, or Relapſes." In the ſeventy-firſt *Aph.* of *Sect.* 4. he informs us, "That if a Criſis happen "upon the ſeventh Day, the Urine has a red Cloud in it upon "the fourth Day, and other Circumſtances accordingly." And, in the ſubſequent Aphoriſm, he tells us, that "Urines, "which are very pellucid and white, are bad; and that ſuch "Urines are generally diſcharged by phrenetic Patients." With reſpect to the Signs of a good *Criſis*, taken from the Urine, he makes the following Obſervations in his *Coacæ Prænotion.* "In the Beginning of a Fever, the Urine which has "a white and ſmooth Sediment, infallibly denotes the ſpeedy "Solution of the Diſeaſe. Reddiſh Urine, with a ſmooth and "reddiſh Sediment, if it appears before the ſeventh Day, ter-"minates the Diſorder; but, after the ſeventh Day, this Ef-"fect is more ſlowly produced, and the Criſis is at a greater "Diſtance. Urine which, on the fourth Day, has a red Cloud, "terminates the Diſeaſe on the ſeventh, if other Circumſtances "are favourable. Bilious Urine, and ſuch as has a ſmall "Quantity of thin Sediment, and which is changed from bet-"ter to worſe, denotes, that the Diſeaſe will be protracted. "But, when Urine of this Kind is diſcharged for a long time, "eſpecially about a *Criſis*, the Patient is not free from Danger. "But aqueous and white Urine, in protracted Diſeaſes, is al-"ways the Sign of a difficult *Criſis*, and an unlucky Progno-"ſtic." Again, in the ſecond Section of the third Book of his *Epidemics*, he tells us, "That a Patient, who, on the "ſecond Day, became deaf, and his Urine thin and pellucid, "died on the fifth Day." And, in *Sect.* 3. he tells us, "That another Patient, whoſe Urine was thin and white, "died phrenetic on the fourth Day."

A Solution of Fevers ſometimes alſo happens by Eruptions of Blood, or an Excretion of the Fæces, on the critical Day. With reſpect to this, there is a memorable Paſſage in *Hippocr. Epidem. Lib.* 1. *S.* 115. "In epidemical burning Fevers, in "which the Blood is copiouſly diſcharged from the Noſtrils, "the Patients are generally recover'd by this means; and I "know of none who died in this Conſtitution, provided the "Blood was copiouſly diſcharged. In *Philiſcus*, *Epaminones*, "and

" and *Silenus*, a few Drops of Blood were diſcharged from " their Noſtrils on the fourth and fifth Days, and they died: " But there was an Eruption of Blood in many, eſpecially " young and vigorous Perſons; and thoſe who had not this " Eruption generally died. But old Patients were ſeiz'd with " a Jaundice, or a Diarrhœa, or they became dyſenterical."

Acute Affections of the Breaſt, as a Peripneumony, attended with a Fever, are abated by Sweat as well as Spitting. Our very excellent Author before quoted, in his Book of *Critical Days*, pronounces of a pleuritical Fever, that " it comes to " a Criſis on the ſeventh Day, and, when longeſt, on the four- " teenth." And, of a Peripneumony, that " the Patient " labours under the Symptoms at leaſt fourteen Days, and at " moſt twenty-one, and coughs violently all the while; ex- " pectorating at the ſame time, firſt of all, much frothy Spit. " On the ſeventh and eighth Days, when the Fever is at its " Height, and the Peripneumony in a humid State, a thicker " Matter is expectorated, otherwiſe not. On the ninth and " tenth Days the Spit becomes of a pale Green, and ſome- " what bloody: From the twelfth to the fourteenth, it is " copious and purulent. Such are the Symptoms when the " Patient is of a humid Nature and Conſtitution, and the " Diſeaſe violent; but when the Diſeaſe, as well as the Pa- " tient, are of a dry Nature and Conſtitution, the Symptoms " are different."

We have hitherto conſider'd the Solution of Fevers, which uſually happens on critical Days, by favour of ſeveral ſorts of Excretions; and now proceed to treat of thoſe imperfect Criſes and Solutions which are effected by an Abſceſs, or, to uſe a Term of *Hippocrates*, by an Apoſtaſis, and Settlement on other Parts, eſpecially the Extremities. Among Abſceſſes we may juſtly reckon Eryſipelas, Buboes, arthritic Pains, and Tumors, Spots, Puſtules malignant or otherwiſe, purple Eruptions, Small-pox, and ſeveral exanthematous Eruptions of the like Kind. It is Nature herſelf which makes theſe Secretions, alſo, on ſtated Days, and oftentimes to the great Advantage of the Patient, who perceives a Mitigation of his Fever, and its Symptoms, tho' not a ſufficient and plenary Solution. As for an Eryſipelas, it is known to attack the Patient with a violent Fever, which is reſolved on the Appearance of a Tumor in the Skin; and *Hippocrates* reckons an Eryſipelas among critical Abſceſſes, as is very evident from *Lib.* 2. *Epid. Sect.* 3. where he ſays, ὁπόσα δήμως ἀφανίζεται δύσκριτα, χὴ δίον τῇ τῦ πολε- μάρχυ παιδίσκη ἐρυσίπελας. " Whatever diſappears, without " the proper Sign of a *Criſis*, determines unfavourably for the " Patient, as it happen'd with the Eryſipelas of *Polemarchus*'s " Maid-ſervant." And, in his Book *de Judicationibus*, and in *Coac.* to the critical Solutions of Fevers he ſubjoins Pains and Tumors of the Joints, Knees, and Hips. Thus again, *Lib.* 3. *Epid. Sect.* 1. he ſays, that " the third Patient, on the " twentieth Day, had an imperfect Criſis by a Pain of the " Right Hip." And, in ſhort, among Abſceſſes, or Matters abſceding under the Skin, he reckons both putrid and ſuppurat- ing Tubercles, and alſo Puſtules, as appears from the ſecond of the *Epidemics*, *S.* 45. under which, no doubt, the Meaſles and Small-pox may be included. Among Abſceſſes are juſtly to be reckon'd thoſe Tubercles, or Tumors about the Ears, by which Fevers are reſolved; as may be infer'd from our Author, who, *Lib.* 1. *Epid. Sect.* 1. ſays, " many had Tubercles about " one Ear, and more about both, ſitting up, and walking " about, without a Fever; tho' ſome of them were a little " hotter than ordinary. Theſe Symptoms happen'd to young " Men, to Perſons of vigorous Habits, and generally to thoſe " who were accuſtom'd to Exerciſe." But the moſt memo- rable Paſſage, relating to the ſeveral Manners in which Fevers are determined, is found in his Treatiſe *de Victus Ratione in Acut.* where, ſpeaking of a certain Kind of burning Fever, he adds the following Words: " If no Hæmorrhage happens from " the Noſtrils, if an Abſceſs does not appear about the Neck, " if the Patient is not ſeiz'd with a Pain of the Legs, if he " does not expectorate thick Spit, if he is not afflicted with a " Pain of the Hip, and if his Pudenda are not livid, then the " Diſeaſe is not determin'd. The Tenſion of a Teſticle is alſo " a Symptom of an approaching *Criſis*." A peſtilential Car- buncle ought alſo to be enumerated among Abſceſſes.

Thus we have taken the Doctrine and Hiſtory of *Criſes*, and *critical Days*, from *Hippocrates* himſelf, who probably firſt diſ- cover'd them, and generouſly convey'd the Diſcovery to Poſte- rity. *Galen*, the faithful Follower of *Hippocrates*, confirms the Sentiments of his Maſter, with reſpect to *Criſes*, almoſt in every Inſtance. He explains the Nature of critical Days; ex- tols the ſalutary Virtue of the ſeventh in particular; but con- demns the ſixth as treacherous and fallacious: The former he compares to a King, who ſets his oppreſs'd Subjects at Liber- ty; and the latter to a Tyrant, who, without Mercy, exerts his Power, and does all the Miſchief he can; for the ſixth Day is productive of Danger, and imperfect and unlucky Criſes, as he informs us in *Lib.* 1. *de Diebus Decretoriis*. But *Galen* has this peculiar to himſelf, that he alſo reckons the ninth Day among the ſalutary critical Days: Hence, in the Part already quoted, he informs us, that, in one Summer, he knew above three hundred Patients labouring under acute Diſorders, in which a Criſis happen'd either on the ſeventh or the ninth Day. He deſerves our Obſervation, alſo, when he writes, that he ſaw none die who had a Criſis after Concoctions; ſee *Lib.* 3. *de Criſibus*, *Cap.* 3. and that there is never a Criſis without a great preceding Perturbation, in which Nature is on a ſudden, and in a moſt violent manner, irritated by the Diſ- eaſe: Hence he aſſerts, that a Criſis always happens at the Height of the Diſtemper; that the preceding Day and Night are moſt troubleſome and dangerous; and that none was ever freed from the Diſorder, without ſome remarkable Evacuation, or an Abſceſs: For which Reaſon, when a Diſtemper ends in an Excretion or Abſceſs, he calls it a *Criſis*. To proceed, *Galen*, *Lib. de Diebus Decretoriis*, calls the ſeventh, fourteenth, and twentieth, *prime critical Days*; on which, he ſays, more reco- ver than die. A ſecond Order of critical Days he calls *inter- nuncial Indices*, becauſe on them are plainly ſeen the Signs of a future Criſis on the ſeventh Day, provided the Excrements are concocted. Theſe are the ſemi-ſeventh Days. The reſt, between the Indices and the truly critical Days, he calls *inter- calary*, and alſo *provocatory* Days, becauſe they irritate Nature to Excretion; ſuch are the third and the fifth in the firſt Week. The other Days are call'd *vacant*, becauſe they neither deter- mine, indicate, nor provoke; and alſo *medicinal*, becauſe on them the Phyſician treats his Patients with Medicines, and Ca- thartics may be ſafely adminiſter'd. And this alſo is what the divine *Hippocrates* has expreſs'd in plain Terms, *Lib.* 4. *de Morbis:* " Whoever, labouring under a continual Fever, ſays " he, were treated with Cathartics on even Days, were never " purged to Exceſs; but they who had Cathartics adminiſter'd " to them on odd Days, were all too much purged, and many " of them died." Theſe Days are by ſome call'd *artificial critical Days*, becauſe they determine; that is, effect a Solu- tion by medicinal Art. See *Laurentius*, *de Criſibus*.

Having thus propoſed and explain'd what we thought uſeful and neceſſary to be known, concerning the *Criſes* of acute Diſeaſes, and critical Days, from the celebrated Writings of *Hippocrates* and *Galen*, before we interpoſe our own Judgment, and confirm what ſhall be found agreeable to Truth and Expe- rience, by juſt Arguments, it will be proper to produce and conſider thoſe Authors, and their Arguments, who call in Queſtion this Doctrine of *Criſes*. The firſt, among the An- tients, was *Aſclepiades*, who, according to *Cœlius Aurelianus*, *Lib.* 1. *Cap.* 14. declares, that there are no ſuch ſtated Days as they call *critical* in Diſeaſes; and that there are no Solutions of Diſeaſes at certain and due Periods of Time. With this very antient Author agrees *Celſus*, who, *Lib.* 3. *Cap.* 4. ex- preſly ſays, " There ariſes a Queſtion concerning Days, be- " cauſe the Antients principally regarded odd Days, and call'd " them κριτίμους, " critical," as if a Judgment were to be " paſs'd on the Patient on thoſe Days. This was by *Aſcle- " piades*, as a vain Opinion, juſtly rejected; for the Patient, " he ſaid, was neither in more or leſs Danger on any Day, " becauſe it was even or odd; for ſometimes the even are the " worſt Days. Sometimes alſo, in the Diſeaſe, the Days take " a new Turn, and thoſe are moſt afflictive, which uſed to be " the moſt favourable: But the Numbers of *Pythagoras*, which " were highly celebrated in theſe Times, deceived the Antients; " for it is the Duty of a Phyſician not to number the Day, " but narrowly to obſerve the Acceſs of the Paroxyſm." Among the Moderns may be reckon'd *Helmont*, who, *Lib. de Tempore*, *Sect.* 53. endeavouring to explode the Obſervation of *Criſes* in Practice, " I have obſerved, he ſays, that there never " is a Criſis, when a Phyſician, who is Maſter of his Art, " takes care to remove the Diſeaſe before the *Criſis* is ex- " pected; for as Nature delights in its ordinary Motions, and " is accuſtom'd to them, and is willingly govern'd by the " Unity of the moving Power; ſo, when the whole Affair of " the Diſeaſe is entruſted to its ſole Management, it exerts it- " ſelf in exciting ſtated Criſes, which would otherwiſe, either " by the Goodneſs of a Medicine, be anticipated, or, by its " Badneſs, retarded and deſtroy'd; by which means the Criſis " is prolonged from the fourteenth Day to the fortieth. It is " the Part, therefore, of a good and faithful Phyſician to " neglect Criſes; and it were better for thoſe Patients, who " recover by a Criſis, to have no Phyſician, and much more " for thoſe who have a ſlow Criſis." The ſame Author, *Lib. de Feb. Cap.* 2. *S.* 8. ſays, " a true Phyſician ought to " ſubdue the Diſeaſe before a *Criſis:* If he acts otherwiſe, " nothing at all can be aſcrib'd to the Aſſiſtance of the medi- " cinal Art." " For if a *Criſis*," as *Langius*, *Miſcell. Quæſt.* 4. infers, " is to be expected in the Cure of Diſeaſes, Me- " dicine muſt certainly be a ſuperfluous and uſeleſs Profeſſion, " becauſe the whole Affair of Curing is by this means com- " mitted, in a manner, alone to Nature, and not to the Art, " nor its Profeſſor." Of the ſame Opinion is *Faber*, who, in his *Panchymag. Tom.* 3. ſays, it is the Duty of a Phyſician to

cure

cure a Diſeaſe before and without a *Criſis*. And, to name no more, the Count *de Filiſco*, *Lib. de Fato*, aſſerts, that this Number of Days is not always obſerved in Practice; and that Criſes often happen on other Days.

There are, beſides theſe before-mention'd, another Set of Authors, who do not, indeed, call in queſtion the Exiſtence and Uſe of critical Days, but ſuppoſe the Obſervation of them to be of Service in *Greece* only, and not in our Countries. Thus the celebrated *Waldſchmid*, in *Fundament. Med.* ſpeaking of a *Criſis*, adviſes us "not to be too curious in our Inquiries into "the Cauſes of critical Mutations, becauſe, in our Times and "Countries, ſuch Criſes no longer take place; for which Rea-"ſon alſo our Predictions in acute Diſeaſes are not ſo certain "and infallible, as they are repreſented to be in *Hippocrates*, "who relates ſuch Phænomena, or Signs of Diſtempers, as "ſeldom or never appear to us." And *Eiſchſtad. Pæd. Aſtron. Sect.* 3. ſays, "In our *German* Countries, and parti-"cularly in our own Climate and Soil, perfect and ſalutary "*Criſes* ſeldom happen." *Hollerius* alſo, in *Aph. Hippocr.* obſerves, "that, in cold and northern Countries, perfectly "critical Evacuations are rarely to be expected." As to the Cauſe why perfect Criſes, happening on critical Days, are ſo rarely obſerved in our Climate, ſome aſcribe it to the Temperature of thoſe Countries. See *Wedel.* in *Diſſert. de Diebus criticis*. *Baglivi*, in *Prax. Med.* ſeems to be of this Opinion, where he grants, that in *Greece* acute Diſeaſes end in perfect Criſes, but not in our northern Countries, which, he thinks, is to be aſcrib'd to the Purity and Thinneſs of the Air, which, in *Greece*, as it is in all the adjacent eaſtern Countries, is endu'd alſo with a great Elaſticity; whereas our Air, which is impregnated with aqueous and groſs Vapours and Impurities, muſt at all times render the Humours of the Body more impure, ſo that they can never attain to a perfect Criſis or Deſpumation.

We are now to give ſome Account of the Cauſes of thoſe wonderful Effects of critical Days, in acute Diſtempers, according to the Sentiments of the Antients. Many of the Antients agree in making the efficient Cauſe of critical Motions to be no other than the Nature of the Body, the Soul, or Principle of Motions in our Body, which rules and governs the whole Machine, which removes Diſeaſes, which, as it is expreſſed, *Lib.* 6. *Epid. Sect.* 5. is informed by none, nor ever learned any thing, and yet effects, in the moſt proper Way, what things are to be done, and where they ought to be done; which encounters with Diſeaſes, and fights it out to the laſt, combating with great Violence and Obſtinacy; which ſecretes Good from Bad by proper Paſſages, in due and convenient Seaſons, and for a good and neceſſary End; which excites Commotions of ſuch a Nature, and in ſuch a Proportion and Degree, as are correſpondent to the preſent morbific Matter; and this it does of itſelf, ſpontaneouſly, and from an innate Principle, not by Compulſion from any neceſſary external Cauſes, as it is ſomething incorporeal, which cannot be affected or altered by corporeal things. Some add, as a more remote Cauſe, an auxiliary aſtral Nature, eſpecially the Influence of the Moon, according to her Aſpects from ſalutary or unfriendly Planets, as ſhe enters the Signs of the Zodiac.

Thus have we given you an Account of *Criſes*, and critical Days, from the Writings of the Antients, with the different Opinions concerning their Effects: We are now to declare and explain our own Opinion, in relation to what there may be of Truth or Falſhood in this Doctrine; as whether there be any critical Days, and why they are of ſo much Importance in the Practice of Medicine as the Antients would have us believe. Now, ſince Experience is of moſt Service in our Inquiries after Truth in Phyſical and Medicinal Affairs, as being the firſt Foundation of all Truth, which conſiſts in Fact, and of Medicinal Ratiocination, it ſeems proper to be alſo firſt conſulted on this Occaſion. Wherefore, diveſting ourſelves of all Prejudice from Authority, we ſhall fairly propoſe what we have learned, from attentive Obſervation, concerning the Solution of Fevers, eſpecially on certain and ſtated Days. Firſt, then, it is certain from undoubted Experience, that, in Fevers, the Ephemera and Synochas are generally reſolved, the firſt in four-and-twenty Hours, and the other on the fourth or ſeventh Day, by Sweat, or a Hæmorrhage. The Pleuriſy, or Peripneumony, is milder and more remiſs about the fourth Day, when bloody Matter is expectorated by Coughing; and, about the ſeventh Day, it is uſually reſolved by Sweat, and a free Expectoration. If the Diſeaſe be pretty ſevere, it is prolonged to the tenth, and ſometimes to the fourteenth Day; but, if it proceeds farther, it turns to an Empyema. An Eryſipelas of the Stomach, indicated by a Lipyria, is reſolved, on the fourth or ſeventh Day, by an Evacuation upwards or downwards, and alſo by Sweating. An inflammatory Fever of the Liver meets with a Solution on the ſeventh, eleventh, or fourteenth Day, partly by Sweat, and partly by a Flux of the Belly; that is, if the concave Part of the Liver be inflamed. A Diſtillation from the Noſtrils ſucceeds an internal Inflammation of the Viſcera, and is ſometimes ſalutary, but ſeldom or never perfectly reſolves the Diſeaſe. Simple Tertians very often leave the Patient, ſpontaneouſly, after ſeven Fits. See *Hippoc. Lib. de Judic. Sect.* 4. Bilious burning Fevers are reſolved on the ſeventh Day generally, or elſe on the fourteenth Day, by Sweat, and a Looſeneſs. See *Hippoc.* in the laſt-mentioned Book. Petechial Fevers loſe their Virulence on the ſeventh, eleventh, fourteenth, and ſometimes, tho' but rarely, on the twenty-firſt Day. The Peſtilence loſes a great Share of its Malignity on the fourth, ſeventh, or eleventh Day, if the Patient recovers; and, in ſhort, moſt continual Fevers generally come to a Period on the ſeventh, eleventh, or fourteenth Day. Malignant and peſtilential Fevers are reſolved more by Stools than Sweat, as I have often obſerv'd, and as *Galen* remarks, *Lib. de atra Bile*, *Cap.* 4. And *Gerhardus Columba*, in *Lib. de Febr. peſtilent.* wonderfully admires the Effects of Excretions of the Belly by Stool; where he ſays, that "in that peſtilential Conſtitution he ſpeaks of, almoſt all "who had plentiful Diſcharges downwards, tho' attended with "the Signs of Crudity, at laſt recovered; for," ſays he, "as "the Looſeneſs proceeded, the Signs of Concoction every Day "more and more appeared, and the Diſeaſe became milder, "the Flux continuing till the Patient was judged out of "Danger."

With reſpect to Fevers, and their Commotions, which are not wholly reſolved, but yet remitted by an Abſceſs, or Settlement of the noxious Matter on ſome Part of the Body, the Caſe, in regard to Time, may be thus repreſented: An Eryſipelas attacks the Patient, in a very violent Manner, with a Fever, which on the ſemi-ſeventh Day, that is, between the third and fourth Day, quite ceaſes, the Matter being propel'd to the Superficies of the Body. The Small-pox and Meaſles come on with violent Symptoms, and a high Fever, which alſo, on the ſemi-ſeventh Day, by the Propulſion of the acrid and cauſtic Matter to the Skin, is not only mitigated, but the Severity of the Symptoms is generally much abated. In the Purple Fever, about the fourth Day, the acrid and pernicious Humours being expel'd and driven to the Superficies, the Violence of the Symptoms is quite ſubdu'd. The Petechiæ always come forth on the fourth or ſeventh Day, with ſome Relief to the Patient. Arthritic Fevers, if violent, are ſoon mitigated, by diverting the Courſe of the acrimonious and cauſtic Humour upon the Joints. Bilious Fevers, on the ſeventh, ninth, eleventh, or fourteenth Day, are relieved by the coming on of a Jaundice. Hence *Hippocrates*, *de Judic. Sect.* 10. was in the right when he ſays, "If a Jaundice comes on at the going off of a burning "Fever, the Patient is not uſually moleſted with Sweats, nor "has an Abſceſs form'd in any Part, but recovers his Health." A Tumor in the auditory Paſſage is a good and ſalutary Apoſtaſis; and Deafneſs thence proceeding is alſo a good Sign, which, in the *Hungarian* Fever, and acute ones, attended with a Pain of the Head, and a Delirium, if it came on a critical Day, and continued, was commonly a very happy Prognoſtic of Recovery. And this was obſerved alſo by *Hippocrates*, *Sect.* 2. *Aph.* 60. The Reaſon of this particular Obſervation is obvious; for it is a Sign of a robuſt and vigorous Conſtitution, when Nature propels a viſcid, and, without doubt, a ſulphureous Humour to the extreme and leſs noble Parts, as alſo to the Emunctories; ſuch as, in this Caſe, the Glands of the auditory Paſſage are. Hence we may clearly underſtand that Aſſertion of *Hippocrates*, in his Treatiſe *de Judicationibus*, "That thoſe who become deaf before the Solution of the "Fever, muſt neceſſarily become delirious: But the Solu-"tion is brought about either by an Hæmorrhage from the "Noſe, an Evacuation of bilious Matter by Stool, a corroding "Dyſentery, or a Pain of the Hips, or Knees."

Neither muſt we forget, that, in this Part of the World, Tranſlations are very common in acute Fevers, when Nature, become weak, does not expel and eliminate from the Body the peccant Blood or Matter, but conveys it to the internal Parts, both at the critical, and at other Times. Theſe Tranſlations, therefore, are almoſt all productive of the worſt of Conſequences; for they ariſe from the Stagnation, which is the principal Source of all the unlucky Symptoms, and of the Patient's Death. By this means are produc'd Phrenſies, Convulſions, Twitchings of the Tendons, Drowſineſs, and Apoplexies, which draw their ſeveral Origins from too large a Quantity of Blood ſtagnating in the Veſſels of the Brain. Inflammations alſo, and Suffocations of the Breaſt, ariſing from a Congeſtion of Blood in theſe Parts, prove mortal. In like manner Inflammations, producing a Quinſey, Aphthæ, accompanied with a Dryneſs of the Mouth, an inſatiable Thirſt, and a Difficulty of Breathing, ariſing from Stagnations of Blood in the Fauces, the Œſophagus, and its Orifice, generally prove fatal. *Hippocrates*, in the fifteenth *Aphor.* of his fourth *Sect.* in a continu'd Fever pronounces a Difficulty of Breathing, accompany'd with a Delirium, a mortal Sign. In the fifty-ſecond *Aphor.* of the ſame *Sect.* he alſo pronounces an involuntary Shedding of Tears, and a difficult Deglutition, fatal Signs in a continued Fever; for theſe Symptoms indicate, that ſome Part of the Blood already ſtagnates, and is fixed out of the Courſe of the Circulation.

With reſpect to the Solution of Fevers, Experience has confirmed, that the following Obſervations deſerve our higheſt Attention.

Firſt, In every ſalutary Determination or Solution of a Fever, either about or on the critical Day, a remarkable Evacuation, either by Sweat or Stool, almoſt always happens. This Evacuation is ſo copious, that it ſometimes continues for ſome Days; and not only when this Evacuation is preſent, but alſo before and after it, the Pulſe is more calm, the Strength is increaſed, the Mind acquires a Vigour and Energy it had not before, the Sleep becomes quiet and uninterrupted, and the preternatural Heat ceaſes.

Secondly, When large Evacuations happen either upon the critical or other Days, whilſt, at the ſame time, the Violence of the Diſeaſe, and its ſeveral Symptoms are not abated, but rather remain in their former State and Condition, this is a very bad Sign.

Thirdly, It is a frequent, and, at the ſame time, an infallible Obſervation, that as the Solution which happens on the critical Days, with Evacuation, and the Relief of the Patient, is lucky and ſalutary, ſo the Evacuations which happen at other times, however they may ſeem to afford ſome Relief to the Body, are yet to be ſuſpected as unſafe. Hence *Hippocrates*, in the fifth Section of the ſecond Book of his *Epidemics*, condemns thoſe Evacuations which, happening not upon the critical Days, relieve.

Fourthly, It is obſerved, that when the Small-pox, Meaſles, petechial and purple Fevers, break out on the firſt or ſecond Day of the Diſorder, they are always of the worſt Kind.

Fifthly, A large Quantity of thin Urine is in no Stage of a continual Fever obſerved to be ſalutary.

Sixthly, Before the Propulſion of exanthematous Efflorescences, and the driving of the peccant Matter from the internal to the external Parts, the Diſorder is generally more violent, and the Symptoms more exaſperated. Hence *Hippocrates*, in the thirteenth *Aphor.* of *Sect.* 2. ſays, that the Night before the Criſis, the Diſeaſe is very violent, but more moderate the Night after it. But this does not always hold true, with reſpect to the full and perfect Solution of Fevers. Hence it is not an univerſal and infallible Rule, that the Solution of a Diſeaſe cannot happen without a previous Perturbation of Nature, and an Exacerbation of the Diſorder, and its ſeveral Symptoms.

Seventhly, Tho', in acute continual Fevers, there is never a total Intermiſſion of the Symptoms, yet there may be a certain Remiſſion, which is ſucceeded by an Increaſe, or freſh Exacerbation, of the Symptoms; and this is often preceded by a Shivering and Rigor, during which both Impoſtumations and Tranſlations are to be apprehended.

Eighthly, In general we are to obſerve, that, in numbering or computing the critical Days, we are not to begin from the Laſſitude of the Patient, taking his Bed, or his bad State and Diſpoſition, but from the febrile Motion, which is known from the Shivering, and the Change of the Pulſe; I mean, when it begins to be ſwifter.

Ninthly, Tho' every fourth and ſeventh Day are more to be obſerved than the reſt, yet the Obſervation of *Hippocrates* and *Galen*, that the fourth indicates the ſeventh, and the eleventh the fourteenth, does not always anſwer in theſe Parts; but the Signs of Concoction in the Urine appear ſometimes on other Days: Wherefore we are every Day to inſpect the State of the Sick, the Strength and Excretions.

Tenthly, Bilious burning Fevers, and alſo inflammatory ones, attended with violent Symptoms, eſpecially in Subjects of a more ſenſible Conſtitution, have always more perfect Criſes at the ſtated Times, than malignant putrid Fevers, in impure, cacochymical, and infirm Subjects, which, though they terminate within fourteen Days, yet keep not ſo exact Time, nor critical Days.

Diſeaſes are not only reſolved on critical Days, but are often exaſperated, and the Patient dies on thoſe Days. Hence it is obſerved, that the ſeventh, eleventh, and fourteenth Days are fatal to Multitudes under inflammatory Diſtempers, the Small-pox, Petechiæ, and other epidemical acute Fevers; and yet more die on the ninth than the ſeventh Day; more on odd than even Days. Copious Evacuations by Sweat, thin and copious Urine, with a ſmall, weak, quick Pulſe, and a Delirium, prognoſticate Death. We have obſerved, that the hotter, and of the more exquiſite Senſe, the Subject or Patient, the warmer the Climate, and the more violent the Diſorder, the ſooner the Diſeaſe comes to a Solution, and changes either for the better or the worſe; but that a Criſis proceeds more ſlowly in languid and phlegmatic Subjects, in cold and marſhy Countries, under a milder Diſtemper, and a full, groſs, and common Diet. In ſuch a State Relapſes are alſo more frequent, and the Diſeaſe more eaſily paſſes, by *Metaſtaſis*, into another of a different Kind.

It alſo deſerves Conſideration, that, as *Hippocrates*, *Lib.* 2. *Epid. Sect.* 20. well obſerves, in calm and ſettled Weather, and Years which happen agreeably to the Seaſons, Diſeaſes are of a mild Nature, and come to a very eaſy Criſis; but when the Seaſons are inconſtant, Diſeaſes partake of their Inconſtancy, and have a difficult Solution. By this we are to underſtand, that when the Years keep up to their natural Conſtitution and Temperature, and no extraordinary or preternatural Weather happens, then are vegetable and animal Bodies in a right Diſpoſition; and, if any Diſeaſes ariſe in ſuch Seaſons, they keep to their ordinary Nature, Cuſtom, and Genus; whence they are attended with none but the uſual Symptoms, run out their legitimate Time, and come to a Solution on the uſual critical Days. But, if the Seaſons of the Year deviate from their natural Conſtitution, and aſſume a quite contrary and unnatural Face, ſo as to be transform'd one into another, the Summer to be like Autumn, the Winter warm, and partaking of the Nature of Summer, the Sky continuing for a long time covered with Miſts and Clouds, and no Winds blowing, in ſuch a Caſe the animal Fluids receive an irregular and preternatural Craſis and Temperature; whence ariſe Diſeaſes of the worſt Sort, attended with unuſual Symptoms, and a very difficult Criſis, becauſe they proceed not according to the ordinary Law and Courſe of Nature. And the Reaſon of this is obvious; for the Air, as *Hippocrates* has determin'd, is the principal Author and Ruler of whatever is done in our Bodies: This it is which, by its Elaſticity, imparts not only Strength and Tone to the Solids, but Spirituouſneſs, and an expanſive Force, to the Fluids; whence it diſpoſes and directs the Circulation of the Blood and Humours, and the Excretions from them, which are ſo neceſſary for the Preſervation of the Body. Nor can it be doubted, but that, in hotter Countries, and a thinner Air, the Humours are more fluid and moveable, and Bodies more diſpoſed to Perſpiration: For which Reaſon *Criſes*, and *critical* Solutions, of acute Diſeaſes, are more obſervable in them than in more humid Countries, where the Air, deſtitute of Elaſticity, is not limpid, but impregnated with Effluvia of a foreign Nature. Hence it comes to paſs, that not only the *Criſis* is retarded, and rendered leſs ſenſible, but the ordinary Motions of Nature, which are bounded within certain Periods of Time, are much diſturb'd; for which Cauſe ſome celebrated Writers doubt even the Exiſtence of *Criſes* in our Countries, or have ventured to pronounce them leſs exact than in *Greece*. Among theſe Authors is *Caſpar Hoffman*, who, in his *Inſtitut. Medicæ*, is of Opinion, that *Criſes* are very rare among us. And *Baglivi*, *Prax. Med.* does not deny, but that, in *Greece*, where the Air is purer, the regular critical Motions take place more than in *Italy*. But, though careful and conſtant Obſervation proves, that there are *Criſes* in our Country, yet we are to have a reſpect to the Difference in the Seaſons of the Year, the Country, Diet, the Conſtitution of the Patient, and his Treatment by the Phyſician; for all theſe things, to a ſurpriſing Degree, circumſcribe and modify the ordinary Motions of Nature in Diſeaſes. *Galen*, therefore, *Lib. de Dieb. decret.* very well adviſes one who would know the Day of the Criſis, carefully to inform himſelf of the Age, Conſtitution, and Pulſe of the Patient, and to conſider the Country, and Seaſon of the Year.

All prudent Phyſicians generally agree in this, that a *Criſis* may be anticipated, poſtpon'd, or diminiſh'd, by a prepoſterous Method of Cure, or an Error in Diet. Thus *Sennertus*, *de Diebus criticis*, *Inſtitut. Lib.* 3. *Part.* 3. *Cap.* 2. expreſly ſays, "If the Patient ſhould commit any remarkable Error, it "is much to be feared, that the *Criſis*, which would have "happened on a good critical Day, for Inſtance, the ſeventh, "will fall out, by Anticipation, ſooner, or, by Retardation, "later, ſo as to happen on the ſixth or eighth Day." And *Proſper Martianus*, *Com. in Lib. de Morb. Sect.* 2. ſpeaks yet more plainly: "By the continual Uſe," ſays he, "of cooling "Medicines, on account of the Fever, the Humours being "incraſſated, and the Corpuſcles condenſed, the ſpontaneous "Evacuations are often prevented; ſo that this is none of the "leaſt Cauſes, why Criſes ſo rarely happen in our Times; "whereas, among the Antients, they were very common." The famous *Baglivi* is alſo very expreſs to this Purpoſe, in *Prax. Med.* where he ſays, "The modern Practitioners in "Medicine ought not to wonder, that Criſes are not ſo frequent and perfect in our Days as they were formerly in "*Greece*; for, either not knowing, or elſe condemning, the "*Greek* Laws, they oppreſs, and almoſt kill, the Patient, by "treating him, from the Beginning to the Decline of the "Diſtemper, with Phlebotomies, and cathartic, diaphoretic, "ſpirituous, and other Sorts of Medicines, imprudently and "unſeaſonably exhibited. It is impoſſible, therefore, that "Humours, thus diſturbed by ſuch oppoſite and diſagreeing "Medicines, ſhould be diſpoſed for the Work of a critical "Deſpumation, at a ſtated Time; but, being perpetually "agitated, and thrown into Confuſion, inſtead of a perfect "Criſis, muſt end in preternatural Metaſtaſes. And, for this "Reaſon, we can neither obſerve the Rules of a *Criſis*, *critical* "Days, nor other Motions of Nature, delivered by the Antients." To the ſame Purpoſe this Author, not without Experience, aſſerts, that, "Among the Peaſants, who have "no Aſſiſtance from a Phyſician, theſe *Criſes*, or Deſpumations

"of

" of the peccant Matter, are accompliſhed by Sweat, a Flux, " Urine, and other Ways of Nature, and by a Motion alto- " gether regular."

Now, ſince the Doctrine of *Criſes*, and *critical* Days, is abundantly confirm'd and eſtabliſh'd, not only on the Authority of the moſt celebrated Men in our Profeſſion among the Moderns, but alſo by Experience, the undoubted Miſtreſs of Truth, as we have proved at large above, it remains for us to inquire into the natural Cauſes of theſe wonderful Effects. *Galen*, *Lib. de Dieb. decret.* rightly acknowledges this Doctrine to be drawn from Experience, not from Reaſon: And, indeed, accurate Inquiſition into the Cauſes of this wonderful Operation in Nature ſeems to ſurpaſs human Capacity. We ſhall, however, rejecting the Opinions of others, propoſe what to us ſeems moſt probable, and endeavour to explain and defend the ſame by proper Arguments. To begin with the Antients; they almoſt unanimouſly ſuppoſe Nature to be the efficient Cauſe of *Criſes*, and *critical* Days; which ſame Nature they believed to be the Principle of all the Actions in the Body, and, being endued with a peculiar Knowledge of Acting, to make uſe of a certain or determinate Time, Order, Degree, Proportion, and Means, according to the Diverſity of the morbific Cauſe, and to inſtitute ſuch Motions as are adapted to the Cauſe and Subject, in order to the Attainment of a certain End, which is the Preſervation of the Body at a certain Time; and, moreover, to direct and regulate thoſe Motions by certain Mediums or Organs. This Agent, which, with ſo much Prudence, moves and governs, and brings all the Motions, both in a ſound and morbid State, to Perfection, by fit and proper Means, they ſuppoſe to be a real Being, free, incorporeal, and endued with the Knowledge of acting; but they judge its Eſſence to be incorporeal, chiefly from its Effect, which is Motion; for they ſuppoſe, that Motion, in itſelf, without Action upon the Body, or while it is in the Body, and acts upon the Body, cannot be ſaid or underſtood to be any thing corporeal, but to be ſeparated from the Eſſence of the Body, and never to exiſt neceſſarily with the Body; ſo that the Body may ſubſiſt without it, and, conſequently, it has no eſſential Relation to Corporeity, as Quantity, Magnitude, and Figure have. Hence they conclude the Cauſe of this Motion to be ſomething ſpiritual, eſpecially conſidering the Order and Regularity of Motion in the Body; and, above all, that neither the material Alteration of the Humours, nor Changes of the Air, nor Diet, nor Medicine, can in the leaſt alter or invert the ſettled Motions of Nature; but they judge of its ſpiritual Force principally, by conſidering, that a Perverſion of the Order and Direction of theſe Motions can be accompliſh'd by mere Imaginations and Fictions of the Mind. This Nature they believe to be alſo very obſervant of Time, that is, to perform its Actions in a certain and determinate Time: Such are thoſe of forming, perfecting, curing, preſerving the Man, correcting the Cauſes of Diſeaſes, or expelling them through proper Emunctories adapted to the peccant Matter; as, for Inſtance, viſcid and bilious Humours, through the Inteſtines; the thin and acrimonious, through the external Habit of the Body; ſalt and ſerous Superfluities, through the Kidneys; the Redundance of the Blood, through the Mouths of the Veſſels; and an acrimonious volatile Bile, by Vomit. Then they affirm, that this Nature, for the Accompliſhment of its moſt remarkable and ſtated Effects, has ſelected the ſeptenary Number of Days, Months, and Years. And this was the moſt common Opinion of the Antients; from which we can only infer, that theſe admirable and orderly Effects have a like Cauſe from whence they proceed; but, we may ſtill juſtly aſk, What is this Cauſe? What is its Nature? Is it endued with Underſtanding, and a Knowledge of Things? Or are theſe Effects the Reſult of a neceſſary and phyſical Order and Contrivance of Cauſes, acting without all manner of Knowledge or Conſciouſneſs?

There is no Doubt, but that an Order, where-ever it is obſerved, always ſuppoſes an antecedent Cauſe, which is the Author of that Order; for Example, the Artiſt is the Cauſe of a Clock: But ſtill it remains a Difficulty, whether theſe orderly or regular Effects are immediately to be derived from the Order or Mechaniſm eſtabliſhed in Nature, or from the firſt Cauſe or Author of this Order, which Cauſe is endued with Knowledge and Perception. For Example; in a Clock, that the Index ſhews exactly the Hour, is not owing immediately to the Artiſt, but to the Order and Contrivance eſtabliſhed by him in this Inſtrument, which is the proximate and immediate Cauſe of ſuch an Effect; and we may very well apply this Inſtance to our Body, in which we perceive the moſt orderly and regular Effects in Nutrition, Augmentation, Perfection, Excretions, Motion of the Blood, and Cure of Diſeaſes. Theſe Things conſider'd, we may juſtly aſk the Queſtion, Whether theſe Effects proceed immediately from God, the firſt and moſt perfect Author of Order, or from the Soul, as a ſubaltern Cauſe, or rather from the Order, Structure, and Mechaniſm, of the Body. For our part, we are of Opinion, as to phyſical and medicinal Affairs, that if Effects can be demonſtrated proximately from corporeal mechanic Cauſes, which are perceptible by the Senſes, there is no Occaſion to have recourſe to remote or obſcure Cauſes, with which we are altogether unacquainted; as Spirit, Soul, Sympathy, Antipathy, Terror, Rage, or to moral Intentions and Direction. Our Sentiments, beſides, are, that, though all Effects which happen in Nature, cannot very clearly be demonſtrated *à priori* to the Senſes and Capacities of Men, becauſe of the narrow Limits of the human Underſtanding, it does by no means follow, that they have their Origin, not from a mechanic, but ſpiritual Cauſe; and this we would the more earneſtly preſs and inſiſt upon, that the Phyſician and Naturaliſt might be induced always to ſearch out the proximate and phyſical Cauſes, without having recourſe to ſuch as are ſpiritual, metaphyſical, unknown, and quite uſeleſs.

None of ſound Judgment can deny, but that in our Body, which is a moſt artificial Structure, there inhabits a Principle whoſe Nature and Operation are quite diſtinct from Motion and Body. Of this Kind are Perception, Cogitation, Direction of Motions, and the Will, which can ſubſiſt without the Body, and have no Agreement with it. But, we utterly deny, that Motion, or rather the Principle from which Motion, whether it be local or inteſtine in Bodies, proceeds, and on which it depends, has no manner of Relation to the Eſſence of Body: For a Body without Operation, and the Principle of Operation, cannot be conceived; ſince a Creature merely paſſive, which is not furniſh'd with a Principle of acting, is not a real phyſical Being, but a Creature of the Imagination. A Body, therefore, never ſubſiſts or exiſts, nor can be conceived, without an innate internal Principle of Motion, which is the Cauſe of the motive Forces and Powers, which it exerts upon other Bodies. Then, where-ever there is Body, or an extended Subſtance, there is Motion, Tendency, Preſſure, and Action, of one Body upon another; and where there is a Machine, or organiz'd Body, there Motion is appointed for ſome certain End. Our Body is a very artificial Machine, which, from the convenient and agreeable Diſpoſition of the fluid and ſolid Parts exerciſed on one another, produces Actions, as it ſufficiently appears from the Preſervation of the Body by Digeſtions, Mixtures, and Excretions, inteſtine progreſſive Motion, and Nutrition. Now theſe Motions are not immediately perform'd by the Soul in the motive Fibres; but the Soul only perceives certain Species of Motion in the Organs, underſtands, diſtinguiſhes, and compares them, and governs thoſe Motions in Parts ſubjected to the Will. And nothing more deſerves our Obſervation, than that great Intercourſe which God has eſtabliſh'd in Man between the Soul, and the Motions of the Body; for though the Soul does not indeed immediately perform Motions in the Body, it has a Power of modifying and diſturbing them. Of this we have a clear Proof from the Paſſions of the Mind, and the Imaginations of pregnant Women, which are very well known to have a ſurpriſing Effect upon the Motion of the Blood and Humours. On the other hand, the Motion of the Fluids has a ſtrange Influence in diſpoſing the Operations of the Soul, I mean the Manners and Paſſions; as may very clearly be demonſtrated from the different Nature of Temperaments, Ages, Nations, and Diet. We cannot doubt, then, but that Motions in the Body are quite diſtinct from the Actions of the Soul; and that the Blood and Fluids are not paſſive in the Caſe, ſo as to be directed by the Soul, but rather theſe Fluids exert their Action on the Soul; And, in ſhort, what can be more evident, than that Diſeaſes are cauſed, and Health reſtored, and Life preſerved or deſtroy'd, by Air, Drink, and Diet? What can be more certain, than that the Structure of the ſolid Parts, which differs with reſpect to Ages, Temperaments, and hereditary Diſpoſition, diſpoſes to particular Diſeaſes? And yet all theſe Things have no Regard to, or Communion with, the Soul, which therefore muſt of neceſſity be paſſive.

That a juſt Time is obſerved in ſome Actions, and thoſe of the principal or more ſolemn Kind, is one of the beſt Proofs of the Preſence and Neceſſity of a Mechaniſm; for an exquiſite and accurate Order is viſible in Actions, of which Mechaniſm is the Foundation. We ſee this in the Macrocoſm, by the remarkable Phænomena of the Tides, the ſtated Winds and Rains in ſome Places, the Revolutions of Times and Seaſons, with the Budding, Bloſſoming, and Fructification of Plants, which all come to paſs in a certain Time, and require a limited Seaſon. The moſt wiſe Architect of the Univerſe has been pleaſed to make Choice of the ſeptenary Number for the Production of many ſolemn and ſurpriſing Effects, eſpecially in our Microcoſm.

The venerable Sages of Antiquity dignify'd this Number with the Epithets of *perfect*, *full*, *holy*, *maſculine*, for the great Effects accompliſhed in it, which are a ſufficient Evidence of the infinite Wiſdom of the Creator diſplay'd in our microcoſmical Nature. We muſt not, however, think there is ſo much Power inherent in this Number, as ſome of the Antients imagin'd; but we are to form our Notions of the Matter by what follows. In order to the Production of certain Effects in

corporeal

corporeal Things, there is required a certain and ſpecific Proportion of the agent Cauſe or Actions: Now all phyſical Actions are nothing but Motion; and therefore a certain Proportion, a certain Number of Motions, is neceſſary to a certain Effect; for the Meaſure and Number of Motions conſtitute Time, and Time is nothing but a certain Number of Motions: Hence *certain* Actions require a *certain* Time. Let us accommodate this to our preſent Purpoſe by the following Inſtance: Under an Inflammation, for the Diſſolution and Abſterſion of a *certain* Proportion of Blood ſtagnating in the Veſſels, there is requir'd a *certain* Force and Number of Motions, by which the Blood, being impelled from the Heart and Arteries, to the affected Part, may free it from the Obſtruction. But God has form'd our Machine in ſuch a manner, that ſeven Days, and the Circulations of Blood, during that Period, are to be ſpent in performing that Operation: Hence acute and inflammatory Fevers are commonly reſolved on the ſeventh Day. Again, From the many uneaſy Irritations excited in the nervous and membranous Syſtem, it is over-and-above evident, that the Matter of the Small-pox, Meaſles, Petechiæ, and Purpura, is of an acrimonious and cauſtic Quality: Now, that this Matter may be removed by a Mixture of other Parts from the Blood, and diſpoſed for Secretion by the Habit of the Body, a *certain* Time is required, which takes up the Space of three or four Days; at the End of which, the peccant Matter leaves the internal Parts, and takes its Courſe to the Superficies. The Poiſon in the Plague, and contagious Fevers, is a Matter of a highly penetrating and putrefying Nature, which, mix'd with the Blood, either introduces a like putredinous Motion, and ſo fatally deſtroys the corporeal Texture; or elſe is itſelf corrected and eliminated out of the Body; in order to which Effect, there is required a juſt Time, and ſufficient Motion, for the Correction and Evacuation of the peſtiferous Matter. Thus again, When a Fever proceeds from the Putrefaction of ſome Humour ſtagnating in the Viſcera, there is a certain or determinate Motion of the Blood neceſſary to cleanſe and abſterge the putrid Collection; which Effect is to be accompliſhed by a certain Number of Pulſations of the Heart and Arteries, even juſt as many as paſs from the Beginning to the ſeventh or eleventh Day. Several Sorts of burning Fevers take their Riſe from a cauſtic acrimonious Bile; for the tempering and correcting, or, as the Antients expreſs'd themſelves, for the concocting and maturating of which, the ſame Time is required. "God, as "*Pliny*, *Hiſt. Nat.* ſays, has appointed this Law for Diſeaſes, "that they ſhould be terminated by a quaternary or ſeptenary "Number."

That the Solution of a Diſeaſe, at a ſtated Time, proceeds not from a Soul, or from Nature, as an intelligent incorporeal Principle, but from Mechaniſm, may be inferr'd, from only conſidering, that ſuch *Criſes* are anticipated or poſtponed, and become irregular, if the Patient errs in Point of Diet; if the Diſeaſe be treated with wrong Medicines; or the Cauſe thereof is ſomething ſtrange and unuſual: On which account, *Criſes* vary alſo according to the Diverſity of Years, Seaſons, Countries, and Subjects. *Riverius*, *in Inſtitut.* writes, that Motion and Diſpoſition are the Cauſe, why Criſes happen ſometimes ſooner, ſometimes later, and ſometimes upon intercalary Days, according to the Celerity of Concoction of the mild, or malignant, Humours: Wherefore, if the Cauſe of the Diſeaſe be not too malignant, and the ordinary Motions not much diſturbed or perverted with improper Diet or Medicines, if there be a free Perſpiration, and the Body not very impure, and if the Air be pure, ſerene, and elaſtic, the Criſes happen in juſt Time and Order.

Here ariſes a Queſtion of ſome Importance, Why full and perfect *Criſes* happen principally on critical Days; and good *Criſes* are attended with a Remiſſion of the Symptoms, and with Evacuations; for, as *Galen* has it, there is no good *Criſis* without ſome remarkable preceding Evacuation. To explain this, it is ſaid, that Nature, which is very obſervant of the ſeptenary Number, riſes up at firſt, with all her Forces, againſt the Cauſe of the Diſeaſe, which ſhe endeavours to mollify and diſpel; for the Preſervation and Continuance of our Bodies are principally maintained by excretory Actions, which prevent Putrefaction and Death. To this we anſwer, that the Soul is, indeed, endu'd with Knowledge; but not Nature, which cures Diſeaſes, and which, being conſcious of nothing, acts out of mere Neceſſity; for which Reaſon, it neither underſtands the Cauſe of a Diſeaſe, nor fights or ſtruggles, or kindles up a Fever, on that account; but all theſe Things, in my Opinion, depend on pure mechanical Principles, ſince external Cauſes alone, for Example, Baths, which obſtruct the Pores, or heterogeneous Liquors infuſed into the Veins, may, by diſtending and pricking the Membranes, excite febrile Spaſms. Further, It cannot be deny'd, that Life, as it ſignifies an Integrity of the Structure or Compoſition, is preſerved by Excretion; but, as Life rather imports an Act, that is, a circular Motion of the Blood and Fluids, which is alſo the neareſt Tye between Body and Soul, and not an Integrity of the Compound, and is, moreover, the Spring of all the Actions in the Bodies of Animals, and of thoſe very Excretions which preſerve the Integrity of the Structure, it evidently appears, that Excretions are not to be regarded as the only Cauſes of the Preſervation of Life; and that Diſeaſes do not ariſe only from a Suppreſſion of Excretions, nor are cured only by their Reſtitution. For nothing can be more evident, than that Life can be taken away by an Effuſion of Blood, by a Polypus, Ligatures, Coagulations, ſtopping the Circulation of the Blood, or a Diſturbance of the Motions by means of Poiſons, the Texture and Compoſition of the Parts remaining inviolated. Hence we may conclude, that all Cauſes which produce a Diſeaſe, are not of ſuch a Nature as to indicate only a Putrefaction, and to require, or even admit, an Excretion; ſince it frequently happens, that a ſmall Portion of Matter, of a very deleterious Quality, which indicates Correction and Preparation, in order to Excretion, proves the moſt dangerous and ſecret Enemy to Life; beſides, the peccant Matter often requires Reſolution, rather than Expulſion.

In compliance with this Sentiment, we might charge Nature with Error and Imprudence, for exciting ſuch violent Motions in Fevers, for the ſake of Reſolution and Excretion; when, it is well known, that the Affair of Excretion, as well as Secretion, would ſucceed at leaſt as happily under a more moderate Motion of the Fluids. For theſe Reaſons, we are of Opinion, that thoſe Excretions, which happen on critical Days, are to be eſteem'd a Sign, and not a Cauſe, of the Solution of the Diſeaſe: For hence it appears, that Nature being compoſed to Reſt, and the irregular and ſpaſtic Motions of the Fibres ceaſing, there commences a quicker Secretion, and a freer Appulſe of thoſe Impurities of the Blood and Humours, which were generated under the Diſeaſe, to the Emunctories of the Body. For if the moſt copious Excretions happen on the critical Days, or any other, without Relief, and an Augmentation of the Strength, they are of no Efficacy; ſo that ſometimes Death comes with large Excretions, which is a manifeſt Proof, that the Diſeaſe is not reſolved by Excretions: Wherefore all Evacuations, which happen not in and with a Decreaſe of the Diſeaſe, are call'd *ſymptomatical*; but thoſe which proceed from an Increaſe of the Strength, and argue a Vigour in Nature, are termed *critical*.

Copious Excretions by Urine, as well as thin watery Urine, and profuſe Sweats, without an Alleviation of the Symptoms, are never ſafe, according to the Authority and Experience both of Antients and Moderns; for they indicate the Matter of the Diſeaſe to be unſubdu'd, and that the Mixture of the Blood, and its Union with the Serum, is deſtroy'd; whence the fluid and aqueous Parts are ſeparated from the thicker: Wherefore copious and thin Urine, as *Hippocrates* long ago obſerved, portend a Delirium; for the Blood being render'd thicker by a Subtraction of the Serum, and being under a more languid Impulſe of the Arteries, eaſily ſtagnates in the Veſſels of the Meninges, and produces a Phrenſy. Whenever there happens an Abſceſſion and Eruption, as of the Small-pox, Meaſles, or Petechiæ, before the ordinary Time, it is an ill Sign; becauſe it indicates a copious Matter, and the ſame not well temper'd and corrected.

From the Premiſes it appears, that Excretions, on critical Days, are not the Cauſes of the Solution of a Diſeaſe, but rather the Conſequences of an Advantage obtain'd over the morbific Cauſe. Of this we have a manifeſt Example in the Paroxyſms of intermittent Fevers, where Sweats yield no Relief; but, when they happen in the Decline of the Diſeaſe, they are of Service; not becauſe they evacuate the formal Matter of the Fever, but becauſe they aſſure us of the Ceſſation of the irregular Motions, and febrile Spaſms: However, much excrementious Sordes, generated in the Diſeaſe, is eliminated with them. It is obſervable, alſo, that under ſevere Pains no Sweat appears; but as ſoon as it flows in a free Manner, it paſſes for a Sign of the Removal of the Pain, a Relaxation of the Tenſeneſs of the Fibres, and a freer Circulation of the Blood.

We may conclude from the preceding Diſcourſe, that the Obſervation of *Criſes*, and *critical* Days, has its Foundation in Nature, and is of Uſe in Practice; for as nothing is made and produced without Time, but every Effect requires a certain Time, ſo is there alſo a certain Time neceſſary for the Correction of the morbific Cauſe, and the Preparation of it in order to an Evacuation. And as a determinate Time is requir'd for the Generation of a morbific Cauſe, ſo alſo is the Correction and Expulſion of it out of the Body perform'd in a certain Space of Time. Now theſe Alterations, Corrections, and Immutations of the morbific Matter, happen on the ſeventh, ſemi-ſeventh, eleventh, or fourteenth Day, according to the ordinary Courſe of Nature. The Phyſician, therefore, (1.) who acts againſt this Order, or uſes violent Means in attempting to ſubdue the Diſeaſe, before the Time appointed by Nature for ſubduing the morbific Matter, acts raſhly and prepoſterouſly, and commits an Error. (2.) When the Matter is to be temper'd and concocted, and the Phyſician attempts Expulſion, and for that End uſes Volatiles, Sudorifics, and

Veneſection, he offends againſt the Law of Nature, and greatly injures the Patient; for the Law of Nature is a Law to the Phyſician. (3.) On *critical* Days, and about that time, it is beſt to abſtain from ſtrong Evacuants, for fear of deriving the Humours, which ought to be excreted by proper Emunctories, into inconvenient and improper Places. (4.) If Nature be weak in Expulſion, we are prudently to aſſiſt it; for Evacuations owing to Strength of Nature, and a Conqueſt over the Diſeaſe, are beneficial, by freeing the Body from many noxious excrementitious Parts, generated in the time of the Fever, as well in the Veſſels, as in the inteſtinal Tube; otherwiſe Evacuations, not well ſucceeding, eaſily induce a Relapſe. (5.) Evacuants and Purges, according to *Hippocrates*, *Sect.* 2. *Aph.* 25. are proper to be uſed in the Beginning of a Fever, when the Matter is redundant, that is, if the Blood be copious, and the Veſſels and *Primæ Viæ* obſtructed with impure Sordes; ſuch Depletions potently aſſiſt Nature, and remove what hinders the Cure, and foments the Diſeaſe. (6.) If, thro' the Malignancy of the Matter, the irregular Motions of Nature ſeem to have a Tendency towards a dangerous Metaſtaſis, the prudent Phyſician, without any regard to Time, will make it his Care to reſolve the Blood, to derive it to other Places, and to prevent its Stagnation, by ſeaſonable Relaxation, Phlebotomy, a Diaphoreſis, external Diſcutients, and ſometimes by Section under the Tongue, or Scarification of the Noſtrils. In ſuch a Situation, when the Signs prognoſticate certain Death, it would be Madneſs to expect a *Criſis*; and, therefore, we have often known gentle Cathartics, and nitro-ſaline Subſtances, mixed with *Aurum fulminans*, and diſcreetly exhibited, ſucceſsful in ſuch Caſes beyond Expectation. *F. Hoffman.*

CRISPATURA. Criſpature, Curling. In Medicine it implies a ſpaſmodic Contraction of the Membranes and Fibres. *Caſtellus.*

CRISPINUS, or CRESPINUS. A Name for the Barberry-tree. *Blancard.*

CRISTA. A Creſt. In Anatomy, a Proceſs of the Os Ethmoides is call'd CRISTA GALLI, from its ſuppoſed Reſemblance to the Comb of a Cock. See CAPUT. In Surgery, certain Excreſcences, about the Anus and Pudenda, are called *Criſtæ*, on account of their Form. See ANUS. In Botany, *Criſta Galli* is the ALECTOROLOPHUS, which ſee; and the *Criſta Pavonis* is the POINCIANA; *flore pulcherrimo*, which ſee.

CRITHAMUM. The ſame as CRITHMUM. *Blancard.*

CRITHE, κρίθη. Barley; a Grain much recommended by *Hippocrates*, and moſt Phyſicians ſince his Days, in acute Diſtempers. Hence, from its Similitude, a ſort of Tubercle on the Eyelids is call'd *Crithe*. See CHALAZA.

CRITHMUM. The Name of a Plant.

The Characters are,

The Root is fibrous, and ſpreading; the Leaves are ſucculent, thick, narrow, trifid, divided, and ſubdivided; the Seed is flat, a little ſtriated, and parts from its Covering.

Boerhaave takes notice of two Sorts of the *Crithmum*.

1. Crithmum; ſive fœniculum maritimum minus. *C. B. Pin.* 288. *Mor. Umb.* 20. *Boerh. Ind. A.* 57. *Tourn. Inſt.* 317. *Crithmum Fœniculum marinum*, *Herba S. Petri*, Offic. *Crithmum marinum*, Ger. 427. Emac. 533. Raii Hiſt. 1. 457. Synop. 3. 217. Mer. Pin. 31. *Crithmum marinum vulgare*, Park. Theat. 1286. *Crithmum ſive Fœniculum marinum*, Merc. Bot. 1. 31. Phyt. Brit. 32. *Crithmum multis ſive Fœniculum marinum*, J. B. 3. 194. Hiſt. Oxon. 3. 289. *Critmum ſive Crithmum*, Chab. 408. SAMPHIRE.

The *Sea-fennel*, or *Samphire*, is a much lower Plant than the common Fennel, having broader, ſhorter, thicker Leaves than that, of a dull-green Colour; the Stalk grows ſcarce a Foot high, having the like Leaves on it; and on the Top it bears Umbels of ſmall yelloviſh Flowers, and, after them, roundiſh Seeds, ſomewhat like ordinary Fennel, but bigger. The Root is thick and long, continuing ſeveral Years. The whole Plant has a warm aromatic Smell and Taſte. It grows upon Rocks by the Sea-ſide in many Places of *England*.

Samphire is more made uſe of as a Pickle, being a very agreeable one, than for any Medicinal Purpoſes. However, it is ſtrengthening to the Stomach, procures an Appetite, provokes Urine, and opens Obſtructions of the Bowels, and is good for the Jaundice. *Miller's Bot. Off.*

It is farther recommended as a Diſſolvent of the Stone, and a Promoter of the Menſes.

Hippocrates directs the Bark of Samphire (κρῆθμον) in Wine, faſting, together with the Grains of Piony, and Seeds of Elder, in a Dropſy of the Uterus; and, in Pains of the ſame Part, he orders Roots and Seeds of this Plant to be taken internally.

2. Crithmum; ſive Fœniculum marinum; majus; odore Apii. *C. B. P.* 288. *M. U.* 3. 290. *Baticulæ alterum genus, ex Siciliâ.* Cæſalp. t. R. P. *Boerh. Ind. alt. Plant. Vol.* 1.

CRITICUS. Critical.

CROCE, κρόκη. In *Hippocrates* it ſignifies a Thread.

CROCIDE CONFECTIO. The Name of a Confection recommended by *Nicolaus Myrepſus* for the Colic. *Sect.* 31. *Cap.* 22.

CROCINUM, κρόκινον. Oil of Saffron is thus deſcribed, by *Dioſcorides*.

The ſame Weight and Quantity of Oil are to be taken as in the Compoſition of the SUSINUM, (ſee this under ÆGYPTION) and alſo inſpiſſated. Into three Pounds and an half of the Oil, thus inſpiſſated as for the SUSINUM, put eight Drams of Saffron, and ſtir them ſeveral times in a Day for five Days together. The ſixth Day cleanſe the Oil well from the Saffron, and pour a like Quantity of Oil upon the ſame Saffron, and ſtir them for three Days. Then cleanſe off the Oil, and put therein of Myrrh, pounded, and ſifted, forty Ounces; ſtir them well together in a Mortar, and afterwards ſet the ſame aſide for Uſe.

Some uſe an Oil impregnated with Aromatics in the Compoſition of the CROCINUM, as they do of the CYPRINUM. The beſt CROCINUM, and the fitteſt for Medicinal Purpoſes, is what ſmells very ſtrong of the Saffron, and the next in Goodneſs is what is well ſcented with the Myrrh.

The *Crocinum* is of a heating Quality, and procures Sleep; whence it is frequently adviſed in Phrenſies, by way of Embrocation, or held to the Noſe, or the Noſtrils are rub'd with the ſame; it is alſo a Suppurative, and deterges Ulcers. It is effectual in Hardneſſes, Obſtructions, and malignant Ulcers of the Uterus, uſed with Wax, Saffron, Marrow, and double its Quantity of Oil; for it concocts, mollifies, moiſtens, and is alſo a Lenitive. It is good againſt a Glaucoma, if it be mixed with Water, and the Eyes anointed with it. *Dioſcorides, Lib.* 1. *Cap.* 64.

CROCUS. The Name of a Plant; the Characters of which are, according to *Miller*,

It hath a Flower conſiſting of one Leaf, which is ſhaped like a Lily, fiſtulous underneath; the Tube widening into ſix Segments, and reſting on the Foot-ſtalk: The Pointal riſes out of the Bottom of the Flower, and is divided into three headed and creſted Capillaments; but the Empalement afterwards turns to an oblong triangular Fruit, divided into three Cells, and is full of roundiſh Seeds. To theſe Marks muſt be added, it hath a tuberous Root, and long graſſy Leaves, with a longitudinal white Furrow thro' the Middle of each.

There are a great Number of Species of the Crocus. *Boerhaave* mentions twenty-eight. But that which is principally uſed in Medicine is, the

Crocus; ſativus. *C. B. Pin.* 65. *Tourn. Inſt.* 353. *Elem. Bot.* 289. *Boerh. Ind. A.* 2. 120. *Rupp. Flor. Jen.* 26. *Mer. Pin.* 31. CROCUS, Offic. Ger. 123. Emac. 151. Raii Hiſt. 2. 1176. Synop. 3. 374. J. B. 2. 637. *Crocus vel Crocum*, Chab. 222. Pin. 31. *Crocus genuinus ſive ſativus*, Merc. Bot. 2. 19. Phyt. Brit. 33. *Crocus Autumnalis ſativus*, Hiſt. Oxon. 2. 335. SAFFRON.

The Plant, which produces the true *Saffron*, has a round bulbous Root, about as big as a Nutmeg, flatted at Bottom, from which ſpring ſeveral white Fibres: It is covered outwardly with a yelloviſh-brown Skin, but is white on the Inſide. From this Root ariſe the Flowers, incloſed in a thin Skin or Huſk, being naked, and without Stalks, made up of ſix long, but roundiſh-pointed, purple Leaves, incloſing in their Middle three Stamina, of a fiery, yellow, red Colour, which being gather'd, and carefully dry'd in a Saffron-kiln, and made into ſquare Cakes, is the *Saffron* of the Shops.

The *Saffron-flowers* blow in *September*, but the Leaves come not forth till the Spring; being narrow and graſs-like, with a white Furrow running thro' the whole Length.

The beſt *Saffron* in the World grows in *England*, being cultivated in *Eſſex*, *Suffolk*, and *Cambridgeſhire*.

Saffron is a moſt noble Cordial, and a Strengthener of the Heart and vital Spirits, reſiſts Putrefaction, and is good in all kinds of malignant and contagious Diſtempers, in Fevers, Small-pox, and Meaſles. It opens Obſtructions of the Liver and Spleen, helps the Jaundice, brings down the Catamenia, expedites the Birth, and expels the Secundines. It is good in Diſeaſes of the Lungs, as Aſthma and Difficulty of Breathing, and of great Service in conſumptive Weakneſs. Outwardly applied in Poultices, it eaſes Pains, and ripens Impoſtumations.

Officinal Preparations of *Saffron* are, the Tincture, the Spirit, the Syrup, the Extract, and the Plaiſter *Oxycroceum*. *Miller's Bot. Off.*

The dry'd Filaments of the Flower, which are more peculiarly call'd *Crocus*, or *Crocum*, κρόκος, κρόκον, by the *Arabians Zaffaran*, or rather *Zahafaran*, whence the *Engliſh Saffron*, are ſlender Subſtances, thinner in the lower Part, and broader in the upper, of a whitiſh or paliſh Yellow, finely crenated, of a peculiar, pleaſant, and aromatic Smell, of ſubtile Parts, and diffuſing its Odour to a great Diſtance, ſomewhat ſtimulating to the Eyes, and moderately ſtuffing the Head, and inclining

to Sleep, of a bitterish Taste, and sufficient, in a small Portion, to turn a large Quantity of Wine or Water of a yellow or Lemon-colour, inclining to Red. Crocus is by the Chymists, from its Golden Colour, call'd *Aroma Philosophorum*, by Contraction *Aroph*; by others *Sanguis Herculis*, and *Aurum vegetabile*: For its extraordinary Virtues against many Diseases, it is honoured with the Title of *Res vegetabilium*, and *Panacea vegetabilis*.

Saffron, by a Chymical Analysis, according to *Geoffroy*'s Account, yields an acrimonious, thin, and highly volatile Spirit, which comes off first, tho' in small Quantity, in the Distillation; to this succeeds an acidish Phlegm, which will turn a Tincture of Heliotropium of a red Colour; then a very little Oil, and a very small Quantity of urinous Salt. Something of a fixed alcaline Salt is extracted from the Caput Mortuum by Lixiviation. The acid Salt is not so deeply involved in the Sulphur, but that it communicates an intensely red Colour to a Solution of Heliotropium. Oil of Tartar, poured on a Solution of Saffron, produces no Alteration; but Lime-water, with a very slight Effervescence, and a thin Coagulum, assumes a white Colour, on account of the Acid concealed in the Saffron, tho' no Heat can be perceived. The Tincture of Saffron may be extracted either with Water, or Spirit of Wine. *Antonius de Heide*, in his *Observ. Medic.* informs us, that a few Drops of this Tincture, poured upon clean Paper, underwent no Change, as to their Colour and Consistence, by an Addition of Aqua-fortis, Pot-ash dissolved, and a Solution of sublimate Mercury, made with Rain-water. *Newman* denies, that the essential Oil, the fixed Sulphur, and the volatile Salt of Saffron, can be obtained separately; and affirms, that it is a mixed, aqueous, gummous, and terrestrial Substance, in which, tho' there are rarefied oleous Parts, mixed with resinous and highly subtile saline Particles, yet these cannot be separated from each other; for from two Ounces and an half of Saffron, dried by a Bath-heat, he obtained by Distillation half an Ounce of a fragrant Liquor, or the Quintessence of Saffron, in which there was no substantial Oil. The Part remaining after Distillation, which weighed two Ounces, he divided into two equal Parts for making Extracts. From an Ounce, therefore, of this Saffron he obtained of the first spirituous Extract five Drams and one Scruple, and of the second aqueous Extract one Dram and half a Scruple, and of the terrestrial Part one Dram and an half. With the other Ounce of Saffron he first used Water, and obtained of the first aqueous Extract six Drams, and of the second spirituous Extract one Scruple, whilst the Saffron remaining weighed five Scruples. Hence 'tis obvious, that, in Saffron, the Quantity of gummous Parts surpasses that of the resinous. But if we may believe the Author of the Annotations on this Passage of *Newman*, the essential Oil of Saffron may be obtain'd by Distillation, entirely separate from the other Parts. According to him, a Dram and an half of this Oil may be obtain'd from one Pound of Saffron, which is of so penetrating a Taste, that one Drop of it, taken upon the Tongue, will be felt for twenty or thirty Hours after. It may be obtained by any one from the Extract of Saffron made with Water, provided half a Pound of the Saffron is used for that Purpose. According to *Schroder*, a Pound of Saffron yields a Dram of this Oil. But since Saffron is dissolved in Water, as well as in Spirit of Wine, and since separately with each of these Fluids, when reduced to a thicker Consistence, by means of Abstraction, it resembles a pinguious balsamic Oil, capable of being mixed with Water, Oil, and Spirit of Wine, *Cartheuser* from this concludes, that there is a fixed Principle, of a very peculiar Nature, lodged in it, since it neither resembles a perfect Oil and Gum, nor a perfect Resin, but is of a kind of neutral Nature, and seems, in some measure, to resemble both. *Boerhaave*, in the second *Vol.* of his *Chymistry*, calls it an heteroclite Body, which scarce resembles any other in Nature. As for the Virtues of Saffron, resulting from its constituent Parts, *Ettmuller*, from its volatile Oil, in Conjunction with its acrid, highly spirituous, and penetrating Salt, derives its intoxicating, and at last narcotic Quality. He affirms, that both these Principles, the Oil and the Salt, are so closely combined and united in the concrete Body, that it yields but very little Oil without contracting an Empyreuma. He also maintains, that the acrid Salt contains a certain aromatic Quality, by which it stimulates the Uterus. The celebrated *Hoffman*, in his *Dissertatio de Remediorum domesticorum Utilitate*, informs us, that Saffron, in consequence of its mild, anodyne, and vaporous Sulphur, is excellently calculated for alleviating Pains and Spasms; and that, by means of its acrid and volatile Salt, it contributes to open and remove Obstructions. *Newman* deduces the narcotic Virtue of Saffron from its highly attenuated, rarefy'd, and vaporous oleous Parts.

Without enumerating the several Uses to which the Antients applied Saffron, whether as an Ingredient in Aliments, or an Instrument of Luxury, we shall proceed to the modern Accounts of it. We shall but just mention, that it serves the Dyers to give a yellow Colour, and the Painters in their Water-colours; and that it is boiled with Alum in Water, to make a yellow Ink; and that the *Indians*, on their Holidays, express their Joy by scattering or throwing about Saffron, as we read in *Ovington*'s *Voyages*; and that it is accounted in many Countries the best Seasoning for Food: This I know to be Matter of Fact, with regard to the Inhabitants of *Poland* and *Courland*; and, as for the *Spaniards* and *Italians*, we are assured by *Labat*, in the Account of his Travels into *Spain* and *Italy*, that they are perswaded, that without the Use of Saffron they should be perpetually molested with Disorders of the Breast, Lipothymies, and want of Sleep. The Women in *Ireland*, as *Laurembergius* says, dye their Shifts with Saffron, to preserve them from Vermin, and to procure to themselves Strength of Body, and Chearfulness of Mind. In that Country the young Men also chew it in their Mouths; by which means they acquire a fragrant Breath, and by breathing upon the Face of a Woman, which they suspect to be painted, immediately make her become pale, and betray her counterfeited Beauty. *Scaliger*, in his *Exercitationes*, informs us, that, in *Ireland* and *Iceland*, there are a Set of clownish People, who wear Shirts tinged with Saffron, for six Weeks and more, with an Intention to banish Lice. *Bacon*, in his *History of Life and Death*, informs us, that, in *Iceland*, Linen and Shirts, tinged with Saffron, were originally intended for preventing Putrefaction; but he thinks, that this Piece of Practice contributes to the Prolongation of Life; and, in the same Work, he expressly affirms, that the *English* are rendered sprightly by a liberal Use of Saffron in Sweetmeats and Broths. And the same *Bacon*, in his Treatise *De retardandis Senectutis Accidentibus*, advises Saffron to be mixed with Medicines intended to prevent the Effects of old Age; for, says he, Saffron conveys Medicines to the Heart, cures its Palpitation, removes Melancholy and Uneasiness, revives the Brain, renders the Mind chearful, and generates Boldness. Saffron seems to produce its Effects on the human Body, by the uncommon Fineness and Subtilty of its Parts; and, according to *Caspar Hoffman*, it is justly doubted, whether it does not surpass all other Simples. Hence it is, as *Lister* observes, that it greatly contributes to promote the Concoctions, especially the third. *Boerhaave*, in the second *Vol.* of his *Chymistry*, calls it a true and genuine Rouser of the animal Spirits, because it is possessed of aromatic, stimulating, and heating Qualities; and is therefore discutient, resolvent, aperient, and corroborating. It is classed not only among the cordial, alexipharmic, sudorific, diuretic, cephalic, pectoral, emmenagogue, and ecbolic, but also among the anodyne and narcotic Medicines. In malignant and contagious Fevers, *Friccius*, from his own Experience, recommends the following Medicine:

Take of Rose-water, beat with the White of a new-laid Egg, two Spoonfuls; of Saffron, one Pugil. When these are sufficiently mixed, add two Spoonfuls of the Spirit of Wine, and about the Bulk of a small Nutmeg of Camphire reduced to Powder. Let it be exhibited Morning and Evening.

Diemerbroeck, in his Treatise *de Peste*, informs us, that in a particular Plague he rarely used Saffron; and that he could not be sensible of its Efficacy and Virtue against this contagious Malignity, when he did use it. Besides, continues he, 'tis not safe to make Trial of its Qualities in a Plague, because it affects the Head; and, when exhibited in large Quantities, induces a Drowsiness or Delirium, both which are greatly to be dreaded, and consequently carefully prevented in Plagues. It is successfully used for freeing the Lungs from thick and viscid Phlegm; for which Reason it is by some call'd *Anima Pulmonum*, the Soul of the Lungs. *Camerarius*, in his *Hortus Medicus*, affirms, that it is so beneficial in Disorders of the Thorax, that some exhibit a Scruple and an half of it, with half a Grain of Musk, to be drank in warm Wine for curing Asthmas. He also affirms, that it greatly contributes to remove the Effects of a Perspiration obstructed by Cold. *Paulus de Sorbait*, in his *Universa Medicina*, informs us, that if we want to protract the Life of a phthisical Patient for a short time, we must exhibit to him half a Scruple of Saffron. *Friccius*, in Coughs, especially those of Children, recommends the following Preparation as a Specific:

Take of fresh Sperma Ceti, half a Scruple, and of Saffron, one Grain, if the Child is a Year old: But, if the Child is two or three Years old,

Take of fresh Sperma Ceti, one Scruple; and of Saffron, two Grains; and to Children farther advanced, half a Dram of Sperma Ceti, and three Grains of Saffron, may be exhibited in warm Broth.

Saffron is by many recommended in removing Obstructions of the Liver, and curing the Jaundice. *Hertodt* in his *Crocologia*, recommends the following Preparation as a Specific in the Jaundice.

Take

Take of Malmſey-wine, one Pint; the Yolks of two Eggs; one Dram of Saffron: Mix all together. One Half of this Preparation is to be taken at Night, when going to Bed, and the other Half in the Morning.

In the Cure of a Dyſentery Saffron acquired an uncommon Reputation, after *Bontius* affirm'd, that no more efficacious Remedy could be found; and that the Extract of Saffron was the moſt genuine Antidote in this Diſorder, tho' of the moſt virulent and obſtinate Kind. This Extract he orders to be prepared in the following Manner:

Take of the beſt Opium, Dragons-blood, Gum Benzoin, and *Perſian* Saffron, each equal Parts; and of black or Japan Amber, a third Part: Mix them all together in an oblong Veſſel with a narrow Neck. Pour a Quantity of ſtrong Wine Vinegar upon them, ſufficient to riſe three or four Inches above the Materials. After Digeſtion in a ſtrong Heat, let the Liquor, ſtrongly expreſſed, be inſpiſſated to the Conſiſtence of an Extract. The Doſe of this Medicine is from ſix to nine Grains, in the Form of a Pill, or diſſolved in a Spoonful of Wine, or any other proper Liquor. It is principally to be exhibited towards Night.

Bauhine, from *Matthiolus*, informs us, that Children, which continually cry, are very weak, and diſcharge ſmall fabulous Concretions in their Urine, are greatly relieved by a little Saffron exhibited with Milk. *Helmont*, againſt the Stone, greatly recommends the *Arcph* of *Paracelſus*, which, according to *Hoffman* in his *Clavis Schrod.* is prepared by putting Saffron and Bread, dipt in Wine, in a Veſſel, and burying them for ſome Days in Horſe-dung, and then diſtilling. According to *Boerhaave*, there is no Neceſſity for a previous Corruption of the Saffron and Bread in Horſe-dung, for extracting this Tincture, ſince, by that means, it is rather rendered worſe than better. But the Caſes, related by Phyſicians, of Children ting'd in their Mothers Bellies, ſufficiently prove, that Saffron has a peculiar Influence on the Uterus, and that its emmenagogue and ecbolic Virtues are to be derived from this Circumſtance. 'Tis alſo certain from Experience, that Saffron, when taken internally, tinges not only the Excrements, but the Urine. But, in *Eph. Nat. Curioſ. Decad.* 3. *a.* 6. *o.* 273. we have an Account of a young Man of twenty-two Years of Age, whoſe Seed was ting'd of a Saffron-colour by his eating Aliments prepared with Saffron. *Riverius* affirms, that half a Scruple of Saffron, exhibited, in ſome proper Broth, every Hour, is ſingularly beneficial in difficult Labours. It is univerſally uſed, as a Medicine of uncommon Service, in promoting the Eruption of the Small-pox; and, in *England*, according to *Ray*, it is ſuſpended in ſmall Bags, under the Chin and Throat, for diſſipating putrid and venomous Matter, leſt, ſtagnating in the Parts, it ſhould excite an Inflammation, and ſtrangulate the Patient. *Verulam* informs us, that a certain *Engliſhman*, who uſed to be exceſſively ſick at Sea, had his uſual Nauſeas prevented by wearing a Bag of Saffron on the Region of his Stomach. Externally it is extol'd, as an excellent Ingredient, in Medicines calculated for Diſorders of the Eyes. Thus *Geoffroy*, in Inflammations of the Eyes, orders the following Preparation.

Take of Fennel-water, four Ounces; and of Saffron, fifteen Grains: Triturate both together, in a Mortar, till the Water aſſumes a Golden Colour. Then the Liquor is to be ſeparated from the Powder by Inclination, and mixed with an equal Quantity of ſtibiated Wine.

Or, according to *Friccius*,

Take a ſufficient Quantity of the Whites of Eggs beat up with Roſe-water, or Womens Milk; add Saffron, and apply to the affected Eyes.

Avenzoar, in Cataracts of the Eyes, orders them to be kept open over the Decoction of Saffron, in ſuch a manner, that the Steam of it may affect them. For reſolving inflammatory Tumors, and alleviating Pain, *Geoffroy* recommends an anodyne Cataplaſm, prepared of

A Pound of the Crumb of the fineſt Wheaten Bread, broken between the Hands; of Cows Milk, a ſufficient Quantity. Theſe he orders to be boil'd, ſtirring them at the ſame time, and adding, towards the End of the Preparation, the Yolk of one Egg, and one Dram of Saffron, reduced to a fine Powder.

According to *Bauhine*, Saffron, mixed with Milk, Oil of Roſes, and a little Smallage, alleviates the intenſe Pains of the Gout, ariſing from a hot Cauſe. In arthritic Pains, and Eryſipelas, a Linen Cloth, impregnated with Saffron, is ſaid to be a divine Remedy. *Mynſicht* gives the following Directions for preparing a Cloth of this Kind.

Take a Piece of new Hempen Cloth; waſh it five or ſix times in Frogs-ſpawn, gathered in the Month of *March*, and ſo carefully filtrated, that the Granulations, reſembling ſmall black Eyes, may be ſeparated from it. Suffer the Cloth to dry as often in a Shade, to which the Heat of the Sun has no Acceſs. Then take of the Vinegar of Elder-flowers, and of Saffron, a ſufficient Quantity. Make into a Tincture, in which boil the Hempen Cloth, till it aſſumes a deep Saffron-colour. Let it cool in this Tincture; then take it out, dry it, and preſerve it for Uſe. After other neceſſary Precautions are taken, this Cloth, when anointed with *Venice* Soap, is to be applied to the Part affected.

According to *Bauhine*, Saffron applied warm, mixed with a Lixivium and Oil of Olives, is of ſingular Service in Tumors in which a Gangrene is dreaded; and a Plaiſter of Lupins, boiled in a Lixivium and White-wine, with an Addition of Saffron, is ſaid to be an excellent Remedy in Gangrenes. *Ettmuller* informs us, that Spirit of Wine, impregnated with Saffron, and applied, with a Linen Cloth, to the Fingers and Toes, when ſo injur'd by the Cold as that a Gangrene is dreaded, is an excellent Remedy. That Saffron contributes to the Cure of Wounds, is obvious from the Caſe of a Man, who, with a Hatchet, inflicted a deep Wound in his Foot; but, by waſhing the Wound with Wine in which Sugar was diſſolved, and filling it with Saffron, he was cured. This Caſe we have in *Ephemer. Nat. Curioſ. Decad.* 1. *a.* 3. *o.* 310. According to *Laurembergius*, the Bites of Spiders and Scorpions are cured by the Application of Saffron. It is applied externally, by way of Epithem, to the Forehead and Wriſts, in order to alleviate Pain, and procure Sleep. Some, for the ſame Purpoſe, place Chaplets or Garlands of Saffron round the Head. According to *Wedelius*, in his *Opologia*, Nurſes, in order to remove obſtinate Watchings in Children, place a Bag, in which Saffron has been kept, below their Heads. But *Friccius*, upon this Paſſage of *Wedelius*, obſerves, that the Bag ought to be removed as ſoon as the Child is aſleep. Saffron is alſo often uſed, in Conjunction with Opium, as we ſee in many of the Laudanums of the Shops. With the learned *Geoffroy* we may juſtly doubt, whether it corrects or augments the Effects of the Opium; or whether, as an Aromatic, it, by the Minuteneſs of its Parts, contributes to divide and reſolve its tenacious and viſcid Quality: For no one ever aſſerted, that Saffron was a more powerful Narcotic than Opium. Nor, in the mean time, does it ſeem proper for correcting or leſſening its Virtues, becauſe its Smell teſtifies, that it is poſſeſſed of narcotic Qualities. Beſides, like Opium, when uſed in too large a Quantity, it induces Drunkenneſs, proves narcotic, or produces a Delirium; but, when moderately us'd, it calms the Mind. For this Reaſon it is recommended for exhilarating melancholic Patients, when ſew'd up in a ſmall Bag with Camphire, and wore on the Pit of the Stomach; but *Juncker* doubts whether this Practice be ſafe. According to *Baubine*, *Geſner* orders a little Saffron to be mixed with Broth, as a proper Means of Relief in melancholic Diſorders. *Borelli*, in his *Obſervationes Medico-phyſicæ*, *Cent.* 2. *Obſ.* 99. informs us, that a certain Woman, by wearing Saffron on the Pit of her Stomach, was cured of Melancholy, and a perpetual Inclination to weep. *Schulzius*, in his *Prælectiones*, informs us, that the exhilarating Virtues of Saffron are ſufficiently conſpicuous in young Children, to whoſe Noſtrils if an empty Glaſs, in which Eſſence of Saffron has been, is applied, they are immediately ſet a laughing. The Power of Saffron to excite Laughter is ſo well known, that it has become a Proverb, when one is eaſily ſet a laughing, to ſay, that *He eats Saffron.* But it ſeems to be an hyperbolical Expreſſion of *Levinus Lemnius*, when he aſſerts, that the Heart is ſo miraculouſly refreſhed by Saffron, that when the Ring Finger of the Left Hand is rub'd with it, it immediately penetrates to the Heart. From what has been ſaid 'tis obvious, why it is call'd the *Hortus Lætitiæ*, and the *Medicina Triſtitiæ*. *Dioſcorides* and *Pliny* aſcribe to Saffron a Virtue, by means of which it reſiſts Intoxication. This Effect it may poſſibly produce as a ſubtile Aromatic, by opening and diſcuſſing, if it is not exhibited in too large a Doſe; for whatever opens the Pores, lays a Foundation for the Elimination of the Wine by Perſpiration. Perhaps, alſo, they aſcribed this Virtue to it, becauſe it procures ſound Sleep to thoſe who are drunk; for, by its mild and gentle Effluvia, it diſcuſſes the Uneaſineſs ariſing from exceſſive Drinking; by which means a calm and pleaſant State being brought on, the Crapula is concocted, as *Plutarch* informs us in his *Sympoſ. Lib.* 3. *Probl.* 1. *Bodæus*, in *Theophraſt.* is of Opinion, that Saffron, previouſly exhibited, diſcuſſes the aſcending Vapours, and prevents their Arrival at the Brain; but that, when drank with the Wine itſelf, it exhilarates the Heart too much, promotes Ebriety, and aſſiſts the Strength of the Wine. But, to uſe the Words of the celebrated *Juncker*, "If we "compare all theſe Encomiums with modern Experience, we "ſhall

" ſhall find the Virtues of Saffron leſs extenſive, and much in-
" ferior to what they are generally ſaid to be; for it is to be
" obſerved, that it muſt be exhibited in ſmall Quantities; other-
" wiſe it excites violent Commotions of the Humours, Cepha-
" lalgias, Drunkenneſs, and Deliriums. Beſides, if it is ex-
" hibited at the time when any Diſeaſe is accompanied with
" Heat and a Fever, various unahppay Symptoms are brought
" on by it. For this Reaſon 'tis to be doubted, whether it is
" proper in malignant Fevers; nor is it to be uſed, except in
" ſmall Quantities, for promoting the Eruption of the Menſes
" and Lochia. Beſides, tho' it in ſome meaſure rouſes the
" languid Motions, and may with Succeſs be exhibited in Dif-
" ficulties of Breathing, and obſtinate Coughs, yet it neither
" remarkably diſſipates the Stagnations of the Humours, nor
" the Obſtructions of the Viſcera; nor is it ſo powerful in Diſ-
" orders of the Lungs, as to deſerve the Title of *Anima Pulmo-*
" *num*; nor does it protract the Lives of phthiſical and pleuritic
" Patients, much leſs procure a perfect Cure in theſe Diſorders.
" But the external Uſe of Saffron is eſtabliſhed upon ſurer and
" leſs precarious Foundations; for it is highly proper for an Ery-
" ſipelas, and all inflammatory Tumors, eſpecially for diſpelling
" the ſerous Matter lodged in them, and alleviating the Pains
" with which they are accompanied. For this Reaſon it is
" frequently mixed with Epithems, medicated Bags, diſcutient
" or maturating Cataplaſms or Plaiſters. Nor is it unſucceſſ-
" fully applied to the Eyes with Milk, in order to free them
" from Inflammations, or to defend them againſt Defluxions in
" the Small-pox." *Hoffman*, in his *Diſſertatio de Remediorum domeſticorum Præſtantia*, gives us the following ſimple and eaſy Preparations of Saffron: " In obſtinate Coughs, and
" Difficulties of Breathing, an Infuſion of Saffron in the
" Water of Paul's Betony, with the Addition of a ſufficient
" Quantity of Sugar-candy, is found to be of ſingular Efficacy.
" The ſame Infuſion, prepared with Cinnamon-water, is highly
" beneficial for provoking the Menſes, facilitating difficult La-
" bours, expelling the Secundines, and promoting the Lochia,
" eſpecially when, at the ſame time, Oil of ſweet Almonds is
" now-and-then exhibited. Externally, Saffron, boiled with
" Milk, the Flowers of Elder and Chamomile, and the Crumbs
" of Wheaten Bread, and applied by way of Cataplaſm,
" wonderfully alleviates arthritic Pains. I have alſo known
" the ſame Remedy applied with Succeſs for removing the
" Pain of the blind Hæmorrhoids. Saffron, put into Roſe-
" water, with the Addition of a little Camphire, cures Inflam-
" mations of the Eyes in the Meaſles and Small-pox."

We ſhall now enumerate the Diſadvantages attending the prepoſterous and unſeaſonable Exhibition of Saffron. *Dioſcorides* then informs us, that three Drams of it, drank in Water, are ſaid to prove fatal. *Galen*, in his Treatiſe *De Simplic. Medicament. Facultat. Lib.* 5. *Cap.* 19. claſſes Saffron among thoſe Subſtances, which, when liberally uſed, either deſtroy the Patient's Reaſon, or procure his Death. And, in the ſecond Book of his Treatiſe *De Compoſitione Medicamentorum*, he affirms, that the Smell of Saffron alone produces a Pain of the Head; and a little after, in the ſame Book, he claſſes it among ſuch Subſtances as diſturb and diſorder the Mind. According to *Geoffroy*, *Coſtæus* informs us, that many, who have uſed a ſmall Bag of Saffron by way of Cuſhion, have been ſeized with a Pain of the Head ſo intolerable as to put an End to their Lives. *Borelli*, in like manner, in his *Obſervationes Medico-phyſicæ*, *Cent.* 4. *Obſ.* 35. gives us an Account of a certain Merchant's Servant, who, uſing to lie down and ſleep near a large Quantity of Saffron, was ſeized with ſo intenſe a Pain of his Head, and a Weakneſs of his Heart, that he died. He alſo tells us, that he was informed, that Horſes, which carry Loads of Saffron, generally died of a Diſcharge of bloody Urine. *Friccius* alſo, from the *Veterinarii*, informs us, that a ſmall Quantity of Saffron, exhibited to the ſtrongeſt Horſe, proves fatal to him, by exciting an immoderate Diſcharge of Urine. *Amatus*, in *Dioſcorid.* gives us an Account of one *Agaſo*, a Native of *Peſaro*, who, happening to ſleep upon two ſmall Bags of Saffron, died the ſame Night. And, according to the ſame Author, a certain Merchant, after throwing a large Quantity of Saffron into a Pot containing ſome Soop, which he intended for his Supper, was, upon eating the Soop, ſeiz'd with ſo violent a Fit of Laughter, that he was near dying. *Serapio*, from *Rhaſis*, affirms, that Saffron intoxicates very much, if mixed with Wine, and produces a Chearfulneſs next to Madneſs. *Konigius* informs us, that, at *Baſil*, Saffron produced Cephalalgias, and exceſſive Laughter, in ſuch as mix'd too large a Quantity of it with their Wine. According to *Caſpar Hoffman*, in his Treatiſe *De Medicamentis officinalibus*, *Julius Alexandrinus* gives us a ſimilar Inſtance, in the following Words: " I myſelf ſaw a Woman of Diſtinction, at *Trent*,
" who was ſeized with an immoderate Fit of Laughter for
" three Hours; and her Misfortune was produced by too large
" a Quantity of Saffron, exhibited with an Intention to pro-
" voke her Menſes." *Riverius* informs us, that he knew a Woman, who, by taking too large a Doſe of Saffron, with a View of reſtoring her Menſes, had them diſcharged ſo immoderately, that ſhe dy'd in three Days time. *Simon Pauli* uſes the following Words: " I remember," ſays he, " that a
" certain Virgin, labouring under a Suppreſſion of the Menſes,
" endeavour'd to provoke them by the Uſe of Saffron; but, by
" this very means, ſhe expoſed her Life to imminent Danger;
" for, tho' ſhe was marry'd immediately after, ſhe has ever
" ſince been afflicted with continual and intenſe Head-achs,
" tho' ſhe is now ſeventy Years of Age." *Bauhine* informs us, that he had ſomewhere read, that the Stamina of Saffron, triturated, and applied to the Wriſts, or under the Breaſts, convey'd their Qualities immediately to the Heart and Brain, produced a Vertigo, attended with Dimneſs of Sight, and weaken'd the Eyes. From the immoderate Joy, and exceſſive Laughter, excited by the Uſe of Saffron, *Lindeſtolpe* ſuſpects, that it was the *Nepenthe* of *Homer*.

From what has been ſaid 'tis ſufficiently obvious, that, as the moderate Uſe of Saffron is beneficial in ſeveral Diſeaſes, ſo, when exhibited unſeaſonably, in too large Doſes, or for too long a Time, it proves highly prejudicial to Health. For this Reaſon it is, by *Boerhaave*, claſſed among the narcotic Poiſons; and the Antidotes to it are aqueous, oleous, acidulated Vomits, and ſuch as have Honey for an Ingredient. Theſe are to be uſed in large Quantities, and often repeated: Clyſters alſo, and Baths, of the ſame Ingredients, are to be employ'd. But, becauſe Saffron is a narcotic Aromatic, poſſeſſed of heating Qualities, and which, by reaſon of the Smalneſs and Subtilty of its Parts, penetrates to the Humours, throws them into Commotions, and ſtimulates the Solids, it ought not to be uſed in Caſes where the Stimulus of the Solids, and an Increaſe of Motion in the Fluids, would produce bad Conſequences. For this very Reaſon it muſt be ſparingly and cautiouſly exhibited to plethoric Patients, and to tender Children; as alſo in burning, bilious, and inflammatory Fevers, critical Hæmorrhages, eſpecially when the Matter to be eliminated is of a malignant Nature; as alſo in painful Spaſms, which are often ſalutary, and aſſiſt the Propulſion, or throwing off, of the Impurities ſtagnating or fix'd in the ſmall Veſſels, or contribute to the Ejection of virulent Matter. In old Men, who begin to labour under a Dryneſs and Rigidity of the Fibres, accompany'd with a Penury of gelatinous Lymph, it does not procure Sleep, but rather induces Watchfulneſs, increaſes the Drineſs and Imbecillity of their Fibres, and diſturbs their Imaginations. The ſame Effects are to be apprehended in Patients of dry, bilious, and choleric Habits, who, in conſequence of the Senſibility and briſk Oſcillation of their Solids, and the hot Quality of their Humours, receive no friendly Impreſſion from Subſtances which produce ſtrong Commotions, but are ſeverely injured, and often thrown into maniacal Diſorders or Deliriums, by them. 'Tis, therefore, obvious, that pregnant Women, and thoſe who are ſubject to too copious Diſcharges of the Menſes, to Apoplexies, and lethargic Diſorders, ought to abſtain from the Uſe of Saffron. *Schulzius*, in his *Prælectiones*, juſtly adviſes, that all Preparations of Saffron ſhould be cautiouſly exhibited to Women in the Flower of their Age. That Saffron ought to be cautiouſly uſed in external Applications, eſpecially to the Head, we learn from the *Ephemerid. Nat. Curioſ. Decad.* 2. *a.* 4. *o.* 67. where we have an Account of a Woman, who, labouring under a putrid Fever, applied a Linen Cloth, impregnated with the Effluvia of Saffron, to her Temples, in order to promote Sleep; but ſhe was forthwith ſeized with a Heat of her Stomach, which was not abated till the Cloth was removed. I think it is obvious, not only from this Caſe, but alſo from what has been before ſaid, how imprudent a Part the common People act, who, without the Knowledge of the Phyſicians, and againſt their Advice, in Phrenſies, acute Fevers, and obſtinate Watchings, have recourſe to Saffron as an approved Remedy, and think, that they may ſafely and innocently tie up the Heads of Patients, afflicted with theſe Symptoms, with Cloths impregnated with Saffron. 'Tis, on the contrary, obvious, that Saffron is a Remedy adapted to thoſe who have cold Conſtitutions, to the Leucophlegmatic, and ſuch as labour under Diſeaſes ariſing from a cold Cauſe. For this Reaſon we underſtand why *Fernelius* aſſerts, that it powerfully aſſiſts lethargic Patients. *Zwelfer* is of Opinion, that the beſt Form of exhibiting Saffron, in Caſes where it is proper, is to add it to Medicines in Subſtance, or to prepare an Eſſence from it; that its Extract is defective, with reſpect to ſeveral Virtues, becauſe, in the Abſtraction of the Menſtruum to the due Conſiſtence of an Extract, many of the ſpirituous and volatile Parts fly off; but that theſe finer Parts of the Saffron are retained in the Diſtillation of a Water from it, whilſt the more valuable, corroborating, terreſtrial, and efficacious Parts, ſubſide in the Diſtillation, ſo that the diſtil'd Water muſt be entirely deſtitute of them. But, with reſpect to the ſalutary or hurtful Doſe of Saffron, Authors are by no means agreed, ſince, as *Geoffroy* obſerves, ſome affirm, that half a Scruple, and others that a Scruple and an half, may ſafely be exhibited internally. But *Rhaſis* affirms, that, with good Succeſs, he exhibited two Drams of Saffron, in order to promote a Delivery: But *Caſpar Hoffman* thinks, that this is an Error of the Printers, who for two Scruples have

placed two Drams; for *Dioſcorides*, and after him *Serapio*, *Avicenna*, and others, inform us, that three Drams of it prove mortal. But, according to *Ettmuller*, the Inhabitants of *Poland* are ſo accuſtom'd to the Uſe of Saffron, that they often mix an Ounce of it with their Aliments; but the Force of Cuſtom is ſufficiently obvious from a long-continued Uſe of Opium, a Dram or two of which may be ſafely taken every Day by thoſe who have been gradually habituated to it; tho' three, four, or five Grains were once ſufficient to have deſtroy'd them. Saffron may, therefore, ſafely be preſcribed in Subſtance, from half a Scruple to a whole Scruple, or even half a Dram. Let me add, that the largeſt Doſe, for ſuch as are not accuſtom'd to it, ought not to exceed half a Scruple.

Processes *upon* Saffron.

Nature has prepared, in certain particular Parts of certain Vegetables, a determined kind of Body, ſo different from all others, as ſcarce to be refer'd to any other known Kind; and has, at the ſame time, endow'd it with Virtues, otherwiſe inimitable. We have an Example of this in the Chives of Saffron. It is incredible how rich this Saffron is in Colour, Taſte, Odour, and Virtue; how ſmall the Bulk is, that poſſeſſes all theſe rich Faculties; and how tender, and eaſily corruptible, the Thing itſelf is; and therefore requires a peculiar Method of Operation.

Take, therefore, two Ounces of the choiceſt *Engliſh* Saffron, dried, and either cut ſmall, or remaining whole; put it into a clean Bolt-head with a long and ſlender Neck; pour upon it ſo much of the pureſt Alcohol, containing no foreign Subſtance, as may float four or ſix Inches above it: Then ſtop the Glaſs ſlightly with a Wreath of Paper, and ſet it in a Heat of only a hundred Degrees. Leave it thus in Digeſtion for three Days, the Veſſel being often ſhook: Let it afterwards reſt, for twenty-four Hours, in a cold quiet Place; then carefully ſtrain off all the tinged Liquor thro' a Piece of clean Linen, placed in a Funnel ſet in a clean Glaſs, and keep it cloſely ſtopt. It will be of a bright-red Colour; the Saffron, remaining at the Bottom of the Glaſs, will be found paler than before. To this pour the like Quantity of freſh Alcohol, and proceed as before; and mix the Tincture, thus acquired, with the former: The Saffron will now remain paler. If more Alcohol be added to it, and the Proceſs be repeated, a ſtill poorer Tincture will be obtain'd, which ought to be kept ſeparate: The Saffron will now become pale, but otherwiſe will have the ſame Appearance and Bulk as before. To this if Water be added, digeſted therewith, and pour'd off, it will be of a yellow Colour: Put on freſh, and continue thus, till more Tincture can be extracted; and now the Chives will appear quite white; and, if gently dried, will retain their former Figure, tho' they appear much ſhrunk, perfectly inodorous, and inſipid, ſo as ſcarcely to be diſtinguiſh'd from Bits of clean Thread: Whence it is wonderful, where the Seat of that ſurpriſing Matter, extracted from it, ſhould be, which is found to give ſo rich a Tincture to ſo large a Proportion of Alcohol. Let the Tincture, procured by the two firſt Digeſtions, be diſtil'd in a Glaſs Body, fitted with its Head, and perfectly well cloſed, with a Fire of a hundred Degrees, till about an Ounce remains behind; which, when cold, is to be pour'd into a Glaſs Veſſel, to be kept carefully ſtopt. It will prove of an exceeding red Colour, a highly fragrant Odour, and a bitter, aromatic, penetrating Taſte, and have the Conſiſtence of thin Oil. Let it be kept under the Title of *The eſſential Extract of Saffron*. The Spirit that came over in the Diſtillation will be limpid and colourleſs; but retain the grateful and aromatic Smell and Taſte of Saffron. This is to be reſerved for the ſame Operation upon freſh Saffron; and thus every time becomes the richer.

Remarks.

This ſurpriſing Experiment ſhews us a new Species of Matter, which we can neither call Oil, Spirit, Gum, Reſin, Gum-reſin, Wax, or Balſam; but it is ſomething perfectly ſingular, and of a ſpirituous oily Nature. This Extract mixes with Water, Spirit, and Oil; and has ſuch exhilarating Virtues, that, being uſed too freely, it occaſions an almoſt perpetual and indecent Laughture; but, uſed moderately, it becomes properly exhilarating. It tinges the Urine red, and is particularly ſaid to deſtroy the petrifying Power thereof in the Kidneys, and therefore to be an extraordinary Remedy againſt the Stone. It is the true *Arcph* of *Paracelſus*. There is no Occaſion previouſly to digeſt the Saffron with Bread, in the Heat of Horſe-dung, in order to procure its Tincture, which is thus render'd rather worſe than better; for, in our preſent Preparation, all that is efficacious is brought together without Loſs, or impairing its peculiar Virtues, or any ſenſible Change. And theſe Preparations, being miſcible with any Liquor, and of a very penetrating ſubtile Nature, eaſily enter the fineſt Veſſels of the Body, and, by their extraordinary Mobility, diffuſe their Virtue thro' the Whole, and chiefly excite the animal Spirits. Laſtly, they have that admirable Virtue, which the Author of Nature has planted in them, and which can never be explain'd upon any Principle, and can only be known by itſelf. *Boerhaave's Chymiſtry.*

Spiritus Croci: *Spirit of Saffron.*

Take of the beſt *Engliſh* Saffron, four Ounces; Spirit of Wine, four Pints: Let them digeſt together, in a Retort, a Week or two; then, in a Sand-heat, draw off the Spirit to Dryneſs. Put to the Reſiduum two Pints more of Spirit; and, after the ſame Digeſtion, draw that off alſo, and mix with the former. Put the Whole back again, and draw a third time. Let the Reſiduum be clean rinſed out with a little freſh Spirit, as little as can be; then ſtrain it hard, and evaporate the Liquor into an Extract.

The College order this Diſtillation but once; yet by repeating, as here directed, the Saffron may, almoſt all, be brought over: But the Junctures muſt be well luted, and all Parts of the Operation managed with Diſpatch and Dexterity; otherwiſe as much of the finer Parts will be loſt, as will be obtain'd by ſuch Repetition. What is got, indeed, this way, is loſt in the Extract; and, therefore, the Operator may manage it as either of the Medicines are depended upon. If the Spirit be but once drawn, the Reſiduum may be mix'd, and digeſted with a ſufficient Quantity of *Canary*; then ſtrain'd, clarify'd, and made into a Syrup, as good as can be made from the freſh Saffron; for, in the Diſtillation, nothing riſes which can be retain'd in a Syrup, howſoever made. This Spirit is one of the greateſt Cordials which Medicine can produce; and has the Advantage, at the ſame time, of being a noble Alexipharmic, and diſpoſing the Patient to ſweat, if it be duly encouraged. It may be given from one Dram to one Ounce, or more, at a Doſe, and repeated as often as there is Occaſion, in any proper Diluter. The Extract is ſeldom given alone, and is fit for no Form but Pills or Boles, wherein it may be mix'd, from two Grains to twelve Grains for a Doſe.

Syrupus Croci: *Syrup of Saffron.*

Take of the *Engliſh* Saffron, one Ounce: Infuſe it in one Pint of *Canary*; and digeſt them together, in a cloſe Veſſel, by a gentle Heat, for three Days; then preſs out the Wine, and diſſolve in it twenty Ounces of the fineſt Loaf Sugar, ſo as to make it into a Syrup.

This hath not, till now, been order'd in any College Diſpenſatory, altho' much directed in extemporaneous Practice; and it ſeems to be one of the beſt of the ſimple Syrups, becauſe capable of containing enough of the Ingredient, in one Doſe, to anſwer ſome Intention of Conſequence, which can be ſaid but of very few others.

Tinctura Croci: *Tincture of Saffron.*

Take Saffron, half an Ounce; Treacle-water, half a Pint: Digeſt for ſix Days, and then ſtrain it for Uſe. It may be alſo made with *Canary*, or *French* Brandy.

This is often preſcrib'd as a Cordial, and an Alexipharmic, in Fevers, and whatſoever Diſorders require ſweating, or driving out by the Skin. But it ſoon loſes its Colour, as Saffron will do in any thing which is acid: For this Reaſon ſome make it with other Menſtrua. This is given from two Drams to one Ounce, or more, at a Doſe.

Emplastrum Oxycroceum.

Take of Saffron, two Ounces and a half; of Pitch, Colophony, and yellow Wax, of each four Ounces; of Turpentine, Galbanum, Gum Ammoniacum, Myrrh, Olibanum, and Maſtich, of each one Ounce and three Drams. To the melted Wax put the Pitch, clear'd of all Droſs, and ſtrain'd, as alſo the Colophony; and, after they are melted together, taken off the Fire, and a little cool'd, mix with them the Galbanum and Ammoniacum, diſſolved in Vinegar, ſtrain'd, and boil'd to the Conſumption of the Vinegar; as likewiſe the Turpentine: Then ſift in the Maſtich and Myrrh, powder'd ſeparately; and, laſt of all,

all, the Saffron. Stir them all well together, and make them into a Plaiſter, according to Art.

This is aſcrib'd to *Nicolaus Myrepſus*, in the *Auguſt. Diſpenſat.* as likewiſe by the firſt of the College, into which it is tranſcrib'd; but here the Quantity of Saffron is much abridged. This ſeems to have taken its Name from the Saffron and Vinegar, both which are expreſs'd by it, notwithſtanding the ſmall Share Vinegar hath in it; and, indeed, the *Auguſtan* Collection gives one Preſcription, under this Title, from *Vigo*, which is alſo in the firſt Edition of the College, that hath in it neither Saffron nor Vinegar; but that whole Compoſition is very juſtly cenſured by *Zwelfer*. The *Pharmacopœia Regia* gives likewiſe a Preſcription bearing this Title, and not greatly differing in Materials. This hath been in great Eſteem for many Intentions of Conſequence; tho' *Hildanus*, *Cent.* 4. *Obſ.* 99, 100. takes notice of ſome Inconveniences and Miſchiefs ariſing from its Uſe. The Manner of its Compoſition hath been very particularly directed by *Zwelfer*; but what the College have thought fit to give here, is ſufficient for any Compounder. Notwithſtanding the Abridgment of the Saffron in its Quantity, (which, in ſome meaſure, might probably be from the Virtues of ours being ſo much beyond any that is foreign) yet the Covetouſneſs of our wholeſale Medicine-makers has found out a Way to diminiſh even that; and, it is to be fear'd, ſometimes to imitate its Colour, without putting in any Saffron at all; ſo that it is incumbent upon us to be cautious, when any great Dependence is had hereupon. It is principally uſed to warm and ſtrengthen debilitated Parts.

CROCUS *Germanicus*, *Saracenicus*, *Spurius*, or *Sylveſtris*, are Names for the CARTHAMUS, which ſee.

CROCUS *Indicus* is the CURCUMA, Turmeric. See CURCUMA.

CROCUS is alſo a Name given to ſome Preparations of Metals, calcin'd to a red or deep-yellow Colour. Thus there is the *Crocus Martis aperiens*, and the *Crocus Martis aſtringens*. See MARS. Thus alſo Copper, reduced to a reddiſh Powder by a ſtrong Calcination, is call'd *Crocus Veneris*.

CROCUS METALLORUM is an emetic Preparation of Antimony with Nitre; for which ſee ANTIMONIUM.

CROCUS alſo is ſometimes uſed to expreſs the Yolk of an Egg.

CROCODES, κροκώδης. An Epithet for certain Troches or Paſtils mention'd by *Paulus Ægineta*, *L.* 7. *C.* 12.

CROCODILION. A Name for the *Echinopus*; *major*. Glove-thiſtle.

CROCODILUS, Offic. Jonſ. 141. Tab. 79. Schw. Rept. 145. Aldrov. Quad. Ovip. 677. Charlt. Exer. 29. Geſn. de Quad. Ovip. 9. Rondel. de Piſc. 2. 234. Bellon. de Aquat. 41. Obſ. ed. Cluſ. 104. *Lacertus omnium maximus*, *Crocodilus dictus*, Raii Synop. A. 261. Sloan. Hiſt. Jam. 2. 332. THE CROCODILE, OR ALLEGATOR.

The Blood of this Animal is ſaid to clear the Sight; and the Fat is recommended for Wounds and Cancers. *Dale* from *Johnſon*.

CROCOMAGMA, according to *Dioſcorides*, is prepared of *Unguentum Crocinum*, and Spices preſs'd, and made into Troches. The choiceſt *Crocomagma* is what is ſweet-ſcented, mix'd with a moderate Quantity of Myrrh, ponderous, black, free from Chips, when ſufficiently diluted, giving the Colour of Saffron, ſmooth, bitteriſh, and dying the Teeth and Tongue with a Colour which laſts for many Hours: Such is the *Crocomagma* imported from *Syria*.

It abſterges ſuch Things as darken the Pupil of the Eye, provokes Urine, heats, mollifies, and concocts; and anſwers in ſome meaſure to the Virtues of Saffron, of which it is principally compoſed. *Dioſcorides*, *Lib.* 1. *Cap.* 26.

CROMMYON, or CROMYON, κρόμμυον, or κρόμυον. An Onion.

CROMMYOXYREGMIA, κρομμυοξυρεγμία. Acid and fetid Eructations reſembling the Taſte of Onions.

CROPIOT. A ſmall Fruit, mention'd by *Cluſius* and *J. Bauhine*, like the *Ethiopian* Pepper, containing a ſmall black Seed.

CROTALARIA.

The Characters are,

It hath ſingle Leaves, in which it differs from Reſt-harrow; and the Pods are turgid, in which it differs from *Spaniſh* Broom.

Boerhaave mentions five Species of this Plant.

1. Crotalaria; Aſiatica; folio ſingulari, verrucoſo; floribus cæruleis. *H. D. Deſcr. & Ic.* 199. *a. Prægn.* ASIATIC CROTALARIA, WITH A SINGLE WARTED LEAF, AND BLUE FLOWERS.

2. Crotalaria; Aſiatica; folio ſingulari, cordiformi; floribus luteis. *H. L. Deſcr. & Ic.* 201. *a. Prægn.* ASIATIC CROTALARIA, WITH A HEART-SHAPED LEAF, AND YELLOW FLOWERS.

3. Crotalaria; Africana; ſtyracis folio; flore cæruleo. *T.* 644. *Geniſta*, *arborescens*, *Africana*, *ſtyracis folio*, *flore cæruleo*. H. L. *Arbor*, *ſiliquoſa*, *Africana*, *Geniſtæ ſemine*. Barthol. Act. Hafn. Anno 1673. Obſervat. 131. *Crotalaria*, *Arbor*, *Africana*, *ſtyracis folio molli*, *incano*, *flore cæruleo*. Amm. Charact. Plant. 241. H. Prægn. AFRICAN CROTALARIA, WITH A LEAF OF THE STORAX-TREE, AND A BLUE FLOWER.

4. Crotalaria; Afra; arboreſcens; eadem; minori folio. *H. Prægn.*

5. Crotalaria; Aſiatica; folio argenteo, villoſo; flore luteo; ſiliquis pendulis in Spicâ. *a. Prægn.* *Boerh. Ind. alt. Plant. Vol.* 2.

No medicinal Virtues have yet been diſcover'd in theſe Plants.

CROTALISTRIA. A Name for the Stork. See CICONIA.

CROTAPHI, κρόταφοι. The Temples.

CROTAPHITÆ, κροταφῖται. The temporal Muſcles.

CROTAPHIUM. This ſometimes implies a Pain in the Head, near the Temples.

CROTON, κρότων. The Plant call'd *Ricinus*. In *Hippocrates* it alſo imports the Bronchia of the Lungs, diſcharged by Expectoration, according to *Foeſius*.

CROTONE, κροτώνη, is properly a fungous Excreſcence on Trees, as appears from *Theophraſtus de Plantis*, *Lib.* 1. *Cap.* 13. but is, by a Metaphor, apply'd alſo to Excreſcences and fungous Tumors on the Periоſteum. *Caſtellus*.

CROUMATA, κρούματα, from κρούω, to beat, in *Hippocrates*, *Lib.* 1. περὶ διαίτ. are the muſical Tones reſulting from the Pulſation of Inſtruments of Muſic. *Foeſius*.

CROUSMATA, κρούσματα. This Word occurs in *Myrepſus*, *Sect.* 10. *C.* 1. The Tranſlators render it *Deſluxiones*, Rheums. But *Fuchſius* thinks it ought to be read ῥεύματα.

CRUCIALIS. An Epithet, uſed by Surgeons, for an Inciſion made in ſuch a manner as to croſs another Inciſion.

CRUCIALIS, in Botany, is the CRUCIATA HIRSUTA.

CRUCIATA. A Plant ſo call'd, becauſe the Leaves are diſpoſed in the Form of a Croſs.

The Characters are,

It hath ſoft Leaves, like the *Gallium*, (Ladies Bed-ſtraw) four being placed at every Joint of the Stalk; in other reſpects it reſembles the *Mollugo* (Baſtard Madder).

Boerhaave divides the Species of this Plant into ſpicated, and verticillated.

The ſpicated are,

1. Cruciata; glabra; folio nervoſo, rigido; baccâ gemellâ, ſiccâ, hiſpidâ; flore lacteo. *Rubia erecta*, *quadrifolia*. J. B. 3. 716. *Mollugo montana*, *erecta*, *quadrifolia*. Raii Syn. 117.

2. Cruciata; glabra; folio rotundiore, nervoſo, rigido, minori; Bacca gemella, ſicca; flore lacteo.

3. Cruciata; paluſtris; parva; procumbens; flore albo ſpicato. Gallium paluſtre album. *C. B. P.* 335.

4. Cruciata; glabra. *C. B. P.* 325. SMOOTH CROSSWORT.

5. Cruciata; Orientalis; latifolia; erecta; glabra. *T. Cor.* 4. *H.* UPRIGHT AND ORIENTAL CROSSWORT, WITH BROAD SMOOTH LEAVES.

The verticillated are,

1. Cruciata; minima; ſeſſilis; floſculo albo verticillato.

2. Cruciata; anguſtifolia; floſculo luteo, verticillato. *Rubeola*, *repens*, *lutea*, *foliis ſpinoſis*. C. B. P. 334. *Rubia*, *minima*, *Lobelii*. Lugd. 1330.

3. Cruciata; tomentoſa; floſculis luteis in Corniculis longis, hiſpidis. *a. Boerh. Ind. alt. Plant. Vol.* 1.

Neither of theſe ſeem to be the ſame as the following *Cruciata*, by the Names, tho' the Virtues aſcribed to them are alike.

CRUCIATA, Offic. Ger. 965. Emac. 1123. Raii Hiſt. 1. 479. Synop. 3. 223. *Cruciata vulgaris*, Park. Theat. 566. Volck. 129. *Cruciata hirſuta*, C. B. Pin. 335. Dill. Cat. Giſſ. 67. Hiſt. Oxon. 3. 328. Rupp. Flor. Jen. 3. Bux. 88. *Cruciata vel Crucialis*, *Gallii ſpecies quibuſdam*, Chab. 549. *Gallium latifolium*, *Cruciata quibuſdam*, *flore luteo*, J. B. 3. 717. CROSSWORT. *Dale*.

This Croſſwort, from a ſlender creeping Root, ſends forth ſeveral hairy Branches, which grow to be about a Foot high; having at the Joints, which are pretty numerous, four ſmall, ſomewhat broad, and round-pointed Leaves, which are alſo pretty hairy, and ſet on without Foot-ſtalks; from the Boſoms of which ariſe, as it were in Whorles, many ſmall four-leaved yellow Flowers, or rather one ſingle Flower cut in four Parts, each of which is ſucceeded by two ſmall, round, black Seeds. It grows in Hedges, and Borders of Fields, particularly in *Hampſtead* Church-yard; but it is not very common about *London*; and flowers in *July*. The Leaves and Tops are uſed.

This is reckon'd among the vulnerary Herbs, being of a drying and binding Nature; and is particularly commended for the

the Swelling of the Scrotum, which is cauſed by the Falling-down of the Inteſtines into it. *Miller's Bot. Off.*

The Decoction of this Herb is thought to be good for Ruptures, taken in Wine. *Tournefort.*

Camerarius recommends it for promoting the Expectoration of viſcid Humours.

CRUCIBULUM, *Gatinus fuſorius*, *Tigillum*, a *Crucible*, is an earthen Veſſel, capable of ſuſtaining the higheſt Degree of Fire, wider above than below, either of a round or triangular Form, and appropriated to the fuſing and calcining of Minerals; as alſo to other chymical and pharmaceutical Operations. The Crucibles moſt generally uſed are thoſe of *Heſſe* and *Auſtria*; but, becauſe the former are ſandy, and cannot ſuſtain the Fire after they are made wet, and the latter are blackiſh, from the Admixture of Iron in their Compoſition, thoſe of *Heſſe* are leſs capable of reſiſting Lead, and thoſe of *Auſtria* leſs proper for the Preparation of Salts and Antimony. For this Reaſon many prefer that Mixture, of which the Glaſs-founders make their Crucibles. Others order the Powder of common Tiles, and an equal Quantity of Chalk, to be mix'd with Linſeed-oil, and made into the Form of a Crucible; after which it is to be baked, till it aſſumes a proper Hardneſs. Others order a large Piece of Chalk to be cut into the Form of a Crucible, and boil'd in Linſeed-oil for twenty-four Hours. This, when dry, they uſe as a Crucible. The Mixture of *Becher*, which for a long time retains the Glaſs of Lead, which is not eaſily done, conſiſts of two Parts of a fat oleous greeniſh Earth, with apparently metallic Veins every-where running thro' it, one Part of Tobacco-pipe-clay, or ſuch as the Glaſs-founders uſe for their Furnaces and Veſſels. Theſe, when triturated together, and paſs'd thro' a fine Sieve, are to be moiſten'd with Water, in which Quick-lime has been extinguiſh'd. They are to be carefully agitated together, till they are ſo mix'd, that the earthy Particles are not to be diſtinguiſh'd from each other. This Maſs is to be form'd into Crucibles, which are to be dried and boil'd. *Charas*, in his *Pharmacopœia Regia*, gives the following Directions for making Crucibles:

> Take equal Parts of the beſt Potters-clay dried, of plumoſe Alum, and of Baſtard Talc, commonly call'd *Lapis Glacialis*: Let them be finely triturated, and mix'd up with Whey, to a Conſiſtence fit for making Crucibles; which are to be harden'd, and treated in the ſame manner with other earthen Ware.

CRUDITAS, Crudity. It is apply'd to unripe Fruits; to raw Fleſh; to undigeſted Subſtances in the Stomach; to Humours in the Body, which are unconcocted, and not prepared for Expulſion; and to the Excrements.

CRUNION, κρήνιον. The Name of a compound Medicine deſcrib'd by *Aetius*, celebrated for provoking Urine.

CRUOR. Sometimes it ſignifies the Blood in general; ſometimes only the venous Blood; and ſometimes extravaſated or coagulated Blood.

CRUPINA. A Plant, call'd alſo *Cyanus pulchro ſemine Centaurii majoris*, J. B. *Chondrilla rara purpurea*, *Crupina Belgarum dicta*, Park. *Chondrilla Hiſpanica*, Ger. *foliis laciniatis ſerratis*, *purpuraſcente flore*, C. B. THE BEARDED CREEPER. *Raii Hiſt. Plant.*

I find no medicinal Virtues attributed to this Plant.

CRURA CLITORIDIS. The two ſpongeous Bodies which form the Clitoris, before their Union, are thus call'd. See GENERATIO.

CRURA MEDULLÆ OBLONGATÆ. The two largeſt Legs, or Roots, of the *Medulla Oblongata*, which proceed from the *Cerebrum*, are call'd by this Name.

CRURÆUS MUSCULUS, or CRUREUS. This is a fleſhy Maſs, covering almoſt all the fore Side of the Os Femoris between the two Vaſti, which likewiſe cover the Edges of this Muſcle on each Side.

It is fix'd to the fore Side of the Os Femoris, from the anterior Surface of the great Trochanter, down to the loweſt Quarter of the Bone, by fleſhy Fibres, which run down ſucceſſively over each other, between the two Vaſti; and are partly united to theſe two Muſcles, ſo as not to ſeem to form a diſtinct Muſcle.

It is not ſo thick as the two Vaſti; and, as it is cover'd by them on each Side, a ſort of fleſhy Chanel is form'd by all the three, in which the Rectus is lodged, covering the fore Part of the Crureus.

It terminates below in a tendinous Aponeuroſis, which joins the back Side of the Tendon of the Rectus anterior, and the neighbouring Edges of the Extremities of the two Vaſti. Theſe four Muſcles form a common Tendon, which is inſerted in the Side of the Patella, in the Edge of the Ligament of that Bone, and in the adjacent lateral Part of the Head of the Tibia. *Winſlow's Anatomy.*

CRURALIS. An Epithet of the Artery which conveys Blood to the *Crura*, Legs; and of the Veins by which this Blood returns towards the Heart.

CRUS. The Leg, including the Whole of one of the lower Extremities, from the *Os Innominatum* to the Toes.

Of the Inferior Extremities.

The inferior Extremities comprehend all thoſe Parts depending from the Acetabula of the Oſſa Innominata, and are commonly divided into three Parts, *viz.* the Thigh, Leg, and Foot.

The Thigh (Μηρὸς, *Femen*, *Coxa*, *Agis*, *Anchæ os*, *Crus*, *Femur*) has only one Bone, which is the longeſt of the Body, and the largeſt and ſtrongeſt of any of the cylindrical Bones. The Situation of it is not perpendicular: For the lower End is inclined conſiderably inwards; ſo that the two Knees are near contiguous, while there is a conſiderable Diſtance between the Thigh-bones above. This is of good Uſe to us, ſince ſufficient Space is thereby left for the external Parts of Generation, the two great Cloacæ of Urine and Fæces, and for the large thick Muſcles which move the Thigh inwards; and at the ſame time this Poſition renders our Progreſſion quicker, ſurer, ſtraighter, and in leſs Room. For had the Knees been at a Diſtance from each other, we muſt, to have made a long Step, have been obliged to deſcribe ſome Part of a Circle with the Trunk of our Body; and, if one Leg was raiſed from the Ground, our Centre of Gravity would have been too far from the Baſe of the other, and we ſhould conſequently have been in Hazard of falling; ſo that our Steps would neither have been ſtraight nor firm, nor would it have been poſſible to walk in a narrow Path, had our Thigh-bones been otherwiſe placed. In conſequence however of the Weight of the Body bearing ſo obliquely on the Joint of the Knee by this Situation of the Thigh-bones it is, that weak rickety Children become inkneed.

The ſuperior Extremity of the Thigh-bone is not continued is a ſtraight Line with the Body of it, but is ſet off obliquely inwards and upwards, whereby the Diſtance between theſe two Bones is conſiderably increaſed above. When this Extremity firſt goes off, it is ſmall, but afterwards is formed into a large round Head (*Vertebrum*) which is the greater Portion of a Sphere unequally divided. This Head is ſmooth, and covered with a Cartilage to play in the Acetabulum Iſchii. Towards its inferior internal Part a round rough ſpongy Pit is obſervable, where the ſtrong Ligament, which is commonly called the round one, but that is of rather an oval Figure in its tranſverſe Sections, is fixed, to be extended from thence to the inferior internal Part of the receiving Cavity, where it is conſiderably broader, than in its Progreſs to the Head of the Thigh-bone. The Neck of the Os Femoris has a great many large Holes, into which the Fibres of the ſtrong Ligament, that covers it, enter, and are thereby ſecurely united to it; and round the Root of the Neck, where it riſes from the Bone, a rough Ridge is found, where the circular Ligament of the Articulation is connected. Below the back Part of this Root, the large unequal Protuberance, called the Trochanter major, (Τρωχὸς, *Rotator Natis*, *Malum granatum teſticulorum*) is obſervable; at the ſuperior Root of which, a Cavity is left for the Inſertion of the Muſculus Glutæus minimus; and immediately without that, is another, where the Pyriformis, Marſupialis, and Gemini, are inſerted. On the ſuperior Extremity of this Proceſs is a ſmooth flat Surface, where the Glutæus medius is attached; and, without and below that, a large ſmooth Surface is to be ſeen for the Inſertion of the Glutæus maximus. From the poſterior Face of the Root of this great Trochanter, a rough Ridge runs backwards and downwards, into which the Quadratus is inſerted. In the Hollow, at the internal Side of this Ridge, the Obturator externus is implanted; and at its interior Extremity we find a conoide Proceſs called Trochanter minor (*Rotator minor*) into which the Muſculus Pſoas, and Iliacus internus, are inſerted, and the Pectineus is implanted into a rough Hollow below the internal Root of it. The Muſcles inſerted into theſe two Proceſſes, being the principal Inſtruments of the rotatory Motion of the Thigh, have occaſioned the Name of Trochanters to the Proceſſes.

The Body of the Os Femoris is convex on the anterior Part, and made hollow behind by the Action of the Muſcles which move upon it, and for the Conveniency of ſitting, without bearing ſo much on theſe Muſcles; and probably the Weight of the Legs depending from the Thighs in that Poſture contributes conſiderably to this Curvature. The anterior Surface is a little flatten'd above by the Beginning of the Crureus Muſcle, as it is alſo below by the Rectus and Crureus. The external Surface is likewiſe made flat below by the Vaſtus externus, where it is ſeparated from the former by an obtuſe Ridge. The Vaſtus internus depreſſes a little the internal inferior Surface. The poſterior concave Surface has a Ridge riſing in its Middle, commonly called Linea aſpera, into which the Triceps is inſerted. At the ſuperior Part of it the medullary Veſſels enter by a ſmall Hole, which runs obliquely upwards, a little above which is a rough Foſſa or two, where the tendinous Expanſion of the Glutæus maximus is fixed. The inferior Extremity of the Linea aſpera divides into two, ſtretching to each Side, the

long Head of the Triceps being inſerted into the internal, and the ſhort Head of the Biceps Flexor Tibiæ riſing from the external. Between theſe two rough Lines, the Bone is made flat by the large Blood-veſſels and Nerves which paſs upon it; and, near the Extremity of each of theſe Ridges, a ſmall ſmooth Protuberance may often be remarked, where the two Heads of the Muſculi Gaſtrocnemii externi take their Riſe, and the ſeſamoide Bones, deſcribed by *Veſalius*, (*lib.* 1. *cap.* 28. & 30.) ſometimes are found.

The inferior Extremity of the Os Femoris is larger than any other Part of it, and formed into a great Protuberance on each Side, called its Condyles; between which a conſiderable Cavity is found, eſpecially at the poſterior Part. The internal Condyle is longer than the external, which muſt happen from the oblique Poſition of this Bone, to give leſs Obliquity to the Leg. Each of theſe Proceſſes ſeems to be divided in its plain ſmooth Surface. The Mark of Diviſion on the external is a Notch, and on the internal a Protuberance. The anterior Part of this Diviſion is formed like a Pulley, the external Side of which is higheſt. On it the Rotula plays. The poſterior Part has two oblong large Heads, whoſe greateſt Extent is backwards for the Motion of the Tibia; and from the rough Cavity between them, but near the Baſe of the internal Condyle, the ſtrong Ligament, commonly called the croſs one, has its Riſe. The Sides of the Condyles are made flat by the Muſcles paſſing along them; and on the back Part of the internal Side a ſlight Foſſa ſeems to be made by the Tendons of the Gracilis and Sartorius; but on the external a conſiderable Depreſſion is formed by the Biceps Flexor Cruris. A little farther forward than where theſe Depreſſions are on each of the Condyles, the lateral Ligaments of the Joint of the Knee riſe out from the Os Femoris. Round this inferior Extremity of the Thigh-bone, large Holes are found, into which the Ligaments for the Security of the Joint are fixed, and Blood-veſſels paſs to the internal Subſtance of the Bone.

All the Proceſſes of the Femur in new-born Children are cartilaginous, and afterwards become ſmall Apophyſes, with large Epiphyſes.

The Thigh-bone is articulated above with the Acetabulum of the Oſſa Innominata by Enarthroſis, and therefore can be moved to every Side; but is reſtrained in its Motion outwards by the high Brims of the Cavity, and by the round Ligament; for otherwiſe the Head of the Bone would be frequently thruſt out at the Breach of the Brims on the Inſide, which allows the Thigh to move conſiderably inwards. The Body of this Bone enjoys little or no rotatory Motion, tho' the Head moſt commonly moves round its own Axis, becauſe the oblique Progreſs of the Neck and Head from the Bone is ſuch, that the rotatory Motion of the Head can only bring the Body forwards and backwards; nor is this Head, as in the Arm, ever capable of being brought to a ſtraight Direction with the Body. So far however as the Head can move within the Cavity in a Circle backwards and forwards, the reſt of the Bone may have a partial Rotation. The Os Femoris is articulated below to the Tibia and Rotula by Ginglymus.

The Leg (Κνήμη, *Crus*, *Tibia*) is compoſed, according to the common Account, of two Bones, Tibia and Fibula, tho' it ſeems to have a very good Title to a third, the Rotula; ſince this, tho' a diſtinct Bone, bears a ſtrong Analogy to the Olecranon or ſuperior great Proceſs of the Ulna. Therefore I ſhall rank the Rotula with theſe other two Bones.

Tibia, (Προκνήμιον, ἀντικνήμιον, *Focile majus*, *Arundo major*, *Canna major*, *Canna domeſtica Cruris*) ſo called from its Reſemblance to an old Muſical Pipe or Flute, is the long thick triangular Bone, ſituated at the anterior internal Part of the Leg, and continued in near a ſtraight Line from the Thigh-bone, to ſupport the whole ſuperior Fabric.

The ſuperior Extremity of the Tibia is large, bulbous, and ſpongy; and is divided into two Cavities by a rough irregular Protuberance, (Ὀφθαλμὸς, ἐξοχὴ τραχυώδης, *Tuber*, *Tuberculum*) which again is hollow at its moſt prominent Part, as well as at its poſterior and anterior Baſe. The anterior of the two Ligaments, which compoſe the great croſs one, is inſerted into the Middle Cavity; and the poſterior Depreſſion of this irregular Proceſs receives the poſterior Ligament. The two broad Cavities at the Sides of this Protuberance are not equal; for the internal is oblong and deep to receive the internal Condyle of the Thigh-bone, while the external is more ſuperficial and rounder for the external Condyle. In each of theſe two Cavities in a recent Subject a ſemilunar Cartilage is placed, the convex Edge of which is thick, and the Cartilage becomes gradually thinner towards the concave or interior Edge. The Middle of each of theſe Cartilages is broad, and the Extremities turn narrower and thinner, as they approach the middle Protuberance of the Tibia. The thick convex Edge of each Cartilage is connected to the circular Ligament of the Articulation, but ſo near to its Riſe from the Tibia, that the Cartilages are not allowed to change Places far; while the narrow Extremities of theſe Cartilages, becoming almoſt Ligaments, are fixed at the Inſertion of the ſtrong croſs Ligament into the Tibia, and ſeem to have their Subſtance blended with that Ligament. Therefore a circular Hole muſt be left between each Cartilage and the Ligament, in which the moſt prominent convex Part of each Condyle of the Thigh-bone moves. In the Circumference of theſe Cavities deſcribed, the ſuperior Extremity of the Tibia is rough and unequal for the firm Connection of the Ligaments of the Joint. Immediately below the poſterior Edge two rough flatten'd Protuberances ſtand out: Into the internal the Tendon of the Semimembranoſus Muſcle is inſerted; and ſome Part of the croſs Ligament is fixed to the external. On the Outſide of this laſt Tubercle, a ſmooth ſlightly-hollowed Surface is formed by the Action of the Poplitæus Muſcle.

Below the anterior Part of the upper Extremity of the Tibia, a conſiderable rough Protuberance (ἀντικνήμιον, *Anterior Tuber*) riſes, to which the ſtrong tendinous Ligament of the Rotula is fixed. On the internal Side of this, a ſcabrous Cavity is form'd, where the Seminervoſus, Gracilis, and Sartorius Muſcles are inſerted: Whence Surgeons know at what Part the Tibia ought to be ſaw'd through in an Amputation, ſo as not to have too long and troubleſome a Stump, and at the ſame time to preſerve the Motions of the Leg, by ſaving the proper moving Muſcles. Below the external Edge of this ſuperior Extremity, a circular flat Surface, cover'd, in a recent Subject, with a Cartilage, is found for the Articulation of the Fibula: Between which, and the anterior Knob, is a rough Hollow, from which the Tibialis anticus, and Extenſor Digitorum longus, take their Origin. From the ſmooth flat Surface, a Ridge runs obliquely downwards and inwards, to give Riſe to the Tibialis poſticus. At the Inſide of this Ridge, an oblique plain Surface is left, where the Muſculus Poplitæus is inſerted, and Part of the Solæus has its Origin. The remaining Body of the Tibia is triangular, the anterior Angle of which is very ſharp, and is commonly called the Spine or Shin (ἄκανθα, *Spina*, *Crea*, *Lineæ prima Tibiæ*, *Angulus acutus*). This Ridge is not ſtrait, but turns firſt inwards, then out, and, laſtly, in again. The plain internal Side is ſmooth and equal, being little ſubjected to the Actions of Muſcles; but the external Side is hollowed above by the Tibialis anticus, and below by the Extenſor Digitorum longus, and Extenſor Pollicis longus. The two Angles behind theſe Sides are rounded by the Action of the Muſcles; and the poſterior Side, comprehended between them, is not ſo broad as thoſe already mentioned; but is more oblique and flatten'd by the Action of the Tibialis poſticus, and Flexor Digitorum longus. Some Way above the Middle of the Bone, the internal Angle terminates, and the Bone is made round, but rough, by the Preſſure of the Muſculus Solæus. Near to this, the Paſſage of the medullary Veſſels is ſeen ſlanting obliquely downwards in the poſterior plain Surface.

The inferior Extremity of the Tibia is made hollow, but ſo as a ſmall Protuberance riſes in the Middle. The internal Side of this Cavity, which is ſmooth, and in a recent Subject is cover'd with a Cartilage, is produced into a conſiderable Proceſs, commonly named *Malleolus internus*, (σφυρὸν, πῆσσον, *Talus*, *Clavicula*, *Cavilla interior*, *Cavilla domeſtica*) whoſe Extremity is divided by a Notch, and from it Ligaments are ſent out to the Foot. We ought to obſerve here with *Winſlow*, (*Expoſition anatomique des Os ſecs*, § 865.) that this internal Malleolus is ſituated more forwards than the internal Condyle of the ſuperior Extremity of this Bone, which is neceſſary to be remark'd in reducing a Fracture of the Leg. The external Side of this Extremity has a rough, irregular, ſemilunar Cavity form'd in it, for receiving the inferior Extremity of the Fibula. The poſterior Side has two lateral Grooves, and a ſmall middle Protuberance. In the internal Depreſſion, the Tendon of the *Muſculus tibialis poſticus* is lodg'd; and in the external, the Tendon of the *Flexor longus Digitorum* plays. From the middle Protuberance, ligamentous Sheaths go out for tying down theſe Tendons.

The Articulations and Motions of the Tibia ſhall be explained, after all the three Bones of the Leg are deſcribed.

The two Extremities of the Tibia are Cartilages at the Birth, and become afterwards Epiphyſes.

Fibula (παραπήμιον, *Perone*, *Focile minus*, *Arundo minor*, *Canna minor Cruris*, *Sura*, *Radius*) is the ſmall long Bone, placed on the Outſide of the Leg, oppoſite to the external Angle of the Tibia; the Shape of it is irregularly triangular.

The ſuperior Head of the Fibula has a ſuperficial circular Cavity form'd on its Inſide, which, in a recent Subject, is covered with a Cartilage, but ſo cloſely connected to the Tibia by Ligaments, as to allow only a ſmall Motion backwards and forwards. This Head is protuberant and rough on its Outſide, where the Muſculus Biceps is inſerted; and below its internal poſterior Side, a Tubercle may be remark'd, which gives Riſe to the ſtrong tendinous Part of the Solæus Muſcle.

The Body of this Bone is a little crooked inwards and backwards, which Figure is owing to the Actions of the Muſcles; but is ſtill increaſed to a Fault by careleſs Nurſes holding Children by the Legs. The ſharpeſt Angle of the Fibula is anterior; on each Side of which, the Bone is conſiderably,

but unequally depreſſed, by the Bellies of the ſeveral Muſcles that riſe from, or act upon it; and, in old People, theſe Muſcles make diſtinct Sinuoſities for themſelves: For the poſterior Surface is flatten'd above by the Solæus, and is made hollow below by the Flexor pollicis longus. The external Surface of this Bone is depreſſed obliquely from above downwards and backwards by the two Peronæi; and the anterior Surface bears the Prints of the Extenſor digitorum longus, Nonus Veſalii, and Extenſor pollicis longus. From the internal Angle, the ſtrong Ligament is produced to be continued to the Tibia, for the Connection of theſe two Bones, and Origin of ſeveral Muſcles. The poſterior Surface is the plaineſt and ſmootheſt: In the Middle of it, the Paſſage of the medullary Veſſels is ſeen ſlanting downwards. I have been particular in remarking, with *Havers*, (*Oſteolog. nov. Diſc.* 1.) the Entry and Direction of theſe Veſſels; becauſe, in ſeveral chirurgical Caſes, the Operator had need to take care, that they are not opened very near to the Bone, to occaſion an obſtinate Hæmorrhage. And then there ſeems to be ſome particular Deſign in contriving theſe Canals, ſo that the Os humeri, Tibia, and Fibula, ſhould have them running obliquely down; whereas the Radius, Ulna, and Os femoris, have them ſlanting upwards, whereby the Arteries and Nerves, which are ſent to theſe three laſt Bones, muſt ſuffer a conſiderable Reflexion before they come at the Cancelli. The Reaſon of this Diverſity may, perhaps, be, that the Arteries, particularly, which are ſo ſmall within the Bones, as to have no ſtrong contractile propelling Force in their Coats, and where they are not aſſiſted by the Action of any moving neighbouring Organ, ſhould have, at leaſt in their Paſſage through the Bone, a favourable Deſcent for their Liquids; which, it is evident, they will have in the deſcending oblique Paſſages form'd for them in the firſt Claſs of Bones, which are generally depending; and they will alſo moſt frequently acquire the like Advantage in the laſt-named Bones, becauſe the Hand, in the moſt natural Poſture, is higher than the Elbow; and, when we ſit or lie, the inferior Extremity of the Thigh-bone comes to be at leaſt as high raiſed as the ſuperior. In ſtanding and walking, or when the Arms are moved, the Blood muſt indeed aſcend, as it paſſes through the Bones of the fore Arm and Thigh; but the Preſſure of the Muſcles, then in Action, on the Veſſels, before they enter the Bones, is ſufficient to compenſate the Diſadvantage of their Courſe. This Reaſoning ſeems to be ſtill enforc'd by obſerving, that this Paſſage is always in theſe Bones nearer the ſuperior, than the inferior Extremities.

The inferior Extremity of the Fibula is extended into a ſpongy oblong Head, on the Inſide of which is a convex, irregular, and frequently a ſcabrous Surface, that is received by the external Hollow of the Tibia, and ſo firmly join'd to it by a very thin intermediate Cartilage, and ſtrong Ligaments, that it ſcarce can move. Below this, the Extremity of the Fibula is ſtretch'd out into a coronoide Proceſs, that is ſmooth, cover'd with a Cartilage, and contiguous to the Outſide of the firſt Bone of the Foot, the Aſtragalus, to ſecure the Articulation on that Side. This Proceſs is named Malleolus externus. This Proceſs being ſituated farther back than the internal Malleolus, and in an oblique Direction, obliges us naturally to turn the fore Part of the Foot outwards, as is obſerved by *Winſlow* (*Memoires de l'Acad. des Sciences*, 1722.). At its inferior internal Part, a ſpongy Cavity for mucilaginous Glands may be remark'd; from its Point Ligaments go out to the Foot, and on the back Part of it is a Sinuoſity, made by the Tendons of the Peronæi Muſcles.

The Conjunction of the ſuperior Extremity with the Tibia is by Arthrodia; and, at the lower End, the Cartilage ſeems to glew the two Bones together; not, however, ſo firmly in young People, but that the Motion, at the other Extremity of ſuch a long Radius as the Fibula, is very obſervable. In old Subjects I often ſee the two Bones of the Leg grown together at their inferior Extremities.

The principal Uſe of this Bone is to afford Origin and Inſertion to Muſcles; the Direction of which may be a little alter'd, on proper Occaſions, by its upper Part ſhuffling backwards and forwards. It likewiſe helps to make the Articulation of the Foot more ſecure and firm.

Both Extremities of this Bone are cartilaginous in a ripe Child, and aſſume the Form of Appendices before they are united to the Body of the Fibula.

Rotula (ἐπιμυλὶς, μυλακεὶς, κόγχος, ἐπιγονατὶς, πλακοειδὲς, *Patella*, *Mola*, *Genu*, *ſcutiforme Os*, *cartilagineſum*, *diſciforme*, *Oculus genu.*) is the ſmall flat Bone ſituated at the anterior Part of the Joint of the Knee. Its Shape reſembles much the Section of a Heart with its Point downwards. The anterior convex Surface of the Rotula is pretty ſmooth; only ſeveral Holes pierce it, into which Fibres of the ſtrong Ligament, that is ſpread over it, enter. The poſterior Surface is ſmooth, cover'd with a Cartilage, and divided by a middle convex Ridge into two Cavities, of which the external is largeſt; and both are exactly adapted to the Pulley of the Os femoris. This plain ſmooth Surface is ſurrounded by a rough prominent Edge, to which the circular Ligament adheres: And, below them, the Point of the Bone is ſcabrous, where the ſtrong tendinous Ligament from the Tubercle of the Tibia is fixed. The ſuperior horizontal Part of this Bone is flatten'd and unequal, where the Tendons of the Extenſors of the Leg are inſerted.

The Subſtance of the Rotula is cellular, with very thin external firm Plates; but then theſe Cellulæ are ſo ſmall, and ſuch a Quantity of Bone is employ'd in the Formation of this Bone, that ſcarce any Bone of its Bulk is ſo ſtrong. Beſides, it is all cover'd over with a thick Ligament, (as was obſerv'd this ſort of Bones generally is) to connect its Subſtance, and is moveable to one Side or other; and, therefore, is ſufficiently ſtrong to reſiſt the Actions of the large Muſcles, that are inſerted into it, or any common external Force applied to it; while a fixed Proceſs, ſuch as the Olecranon, would not have been ſufficient to bear the whole Weight of our Bodies falling on it, as frequently happens to this Bone, and muſt have hinder'd the rotatory Motion of the Leg. Notwithſtanding theſe Precautions to preſerve this Bone from ſuch Injuries, yet I have ſeen ſuch another Caſe as *Ruyſch* (*Obſerv. Anat. Chirurg. Obſ.* 3.) mentions; that is, a tranſverſe Fracture in this Bone, when, by the Report of the Patient, and People about him, and by the want of Swelling, Diſcolouring, or other Mark of Bruiſe or Contuſion, it was plain the Bone was broke by the violent Straining and Effort of the Muſcles. Though my Patient recovered the Uſe of the Joint of the Knee, yet I think it reaſonable to believe, that this ſort of Fracture ſhould be attended with a Difficulty of Motion, after the broken Parts of the Rotula are reunited; becauſe the callous Matter will probably extend itſelf into the Cavity of the Joint, where it may either grow to ſome of the Parts; or, at beſt, it will make ſuch an Inequality on the poſterior Surface of this Bone, as will not allow it to perform the neceſſary Motions on the Condyles of the Femur.

The Articulation of the Rotula with the Os femoris is a plain Ginglymus, and it is connected to the Tibia by a ſtrong Syndeſmoſis.

At the ordinary Time of Birth, the Rotula is entirely cartilaginous, and ſcarce aſſumes a bony Nature ſo ſoon as moſt Epiphyſes do.

Now, therefore, that all the Parts of the Joint of the Knee are deſcrib'd, let us examine what are its Motions, and how perform'd. The two principal Motions are Flexion and Extenſion. In the former of theſe, the Leg may be brought to a very acute Angle with the Thigh, by the Condyles of the Thigh-bones being round and ſmoothed ſo far backwards. In performing this, the Rotula is pulled down by the Tibia. When the Leg is to be extended, the Rotula is drawn upwards, and, conſequently, the Tibia forwards, by the Extenſor Muſcles, which, by means of the protuberant Joint, and this thick Bone, with its Ligament, have, in effect, the Chord with which they act, fixed to the Tibia, at a conſiderable Angle; therefore act with Advantage; but are reſtrain'd from pulling the Leg farther than to a ſtraight Line with the Thigh, by the poſterior croſs Ligament, that the Body might be ſupported by a firm perpendicular Column: For, at this time, the Thigh and Leg are as little moveable as if they were one continued Bone. But when the Joint is a little bended, the Rotula is not tightly braced, and the poſterior Ligament is relaxed. Therefore, conſidering the ſuperficial Cavities of the Tibia, this Bone may be mov'd a little to either Side, or with a ſmall Rotation; which, *Winſlow* (*Expoſition Anatomique du Corps humain, Traité des Os ſecs*, § 976.) juſtly remarks, is done by the Motion of the external Cavity backwards and forwards on the internal, which ſerves as a ſort of Axis. Seeing then one Part of the croſs Ligament is ſituated perpendicularly, and the poſterior Part is ſtretch'd obliquely from the internal Condyle of the Thigh outwards, that poſterior Part of the croſs Ligament will prevent the Leg's being turn'd at all inwards; but it could not hinder it from turning outwards almoſt round, was not that Motion confin'd by the lateral Ligaments of this Joint, which can yield no great Way. This Rotation of the Leg outwards, is of good Advantage to us in croſſing our Legs on ſeveral neceſſary Occaſions; though it is altogether fit this Motion ſhould not be very large, leſt Luxations ſhould frequently have happen'd here. While all theſe Motions are performing, the only Part of the Tibia, that moves immediately on the Condyles, is only ſo much as is within the cartilaginous Rings, which, by their Thickneſs on their Outſides, make the Cavities of the Tibia more horizontal, by raiſing their external Side, where the Surface of the Tibia ſlants downwards. By this means, the Motions of this Joint are more equal and ſteady than otherwiſe they would have been. The Cartilages being capable of changing a little their Situation, fits them for doing this good Office in the different Motions and Poſtures of the Member, and likewiſe contributes to make the Motions larger and quicker.

The Foot is divided, as well as the Hand, into three Parts, that is, Tarſus, Metatarſus, and Toes; in the Deſcription of which, the ſeveral Surfaces ſhall be named according to the natural Situation, that is, the Broad of the Foot ſuperior, the

Sole inferior; the Side of the Great Toe internal, the Little Toe external.

The Tarſus (*Raſſeta*) conſiſts of ſeven ſpongy Bones; of which the Aſtragalus is the ſuperior, the Os calcis poſterior; the Os naviculare in the Middle, the Os Cuboides the external of the four anterior; Os Cuneiforme externum, medium, and internum, follow in reckoning inwards. That the Deſcription of theſe Bones may not be ſwell'd with Repetitions, I deſire, once for all, to obſerve, that where-ever a rough Ridge is mention'd, without a particular Uſe aſſign'd, a Ligament is underſtood to be fix'd to it; or where-ever a ſpongy rough Cavity, Depreſſion, or Foſſa, is remark'd, without naming its Uſe, a Ligament is inſerted, and mucilaginous Glands are lodg'd; for ſuch will occur in the Detail of each of theſe Bodies.

The Aſtragalus is already deſcrib'd under the Article of its Name.

The Calcaneum, Os Calcis, πτέρνα, Calcar Pedis, is the largeſt Bone of the ſeven, ſituated at the inferior and poſterior Part of the Tarſus. See CALCANEUM.

Os naviculare, (σκαφοειδὲς, *Os cymbæ*) ſituated immediately before the Aſtragalus, is ſomewhat circular. Its poſterior Surface is form'd into an oblong Concavity, for receiving the round anterior Head of the Aſtragalus. On the ſuperior Surface is a rough Foſſa. Below, the Os naviculare is very unequal and rough, but hollow, for the Safety of the Muſcles. On its Inſide is a pretty large riſing Knob, from which the Abductor pollicis takes in part its Origin, and the Tendon of the Tibialis poſticus is inſerted into it: And to it two remarkable Ligaments are fix'd; the firſt is the ſtrong one formerly mentioned, which ſupports the Aſtragalus; the ſecond is ſtretch'd from this Bone obliquely croſs the Foot, to the metatarſal Bones of the middle Toe, and of the Toe next to the little one. On the Outſide of the Os naviculare is a ſemicircular ſmooth Surface, where it is joined to the Os cuboides. The anterior Surface of this Bone is all cover'd with a Cartilage, and divided into three ſmooth Plains, fitted to the three Oſſa cuneiformia.

The Os naviculare is wholly Cartilage in a new-born Infant.

Os Cuboides (πολύμορφον, *cubiforme, quadratum, grandineſum varium, Teſſaræ, multiforme*) is a very irregular Cube, ſituated immediately before the Os calcis. The poſterior Surface is an oblong unequal Concavity, adapted to the anterior Part of the Os calcis. On the internal Side of this Bone, a very ſmall ſemicircular ſmooth Cavity is form'd, to join the Os naviculare; immediately before which, an oblong ſmooth Plain is made by the Os cuneiforme externum; and, below this, the Bone is hollow and rough. On the internal Side of the inferior Surface, a round Protuberance and Foſſa are found, where the Abductor pollicis has its Origin. On the external Side of this ſame Surface is a round Knob, cöver'd with a Cartilage; immediately before which, a ſmooth Foſſa may be obſerv'd, in which the Tendon of the Peronæus primus runs obliquely croſs the Foot; and, on the Knob, the thin flat Cartilage, proper to this Muſcle, plays; in place of which ſometimes a Bone is found: More externally than the Knob, a rough Hollow is made, for the ſtrong Ligament ſtretch'd betwixt this Bone and the Os calcis. The anterior Surface of the Os cuboides is flat, ſmooth, and ſlightly divided into two Plains, for ſuſtaining the Os metatarſi of the Little Toe, and of the Toe next to it.

The Oſſification of this Bone is ſcarce begun at the Birth.

The Os cuneiforme externum, (*Chalcoideum externum*) is much of the Shape of a Wedge, being broad and flat above, with long Sides running obliquely down, and terminating in a ſharp Edge. The ſuperior Surface of this Bone is an oblong Square: The poſterior is a ſmooth Triangle, which is not complete at the inferior Angle, and is joined to the Os naviculare. The external Side is divided, as it were, by a Diagonal; the ſuperior poſterior Half of which is ſmooth, for its Conjunction with the Os cuboides; and the other is a ſcabrous Hollow. In the ſuperior anterior Angle of this Surface, a ſmall ſmooth Impreſſion is made by the Os metatarſi of the Toe next the little one. The internal Side of this Bone has both the anterior and poſterior Edges made flat and ſmooth, the firſt by the Os metatarſi of the Toe next the great one, and the laſt by the Os cuneiforme medium. The anterior Surface is exactly an oblong Triangle, for ſuſtaining the Os metatarſi of the middle Toe.

Os cuneiforme medium, or minimum, is ſtill more exactly the Shape of a Wedge than the former. Its internal Side has a flat ſmooth Surface above and behind, for its Conjunction with the following Bone; with a ſmall rough Foſſa below; and a conſiderable Share of it is rough and hollow. The external Side is ſmooth, and a little hollowed, where it is contiguous to the laſt deſcribed Bone. Both anterior and poſterior Surfaces are flat, ſmooth, and triangular, for its Articulation with the Os naviculare behind, and with the Os metatarſi of the Toe next the great one before.

Os cuneiforme maximum, or internum, differs from the two former in its Situation, which is more oblique. Beſides, the broad thick Part is placed below, and the ſmall thin Point above and outwards; while the inferior broad Surface is concave, for allowing a laſe Paſſage to the Flexors of the great Toe. The poſterior Surface of this Os cuneiforme is hollow, ſmooth, and of a circular Figure below, but pointed above. The external Side is alſo ſmooth and flat, but divided into two, whoſe Direction is near at right Angles with each other. With the poſterior, that runs obliquely from below forwards and upwards, the Os cuneiforme minimum is joined; and, with the anterior, whoſe Direction is longitudinal, the Os metatarſi of the Toe next the great one is connected. The anterior Surface of this Bone is ſemilunar, but flat and ſmooth, for ſuſtaining the Os metatarſi of the great Toe. The internal Side is ſcabrous, with two remarkable Tubercles below, from which the Muſculus abductor pollicis riſes; and the Tibialis anticus is inſerted into its ſuperior Part.

The three cuneiform Bones are all in a cartilaginous State in a Fœtus of nine Months.

Theſe ſeven Bones of the Tarſus, when conjoin'd, are convex above, and leave a Concavity below, for lodging ſafely the ſeveral Muſcles, Tendons, and Veſſels, that lie in the Sole of the Foot, and are, in the ſame manner as thoſe of the Carpus, all (except ſome few Parts mention'd in their particular Deſcriptions) cover'd over with ſtrong Ligaments, that, by entering the Holes on their Surface, adhere firmly to them; and therefore ſo tightly connect them to each other, that, notwithſtanding the many ſmooth Surfaces they have all cover'd with Cartilage, and ſome of them of the ſame Shape as if deſign'd for a very moveable Articulation, no more Motion is here allow'd, than only to prevent too great a Shock of the Fabric of the Body in walking, leaping, &c. by falling on too ſolid a Baſe; which, if it was one continued Bone, would likewiſe be much more liable to be broke; and to make our Foot accommodate itſelf to the Surfaces we tread on, by becoming more or leſs hollow, or by raiſing either Side. When the Ligaments are too weak, as in ſome morbid Caſes, a very evident Motion of the Os naviculare on the Aſtragalus may be obſerved.

Metatarſus (πῆχυς, πέδιον. *Planta, Planum, Veſtigium, Solium, Pectus, Præcordium, Pectuſculum*) is compoſed of five Bones, which, in their general Characters, agree with the metacarpal Bones, but may be diſtinguiſhed from them by the following Marks: 1. They are longer, thicker, and ſtronger. 2. Their anterior round Extremities are not ſo broad, and are leſs in proportion to their Baſes. 3. Their Bodies are ſharper above, and flatter on the Sides, with their inferior Ridge inclin'd more to the Outſide. 4. The Tubercles at the inferior Roots of the round Heads are larger.

The firſt, or internal metatarſal Bone, is eaſily diſtinguiſhed from the reſt by its Thickneſs. The one next to it is the longeſt, and with its ſharp Edges almoſt perpendicular; and the others are ſhorter and more oblique, as their Situation is more external: Which general Remarks, with the Deſcription I am now to give of each, may learn us to diſtinguiſh what Bone, and of which Foot, any one is, that can be offered to our Examination.

Os metatarſi pollicis is by far the thickeſt and ſtrongeſt, as having much the greateſt Weight to ſuſtain. Its Baſe is oblong, irregularly concave, and of a ſemilunar Figure, to be adapted to the Os cuneiforme maximum. The inferior Edge of this Baſe is a little prominent and rough, where the Tendon of the Peronæus primus Muſcle is inſerted. On its Outſide, an oblique circular Depreſſion is made by the following Bone. Its round Head has generally on its fore Part a middle Ridge, and two oblong Cavities, for the Oſſa ſeſamoidea; and, on the external Side, a Depreſſion is made by the following Bone.

Os metatarſi of the ſecond Toe is the longeſt of the five, with a triangular Baſe, ſupported by the Os cuneiforme medium, and the external Side produced into a Proceſs, whoſe Extremity is an oblique ſmooth Plain, to be joined to the Os cuneiforme externum. Near the internal Edge of the Baſe, this Bone has two ſmall Depreſſions, made by the Os cuneiforme maximum, between which is a rough Cavity. Farther forwards we may obſerve a ſmooth Protuberance, which is join'd to the foregoing Bone. On the Outſide of the Baſe are two oblong ſmooth Surfaces, for its Articulation with the following Bone; the ſuperior ſmooth Surface being extended longitudinally, and the inferior perpendicularly; between which is a rough Foſſa.

Os metatarſi of the middle Toe is the ſecond in Length. Its Baſe, ſupported by the Os cuneiforme externum, is triangular, but ſlanting outwards, where it ends in a ſharp-pointed little Proceſs; and the inferior Angle is not completed.

The internal Side of this Baſe is adapted to the preceding Bone; and the external Side has alſo two ſmooth Surfaces cover'd with Cartilage, but of a different Figure; for the ſuperior is concave, and, being round behind, turns ſmaller as it advances forwards; and the little inferior ſmooth Surface is convex, and very near the Edge of the Baſe.

Os metatarſi of the fourth Toe is near as long as the former, with a triangular ſlanting Baſe joined to the Os cuboides,

and

and made round at its external Angle, with one hollow ſmooth Surface on the Outſide, where it is preſſed on by the following Bone, and with two on the internal Side, correſponding to the former Bone; behind which, is a long narrow Surface impreſſed by the Os cuneiforme externum.

Os metatarſi of the little Toe is the ſhorteſt, ſituated with its two flat Sides above and below, and with the Ridges laterally. The Baſe of it, Part of which reſts on the Os cuboides, is very large, tuberous, and produced into a long pointed Proceſs externally; whence Part of the Abductor minimi digiti has its Origin; and, into its ſuperior Part, the Peronæus ſecundus is inſerted. Its Inſide has a flat conoidal Surface, where it is adjoining to the preceding Bone.

When we ſtand, the anterior Extremities of theſe metatarſal Bones, and the Os calcis, are our only Supporters, and therefore it is neceſſary they ſhould be ſtrong, and have a confin'd Motion, as indeed we ſee they have.

The Bones of the Toes are much of kin to thoſe of the Thumb and Fingers, particularly the two of the great Toe are preciſely form'd as the two laſt of the Thumb; only their Poſition, in reſpect of the other Toes, is not oblique; and they are proportionally much ſtronger, becauſe they are ſubjected to a greater Force; for on thoſe principally the Weight of the Body is ſupported, when we are raiſed on our Tip-toes.

The three Bones in each of the other four differ from thoſe of the Fingers, in theſe Particulars: They are leſs, and ſmaller in proportion to their Lengths: Their Baſes are much larger than the anterior Extremity: Their Bodies are ſharper above and below, and flatter on the Sides: The firſt Phalanx is proportionally much longer than the ſecond and third, which are very ſhort.

Of the four, the Toe, next the great one, has the largeſt Bones in all Dimenſions, and more externally the Toes are leſs. The little Toe, and frequently that next to it, have the ſecond and third Bones intimately united into one, which may be owing to their little Motion, and the great Preſſure they are ſubjected to.

The Toes are of good Uſe to us in Walking, by ſerving as Supporters to the Foot behind, when the Sole is raiſed, in order to bring our Body, with its Centre of Gravity, perpendicular to the advanced Foot.

The Bones of the Metatarſus and Toes are in the ſame Condition, in Children, as thoſe of the Metacarpus and Fingers.

The only Bones, now remaining to complete the Deſcription of the Skeleton, are the ſmall ones, which are found in the Hand, Foot, and ſome other Parts.

Oſſa Seſamoidea are the little Bones moſt frequently found at the Articulations of the Toes and Fingers, which, tho' generally ſaid to reſemble the Seed of the Seſamum, are of very different Figures and Magnitudes. After the Diſſection of ſeveral of them in recent Subjects, they ſeem to me nothing elſe than the Ligaments of the Articulations, or the firm Tendons of ſtrong Muſcles, or both, become bony by the violent Compreſſion they ſuffer in the Situation they are. Thus the ſeſamoide Bones, at the Beginning of the Gaſtrocnemii Muſcles, are evidently compoſed of the tendinous Fibres only. Theſe, at the firſt Joint of the great Toe, are as plainly the ſame continued Subſtance with the Ligaments and Tendons of the Abductor, Flexor brevis, and Adductor; and that, which is ſometimes double at the ſecond Joint of that Toe, is Part of the circular Ligament; and, indeed, if it was worth while to enumerate all of them, that are at any time found, we ſhould obſerve the Whole of them form'd in this Manner. Their Number, Figure, Situation, and Magnitude, are ſo uncertain, that it were in vain to inſiſt on the Differences of each; and, therefore, I ſhall only in general remark,

1. That, where-ever the Tendons and Ligaments are firmeſt, the Actions of the Muſcles ſtrongeſt, and Compreſſion greateſt, there ſuch Bones will be moſt probably found.

2. That, *cæteris paribus*, the older the Subject is, in which they are ſought, their Number will be greater, and Size bigger.

3. The more Labour of either or both Extremities any Perſon is enured to, he will, *cæteris paribus*, have the moſt numerous and largeſt Oſſa ſeſamoidea.

However, as the two at the firſt Joint of the great Toe are much larger than any other, and are ſeldom wanting in an Adult, we may judge, that, beſides the more forcible Cauſe of their Formation, there ſhould alſo be ſome particular Advantage neceſſary at this Place, rather than elſewhere; which may poſſibly be, to allow the Flexor Muſcles to ſend their Tendons along this Joint, ſecure from Compreſſion, in the Hollow between the two oblong ſeſamoide Bones, while, by removing theſe Tendons from the Centre of Motion, and giving them the Advantage of an Angle at their Inſertion, the Force of the Muſcles is increaſed; and therefore the great ſuperincumbent Weight of our Body, in Progreſſion, is more eaſily raiſed.

For the Arteries of the inferior Extremities, ſee ARTERIA.

For the Veins of the inferior Extremities, ſee VENA.

For the Nerves of the inferior Extremities, ſee NERVUS.

The Muſcles of the lower Extremities are, firſt, thoſe which move the Os Femoris upon the Pelvis.

Theſe Muſcles are commonly twenty-two in Number, ſixteen of which are inſerted in the Os Femoris, and ſix move it, without being fix'd to it.

Thoſe Muſcles only, which are inſerted in the Os Femoris, are reckon'd to belong to the Thigh, and they are commonly ſaid to be fourteen in Number; but it is eaſy to make out ſixteen very diſtinct from each other. Of theſe ſixteen, three lie on the fore and upper Part of the Thigh. They are the,

1. Pſoas.
2. Iliacus.
3. Pectineus.

On the Inſide of the Thigh are three, commonly reckon'd one, by the Name of *Triceps*; tho', according to the antient Language, it has three Tails, as well as three Heads, and three Bellies, and therefore might more properly be call'd Triplex.

4. Triceps ſive Triplex primus.
5. Triceps ſecundus.
6. Triceps tertius.

Three form the Buttocks, and are call'd,

7. Glutæus Maximus.
8. Glutæus Medius.
9. Glutæus Minimus.

There are ſix very ſmall Muſcles, more or leſs, hid under the Glutæi; the four firſt of which are by ſome term'd *Quadrigemini*. The particular Names of theſe ſix are,

10. Pyriformis.
11. Gemellus ſuperior.
12. Gemellus inferior.
13. Quadratus.
14. Obturator externus.
15. Obturator internus.

Laſtly, there is a ſmall anterior ſuperficial Muſcle, commonly, but falſly, term'd *Faſcia Lata*, which is a large membranous, tendinous, or ligamentary Covering, to which the greateſt Part of this ſmall Muſcle is fix'd; and, therefore, it ought not to be call'd by the Name of that Membrane without Reſtriction, that is, without the Addition of *Muſculus*, in this Manner:

16. Muſculus Faſciæ latæ ſive muſculus Membranoſus. See FASCIA.

The ſix Muſcles which move the Os Femoris, without being inſerted in it, belong to the Claſs of thoſe which move the Leg upon the Thigh. They are,

17. Sartorius.
18. Rectus Gracilis.
19. Rectus ſive Gracilis internus.
20. Semimembranoſus.
21. Seminervoſus.
22. Portio Bicipitis longa.

All theſe Muſcles, whether inſerted or not inſerted in the Os Femoris, not only move that Bone on the Pelvis, but may alſo move the Pelvis on the Os Femoris.

The MUSCLES *which move the Bones of the* LEG *on the* OS FEMORIS.

Ten Muſcles are commonly reckon'd to belong to this Articulation. Moſt of them are very long, and ſituated lengthwiſe near each other, quite round the Os Femoris.

1. Rectus anterior ſive Gracilis anterior.
2. Vaſtus externus.
3. Vaſtus internus.
4. Crureus.
5. Sartorius.
6. Gracilis internus ſive Rectus internus.
7. Biceps.
8. Seminervoſus.
9. Semimembranoſus.
10. Popliteus.

Of theſe ten Muſcles the Popliteus only is ſmall, and lies, as it were, out of the Rank of the reſt, being ſituated below the Thigh. One Portion of the Biceps is likewiſe ſmall.

Theſe Muſcles not only move the Leg upon the Thigh, but alſo the Thigh upon the Leg, the Popliteus excepted. Some of them likewiſe move the Thigh upon the Pelvis, and the Pelvis upon the Thigh; as the Gracilis anterior, Sartorius, Gracilis interior, the great Portion of the Biceps, Seminervoſus, and Semimembranoſus.

Theſe are not the only Muſcles which move the Leg upon the Thigh, and the Thigh upon the Leg. The Gaſtrocnemii may likewiſe perform theſe Motions, tho' commonly confined to the Extenſion of the Foot.

The MUSCLES *which move the* TARSUS *on the* LEG.

The Motions of the Tarſus are ſuppoſed to be perform'd by nine Muſcles, ſituated in the Leg; three on the fore Side, and ſix on the back Side. They are the,

1. Tibialis Anticus.
2. Peronæus Medius.
3. Peronæus Minimus.
4, 5. Gaſtrocnemii.
6. Solæus.
7. Tibialis Gracilis vulgo Plantaris.
8. Tibialis Poſticus.
9. Peronæus Maximus.

Theſe Muſcles, three of which are anterior, and ſix poſterior, not only move the Tarſus on the Leg, but alſo the Leg on the Tarſus, except the Tibialis Gracilis, or Plantaris. Theſe Motions may likewiſe be perform'd by four Muſcles which belong to the Toes, the Names of which are theſe:

10. Extenſor Pollicis longus.
11. Extenſor Digitorum longus.
12. Flexor Pollicis longus.
13. Flexor Digitorum longus.

The Muſcles which move the Metatarſus and Toes, are theſe,

1. Extenſor Pollicis longus.
2. Flexor Pollicis longus.
3. Thenar.
4. Antithenar.
5. Extenſor Digitorum longus.
6. Extenſor Digitorum brevis.
7. Flexor Digitorum brevis ſive perforatus Pedis.
8. Flexor Digitorum longus ſive perforans Pedis.
9. Flexor Digitorum acceſſorius.
10. Lumbricales.
11. Tranſverſalis Digitorum.
12. Interoſſei.
13. Metatarſus.
14. Parathenar major.
15. Parathenar minor. *Winſlow.*

For an Account of the particular Origins and Inſertions of the Muſcles, ſee the Articles of their reſpective Names.

CRUSTA. The Shell of a Lobſter, Crab, Crawfiſh, Shrimp, or Prawn.

It alſo imports a Scab or Scurf upon a diſeaſed Part, or an Eſchar, or a ſort of Cruſt, or Cream, which coagulates on the Superficies of any Liquor, as upon Blood, or Urine, or upon fermentable Liquors, during one Stage of their Fermentation. See ALCOHOL.

CRUSTA LACTEA. See ACHOR.

CRUSTACEA.

Cruſtata and μαλακόστρακα are Animals, which have their external Parts firm and hard, but contain a fleſhy ſoft Subſtance within; or which, being cover'd with ſlender Cruſts or Shells, are deſtitute of Bones internally, which have their Heads furniſh'd with Horns, and other Appendages, which have eight Feet obliquely bended, and two Arms call'd Claws, notch'd like a Forceps. According to *Ray*, they belong to the Claſs of the exſanguious, large, cirrated Animals, furniſh'd with Feet. *Pliny*, in the thirty-firſt Chapter of his ninth Book, comprehends all cruſtaceous Animals under the Name of Crabs. In this Sentiment he is follow'd by *Bodin*, in his *Univerſæ Naturæ Theatrum*. By the celebrated *Linnæus*, in his *Syſtema Naturæ*, they are claſs'd among the Inſects without Wings, under the generical Name of Crabs; the characteriſtic Marks of which are ten Feet, the largeſt of which are like Claws, two Eyes, and a Tail, as it were, foliated. According to *Kleinius*'s Diſtribution of Animals, they belong to the Claſs of Multipeds, or ſuch as have more Feet than four, and conſtitute a particular Genus of loricated or cruſtaceous Animals; the ſeveral Species of which, uſed in Medicine, will be ſpecified under their reſpective Articles.

CRUSTULA. This Word is ſometimes uſed in the ſame Senſe as ECCHYMOSIS, which ſee.

CRUSTUMINA PYRA. Pears much admired by the *Romans*. They are mention'd by *Columella*, *L.* 5. *C.* 10. *Rhodius*, in his Notes on *Scribonius Largus*, takes it to be the ſame with that which is now call'd the *Bergamotte* Pear.

CRUSTUMINATUM, κρυσταλλινατον. A ſort of Rob, made of the Juices of Apples or Pears, boil'd up with Rain-water and Honey. *Aetius*, in *Tetrabib.* 2. *Serm.* 1. *C.* 138. directs the Manner of preparing a *Cruſtuminatum*.

CRUX CERVI. The Bone of a Stag's Heart. *Caſtellus.*

CRYMODES, κρυμώδης, from κρύος, Cold. An Epithet for a Fever, wherein the external Parts are cold. *Aetius*, in *Tetrabib.* 2. *Serm.* 1. *C.* 89. mentions ſuch a Fever as an Attendant of an Eryſipelas of the Lungs.

CRYOXA, κρύοξα. *Erotian* explains this, a ſort of Pot-herb, like Parſley, which grows near the Sea.

CRYPHEMA, τὰ κρύφεμα. In *Hippocrates*, *L. Epidem.* 7. imports private Sentiments.

CRYPTOS. Occult, or latent.

CRYSORCHIS. A Retraction or Retroceſſion of one of the Teſticles. *Caſtellus* from *Galen*, *Definit. Medic.*

CRYSTALLI. Eruptions about the Size of a Lupin, white and tranſparent, which ſometimes break out all over the Body.

CRYSTALLINÆ MANUS, κρυσάλλιναι χεῖρες, in *Hippocrates*, *Epidem. L.* 7. are hard Hands, ſo exceſſively cold as to ſeem almoſt frozen.

CRYSTALLINÆ, Cryſtallines.

Theſe are little Puſhes fill'd with Water, or Phlyctænæ, are tranſparent, reſemble Cryſtal, and, on that account, are call'd Cryſtallines. They are reckon'd in the Number of the worſt Symptoms of a Gonorrhœa. But, as theſe Bladders are not always full of Water, they are flat, when they are preſs'd with the Finger, and are always without Pain. The Cryſtallines are only on the Foreſkin; the Parts whereof, on which theſe Bladders do not appear, being very red, and of a blackiſh Colour, as all Parts are which have been bruiſed. This blackiſh Redneſs is very different from the Inflammations of the Glans and Foreſkin, and therefore does not ſeem to be the Offſpring of the virulent Matter of a Gonorrhœa; and far leſs can we imagine, that the Bladders and Cryſtallines are produced by the Sharpneſs of the Corruption.

On the other hand, by conſidering the dark Redneſs ſo very common in all Contuſions, we may naturally conclude, that this Symptom is of the ſame Sort. On this Suppoſition of a Bruiſe, the Bladders will eaſily become manifeſt; eſpecially if we conſider, how plentifully lymphatic Veſſels appear to be beſtow'd on that Part. Now a Contuſion of ſuch Veſſels would certainly hinder the Lymph to flow along them, and the Lymph, thus interrupted, will diſtend its Veſſels in their natural Form, which is the very Figure of the Cryſtallines; for the Lymphatics are not equal in their Surface, nor conical, nor cylindrical, like the reſt of the Veſſels; and, tho' they be really Cylinders, they are unequal and knotty, becauſe of the frequent Interruption their Liquor finds from the great Number of their Valves, which occaſion them to ſwell thus unequally, when the Lymph proceeds more ſlowly in its Courſe, or endeavours any Return or Reflux, and is the true Cauſe of the cryſtal Knots, the Figure of the Cryſtallines: So the Cryſtallines may be the Effect of Coition, but are never the Product of Infection received at that time.

The Nature of Cryſtallines, one ſort of the Caries mention'd by *Antonius Muſa*, and call'd *Taroli* by *Italian* Phyſicians, being thus explain'd, we are under no Difficulty in laying down the Indications of their Cure; eſpecially if we conſider, that they are the Effect of a Bruiſe, on a Part ſubject to a great Afflux of Humours, and to a Gangrene: On which account the Applications muſt be ſo temper'd, as to be ſtyptical and aſtringent, to contract the Bladders, without any Danger of condenſing the Liquors of the bruiſed Part, which might occaſion a Gangrene; or elſe, aſtringent Applications muſt be ſo well animated with ſpirituous Medicines, that all Riſque of ſplitting on the ſame Rock may be avoided.

A Practice of this Kind, always ſucceeding in Experience, is a ſtrong Confirmation of the Theory that was eſtabliſh'd: For, by it, Cryſtallines are not a Symptom of the Gonorrhœa, but a genuine Effect of Coition, more eſpecially in the Circumſtances there mention'd. On the other hand, Methods of any other Kind either do not ſucceed, or after a very long time. Mr. *Blegny*'s Experience agrees perfectly with this Doctrine. "Thoſe watry Tumors, ſays he, being uſually accompany'd "with other grievous Circumſtances, ſome Authors have con-"ſider'd them as Symptoms of a Pox, and ſometimes taken "them for the Pox itſelf; and therefore have endeavoured to "cure them by directing Purgatives, Sudorifics, and the moſt "violent Diuretics, the Fumes of Cinnabar, the Applications "of Plaiſters and Ointments prepared with Mercury; and, in "a Word, by all the general Remedies employ'd for the Cure "of a Pox. But in this they are groſly miſtaken; for thoſe "watry Tumors have no Dependence upon a Pox; and it is "very certain, that the general Medicines, employ'd in the "Cure of it, do not effectuate the Cure in ſo ſhort a time as "is neceſſary for the Cure of watry Tumors, which are al-"ways ſo urgent, that they come to their Height in three or "four Days, if they be not check'd by topic Remedies."

This was proper to be ſhewn, from one of the beſt Books we have on theſe Subjects, firſt, That I might not appear altogether ſingular in an Opinion, which may ſeem ſtrange to moſt Phyſicians. Then, ſecondly, Becauſe they may rather embrace it on the Authority of a dead and foreign Practitioner, than from any living Author; howſoever this Opinion be ſupported on Experience, and the beſt Reaſon. But Monſieur *Blegny*, not taking his Indications from the Nature of Cryſtallines, but the Appearance of their Water, falls into as great, tho' not ſo pernicious Miſtakes, as ſome other Authors; and fanſies, that the Water of the Bladders may be carry'd off, as is commonly ſaid, by Medicines that purge Water; and he ſtill bears ſo great a Tenderneſs for the Specifics of the Pox, that he would have them mix'd with ſome he recommends for Venereal Ulcers and Chancres; but withal, that none of theſe ought to hinder our uſing proper Topics: "Which, he ſays, "are ſo much the more neceſſary, that they only are ſo ſuc-

" ceſsfully employ'd in curing ſome Patients, that, without " them, internal Remedies would prove ineffectual." Now, as theſe Topics are ſo neceſſary, that all internal Medicines will prove ineffectual in curing Cryſtallines without them, and as he uſes purging Medicines only with a View to diſcharge the Water, which they cannot do; ſo we may ſafely conclude, that Mr. *Blegny* has not made a right Uſe of his Experience, and that Cryſtallines are cured only by topical Medicines, without having any regard to a Gonorrhœa, a Chancre, or any other of their Symptoms.

Tho' Cryſtallines have been commonly reckon'd among the moſt terrible Symptoms of a Gonorrhœa; and tho' neither the Notion, nor Experience, I have of its Cure, can induce me to that Perſuaſion, I hope the Practice of other Authors, which confirms this my Opinion, rather than overturns it, ſufficiently warrants the Liberty I have taken to differ from them. And, therefore, that Means, proper to cure this Symptom, may not be wanting, however different our Opinions are about its Nature, we find the following Method principally recommended.

Muſitanus thinks the Spirit of Tobacco the only Medicine ſufficient againſt this great Evil, which he thus prepares:

Take of the green Leaves of Tobacco, as much as you pleaſe: Infuſe them in Malmſey-wine. The Tincture is uſed without Diſtillation.

The Cryſtallines are to be touch'd with this Tincture five times at moſt, after it is firſt humbled with ſublimate or precipitated Mercury. This is to be done when the Patient is lying, leſt the Violence of the Pain, becauſe of the violent Operation of the Tincture, ſhould make him drop down in Convulſions.

If this Symptom was near as fatal as this Author pronounces it, or if it was attended with ſuch dreadful Conſequences in its only Cure, it ought deſervedly to be reckon'd the moſt terrible Symptom of the Gonorrhœa, or of the Pox.

But Monſieur *de Blegny*, and moſt Practitioners, do not find the Cryſtallines ſo dangerous a Symptom, or to require ſo violent a Remedy, tho' he be led away with greater Apprehenſions of Danger than ever he obſerved, and had Occaſion to fear; for he finds, that drying and diſcuſſing Medicines are a ſufficient Cure of Cryſtallines, and give Forms accordingly of camphorated Spirit of Wine, making a Paſte with Bean-flower, Lime-water, and Sal Ammoniac; and even comes to aſtringent Medicines, as Whites of Eggs, with Alum, mix'd with ſympathetic Powder.

But, as I have already obſerved, the Bruiſe requiring warm Medicines, in order to diſcuſs the Liquors, or to make them flow, ſuffers very much by indiſcreet Applications of aſtringent and drying Medicines, made for waſting the Liquor of the Cryſtallines; whereby a Gangrene often enſues, as would be the Conſequence of all other conſiderable Bruiſes, that are treated with theſe like Medicines. And, therefore, the Applications ought rather to have the greateſt View to the Contuſion, and may carry ſome Degree of Aſtringency with them; as,

Take of Lime-water, three Ounces; and Spirit of Wine, two Ounces: Bathe the affected Part with this, when warm, four or five times a Day.

Take of the Leaves of Wormwood, one Handful; of the Flowers of Chamomile and Elder, of each half a Handful. Boil them, in a Pint and a half of Lime-water, to the Conſumption of a third Part; and to the Liquor, ſtrain'd and preſs'd out, add ſix Ounces of Spirit of Wine.

When no further Apprehenſions remain from the bruiſed Part, the former Medicines may be made more aſtringent, with ſome *Roman* Vitriol diſſolved in them, or ſome *Aqua Opthalmica Sapphirina*; which will perfect the Cure, without any Preparation of Mercury, or adminiſtring any ſort of inward Medicines.

But as neither the Spirit of Tobacco, nor the moſt powerful and effectual of the other Medicines, can be ſaid to deſtroy the Venereal Contagion, while they cure Cryſtallines, there is not ſufficient Experience for aſſerting their being occaſioned by it, ſince neither their Nature nor Cure give any Proof of it. And, therefore, the former Doctrine, that Cryſtallines are rather the Effect of Coition than of Contagion, is plain from both Experience and Reaſon. No doubt they may be together; but, in that Caſe, neither of them is the Cauſe of the other. *Cockburn.*

CRYSTALLINUS HUMOR. The Cryſtalline Humour of the Eye. See OCULUS.

CRYSTALLION, in *Oribaſius, Med. Collect. Lib.* 12. is a Name for the PSYLLIUM. *Fleawort.*

CRYSTALLIZATIO.

Cryſtallization is that particular Operation, by which the ſolid Parts, which, in any Fluid, are highly attenuated, extended, or diſengaged, are reduced to a Body which is dry, hard, compact, diaphanous, or at leaſt ſemidiaphanous, and either foliaceous, or of ſome geometrical Figure, ſuch as cubical, priſmatical, or conical. This Deſcription comprehends not only the Cryſtallizations of Salts, and ſaline Corpuſcles, ſuch as thoſe uſed in Laboratories and Shops, but alſo of earthy Bodies. That theſe laſt are capable of being cryſtallis'd, is obvious from the Experiment the learned *Henkelius* made on recent Urine, diſcharged in the Morning, by a young Man, who drank only Beer; for after this Fluid had ſtood unmoved for four Years, in a moderately warm Place, and in a pretty large Cucurbit, which had a long Neck, a narrow Mouth, ſtopt with a Cork, and covered with a Bladder, and was half full, beſides the ſmall pinguious Drops adhering to the Neck, which were Marks of a volatile Salt, and the whitiſh-yellow Earth in the Bottom, which is common to Urine, it depoſited, firſt, a conſpicuous white Earth, which gently adhered to the ſuperior Part of the Belly of the Cucurbit; and, ſecondly, eſpecially near the Surface of the Liquor, by the Sides of the Glaſs, all around, were oblong priſmatical Cryſtals, as large as a Grain of excorticated Oats, running unequally into Points at both Extremities; not ſaline, but of a ſtony Conſiſtence; void both of Taſte and Smell; ſemidiaphanous; crackling betwixt the Teeth, like the Selenites; combuſtible; indiſſolvable in boiling Water, and incapable of Fuſion by the Fire.

The Cryſtallization of Salts and ſaline Bodies is performed, when a Liquor, which is generally aqueous, and contains a Salt diſſolved in it, is filtrated, and, when thus depurated, inſpiſſated by a ſlow and continu'd Evaporation, till a Pellicle appears on the Surface, which is the firſt Beginning, as it were, of the Cryſtallization. The Evaporation is generally thought to be completed, when a Drop of the Solution, poured upon the Nail of the Finger, or any cold Subſtance, is forthwith concreted into a Salt. The Evaporation may be either performed by the Fire, or by the Heat of the Sun; in which laſt Manner Sea Salt is better cryſtalliz'd than any other. The Evaporation ought to be made in large-mouth'd Veſſels, the beſt of which are Glaſs; next to theſe are Earthen Pots, well bak'd, and ſuch as will not ſuffer the Salts to paſs through the Pores; but thoſe made of Metal are corroded by the Salts, and ſubject to be ſpoil'd by the Ruſt. The inſpiſſated Liquor is lodg'd in ſome cool Place, and kept in Veſſels of Glaſs or Wood, or in Earthen Veſſels, well bak'd, and whoſe Mouths muſt be conſiderably large, that the cryſtalliz'd Subſtance may be the more commodiouſly taken out. Some time after, the latent Particles of Salt, diſperſed through the Liquor, are approximated, and joined to each other, and, at the Sides or Bottom of the Veſſel, form ſaline Cryſtals, which are greater or ſmaller according to the Quantity of the Solution. In either Caſe all the Cryſtals are not equally large, but are endow'd with the Figure peculiar to each Salt, ſingle, beautifully ſhining, and the more elegant and large, the more ſlowly the Evaporation has been made. But the whole ſaline Subſtance is not found form'd into Cryſtals, but there is a large Number of irregular Concretions, eſpecially in that Baſe in which the larger Cryſtals are planted, and which ſeems to be, as it were, the Matrix from which theſe Cryſtals ariſe. Nor is all the diſſolved Salt, which was in the Liquor, form'd into Cryſtals, but a Quantity of it remains, ſufficient to ſaturate the Fluid. Hence, when the Cryſtals form'd are taken out, there is a Neceſſity for a new Evaporation, and the Liquor muſt be lodged in a cool Place, in order to obtain more Cryſtals; and theſe Meaſures are to be repeated, till no more Cryſtal can poſſibly be form'd. But ſince, for the Purpoſes of Cryſtallization, ſome Quantity of a Fluid is always required, the Salt cannot poſſibly be totally extracted from the Liquor by Cryſtallization, but Exſiccation becomes neceſſary for drawing off the Remainder. Sometimes, in order to obtain the more elegant Cryſtals, Twigs are put into the Veſſel, or Threads are ſtretched in it as proper Supports, to which they may adhere, as is uſual in collecting the Cryſtals of Alum, Copper, and Sugar. The collected Cryſtals are in the Shops dry'd on coarſe Paper, by the Heat of the Sun. Theſe, however carefully they may be freed from the Humidity adhering to their Surfaces, ſcarce afford ſo genuine a Salt, but that it contains ſome Mixture of Earth and Water. This ſupplies the Place of a Glue or Calx, for uniting, as it were, the ſaline Cryſtals; for it is diſſolv'd when the Water is expel'd, or by Calcination, as we may obſerve in decrepitated Sea Salt, Alum, and Vitriol, calcin'd. Some Salts undergo a better and more perfect Cryſtallization, when, to their Solution, a calcareous Earth is added, as is proved by *Geoffroy*, in the Inſtance of Borax. Thoſe Salts, to which an Oil adheres, are unfit for Cryſtallization, and proportionably more ſo according to its Quantity; becauſe the Oil, interpoſed between the ſmall Portions of Matter, by its Tenacity prevents the Union of the ſimilar Particles; and if, in ſome meaſure, they ſhould happen to unite, yet they never acquire a due Degree of Solidity, but are forthwith melted down, on the Acceſs or Contact of a moiſt Air. Hence the Salters of Herrings

Herrings take care, that in boiling no Fat be mixed with the ſalt Water; and ſkilful Chymiſts, when they ſuſpect an Admixture of oleous and pinguious Parts, after a proper Evaporation, pour Spirit of Wine upon it, which diſſolves the oleous Parts, receives them, as it were, into its Boſom, and ſo ſeparates them from the ſaline, by which means they facilitate the Concretion of the Cryſtals. This Obſervation is of ſingular Uſe to Phyſicians, with reſpect to the Formation of Stones in the animal Body; and points out the moſt effectual Remedies, by which their Concretion may be prevented. Hence we learn, that Salts, diveſted of all pinguious Parts, are moſt eaſily cryſtalliz'd. The white Colour of the ſaline Cryſtals is ſomewhat darken'd by the adhering Oil. This Colour is alſo variegated by metalline Particles, almoſt infinitely divided, and combin'd with their ſolvent Salt, as appears in the bluiſh Vitriol of Copper, and the green Vitriol of Iron, which conſiſt of a Metal which is kept diſſolv'd by an acid Salt, and a little pure Water.

The Uſe of ſaline Cryſtallizations is,

Firſt, To ſeparate Salts, in a dry Form, from their ſolvent Liquor.

Secondly, To depurate Salts; for the Water, leaving the Sordes, retains the Salts; for which Reaſon, the better theſe are depurated, the more elegant Cryſtals they yield in Cryſtallization.

The Ætiology of theſe Cryſtallizations is obvious, if we conſider, that, in order to their Production, there is requiſite, firſt, Too ſmall a Quantity of Water to keep them diſſolv'd; ſecondly, The Reſt of the particular Liquor in which the diſſolved Salt is lodg'd; and, thirdly, Cold; for, when the ſolvent Menſtruum begins to prove defective, a ſlender Pellicle is form'd on the Surface of the ſaline Parts, which can no longer be kept in a State of Solution by the Liquor. Then this Pellicle becomes gradually thicker, till at laſt becoming ſpecifically heavier than the reſt of the Solution, it is broken into different Parts, ſubſides, and forms itſelf into Molecules, or Cryſtals, of different Bulks; which could not be produced, unleſs the Liquor was in a State of Reſt, becauſe then the Principle of Solution, which is Motion, proving defective, nothing hinders the mutual Approach of the ſaline Parts to each other; for, as the Want or Defect of Humidity brings the Parts nearer to each other, it conſequently lays a Foundation for their Union. Thus the Diminution of Motion renders the Fluid unfit for ſeparating the Parts, when they happen to adhere. But, when Liquors are compreſſed by the cold Air, many of the Particles flying off from the ſolvent Liquor, the contain'd ſaline Parts are, by the Conſtriction, more and more expel'd, and thrown out from the Pores of the fluid Maſs; and the more intenſe the Cold is, the larger Cryſtals are form'd; but theſe are continually mov'd upon the Acceſſion of Heat. Hence it happens, that, in a warm Air, very ſmall Cryſtals are generally formed. Cryſtallization is, therefore, perform'd, when a ſufficient Quantity of Moiſture, Motion, and Heat, which are the Cauſes of the Solution, prove defective. Cryſtallizations, indeed, of Salts happen, when their highly ſaturated and warm Solutions are left to themſelves; in which manner volatile Salts, ſuch as that of Hartſhorn, Vipers, and Silk, and others obtain'd from the Animal Kingdom, are cryſtalliz'd. But theſe are very near to a State of Cryſtallization; for the Evaporation is perform'd with this Deſign, that the Solution, which remains after the Diminution of the Liquor, may become more ſaturated. But, even in a highly ſaturated Solution, a very ſmall Quantity of Cryſtals are form'd, without a previous Evaporation. 'Tis therefore obvious, that Evaporation, that is, a Diminution of the ſolvent Liquor, is abſolutely neceſſary to the Cryſtallization of any Salt. Hence alſo 'tis obvious, why in a Receiver, from which the Air is exrtacted, as alſo in a cloſe-ſtopt Veſſel, Cryſtals are not form'd; becauſe, in theſe Caſes, a very ſmall Evaporation, or none at all, is made. We muſt carefully conſider, that the Cryſtals of Salts, peculiar to each Species, are not obtain'd by every Kind of Concretion; for when the Solution of any Salt, ſufficiently warm, is ſuddenly cool'd, when, for Inſtance, the Veſſel containing it is put in cold Water, the diſſolved Salt, lodged in the Liquor, is precipitated to the Bottom, in the Form of a Powder; for then the Solution is, with a kind of Impetus, condens'd, and forc'd too precipitately to depoſit its Salts. Nor does the Salt acquire its peculiar Figure by a ſudden and continu'd Evaporation on the Fire, till the whole Liquor is totally exhal'd, or, at leaſt, rendered thicker than it ought to be; for the Heat, exciting a preternatural Commotion of all the Parts, hinders the ſaline Parts from receding from each other; but, being forced to run, in all Directions, with a tumultuous Confuſion, and being prepoſterouſly mixed, they are form'd into leſs elegant Cryſtals. As, therefore, a precipitate Refrigeration, ſo alſo an intenſe Heat, hinders Cryſtallization. The beſt Evaporation is made without Boiling; and the Place fitteſt for Refrigeration is that which is of the ſame Temperature with Cellars about the Months of *June* and *July*. But, there are ſome Salts, which are more commodiouſly cryſtalliz'd in a pretty warm Air, ſuch as rich, acid, and alcaline Salts; and, for the Cryſtallization of Sugar in the Pans, a pretty briſk Heat is neceſſary; perhaps becauſe Salts of this Kind require little Moiſture for their Solution, and retain it cloſely, which muſt be afterwards leſſen'd by Evaporation, and a Continuation of the Heat; for it muſt be obſerved, that the Salts, which require a large Quantity of Water to keep them diſſolved, are firſt formed into Cryſtals: On the contrary, the more eaſily and quickly, and with the ſmaller Quantity of Water, Salts are diſſolved, the more firmly they ſeem to retain the Water they receive. Salt of Tartar, for Inſtance, which, of all Salts, requires the ſmalleſt Quantity of Water for its Solution. Hence, if different Salts are diſſolved in the ſame Water, ſome of them will be form'd into Concretions ſooner than others, and each of them will be diſtinguiſhed by the particular Figure of its Cryſtals. Thus, for Inſtance, the Cryſtals of common Salt are quadrilateral Pyramids, with a ſquare Baſe: Thoſe of Sugar are oblong, and have rectangular Baſes: The hexagonal Cryſtals, ariſing in Alum, have alſo hexagonal Baſes: The Cryſtals of Vitriols, for the moſt part, reſemble Iſicles, variouſly interwoven, and Polygons interpoſed, or lying between them: Sal Ammoniac elegantly reſembles the Branches of a Tree; and Salt of Hartſhorn, Arrows plac'd in a Quiver: In the Sal Mirabilis Glauberi, which is made of common Salt and Vitriol, the Figures of both Salts are exhibited: Nitre is formed into priſmatical Columns, not unlike Faggots of Wood; and between theſe are ſome Figures, ſometimes rhomboidal, and ſometimes pentagonal, which ſeem to approach pretty near to common Salts. In the Salt of Tin, ſmall Lines, like Pins, ſo run out in every Direction from the Centre, as to form a Star, ſuch as that obſerved in the martial Regulus of Antimony. 'Tis ſurpriſing, that the Cryſtals of the ſame Salt ſhould be perpetually formed in the ſame Figure. *Willis*, in order to account for this Phenomenon, affirms, that the Author of Nature granted ſuch peculiar Modes of Figuration to Salts, as well as other natural Concretions, according to the Prepollence of the Spirit or Salt, and their Commixture with the other Principles. But this is no more than a formal and explicit Declaration, that we are ignorant of the phyſical Cauſe of this ſurpriſing Appearance. *Muſſchenbroek* alſo denies, that this has hitherto been accounted for by any one, any more than this other Phenomenon, Why green Vitriol and Alum, diſſolv'd, and mix'd with Water, return to their own Cryſtals, and do not become a third Salt of a different Kind. If it ſhould be aſk'd, Why, ſometimes, the Weight of the Salt, uſed in the Solution, is diminiſh'd in the concreted and dry'd Cryſtals, we anſwer, with *Gulielmini*, that the Salt is ſo eaſily diſſolved in the Water, that the aqueous Exhalation, eſpecially when riſing in large Quantities from the Water, may contain ſome of the diſſolv'd Particles of the Salt, eſpecially if they are very minute and fine, like thoſe ſent up by Water, when in a State of violent Ebullition and Evaporation. As much Salt, therefore, as is carry'd off by the Exhalation, ſo much muſt be wanting or defective in the concreted Cryſtals. Some, who are fond of reducing Phenomena to a certain Cauſe, in order to explain ſaline Cryſtallizations, think the Principle of Attraction beſt calculated and adapted to explain ſaline Cryſtallizations. They affirm, that the Parts of the Salt, diſſolv'd in a large Quantity of Water, are more attracted by the Particles of the Water, than by each other, and remain ſeparate from each other for a conſiderable time; but, after a large Quantity of the Water is expel'd in Vapours, and a ſmall Pellicule of Salts begins to be formed on the Surface, ſince the ſaline Parts are brought nearer to each other, and almoſt into mutual Contact, and as the Force of Attraction is greateſt during the Contact, this Pellicule more ſtrongly attracts the Salt from the ſubjacent Water, than an equal Quantity of the Solution, which conſiſts partly of Water, and partly of Salt. When this Pellicule becomes ſpecifically heavier by Inſpiſſation, it is broken into Parts, ſubſides, and, by attracting the ſaline Parts to itſelf, exhibits Cryſtals, which, ſay they, are not formed into Concretions, ſo long as the Solution is warm, becauſe, ſo long as the Motion excited by Heat remains, the Whole of that Motion, which ought to be produced by the attractive Force, is hinder'd and deſtroy'd. But, ſince the Figures of the moſt ſimple Parts remain invariably the ſame, 'tis neceſſary the Forms of the Bodies, into which they are concreted, ſhould alſo be the ſame: And becauſe, on one Side of the ſame ſaline Particle, the attractive Force is greater than on the other, the Concretion always happens on thoſe Sides which attract moſt powerfully: Hence it may be demonſtrated, that the Figure of the minute conſtituent Particles is different from that of the Cryſtal itſelf. From what has been ſaid 'tis ſufficiently obvious, that Cryſtallization may be call'd a Species of Coagulation; and that it is a ſurpriſing and geometrical Operation of Nature, in which ſhe exhibits herſelf to the Eye of the Spectator, not in a falſe and varniſh'd, but in her genuine and real Dreſs.

CRYSTALLUM MINERALE. This is *Sal Prunellæ*, purify'd by Solution and Cryſtallization.

CRYSTALLUS, Offic. Aldrov. Muſ. Metall. 934. Charlt. Foſſ. 35. Wormd. 99. Schrod. 349. Boet. 217. Matth. 1388.

Lact.

Laet. 56. Kentm. 46. Mont. Exot. 14. Geoff. Prælect. 77. *Lapis Cryſtallus*, Cup. Hort. Cath. Supp. 2. 50. CRYSTAL.

Schroder informs us, that it is aſtringent, and good in a Dyſentery, Diarrhœa, the Cœliac Paſſion, Cholera, and uterine Fluxes; that it increaſes Milk, wears away the Stone in the urinary Paſſages, and is beneficial in the Gout. He farther ſays, from *Boetius de Boodt*, that two Scruples or a Dram of this, exhibited in Oil of ſweet Almonds, is good for thoſe who have taken Mercury. *Schroder* takes notice of the Salt, Magiſtery, Oil, Elixir, and Eſſence of Cryſtal: But I believe theſe are never either made or uſed.

Frederic Hoffman, in many Parts of his Works, recommends Cryſtal as a Medicine, under the Name of *Cryſtallus Montana*, which I have ſomewhere, by Miſtake, tranſlated *Muſcovy Glaſs*, which is the *Lapis Specularis*.

Rock Cryſtal is a ſoft tranſparent Gem, reſembling Ice, and its Figure is that of an hexagonal Pillar, pointed at both Extremities; or it may be ſaid to be compounded of two Pyramids, with ſuch a Pillar between them. A ſecond Kind is found in *Iceland*, and in ſome Parts of *France*, eſpecially about *Troyes* in *Champagne*, which ſeems to be made up of cryſtalline Plates, and fiſſil in the Direction of all its plain Surfaces; and, when reduced to Powder, it ſtill retains a rhomboidal Figure, ſo that even the fineſt Powder, view'd through a Microſcope, ſhews a Congeries of very ſmall rhomboidal Solids. Another Property of this Cryſtal is, that all Objects, ſeen thro' it, appear double; which ariſes from a double Refraction of the Rays of Light. A third Species of Cryſtal is that mention'd by Dr. *Lyſter*, in the *Philoſophical Tranſactions*, which is very ſmooth, pellucid, and glittering, coming near to a Diamond. Its Figure is ſpherical, oval, depreſſed, and ſometimes repreſenting an Hemiſphere, or Hemiſpheroide, and in others roundiſh and irregular. It is very hard, and has an exquiſite natural Poliſh, and is dug up in Pieces of different Sizes in ſeveral Places of *England*. *Geoffroy*.

(ed. 1658.) 144? *Arbor baccifera Braſilienſis, fructu Piper recipiente*, Raii Hiſt. 2. 1593? *Arbor Biſnagarica Myrti amplioribus foliis, per ſiccitatem nigris, Cubebæ ſapore*, Plukn. Almag. 43? Phytog. Tab. 140? CUBEBS.

This is a ſmall round Fruit, or Berry, rather leſs than Pepper, with a dark-brown wrinkled Outſide, and whitiſh within, having a little ſhort Stalk at one End; whence it has been call'd *Piper Caudatum*, or Pepper with a Tail. It is not near ſo hot and biting as Pepper, but is of an aromatic Smell and Taſte. *Cubebs* come from the Iſland of *Java*.

Botanical Writers differ in their Opinion as to the Growth of *Cubebs*; ſome, as Mr. *Ray*, Dr. *Plukenet*, and others, believing that they grow on Trees about as big as Apple-trees, in Bunches like Grapes; of which Dr. *Plukenet* gives a Figure, *Tab.* 140. *Fig.* 1. Others, as *Herman* and *Pomet*, will have them to grow on a ſcandent Plant like Pepper.

Cubebs are heating and drying, ſtrengthen the Stomach, expel Wind, comfort the Brain and Nerves, and are particularly uſeful againſt the Vertigo, or Giddineſs, and other Diſorders of the Head. *Miller's Bot. Off.*

They are brought from the Iſland of *Java*, and other Parts of the *Eaſt Indies*, and are recommended in a Hoarſeneſs and Loſs of Voice, eſpecially when the Tonſils are ſtuffed and obſtructed. The Doſe is from ten to twenty-four Grains in Subſtance, to be chewed; or from a Dram to a Dram and a half in Infuſion. *Groſſroy*.

They are, farther, recommended in Diſorders of the Spleen, and in cold Diſtemperatures of the Uterus. *Dale*.

CUBIFORME OS. The ſame as CUBOIDES.

CUBIL. *Rulandus* explains this by *Terra Rubea*, Red Earth.

CUBITALIS MUSCULUS. A Name for the ANCONÆUS.

CUBITUS, κυβιτος. The Elbow, or the fore Arm from the Elbow to the Wriſt. See BRACHIUM.

A *Cubit*, conſidered as a Meaſure, is eighteen Inches.

CUBOIDES OS. The Name of a Bone in the *Tarſus*. See CRUS.

CUCI. The Fruit of the *Palmæ ſocie Cuciphora*, J. B. *Palmæ cujus Fructus Cuci*, C. B.

This is a round, oblong, *Eaſt Indian* Fruit, of the Size of a ſmall Fiſt, of a yellowiſh Colour, and ſweet agreeable Taſte, containing a very hard Nucleus. *Lemery* tells us, that this Fruit is cordial and reſtorative.

CUCUBALUS *Plinii*. The ſame as CACUBALUM, which ſee.

CUCULATUM MAJUS. Brandy, or Spirit of Wine. *Rulandus*.

CUCULLARIS MUSCULUS, or *Trapezius*. This Muſcle derives the former Name from its Reſemblance to a Frier's Cowl. It is a large, broad, thin, fleſhy Plane, ſituated between the Occiput and lower Part of the Back, and from thence extending to the Shoulder, in the Figure of a large irregular Square. From this Figure the antient *Greeks* borrow'd its Name, and, together with the Trapezius of the other Side, it forms a kind of Lozenge.

Above, it is fixed in the ſuperior tranſverſe Line of the Os Occipitis, by a thin Series of fleſhy Fibres, reaching to the Occipital Muſcle, and appearing to cover that Muſcle by a kind of Aponeuroſis. Behind, it is fixed to the five ſuperior Spinal Apophyſes of the Neck, by means of the poſterior Cervical Ligament, and immediately to the Extremities of the two loweſt Spinal Apophyſes of the Neck, and of all thoſe of the Back.

Theſe Inſertions are by ſmall and very ſhort tendinous Fibres, except between the ſixth Apophyſis of the Neck, and the third of the Back incluſively, where theſe Fibres are ſomething longer, and form a ſmall Aponeuroſis in form of a Creſcent, which, with that on the other Side, repreſent a kind of Ellipſis pointed at both Ends. At the lower Spinal Apophyſis of the Back, theſe Inſertions are likewiſe tendinous, and form a ſmall triangular Plane, which, together with that of the other Side, repreſent a Square.

From all theſe Inſertions, the fleſhy Fibres run in different Directions, and terminate by one continued Inſertion in about one third Part of the Clavicula, in the poſterior Edge of the Acromium, and through the whole Superior Labium of the Spine of the Scapula, all the Way to the ſmall triangular Surface in that Spine, over which Surface the Fibres paſs and ſlide freely without being fixed therein.

The Directions of all theſe Fibres are theſe: The ſuperior run obliquely downward from the Occiput to the Clavicula: The next to theſe run a little leſs obliquely, and, together with ſome of the ſuperior, are fixed in the ſuperior articular Ligaments of the Shoulder, and in the Acromium. Here the Muſcle forms a kind of Angle included in that formed by the Acromium, and Extremity of the Clavicle.

The reſt of the Fibres that come from the Neck, and thoſe from the ſuperior Spines of the Back, are fixed in the Spine of the Scapula, reaching within an Inch of the ſmall triangular Surface, becoming gradually leſs oblique, or more tranſverſe, as they deſcend.

Laſtly, The Fibres which come from all the other Spinal Apophyſes of the Back, contract like Radii tending toward a Centre, and are inſerted in the Extremity of the Spine of the Scapula, paſſing over the ſmall triangular Space, the ſuperior being more or leſs tranſverſe, and the reſt becoming gradually more and more oblique, running from below upward.

This Muſcle covers immediately, the Splenius or Maſtoidæus Superior, Part of the Complexus Major, the Angularis, Rhomboides, and Part of the Latiſſimus Dorſi. The common Inſertion of the two Trapezii in the Cervical Ligament is the Reaſon, that, in pulling either of them toward one Side of the Neck, the other will follow it a little beyond the Spinal Apophyſes. *Winſlow's Anatomy*.

CUCULLUS. The ſame as *Cucupha*. It ſignifies alſo a Piece of Paper wrapt up in the Form of a Horn, or Cone, in which Grocers include ſmall Quantities of Spices, and Apothecaries ſometime incloſe Pills, or Boles.

CUCULUS, Offic. Schrod. 5. 317. Schw. A. 249. Bellon. des Oyſe. 132. Charl. Exer. 73. Geſn. de Avib. 319. Will. Ornith. 62. Raii Ornith. 97. *Cuculus alter*, Aldrov. Ornith. 1. 416. *Cuculus minor*, Jonſ. de Avib. 14. *Cuculus noſtras ſeu Aldrovandi ſecunda*, Raii Synop. A. 23. THE CUCKOW.

The whole Bird, and its Dung, are uſed in Medicine. The Bird burnt whole is recommended for the Gravel, Pains of the Stomach, and exceſſive Humidity of the ſame Part. *Rondel.* It is given with good Succeſs alſo in the Paroxyſms of Fevers. The Dung of the Cuckow, drank, cures the Bite of a mad Dog. *Schroder*.

CUCUMIS. The Cucumber.

The Characters, according to *Miller*, are;

It hath a Flower conſiſting of one ſingle Leaf, which is Bell-ſhap'd, and expanded towards the Top, and cut into many Segments, of which ſome are Male, or barren, having no Embryo, but only a large Style in the Middle, which is charg'd with the Farina; others are Female, or fruitful, being faſten'd to an Embryo, which is afterwards chang'd into a fleſhy Fruit, for the moſt part oblong, and turbinated, which is divided into three or four Cells incloſing many oblong Seeds.

CUCUMBER.

The *Cucumber* is a Fruit ſo well known, that it were Labour loſt to ſay much of it. It grows upon a creeping rough Stalk, or Vine, as the Gardeners call it, which has ſeveral Tendrils or Claſpers. The Leaves are rough, and almoſt prickly, in Shape ſomewhat reſembling a Vine-leaf. The Flowers are of a yellowiſh White, Bell-faſhioned, of one Leaf, divided into five Segments. The beſt Fruit is that which is longiſh, of a deep-green Colour, and beſet with ſmall, blackiſh, prickly Tubercles. They are raiſed every Year from Seed; flowering, and bearing Fruit, a great Part of the Summer.

Cucumbers are more eaten as Food and Sallad, than uſed medicinally; and are cooling to the Stomach, quenching Thirſt, and provoking Urine. The Seed only is uſed in Phyſic, being one of the Four greater cold Seeds, and is accounted cooling and diuretic, and is frequently put into Emulſions againſt the Stone, Strangury, and Heat of Urine; as alſo in burning Fevers and Pleuriſies. *Miller's Bot. Off.*

You muſt chuſe ſuch as are long, thick, full-ripe, having a thin Rind, and full of a white, juicy, and firm Pulp.

They moiſten and cool very much, quench Thirſt, allay the Sharpneſs of Humours, and too great an Effervescence of the Blood, and provoke Urine.

They are not eaſily digeſted, and produce groſs and phlegmatic Humours.

They contain a little Oil, much Phlegm, and an indifferent Portion of eſſential Salt.

Cucumbers in hot Weather are proper for young Perſons of an hot and bilious Conſtitution; but weak and tender People, who have a bad Stomach, ought to abſtain from them.

REMARKS.

Cucumbers are Fruits much in Uſe for Food; they are uſually yellowiſh, ſometimes white, and at other times green. Theſe Fruits moiſten much, becauſe they contain a viſcous and thick Juice, very fit to qualify the over-violent Motion of the Humours. In the mean time, this Juice makes them hard of Digeſtion, becauſe they continue long in the Stomach, and becauſe their Parts cannot be disjoined without Difficulty; and therefore they ought always to be well dreſs'd and ordered before they are eaten, that this viſcous Phlegm, wherewith they abound, may be the better digeſted: You may alſo mix ſome other Things with them to help Digeſtion; ſuch as Onions, Salt, Pepper, and other Things of the like Nature.

We find a Number of Seeds in Cucumbers, which contain a ſweet oily Kernel, agreeable enough to the Taſte. This Seed is one of the Four greater cold Seeds, and much uſed by Phyſicians in Emulſions. It is alſo very qualifying, refreſhing, and moiſtening. It operates likewiſe by Urine. *Lemery on Foods.*

The Juice of the Cucumber is nitrous, mucilaginous, emollient, diuretic, and refrigerating; it is therefore excellent Food for hot bilious Conſtitutions, in very warm Seaſons, provided they are not eaten to Exceſs: But the *French* way of preparing them ſeems to be the beſt, which is to boil them in Soops; for the Coction diveſts them of Part of their Viſcidity, and renders them more eaſily digeſtible. Decoctions of Cucumbers are recommended in inflammatory Fevers, in the Stone and Gravel, and when bloody Urine is diſcharg'd; but, in theſe Caſes, their Indigeſtibility renders them unfit to be exhibited crude.

Small Cucumbers pickled with Vinegar, Salt, Pepper, and Dill, are ſaid powerfully to excite an Appetite, when it languiſhes, in conſequence of the Stomach being too hot.

The *Hiſtoria Plantarum*, publiſh'd under the Name of *Boerhaave*, informs us, that if the Branches of Cucumbers are much trodden upon, the Pulp of the Fruit will be bitter and emetic; and that a Water diſtil'd from Cucumbers when full-ripe, and beginning to putrify, purges ſmartly, in the Quantity of a Dram.

Mr. *Ray*, from his own Experience, tells us, that Cucumbers are a very wholſome Food, provided, after cutting them into thin Slices, they are ſhak'd well, ſo that a great deal of their Moiſture may be got out, and then ſeaſon'd with Oil, Vinegar, and Pepper. He farther informs us, that in a Fever which he labour'd under at *Florence*, he took the Pulp of Cucumber boil'd in Broth, by the Directions of Dr. *Kirton*, an *Engliſh* Phyſician; and that he found from it great Relief.

2. Cucumis; ſativus; vulgaris; fructu albo. *C. B. P.* 310. *Var. a.* THE WHITE CUCUMBER.

3. Cucumis, flexuoſus. *C. B. P.* 310. *Cucumeres, longiſſimi. J. B.* 2. 247. *Cucionti, oblongus.* Dod. p. 662. a. THE LONG TURKEY CUCUMBER.

4. Cucumis; Ægyptius; rotundiſolius. *C. B. P.* 310. *Cucumis Ægyptiis Chate.* J. B. 2. 248. a. *Boerh. Ind. alt. Vol.* 2.

The *Chate*, or *Egyptian* Cucumber, has Leaves which are ſmaller, more white, ſoft, and round, than thoſe of our Garden Cucumber. The Fruit is longer, more green, has a ſmooth, ſoft, even Rind, and a ſweeter Taſte than the other. The *Egyptians* eſteem this a very wholſome Food; and the Phyſicians allow ſome Patients labouring under Fevers, and the Plague, to eat them crude, being perſuaded, that they are in theſe Caſes of ſingular Uſe. They preſcribe them alſo boil'd in burning Fevers, with a View of refrigerating and moiſtening. They are taken, boil'd in Milk, in all hot Diſorders of the urinary Paſſages, with very good Effect; and Emulſions of the Seeds are alſo exhibited in the ſame Diſorders. The contus'd Pulp, mix'd with Milk, is apply'd to Inflammations of the Eyes, and of other Parts. The Juice, mix'd with Milk and Oil of Roſes, is apply'd externally to Parts affected with arthritic Pains ariſing from a hot Cauſe. They direct alſo the diſtil'd Water to be taken for many Days together, with a View of correcting hot Intemperatures of the Liver, and of curing Inflammations of the Kidneys, and relieving under the Stone, and this with very good Succeſs, as we learn from *Proſper Alpinus de Plantis Ægypti.*

CUCUMIS SYLVESTRIS, or CUCUMIS ASININUS. See ELATERIUM.

CUCUPHA. *Cucupha*, *Cucullus*, *Pileolus*, *Byrethrum*, and *Birrethus*, are ſo many Names, by different Authors given to what in *Engliſh* we call *an odoriferous Cap for the Head.* This is a kind of Bag appropriated to Diſeaſes of the Head. It is made in the Form of a Mitre or Night-cap, either of Pieces of thin Silk or Linen ſtitch'd together at proper Diſtances. Between theſe Pieces of Cloth are put proper Cephalic Species, either cut ſmall, or reduc'd to a groſs Powder. Theſe Species are ſometimes intermixed with Cotton, before the internal and external Parts of the Cap are ſued together, that they may remain equally diſpers'd, and render the Cap ſofter and more commodious for the Patient. Theſe Species are alſo generally ſprinkled either with ſome diſtil'd Oil, or Spirit, or Vinegar, according to the Intention of the Phyſician. It is to be apply'd to the Head, under ſome proper Covering, to prevent its falling off; or it may be ſew'd to the Inſide of a Cap. Sometimes two Cucuphas are order'd, one to be worn in the Night-time, and the other, which is ſew'd to the Hat, is intended for the Day. When Half of the Head is only to be cover'd, in a Hemicrania, for Inſtance, or when the Application is only to be made to a particular Part of the Head, the Preparation us'd is call'd a *Semicucupha*. Cucuphas are to be worn ſo long as the Phyſician ſhall judge them beneficial for the Diſorder they were intended to remove; and, if the Uſe of them is to be long perſiſted in, the Ingredients are to be renew'd, when they have loſt their Virtues. The Species us'd for theſe Intentions are generally preſcrib'd in the following Proportions; that is, one Ounce of Roots, two or three Handfuls of Leaves, two or three Pugils of Flowers, between one and two Drams of ſome proper Gum, and of Powders one Ounce. The Quantity of the whole Preſcription rarely exceeds four Ounces; and, according to ſome, two, leſt the Head ſhould be too much burden'd by it. But this will be better underſtood by Examples, the firſt of which we ſhall take from *Hoffman's Conſult. & Reſponſ.*

Take of the Root of Florentine Orris one Ounce; of Amber, the beſt, Benjamin, Storax, and Cloves, each two Drams; of the Herb Marjoram one Handful; of the Flowers of Lavender, Roſemary, and Roman Chamomile, each four Pugils: Mix up into a Powder, to be made into a Cucupha for ſtrengthening the Head in Vertigos.

The other occurs in the ſame Author's *Medicina Rationalis Syſtematica*, and is prepar'd in the following Manner:

Take of the Roots of the Long Cyperus, of the Seeds of Fennel-flower, of Amber, Benjamin, Storax, and Florentine Orris, each one Ounce; of Muſk, half a Dram; of the Flowers of Roſemary, Lavender, and Roſes, each three Pugils; of Mother of Thyme, and Marjoram, each half an Ounce: Make into a Powder, to be uſed in Cucuphas, for defending the Head againſt cold and moiſt Intemperatures of the Air; as alſo in Defects of the Hearing, ariſing from a Laxity of the Parts.

Cucuphas act by virtue of the exhaling Species they contain, either by ſtimulating, contracting, and corroborating; or by relaxing the external Skin of the Head, and conſequently

by heating or refrigerating, ſince by that means their Virtues are more thoroughly convey'd into the Veſſels thro' the Pores; for Cucuphas may operate in theſe ſeveral Manners. But the Phyſician in his Choice of the Ingredients ought to be directed by the Nature of the Diſeaſe, and the particular Conſtitution of the Patient. From what has been ſaid, it plainly appears to be an Error, that aromatic and heating Subſtances are the only proper Ingredients in Cucuphas, intended for the Removal of cold and catarrhous Diſorders; for *Stahl*, in his *Diſſertatio de Multitudinis Remediorum Abuſu*, juſtly obſerves, that we ſhould be very cautious in the Uſe of theſe Subſtances: "For, ſays he, the more attentive Practitioners "have long ago obſerv'd, that not only the daily, but the "frequent Uſe of Cucuphas, compos'd of what we call the "nervino-cephalic and odoriferous Species, whether for cor-"roborating the Head in general, or the Memory in parti-"cular; whether for curing Vertigos, or removing that "Drowſineſs with which cold Catarrhs are accompanied; do "often more Harm than Good, eſpecially in plethoric Ha-"bits. But the leaſt Diſadvantage, attending the Abuſe of "theſe Things, is, that they generally render Patients ſo de-"licate and ſenſible of the ſmalleſt Changes of Heat and "Cold, that by theſe very Changes they are afterwards much "diſorder'd, and their Heads ſurpriſingly diſturb'd." A prepoſterous and immoderate Uſe of refrigerating Cucuphas is not a little hurtful to the Body, by obſtructing Perſpiration, and driving the Humours inwards. There are various Species directed for this Intention in the ſeveral Diſpenſatories, ſuch as the *Species pro Cucupha Francofurtenſium* in *Schrod. Pharmacop.* the *Pulvis* and *Cucuphas* in *Lemery's Pharmacopée univerſelle*; and the *Species Cephalicæ pro Cucuphis* in the *Diſpenſat. Brandenburg.*

CUCURBITA. The Gourd.

The Characters, according to *Miller*, are,

It hath a Flower conſiſting of one Leaf, which is of the expanded Bell-ſhape, for the moſt part, ſo deeply cut, that it ſeems to conſiſt of five diſtinct Leaves. This, like the Cucumber, has Male and Female Flowers on the ſame Plant: The Fruit of ſome Species is long, of others round, or Bottle-ſhaped, and is commonly divided into ſix Cells, in which are contain'd many flat oblong Seeds, which have ſometimes a Border round them.

1. Cucurbita lagenaria; flore albo; folio molli. *C. B. P.* 313. *Hiſt. Oxon.* 2. 23. *Boerh. Ind. A.* 2. 80. *Cucurbita*, Offic. *Cucurbita lagenaria*, Ger. 777. Emac. 923. *Cucurbita lagenaria major*, Park. Theat. 769. *Cucurbita lagenaria*, J. B. 2. 216. Raii Hiſt. 1. 632. Tourn. Inſt. 107. Elem. Bot. 89. Chab. 129. THE GOURD.

This will grow, in a ſuitable Soil, to be a large Plant, with great thick-corner'd rough Stalks, running a great Way on the Ground, or climbing by its Tendrils on Trees, Hedges, or any thing it meets with. The Leaves are large, rough, woolly, and corner'd; among which grow large, white, ſingle-leaved Flowers, as big as white Lilies, and much of their Shape, full of ſoft Downineſs on the Inſide, and a little hairy without; which are ſucceeded by large Fruit, in Shape of a Bottle, which will ſometimes hold ſeveral Quarts, whoſe Outſide is a hard, but brittle Shell, containing a juicy Pulp, full of flattiſh oblong whitiſh-brown Seed. The Root is but ſmall, in proportion to ſo large a Plant, being full of Fibres, and dying every Year. It is ſown annually in rich Ground, flowering in *July*; and the Fruit is ripe here in *September*. The Seed is only uſed.

This Seed is one of the Four greater cold Seeds, being uſed as the Seed of the reſt, in cooling and diuretic Emulſions. *Matthiolus* ſays, that the green Leaves, applied to the Breaſts of Nurſes, dry away their Milk; and ſome commend a Water diſtil'd from the green Fruit, beaten to a Pulp, as very good to cool ſore inflamed Eyes. *Miller's Bot. Off.*

The Seeds ſhould not be kept above a Year; for, after that, they grow rancid and inflammatory.

2. Cucurbita; ſalcatâ figurâ; folio molli; flore albo. *C. B. P.* 313. *Cucurbita, ſive Zucchia, omnium maxima, anguina.* Lob. Ic. 644. THE SICKLE-SHAPED GOURD, WITH A SOFT LEAF, AND A WHITE FLOWER.

Boerh. Ind. alt. Plant. Vol. 2.

CUCURBITA alſo ſignifies a Cupping-glaſs. See CUCURBITULA.

CUCURBITA. A *Cucurbit*. This is a chymical Veſſel, ſo call'd from its Reſemblance to a Gourd; for it gradually ariſes from a wide Bottom, and terminates in a narrow Neck. The *Germans* call it *Kolbe*, from the ſuppoſed Reſemblance it bears to *Hercules*'s Club. Some give it the Name of *Vas Urinale*, becauſe a Glaſs Veſſel of its Figure, only with a wider Neck and Mouth, is generally uſed for inſpecting the Urine of ſick Perſons. This Inſtrument is of much Uſe in chymical Diſtillations, if a Capital, or an Alembic, with a Worm, is fitted to it; and, in Digeſtions and Sublimations, if a blind Alembic is adapted to it. The more the Wideneſs of the Bottom, at its largeſt Part, ſurpaſſes the Narrowneſs of the Neck, and the narrower and longer the Neck is, with the greater Difficulty is the Liquor in the Cucurbit diſtil'd. Upon theſe Circumſtances depends the Choice we ought to make of Cucurbits; ſo that the leſs any Body is obedient to the Fire, which ought to raiſe it, Cucurbits the more receding from the now-mention'd Conditions ought to be uſed, and *vice verſa*. It is call'd a blind Cucurbit, when a ſmall inverted Cucurbit is adapted to another in ſuch a manner, that the Neck of the one is inſerted in that of the other. The Veſſel call'd a *Circulatory* is one of this Kind. Their principal Uſe is in performing Digeſtions and Sublimations. Cucurbits are divided into thoſe of a larger, an intermediate, and a ſmaller Size, which laſt are call'd ſeparatory Cucurbits. If the Belly, or inferior Part, of the Cucurbit is of a ſpherical Figure, with a long cylindrical Neck, it is call'd a Matraſs, or a Bolt-head, which, according to *Boerhaave*, is of incredible Uſe in performing the moſt curious chymical Operations; for, ſince the Length of the Neck, and its Narrowneſs, in proportion to the Wideneſs of the Belly, may be enlarged at Pleaſure, 'tis ſufficiently obvious, that ſuch a Degree of Reſiſtance may be procured to the Liquor contain'd in the Cucurbit, that ſcarcely any of it ſhall aſcend thro' the Mouth of the Veſſel. But, in Veſſels of this Kind, we are, above all Things, to conſider the Preſſure of the Atmoſphere, which, poſſeſſing the Cavity of the Neck, ſurpriſingly compreſſes the Liquors and Bodies contain'd within, and agitated by the Fire. This Column of Air is, as it were, a Covering to the Aperture of the Veſſel, which preſſes equally every-where, and proves a Reſiſtance to the Liquors endeavouring to riſe; for whilſt, by the Heat of the Fire, the rarefied Air, in the Belly of the Cucurbit, endeavours to raiſe the whole ſuperincumbent Column of the Atmoſphere, it meets with an equal Reſiſtance from the Weight of this Column; by which means the liquid Particles, contain'd in this rarefied Air, are repel'd to the Bottom of the Veſſel: Hence it happens, that the Parts agitated by the Fire are powerfully applied to the Bodies lodged in the inferior Part of the Cucurbit. This Phenomenon may be ſubjected to the Sight, when Alcohol of Wine is prudently expoſed to the Fire, in ſuch a long and ſtraight-neck'd Cucurbit; for, when the Liquor becomes ſo hot as to be almoſt boiling, a Smoak-like Exhalation is obſerved to riſe in the Cavity of the Neck, which is again depreſs'd in the Form of a ſmall fluctuating Cloud. By this Expedient the Digeſtions of Menſtruums, with the ſeveral Subſtances to be reſolved in them, are conveniently carried on, without any Loſs, either of the Menſtruum, or of the Body to be deſolved; a Circumſtance, which, in Chymiſtry, contributes to the Performance of many Experiments, which could not otherwiſe be made. Beſides, theſe long-neck'd Cucurbits are ſingularly uſeful in ſeparating pure alcaline and volatile Spirits and Salts from Water, Oil, and volatile Earth; for theſe Principles are, with great Difficulty, ſeparated from each other. One Diſadvantage, however, attends Cucurbits of this Kind; for, when they are very long, then the boiling Liquor, at the Bottom of the Veſſel, not being able to riſe ſo high, leaves the higheſt Part of the Neck cold, whilſt its inferior Part is intenſely hot: Hence, if the Steam ſhould happen to riſe ſuddenly upwards, it will, by its ſudden Heat, burſt the Neck of the Veſſel, eſpecially in the Winter-time, or in froſty Weather. Another Diſadvantage attending long-neck'd Cucurbits is, that the Drops, collected in the ſuperior Part of the cold Neck, falling down to the intenſely hot Parts of the Belly or Neck, burſt the Veſſel in theſe Parts. Cucurbits are, for the moſt part, made of Glaſs; only ſometimes, for Diſtillations, eſpecially in an open Fire, earthen Cucurbits, call'd alſo *Canthari figulini*, are uſed. Thoſe made of Copper, and lined with Tin, are call'd *Veſicæ Diſtillatoriæ*. In what Manner, by means of Cucurbits, Diſtillations, Digeſtions, and Sublimations are made, is to be ſeen under their ſeveral Articles. As for the Cucurbits uſed in trying Gold and Silver, by means of a Separation, with the Aſſiſtance of *Aqua-fortis*, we muſt obſerve, that they ought not to be of Cryſtal, but of the beſt common Glaſs, which, without ſuffering any Corroſion, bears the Action of the corroding Menſtruums, and the Fire: Nor ought they to be too thick, eſpecially in the Bottom, ſince, when they are ſo, they ſoon crack, when put upon the Tripod. They are eight or ten Inches high, and their Orifice is not above half an Inch in Diameter, leſt, if a violent Efferveſcence ſhould happen in the Matter contain'd in the Veſſel, it ſhould either come over the Lips, or leſt ſome Part of it ſhould be carried off in the Form of ſmall Drops, reſembling thoſe of a gentle Rain, to which ſome of the diſſolved Metal always adheres. By this Narrowneſs of the Neck, the Steams are alſo more effectually reverberated, and beat back. The Belly of this Species of Cucurbit is ſufficiently large, if it contains an Ounce or two of Aqua-fortis. It is alſo proper, that the Mouths of theſe Cucurbits ſhould be turn'd outwards, with a kind of broad or reflected Margin, that the Solutions, when pouring out, may not run down their Sides.

CUCURBITULA, *σικύα*. A Cupping-glaſs, ſo call'd at preſent, becauſe uſually made of Glaſs. But the Cupping-glaſſes of the Antients were made of various Materials, as Horn, Copper, or Glaſs. The Uſe of Cupping-glaſſes is very antient. *Hippocrates* frequently directs them either with or without Scarification.

The Phyſicians of the Methodic Sect made great Uſe of them, with a View of relaxing. They began to apply them the ſecond or third *Diatritos*, that is, the fifth or ſeventh Day of the Diſeaſe, provided it was an acute one. With theſe they uſed almoſt to cover the Patient, in moſt kind of Diſorders. In a Phrenitis, for Example, they apply'd them upon the Head, and the neighbouring Parts, round the Neck, upon the Thighs, the Belly, the Back, and the Hypochondria.

The Methodics generally uſed Scarification with their Cupping; or elſe apply'd Leeches to the Part; and, as ſoon as ever they were full, and fell off, they apply'd their Cucurbitulæ to draw what Quantity of Blood they thought neceſſary.

Sometimes they apply'd them, without any Scarification at all. Theſe they call *Leves*, *λίφας*. *Cœlius Aurelianus*, *Acut. L.* 2. *C.* 29.

They made uſe of others, which were call'd *Arentes*, and *Siccatæ*, by *Cœlius Aurelianus*, *Acut. L.* 1. *C.* 11.

The Cucurbitulæ of the Antients were generally made of Copper, ſome with narrow Mouths, in order to attract more forcibly; others had their Mouths larger, and the Edges bent outwards, that they might not draw too forcibly. *Cœlius Aurelianus*, *Acut. L.* 3. *C.* 17.

For the moſt ſenſible Parts they had them made of Glaſs or Clay. They had others alſo made of Horn. *Cœlius Aurelianus.*

They always made uſe of Fire with thoſe of Copper or Glaſs: But, as *Antyllus* writes, thoſe of Horn were uſed with Suction by the Mouth, having a Perforation at the Top for that Purpoſe.

The Application of Cupping-glaſſes, and taking away Blood by their Means, was very frequently practiſed among the Antients, as we learn from *Hippocrates*, *Celſus*, *Galen*, and others. But theſe Inſtruments are now neglected, and quite diſuſed, in many Countries; in *Germany*, particularly, they are no-where in Faſhion, but among the Retainers to the Baths, who are accounted a lower Rank of Surgeons. However, ſince they come under the Conſideration of Surgery, as the Operations perform'd by them are truly chirurgical, we think ourſelves obliged to give a brief Explication of their Uſe and Manner of Application. The Uſe of Cupping-glaſſes is very extenſive, comprehending almoſt the whole Body: But their Application is to be conſider'd under two different Circumſtances; for they are either apply'd to the Place, firſt ſcarify'd with a Knife, or to a whole Skin: This latter is call'd a *dry*, and the other a *ſanguineous* or wet Cupping. The Figure, which is common to them both, is repreſented *Tab.* 33. *Fig.* 1. In the dry Cupping, before the Application of the Glaſs, a lighted Candle, or Fire, is to be convey'd into it, that the Air being expel'd by the Heat, the Glaſs may immediately be adapted to, and impreſs'd upon the Body, till it firmly adheres with a ſtrong Attraction; an Operation which the Practitioners at the Baths perform with great Dexterity. The View of the Operator, in this dry Cupping, is either to make a Revulſion of the Blood from other Parts, or elſe to invite it to the Place where the Glaſs is apply'd: Hence we ſee the Reaſon why *Hippocrates*, *Sect.* 5. *Aph.* 50. preſcribes the Application of a large Cupping-glaſs under the Breaſts of Women affected with too profuſe a Diſcharge of the Menſes, which was in order to cauſe a Revulſion of the Blood upwards from the Uterus. And, upon the ſame Principle, I have myſelf, in a profuſe Hæmorrhage at the Noſe, and in Spitting of Blood, ſucceſsfully apply'd them to the Feet, the Calves of the Legs, and juſt above the Knees. *Sculteſus*, *Obſ.* 85. gives us a remarkable Inſtance of a Woman, who, by the repeated Application of ſix Cupping-glaſſes, without Scarification, was not only relieved from the troubleſome Symptoms cauſed by an Obſtruction of her Menſes, but was alſo thereby freed from the Obſtruction itſelf. Dry Cupping is alſo of Uſe in Pains of the Head, Vertigo, and other Diſorders of that Part, by making a Revulſion, with the Glaſſes apply'd on the Head, to the Temples, behind the Ears, to the Neck or Shoulders. So *Celſus*, *Lib.* 4. *Cap.* 2. in violent Pains of the Head, preſcribes Application of Cupping-glaſſes to the Temples, and back Part of the Head. In Palſies of the Members they are apply'd to the Hands and Feet, in order to provoke the Influx of the Blood and Spirits into the affected Parts; and in the Sciatica, or Pain of the Hips, or other Parts, they are apply'd to the Places affected. In all theſe Caſes the Operation is to be repeated, till the Part appears very red, and is pain'd.

In *Germany*, and in other Northern Countries, Cupping is much oftener join'd with Scarification. In this Caſe the Part is firſt to be dry-cup'd, till it looks red; after which the Skin is to be cut, with about ſixteen or twenty Inciſions, made with a ſmall Inſtrument call'd a ſcarifying Lancet, repreſented *Tab.* 2. *Fig.* 33. Theſe Wounds are to be made ſo cloſe to each other, that the Cupping-glaſs may be able to cover them all, and to draw Blood out of them. See *Fig.* 3. The Operator muſt begin his Inciſions in the loweſt Part, and aſcend gradually; for, otherwiſe, the Profuſion of Blood from the Inciſions in the upper Parts might obſtruct his Work in the lower Parts. Having ſcarify'd the Skin, the Cupping-glaſs, firſt heated with a Candle, is to be apply'd, which, from the Preſſure of the external Air firmly adhering to the Part, draws the Blood from the Inciſions. But as it is cuſtomary for ſeveral Glaſſes, as four, ſix, or eight, and ſometimes more, according to the Diſcretion of the Phyſician or Operator, or the Will of the Patient, to be at one time apply'd to different Parts of the Body, the Buſineſs of Scarification is to be ſo managed, that, while the firſt Glaſs adheres and draws, the reſt may be apply'd, with Scarification, after the ſame Manner; which done, the firſt is to be removed, and the Blood pour'd into a Veſſel; then the Glaſs is to be waſh'd out with warm Water, the Skin cleanſed with a Sponge, dipt in the ſame, and the Sponge again apply'd as before. When the Blood too ſoon ceaſes to flow, freſh Inciſions are to be made, and the Glaſſes apply'd, till a ſufficient Quantity of Blood be taken away; or, as it uſually happens, till it ſtops of itſelf. The Operation being finiſh'd, the wounded Parts are cleanſed with a Sponge and warm Water, and anointed with ſome Fat, to promote Conglutination. But, if the Blood continues to flow, which happens but ſeldom, you are to waſh the Parts with Spirit of Wine, or *Hungary* Water, and bind them up with Bolſters, and a Bandage.

The modern Surgeons have, for Convenience to themſelves, and Eaſe to the Patient, contrived an Inſtrument, conſiſting of ſixteen ſmall Lancet-blades, fix'd in a cubical Braſs Box, with a Steel Spring. See *Tab.* 33. *Fig.* 4. The Side C. C. C. C. of this Inſtrument is apply'd to the Skin; and the Spring, conceal'd within, is raiſed by the Plate *A.* as with a Lever; when, on a ſudden, by depreſſing the Button B. it falls with ſuch a Force as to ſtrike the Edges of the prominent ſixteen Blades, all at once, into the Skin, making ſixteen ſmall Inciſions, over which the Cupping-glaſs is to be apply'd, as before directed. We have the Figure of a Scarificator, not much differing from this, in M. *Paré*'s Surgery, *Book* 11. *Chap.* 5. and, after him, in *Lambzweerde*'s Notes on *Sculteſus*'s *Armamentarium Chirurgicum*. But neither of theſe Authors propoſes any other Uſe of this Inſtrument, than to ſcarify the Parts affected with a Gangrene; whereas this before us is uſed with good Succeſs by our Cuppers, in all manner of Diſeaſes which require Scarification, as I have often ſeen, and have myſelf experienced. M. *Garengeot*, indeed, *Tr. de Inſtr. Chir. Tom.* 1. explodes it, as a bad and uſeleſs Inſtrument; but, perhaps, that Gentleman never ſaw it uſed, tho' nothing is more common than this Method among us.

Scarifications are frequently uſed in various Parts of the Body, particularly in the Head, Neck, on or between the Scapulæ, behind or under the Ears, in the Occiput, Back, and Loins, Arms, and Legs, and eſpecially near the Ankle-bones; of which laſt *Mannus* has written a particular Treatiſe, intituled, *De Malleolorum Scarificatione ex Veterum ſententia*, wherein he highly extols it. *Rhodius*, *Cent.* 3. *Obſ.* 17. ſays, that he had obſerved it attended with Danger; but this ſeems to be by Accident. To proceed: Scarifications are of Uſe in various kinds of Diſorders, which, thro' a Redundance of Blood, require Revulſion, Derivation, or Evacuation. Of this Sort are ſeveral Diſeaſes incident to the Head, particularly of the Eyes, Ears, Tonſils, and Uvula, Head-ach, Stuffings of the Head, Ophthalmies, Amauroſis, and Cataracts. In all theſe Caſes it is ſcarce poſſible to expreſs the great Benefit which may be receiv'd from Scarification, eſpecially if uſed at a proper time, and judiciouſly repeated at proper Intervals. Nor is this Operation much leſs beneficial than Phlebotomy to thoſe Patients, whoſe Veins are ſo ſmall as to render it impracticable to take any Blood from them with the Lancet, as it often happens, and yet ſtand in Want of ſuch an Evacuation: The Uſefulneſs of this Method, in ſuch a Caſe, I have ſeveral times experienced. That ingenious and ſkilful Phyſician *Morgagni*, *Adverſar. Anatom.* adviſes Scarification of the Veins of the Occiput in Apoplexies, and comatous Diſorders, being convinced of their ſurpriſing Efficacy, both from Reaſon and Experience. And *Zacutus Luſitanus* relieved a Patient from a dangerous Apoplexy by repeated Scarifications of the Occiput. This, indeed, ſeems to be the fitteſt Method for diſcharging the Blood, ſtagnating in the Veins of the Brain, which have a Communication with thoſe of the Occiput; and reſtoring its uſual Motion: But, then, *Morgagni* directs profound Scarification. This Scarifying of the Occiput is no leſs ſerviceable in Inflammations of the Eyes; and *Lantiſi*, a celebrated Author, aſſures us, that in a Pleuriſy, eſpecially a Baſtard Pleuriſy, a deep Scarification of the affected Side, after Phlebotomy premiſed, affords ſpeedy and ſurpriſing Relief. But it is to be obſerved, that Scarification, like Phlebotomy, is

one

one of thoſe ſtated Remedies, which are repeated at certain Seaſons of the Year, and, being neglected, after the Patient is once accuſtom'd to them, endanger a Return of the ſame or even worſe Diſorders.

I muſt confeſs, indeed, that there are many among our Phyſicians and Surgeons, who would perſuade us, that Scarification is of little or no Efficacy; and the principal Reaſon they offer is, that, by this Operation, only that Blood is diſcharged which lodges betwixt the Fleſh and the Skin. But, with due Deference to their Authority, this Opinion of theirs ſeems too haſtily form'd, and without juſt Foundation; for I am convinced, by my own Experience, and that of many eminent Phyſicians, that as much, and as thick, Blood has been diſcharged by Scarification as by Phlebotomy; and conſequently the moſt ſevere and dangerous Diſtempers, which proceed from a Plethora, may be cured by this Method as well as by Veneſection: I dare even aſſert, for good Reaſons, that, on ſome Occaſions, Scarification far excels Phlebotomy in this reſpect; that the Cupping-glaſſes, by their firm Adherence to the Skin, not only draw out, but attract the Blood, with extraordinary Force, from all Parts, to a determinate Place; for which Reaſon it gives ſpeedy and effectual Relief in many Diſorders of the Head, Eyes, and Ears, ſoporific Diſorders, Inflammations of the Tonſils, Pains of the Joints, Hæmorrhages, and other Diſeaſes of that Kind.

Again, there are other Phyſicians, who imagine Scarification to be not only uſeleſs, but pernicious; and they think themſelves ſupported in their Opinion by Inſtances, where Scarification, adminiſter'd at an unſeaſonable Time, or with impure and infected Inſtruments, has produced moſt fatal Effects, and even Death itſelf. Thus *Hildanus*, *Cent.* 5. *Obſ.* 71. remarks, that a Palſy was produc'd by this Operation; which, however, might proceed from many other Cauſes. The moſt pure and innocent Perſon, ſay they, may be in Danger of contracting ſome foul Diſeaſe, by being ſcarify'd with an Inſtrument which had not long before been uſed upon one infected with the Lues Venerea, Leproſy, Itch, or other contagious Diſeaſes; and, by this means, the Infection may be communicated almoſt in the ſame manner as the Small-pox is by Inoculation. *See* Jordanus, *Of the new Lues broke out in* Moravia; Sporiſchius, *Of the dreadful Symptoms ſucceeding the Uſe of Scarification and Cupping, at* Brin *in* Moravia; with the *Obſervations of* Libavius *concerning a malignant Scarification*, extant in *Horſii Obſ. Lib.* 4. But, whatever Weight this Objection may ſeem to carry with it, it is not ſufficient to induce us to condemn and reject Scarification; for if it were, we muſt, for the ſame Reaſon, diſcard Phlebotomy, which is ſubject not only to other dangerous Accidents, but to the ſame as are charged upon Scarification, if the Lancet be not well cleaned. Wherefore, that the Patient may have nothing to fear on this Account, he ought to employ none but ſuch as are neat and cleanly for his Surgeons or Cuppers, and who uſe none but the cleaneſt and brighteſt of Inſtruments. But, if thoſe who require Scarification cannot otherwiſe think themſelves in abſolute Security in this reſpect, I would adviſe them to provide proper Inſtruments and Scarificators of their own for the Operation, which they may always keep as clean and dry as they pleaſe for the Purpoſe.

There is another Method of Scarification, beſides the above-deſcrib'd, uſed by Surgeons in violent Inflammations, recent or confirmed Mortifications, peſtilential Carbuncles, and the like; in which Caſes it has been found highly ſerviceable to make many ſmall Inciſions in the Skin with a proper Knife or Lancet, in order to diſcharge the ſtagnant and putrefying Blood, tho' without the Aſſiſtance of Cupping-glaſſes. This Kind of Scarification is uſually denominated *Chirurgical*, to diſtinguiſh it from what is uſed by the Cuppers. Its principal Uſe is in Gangrenes and Mortifications, but ſome recommend it alſo in ſwell'd Feet, and in a Hydrocephalus, and in hydropical Affections, eſpecially of the Scrotum. For, whenever any Member, for Inſtance the Leg, is ſo diſtended by a Dropſy, as to endanger burſting of the Skin, it may be proper to ſcarify the Part in order to evacuate the noxious Humours. But this muſt be done with Caution; for except Nature, on account of the exceſſive Diſtention of any Member, requires Relief from the Lancet, we muſt abſtain from the Operation, for fear of a Gangrene or Sphacelus, which often happen in ſuch a Caſe, and deſtroy the Patient. *Pliny*, *Hiſt. Lib.* 28. *Cap.* 1. and 11. adviſes Scarification of the Gums in the Tooth-ach, which, in my Opinion, is not improper on many Occaſions.

Of much the ſame Nature with Scarification is the Method uſed by the *Egyptians*, and recommended by *Celſus*, *Lib.* 4. *Cap.* 2. where he directs taking of Blood from the Noſtrils in the Head-ach; and by *Aretæus*, *De Curat. Chron. Morb. Lib.* 1. *Cap.* 11. Their Cuſtom is to inflict many ſmall Wounds on the Inſide of their Noſtrils, on the Ears, Lips, and Gums, which Practice is ſometimes attended with ſurpriſing Succeſs, in mitigating Inflammations, and in ſeveral other Diſorders. See *Proſper Alpinus*, in *Med. Ægypt.* and *Stahlius*, *de Scarific. Narium Ægyptiaca.* None, I believe, are ſo ignorant as not to know what extraordinary Benefit and Relief to labouring Nature reſult from an Hæmorrhage at the Noſe. The ſame People have another Practice, which is, to beat the Calves of their Legs with Cudgels till they look red, and then to ſcarify, or make ſmall Inciſions in them, by which means they procure a powerful Revulſion of the Humours in violent Inflammations of the Brain, Deliriums, Fevers, and want of Sleep. See *Proſper Alpinus*, *Med. Ægypt. p.* 72. where you have a Figure of this Practice. At preſent theſe Methods of Cure are grown almoſt out of Uſe among *European* Nations.

Some of the antient Phyſicians and Surgeons, in Imitation of *Hippocrates*, the great Founder of their Art, had a Cuſtom, in ſeveral Diſorders of the Eyes, of ſcarifying the Inſides of the Eyelids, and even the Eyes themſelves, with a proper Inſtrument for the Purpoſe, as appears very plain from the Treatiſe of *Hippocrates*, *de Viſu*. Phyſicians of great Eminence ſince *Hippocrates* diſus'd this Practice, and it had for a long time been neglected, till it was revived in our Age by one *Woolhouſe*, an *Engliſh* Phyſician, at *Paris*; and has, ſince him, been exercis'd with tolerable Succeſs, as we are told, by others: But for the Inſtrument, and Manner of performing the Operation, we ſhall refer to the Article Oculus. *Heiſter*, *Chirurg.*

CUDU-PARITI. The Name of a Shrub which grows in *Malabar* to about twice the Height of a Man, and which flowers all the Year round. The Leaves bruis'd, mixed with Milk, and apply'd to the Head by way of Ointment, procure Sleep, and remove Head-achs and Vertigoes. The Fruit bruiſed, and drank with Water, ſtops a Dyſentery, and is good for Chaps in the Mouth. *Raii Hiſt. Plant.*

CUIETE. A Name for the *Arbor Cucurbitifera Americana folio ſubrotundo.* Marcgr. & Piſon.

CUIPOUNA. The Name of a Tree which grows in *Braſil.* The Juice of the Bark of that Species which bears yellow Flowers, expreſſed, and mixed with fair Water, cleanſes and incarns inveterate Ulcers. *Raii Hiſt. Plant.*

CULATUM. Calcin'd. *Rulandus.*

CULBICIO. A Sort of Strangury, or rather a Heat of Urine. *Caſtellus* from *Velſchius.*

CULEUS. The greateſt Meaſure among the *Romans*, of liquid Things was the *Culeus*, or *Culleus*, containing twenty *Amphoræ*. *Rhemnius Fannius.*

Eſt & bis decies quem conficit Amphora noſtris,
Culeus: hoc nulla eſt major menſura liquoris.

For *noſtris* undoubtedly it ſhould be read *noſtra*. *Pliny*, *Lib.* 14. *Cap.* 4. interprets ſeven *Culei* one hundred and forty *Amphoræ*. When, ſaith he, oftentimes each Acre will yield ſeven *Culei* of Wine, that is, one hundred and forty *Amphoræ*. A *Culeus* likewiſe contains forty *Roman Urns*, an *Urn* being the half of the *Amphora*.

Columella, *Lib.* 3. *Cap.* 3. reckons the *Culeus* of Wine at the Vineyard worth three hundred *Nummi*, or ſeventy-five *Denarii*, that is, according to *Engliſh* Rate, one hundred and forty-three Gallons, three Pints, and a half, for 2 *l.* 8 *s.* 5 *d.* $\frac{1}{4}$. which is about a Halfpeny the Pint.

The *Culeus* likewiſe contain'd 160 *Congii*, or 960 *Sextarii*. We read of *Dolia Culearia*, and *Seſquiculearia*. *Dolia Seſquiculearia* muſt have been very large, being about 3 $\frac{1}{2}$ Hogſheads, and ſo therefore larger than our Pipes. *Culeus* ſignifies ſometimes a Leathern Sack. *Arbuthnot.*

CULMUS.

The *Culmus* and *Culmen* of the *Latins*, and the καλαμὸς of the *Greeks*, are what we call a Stalk of Corn or Graſs. In Graſſes and Corns the *Culmus* or Stalk correſponds to the *Caudex* or Trunk in Trees, and to the *Calamus* in the Cyperus and Bulruſh; ſo that it generally denotes that Part which reaches between the Root and the Ear or Panicle. Hence it appears, in general, what Plants are of the culmiferous Kind; but theſe are variouſly limited by the Founders of different Botanic Syſtems, who have adopted them for conſtituting ſome Genus of Plants. Thus, for Inſtance, according to *Moriſon*, to this Claſs belong all herbaceous Plants, which ſend forth a ſingle Seed after each Flower, are furniſhed with ſtraight arundinaceous Leaves, and are commonly call'd Graſſes and Corn. Theſe have their Seeds either naked and decorticated, or covered and wrapt up in Coats and Membranes. Both theſe are divided either into the ſpicated Kind, or into ſuch as have ſcatter'd Ears. According to Mr. *Ray*, culmiferous Plants are ſuch as ſend forth a Stalk which is round, geniculated with knotty Joints, hollow for the moſt part, with a ſingle Leaf at each Geniculation; and theſe Leaves are ſlender, riſing gradually from a broad Baſe, and terminating in an acute Point. The Plants of this Kind have either a large Seed uſeful for making Bread, and theſe are call'd frumentaceous Plants: Or they are ſuch as have a ſmall Seed, and theſe are call'd Graſſes; tho', properly ſpeaking, Corn and Graſſes do not differ as to their Genus. Both theſe Species Mr. *Ray* divides into thoſe of the ſpicated, and thoſe of the paniculated Kind; but he claſſes them all under the

the common Genus of graminifolious Herbs, with a ſtaminaceous Flower. According to *Herman*, culmiferous Plants are ſuch as are apetalous, furniſhed with an Huſk, and ſtamineous. *Ludwig*, in his *Definitiones Plantarum*, claſſes among the ſtaminaceous Plants, thoſe of the culmiferous Kind, which have their Fruit contiguous to the Flower. According to *Boerhaave*'s Syſtem, culmiferous Plants belong to the monocotyledon and apetalous Kind, and are ſuch as have their Stalks hollow, diſtinguiſhed by Joints, and at theſe Joints rendered firm by a kind of Septum or Diaphragm. From theſe Knots or Joinings ariſe ſingle Leaves, which are ſtraight, arundinaceous, alternate, and, at their Baſe, ſo conſtitute that Part of the Stalk, that, by a careful Separation of them, it is render'd extremely ſlender. Theſe culmiferous Plants are divided into thoſe of the ſpicated, and thoſe of the paniculated Kind. The Stubble of Corn, remaining after the Ears are cut off, is alſo call'd *Culmus*. Hence the Word *Culmare*, if we may believe *Salmaſius*, in his *Exercitationes Plinianæ*, is applied to thoſe who pull up Root and Stalk; and becauſe, in earlier Ages, when Slates and Tiles were not known, the Roofs of Houſes were cover'd with Straw and Stalks, the Tops of theſe Roofs were, for that Reaſon, call'd *Culmina*.

CULMUS. The Stalk of Corn or Graſs. Hence culmiferous Plants are ſuch as have a ſmooth, jointed Stalk, and uſually hollow, and, at each Joiut, wrapt about with ſingle, narrow, ſharp-pointed Leaves; and their Seeds are contained in chaffy Huſks, as Wheat, Barley, *&c.*

CULTER. The third Lobe of the Liver is call'd by this Name in *Theoph. Protaſpatarius*, according to *Caſtellus*.

CULUS. The Anus.

CUMANA *Arbor dicta*, De Laet. *Gacirma*, Nierenberg. Theſe are Names for an *Indian* Tree, like that of the Mulberry, both with reſpect to the Appearance of the Tree, and the Fruit it bears, of which a Syrup is made, ſaid to be good in Coughs and Hoarſneſs. The Wood is ſo hard, that it ſtrikes Fire like a Flint.

CUMANDA GUACU. A Name for certain very large *Indian* Kidney-beans. Theſe roaſted, contus'd, and exhibited with an Egg, are given for Fluxes of the Belly: Boil'd, and made into a Cataplaſm, and applied to the Belly, they are ſaid to cure colic Pains; and they are, in this Form, applied to Apoſtemations, with a View of reſolving them.

There is a ſecond Species, call'd *Cumanda Guara*.

CUMBULU. H. M. *Nux Malabarica unctuoſa Flore cucullato*, D. Syen. *An Adhatoda Zeilanenſium*, Herman?

This is a tall Tree which grows in *Malabar*. The Root, given in Decoction, with the Addition of a little Rice, is ſaid to be of Service in the ſymptomatic Fever, attending the Gout. This Root alſo, exhibited in ſour Milk, is good in Flatulences, and Pains of the Breaſt; bruis'd, and boil'd in Water, it is uſeful in cold languid Fevers; roaſted, and reduced to Powder, it is apply'd to Parts affected with the Gout; taken in ſour Milk, it relieves griping Pains of the Belly; and the Juice of the Leaves, drank, has the ſame Effect. *Raii Hiſt. Plant.*

CUMINOIDES. Wild Cumin.

The Characters are,

It hath Leaves conſiſting of many Lobes, like thoſe of Burnet: The ſmall Flowers, which conſiſt of many Petals, are collected into a round Head: The Petals, or Flower-leaves, are fringed: Each of theſe Flowers are ſucceeded by a ſingle Seed. *Miller's Dictionary.*

Cuminoides; vulgare. *Tourn. Inſt.* 300. *Elem. Bot.* 250. *Boerh. Ind. A.* 132. CUMINUM SYLVESTRE, Offic. Ger. 908. Emac. 1067. Park. Theat. 372. Raii Hiſt. 1. 402. Chab. 384. *Cuminum ſylveſtre Capitulis globoſis*, C. B. Pin. 146. *Cuminum ſylveſtre primum valde odoratum, globoſum*, J. B. 3. 23. *Paſtinaca tenuifolia Cretica capitulis globoſis*, Mor. Umb. Tab. 4. *Daucus odoratus Creticus Sanguiſorbæ capitulis villoſis*, Pluk. Almag. 130. *Umbelliferis affinis, capitulis globoſis & villoſis*, Hiſt. Oxon. 3. 265. WILD CUMIN.

This Plant grows principally in *Crete*. The Part uſed in Medicine is the Seed, which is recommended againſt Gripes and Flatulencies, for curing the Hiccough, for removing Sugillations, and repelling Inflammations of the Teſtes. *Dale.*

CUMINUM. Cumin. *Miller* derives this from κυέω, to bring forth, becauſe it is very efficacious againſt Barrenneſs.

The Characters are,

The Root is annual: The Leaves are like thoſe of Fennel: The Seeds are ſmall, long, narrow, and crooked; two of which ſucceed each Flower, as in the other umbelliferous Plants.

1. Cuminum. *Mor. Umb.* 4. *Hiſt. Oxon.* 3. 271. *Boerh. Ind. A.* 49. *Cuminum*, Offic. *Cyminum, ſive Cuminum Sativum*, J. B. 3. 22. Raii Hiſt. 1. 433. *Cyminum ſive Cuminum*, Chab. 384. *Cuminum vulgare*, Park. Theat. 887. *Cuminum ſemine longiore*, C. B. Pin. 146. *Cuminum ſativum Dioſcoridis*, Ger. 207. Emac. 1066. *Fœniculum Orientale Cuminum dictum*, Tourn. Inſt. 312. CUMIN.

This is a ſmall low Plant, ſeldom growing above a Foot high, with many fine ſlender Leaves like Fennel, but not near ſo large, and winged. The Flowers grow in ſmall Umbels, of a reddiſh-white Colour, each of which is followed by two long, yelloviſh-brown, ſtriated Seeds, of a very ſtrong, not unpleaſant Scent. The Root is ſmall, and periſhes after giving ripe Seed. It is ſown yearly in great Quantities in *Sicily* and *Malta*, from whence we have the Seed, which is the only Part us'd.

Cumin-ſeed is one of the Four greater hot Seeds, and conſiſts of very warming diſſolving Parts, being very good to expel Wind out of the Stomach and Bowels, and is frequently put into Glyſters for that Purpoſe, as well as given in Powder, or infuſed in Wine. Outwardly apply'd, it is of great Service in Pains of the Breaſt or Side, as well as in the Bowels.

The only officinal Preparation is the *Emplaſtrum è Cymino*. *Miller's Bot. Off.*

Emplaſtrum è Cymino: CUMIN PLAISTER.

Take of Cumin-ſeeds, and Bay-berries, each half a Pound; of Ground-pine, four Handfuls: Boil them in twelve Pints of Spring-water; and afterwards, in the ſtrained Liquor, boil ſix Pounds of *Burgundy* Pitch to the Conſiſtence of an hard Plaiſter. Let them ſtand together till almoſt cold, then pour away the ſeparated Decoction. Melt again the Pitch, and to it, by degrees, add, in Powder, Bay-berries and Cumin-ſeeds, each half a Pound; and continually ſtir them together till the Plaiſter acquires a due Conſiſtence.

This was never received by any officinal *Diſpenſatory*, until by the College of *London*; and the firſt Edition of theirs puts half a Pound of the Oil of Dill with a Pound of each of the Powders, ſo that the Conſiſtence in both comes out pretty much the ſame. The Ground-pine is likewiſe an Addition in the Decoction; tho' the firſt Receipt directs no Decoction at all. If good Care is not taken, that the Seeds and Berries be reduc'd to a Powder, without too fierce a Drying, the Whole will be of a brittle Conſiſtence; but otherwiſe there will remain in them ſo much of an oily Moiſture, as not to make the Pitch harder than it would be without them, but give to the Whole a very good Body.

Beſides the preceding, *Dale* mentions the following.

CUMINUM SILIQUOSUM, Offic. Ger. 908. Emac. 1067. *Hypecoi altera Species*, C. P. Pin. 172. *Hypecoum alterum*, Park. Theat. 372. Raii Hiſt. 2. 1328. *Hypecoon ſiliquis propendentibus, non articulatis, bivalvibus incurvis*, Hiſt. Oxon. 2. 579. *Hypecoon tenuiore folio*, Tourn. Inſt. 230. Elem. Bot. 197. CODDED WILD CUMIN.

This Plant is ſaid to have the ſame Effect as the Poppy. It grows in *Spain*, where it flowers in *May*. *Dale.*

CUMINUM PRATENSE. See CARUM.

CUMINUM SYLVESTRE. See CUMINOIDES.

CUNANE. The Name of a large *Indian* Fruit, which grows on a ſmall Tree, call'd *Morremor*. The Inhabitants of the Country where it grows roaſt it, and eat it as a Remedy againſt the Head-ach. *Raii Hiſt. Plant.*

CUNEALIS SUTURA. The Suture by which the *Os Sphenoides*, or *Cuneiforme*, is join'd to the Os Frontis.

CUNEIFORME OS. The ſphenoidal Bone. See CAPUT.

CUNEIFORMIA OSSA. According to *Blancard*, the fifth, ſixth, and ſeventh Bone of the Tarſus are thus call'd. See CRUS.

CUNICULUS, Offic. Schrod. 5. 284. Raii Synop. A. 205. Mer. Pin. 168. Aldrov. de Quad. Digit. 382. Schw. de Quad. 86. Jonſ. de Quad. 111. Geſn. de Quad. 362. Charlt. Exer. 23. THE RABBET OR CONEY.

A Rabbet, calcin'd whole, is ſaid to cure a Quinſey, or Inflammations of the Fauces. The Fat is uſed for reſolving Indurations of the Tendons and Joints, and the Brain is ſaid to reſiſt Poiſons.

Conſidered as an Aliment, thoſe Rabbets are to be choſen, which are tender, fat, well fed, and neither too young, nor too old. Rabbet is better in Winter than Summer, becauſe its Fleſh is the more tender and mellow.

Rabbet is very nouriſhing, and affords good Food.

When they are young, they breed many viſcous Humours; and, on the contrary, when they are too old, their Fleſh becomes dry, hard, and not eaſy of Digeſtion.

A Rabbet contains much volatile Salt and Oil.

It agrees, eſpecially in Winter-time, with any Age and Conſtitution, provided it be uſed moderately.

REMARKS.

A Rabbet is an Animal well known, and like a Hare in many things: Firſt, becauſe it is very near of the ſame Make, tho' ſmaller; ſecondly, becauſe it is of a fearful Nature, runs very faſt, is very quick of Hearing, and chews the Cud; thirdly,

thirdly, becauſe it multiplies apace, which made many ſay, who believed that a Hare was an Hermaphrodite, that a Rabbet was ſo too.

Rabbets are either wild or tame; the firſt of which are the more dainty and pleaſant Food, not only becauſe they are more in Motion, and contain leſs ſuperfluous Moiſtures, than the others, but alſo becauſe they feed upon ſeveral aromatic Plants, ſuch as Thyme, and the like, which gives their Fleſh a nicer and more agreeable Reliſh. Rabbets differ much in reſpect of their Colour; for ſome are white, others brown, ſome black, others yellow, and ſome again party-colour'd.

Though a Rabbet is in many things like a Hare, yet the Fleſh ſomewhat differs from the other in Taſte: It is alſo moiſter, tenderer, and more juicy. We do not think, that Rabbets are ſuch wholſome Food when very young, as when of a middling Age, becauſe they are full of viſcous Humours when young: On the contrary, a Hare being of a drier Temper than a Rabbet, ought to be uſed younger than the other; tho' moſt Authors, who have writ concerning a Rabbet, look upon it as bad Food, fit to produce groſs and melancholy Humours: However, when it is endu'd with all the Properties we have mentioned, it produces few ill Effects.

Some fanſy, that Rabbets Brains weaken the Memory, becauſe this Animal cannot for a Moment after retain in mind the Toils laid for her, and that ſhe had juſt eſcaped; but this Conjecture being grounded upon a weak Foundation, I ſhall not endeavour to confute it. *Lemery on Foods.*

CUNTUR. The Name of a very large *American* Eagle, according to *Lemery*, whoſe Fat is ſaid to be reſolvent, and good for the Nerves.

CUPELLA, or, according to ſome, *Capella*, *Catellus Cinereus*, *Cineritium*; *Patella* or *Teſta probatrix*, *exploratrix*, or *docimaſtica*, are ſo many Names for what we call a *Cupel*, or *Teſt*. This is a chymical Veſſel made of Earth, pretty thick, and of the Form of a Diſh or Platter, in which Aſſay-maſters examine Metals, in order to diſcover the Quantity of Gold or Silver intermixed with the other foſſile Bodies, of which they are compos'd. It ſuſtains the higheſt Degree of Fire, cannot be melted by any Degree of common Fire, and retains all fus'd Metals; but in it all the foſſile Portions of any Metal, when mix'd with fus'd Lead, are carried off, except Gold and Silver, which are left fus'd in ſmall Globules. This Veſſel has a ſmall Cavity, which is a ſomewhat obtuſe ſpherical Segment, with a ſmall Canal at its Margin, thro' which the Metal examin'd may be the more commodiouſly pour'd out. The external Surface of this Veſſel towards its Baſe is ſomewhat like a truncated Cone, that it may ſtand the more ſecurely. Theſe Veſſels may be made of different Bulks, according to the Quantity of the Metal to be tried. They may be made either of ſome proper Earth, or of Aſhes obtain'd from the calcin'd Bones, almoſt of any Animals, except thoſe of Hogs; for the Cupels made of theſe, beſides Lead and other Foſſils, alſo abſorb ſome Parts of Gold and Silver. The Aſhes of calcin'd Plants are alſo proper for this Purpoſe, provided their Salts are well waſh'd out of them. Plaiſter alſo of ſome Kinds is fit for making theſe Veſſels; and thoſe made of it *Cramer* thinks preferable to thoſe before-mentioned. For this Purpoſe the ſmaller Bones of Calves, Oxen, Sheep, and Horſes, are moſt commonly us'd; and theſe are the more eaſily calcin'd, the longer they have been expos'd to the Injuries of the Weather. The Manner of calcining them is in the higheſt Degree of an open Fire, for ſome Hours or longer, according to their Thickneſs. The Mark of a perfect Calcination is, when no black Spot appears either externally or internally, when they are broken. Theſe Bones, thus calcin'd to the higheſt Degree of Whiteneſs, are to be triturated in a Mortar, and paſſed through a fine Sierce; or, if ſuch a one cannot be had, the groſſer Powder paſs'd through a common Sierce, is to be levigated upon a Marble, and then waſh'd with freſh warm Water. Since the Bones of Fiſhes are generally pretty ſmall, they are more eaſily calcin'd than thoſe of other Animals, in a large open earthen Veſſel; and, when thus prepar'd, they are preferable to the others. A ſmall Quantity of the Aſhes of theſe Bones, thus treated, is to be put into a clean earthen Veſſel, and a ſecond time calcin'd in a ſtrong Fire, for ſome Hours. Then the Aſhes are to be waſh'd with Water, and levigated upon the Porphyry to a fine Powder. This Powder, when moiſten'd by Drops of pure Water, or the White of an Egg diluted with Water, till the Maſs coheres, when ſtrongly compreſs'd between the Fingers, is to be put into a Copper, or braſs Mortar, of any Size, or if calcin'd Plaiſter is uſed, it is to be ſprinkled with a Solution of Vitriol. Then the Maſs is to be excavated with the Peſtil, apply'd with a ſufficient Force. Over the Surface of the Cavity thus form'd, the fine Powder above-mentioned is to be ſprinkled dry, by means of a Sieve, and ſtrongly preſs'd to the Maſs by a Stroke or two of the Peſtil, that its ſmalleſt Inequalities may be fill'd up; and, after the Inequalities protuberating on the upper Margins and the Bottom, are cut off with a ſharp Knife, the Cupel is to be laid by in a dry Place. The Cupels form'd of the Aſhes of Bones, the Spines of Fiſhes, and Plaiſter, are of all others beſt; becauſe, before they are applied to Uſe, there is no Neceſſity for their being ſtrongly burn'd, nor do they require ſo ſtrict an Attention with reſpect to the Degrees of Fire. But if the Aſhes of Wood are added, the Cupels muſt be burn'd for half an Hour, or an Hour, before the Metal is put in. And, unleſs this Circumſtance is remembered, the Metal is thrown out of the Veſſel, Drop by Drop, by the Eruption of the aqueous Vapours; for theſe Cupels can never be ſufficiently dried by the Air alone, ſince there is always ſome Portion of an alcaline Salt adhering to the Aſhes of the Wood, which attracts the Moiſture of the Air, as we are ſufficiently inform'd by the browniſh Colour of theſe Aſhes, and by an Affuſion of the Solution of Sal Ammoniac upon them. Hence alſo theſe Aſhes have a ſtronger Tendency to Vitrefaction, than the Aſhes of Bones. Beſides, the dry Powder, with which the Cavity of the Cupel was ſprinkled, is more eaſily ſeparated during the Cupellation, if the Aſhes of Wood have been mix'd with the Materials of the Cupel, which proves very prejudicial to the Operation; becauſe by the Adheſion of theſe Aſhes the Weight of the Metal is either increas'd, or, in purging it, ſome of it is loſt. In a Cupel made of the Aſhes of Bones, the Spines of Fiſhes, or Plaiſter, the Cupellation is longer about, but then it is more ſafely perform'd, than if Aſhes of Wood had been added. It indeed receives the melted Metal more ſlowly, in conſequence of its compacter Texture; but, for this very Reaſon, it is the leſs to be apprehended, that any Part of the perfect Metal ſhould be abſorb'd, tho' the Degrees of Fire ſhould be leſs accurately obſerv'd. The beſt Cupels made of Bones may be uſed for two or three Trials, whereas others are only fit to be once employ'd.

CUPEROSA. Copperas. See VITRIOLUM.

CUPHOS, κῦφος. Light. When applied to Aliments, it imports their being eaſily digeſtible; when to Diſtempers, that they are mild and gentle.

CUPRESSUS. See CYPRESSUS.

CUPRUM. Copper. See Æs.

CURA AVENACEA. The Name of a Decoction, of which there is a Deſcription in a *High Dutch* Book, intituled, *Engliſhes Artzey-Buchlein*, as follows:

> Take of recent Oats, entire and well waſh'd, one Pound and an half; of the recent Root of wild Succory ſlic'd, one Handful; and of Spring-water, twelve Pints: Let them be boil'd in a clean earthen Veſſel, to the Conſumption of Half, and then ſtrain the Liquor through a linen Cloth. To the ſtrain'd Liquor add half an Ounce of Sal Prunellæ, and ſix Ounces of coarſe Sugar. Then boil it again, and, taking it off the Fire, let it ſtand cover'd for a Day and a Night in ſome quiet Place; the next Day let it be pour'd off into glaſs Veſſels, taking care that the thick Matter, remaining in the Bottom, be not mix'd with the pure Liquor intended for Drink. Let the Glaſſes be cloſely ſtopt, and the Liquor preſerv'd for Uſe in a Cellar.

Two ordinary Cupfuls of this Liquor, exhibited twice a Day, that is, two or three Hours before, and three Hours after Dinner, are highly extol'd againſt all Kinds of Fevers, Colic Pains, Pleuriſies, Itches, cutaneous Tumors, and hypochondriacal Diſorders; as alſo for cleanſing the Kidneys from Sand, and opening Obſtructions of the Viſcera. The Uſe of it is order'd to be perſiſted in for thirteen Days. If the Body is cacochymic, a gentle Purge ought to be exhibited before it is uſed. The Effects of this Medicine are moſt ſingular in the Dog-days; and it is highly extol'd as a Preſervative, if uſed once a Year, for two Weeks, either in the Spring, the Autumn, or during the Dog-days. The Inventor of this Decoction was *Johannes de S. Catharina*, who, by uſing it thrice a Year, in the Spring, Autumn, and Dog-days, is reported to have protracted his Life, without Sickneſs, to the hundred and twentieth Year of his Age. After Doctor *Richard Lower* had obſerv'd the Efficacy of this Drink in the Cure of ſeveral Diſeaſes, he made the Preparation of it public. The celebrated *Hoffman* publiſh'd a Diſſertation *de Cura Avenacea*, in which, inſtead of Sal Prunellæ, he orders the Uſe of depurated Nitre, both in continued and intermittent Fevers; becauſe it is more efficacious than the Sal Prunellæ, for allaying and leſſening the Effervеſcence of the Blood. In the ſame Diſſertation he obſerves, in general, that the two Boilings, ordered by *Lower*, are by no means neceſſary; and that the Sugar and Nitre ſhould be added in the Beginning of the Operation. When it is ſufficiently boil'd, he orders the Ptiſan to be put into Stone or Glaſs Veſſels, kept for twenty-four Hours in ſome cold Place, and then pour'd off from its Sediments. He alſo obſerves,

obſerves, that this Liquor cannot be kept long, eſpecially in the Summer, when, by the Acceſs of the hot Air, it undergoes a Fermentation, acquires an acid Taſte, and ungrateful Smell, by which means it becomes unfit for drinking. For this Reaſon, 'tis highly neceſſary it ſhould be kept in a cool Place, and in cloſe-ſtopt Veſſels. If any one deſires to give this Liquor a fine Colour, which contributes nothing to its Virtues, he muſt boil with it one Ounce of Alkanet-root, or two Ounces of the Raſpings of red Sanders; which was the Method of preparing it uſed by the celebrated *Joannes Francus*. The red Sanders, with the other Powders, muſt be put into the Veſſel when the Fire is not very ſtrong, leſt the Liquor ſhould come over the Margin of the Veſſels, and its reddiſh be chang'd into a greeniſh Colour. From a Conſideration of the Ingredients, 'tis not to be doubted, but this Liquor is of ſingular Efficacy in the Cure of many, and theſe very terrible Diſorders; for it affords ſingular Relief, where Obſtructions of the Veſſels are to be remov'd; where peccant and recrementitious Salts are to be waſh'd out of the Habit; where the viſcid Juices are to be diluted, and a due Degree of Moiſture and Humidity to be reſtor'd. It is alſo excellent for allaying Thirſt, alleviating all feveriſh Heats, and ſtopping Hæmorrhages. Hence it is an approv'd Remedy when uſed for ſome Weeks, in cronical Diſeaſes, eſpecially Aſthmas, Dyſpnœas, Gouts, the Stone of the Kidneys and Bladder, the wandering ſcorbutic Gout, ſcorbutic and hypochondriac Diſorders, the Jaundice, Obſtructions of the Menſes, a Chloroſis, Lippitude of the Eyes, the Itch, and all Impurities of the Blood, provided bitter Balſamics are now-and-then interpos'd, in order to prevent the Weakneſs of the Stomach, to be apprehended from the large Quantity of Water. This Drink may alſo be preſcrib'd in all thoſe Diſorders in which medicated and mineral Waters are proper; and we muſt proceed in the ſame manner in both Caſes; that is, we muſt prepare the Body by Veneſection and Purgatives, and increaſe the Doſe daily, beginning at one Pint, and proceeding to uſe two; at which Number we are to ſtop, through the whole Courſe of the Cure, which is to be finiſh'd by ſome Laxative of a balſamic Nature. *Rieger.*

CURCAS, alſo call'd CARPATA, and, in *Malabar*, CHIVIQUILENGA.

This is a Fruit which grows in *Malabar*, about the Size of a Filberd, and in Taſte reſembling a boil'd Muſhroom. It is not uſed in Medicine.

CURCULIO. A ſmall Inſect, which breeds in Corn, call'd the Weevil. The Leaves of Pellitory of the Wall, are reported to deſtroy theſe Inſects.

CURCUMA. Offic. J. Comm. Hort. Amſt. 107. Park. Theat. 1584. Ger. Emac. 32. C. B. Theat. 679. *Curcuma Officinarum.* Hort. Amſt. Cat. 107. *Curcuma radice longa.* Herm. Hort. Lugd. Bat. 208. C. Comm. A. 2. 127. *Manjella Kua.* H. M. P. 11. 21. *Kaha.* Herm. Muſ. Zeyl. 30. TURMERIC.

This is a longiſh, firm, tuberous Root, of a browniſh yellow on the Outſide, and a deep ſaffron Colour within; of a ſtrong Scent, and a hot, but ſomewhat bitteriſh, Taſte. It comes from the *Eaſt Indies*. It is well deſcrib'd by *Herman* in his *Hortus Lugduno-Batavus*, *P.* 209. who ſays, "That it has "a tuberous long Root running acroſs the upper Part of the "Earth, like Ginger, of the Thickneſs of a Finger, having "many round knotted Circles, and many large Fibres; from "each of which Knots ſpring three or four large Leaves upon "large Foot-ſtalks: They are about a Span long, and ſcarce "half ſo broad, ſharp-pointed, and very much reſembling "the Leaves of the Canna Indica. The Flowers grow out "of the ſtrongeſt young Roots, on pretty long Foot-ſtalks, in "Faſhion of long ſcaly Spikes, firſt of a pale green, and after-"wards of a reddiſh yellow Colour; from among which come "forth yellow or red Flowers, in Shape like thoſe of the Canna "Indica, but ſmaller; which are ſucceeded by tricapſular "Seed-veſſels, containing ſmall round Seed."

This Plant grows copiouſly in the Woods of the *Eaſt Indies*, and is propagated both from the Seed, and the Buds cut from the Root. It is ſaid, that in that Country there is ſcarce a Garden in which it is not cultivated for the ſake of the Root, which becomes ripe, and is dug up, after the Flowers are wither'd. Becauſe the Root tinges Bodies with a yellow Colour, juſt as the garden Saffron does; 'tis therefore call'd *Crocus Indicus*, and *Curcuma*, which is a Name given by the *Arabians* to every Root of a ſaffron Colour. The *Portugueſe* call it *Saffran de Terra*, or ſubterraneous Saffron. In the Shops it is call'd *Terra Merita*, becauſe, when reduced to a Powder, it reſembles that Species of yellow Earth call'd Oker. Some of the Literati are of Opinion, that this Plant is the Cyperus Indicus of *Dioſcorides*, which, he ſays, "grows in "the Form of Ginger, is poſſeſſed of the Bitterneſs, and "other Virtues, of Saffron, when chew'd; and which, when "the Hairs are anointed with it, ſpeedily makes them fall off." Hence we underſtand, why ſome make a Diſtinction between the Curcuma of the *Greeks*, of which we now ſpeak, and that of the *Arabians*, which they take for the greater Celandine. According to *Bontius*, and *Rumphius*, in his *Herbarium Amboinenſe*, the *Indians* levigate it on Marble, together with other fragrant and aromatic Species, which they reduce to the Conſiſtence of an Ointment, with newly-expreſs'd Oil of Coco, or any other Oil. With this Preparation they anoint their Bodies, to defend them from the troubleſome Bites of Flies, for the ſake of its grateful Smell, in order to keep themſelves warm in cold and rainy Days, and with an Intention to leſſen the intenſely cold Paroxyſms of Fevers. This Species of Ointment is by them call'd *Borri-Borri*, or *Boberri*, with them the moſt common Name for Turmeric. The Inhabitants of that Country find, from daily Experience, that the recent Root of Turmeric bruiſed, ſprinkled with Oil of *Indian* Coconut, roaſted in its own Leaves, under the Aſhes, and applied to the Parts oppoſite to thoſe in which Splinters, Thorns, or the Points of Arrows, are lodg'd, ſoon expels theſe extraneous Bodies. When prepar'd in the ſame manner, and applied, it is alſo ſaid to ſoften Impoſtumations, to reſolve obſtinate and inveterate Tumors, to conglutinate recent Wounds, to ſoften and deterge callous and ſordid Ulcers, to alleviate the Pains attending Contuſions and Sugillations, and to afford Relief in Luxations. It is alſo uſed as a Suppoſitory, when reduc'd to a proper Form, and anointed with Salt and Oil. Its Juice is dropt into the Eyes, in order to remove Defluxions and Inflammations; and pour'd into the Ears, with an Intention to ſoften and maturate Tubercles. It alſo checks Inflammations and Eryſipelas, when anointed with it; and, when mix'd with Juice of Lemons, and applied by way of Ointment to the Parts affected, it is ſaid to cure the Itch. *Bontius* obſerves, that the Inhabitants of *China* uſe this Root like that of the white Hellebore, in their ſternutatory Preparations. Beſides, the *Indians* make much uſe of it as a grateful Seaſoning in the Preparation of their Aliments. The Juice, or Powder of this Root, is alſo uſed for promoting a Diſcharge of the Urine, provoking the Menſes, and expelling the Secundines; as alſo for reſiſting and preventing Intoxication. This Root, imported from the *Eaſt Indies*, is alſo uſed by the *Europeans* for medicinal Purpoſes; and we commonly divide it into two Kinds, the round, and the long; but this Diviſion is groundleſs, ſince theſe apparently diſtinct Species, are but different Parts of one and the ſame Root. The round is a Congeries of tuberoſe Glands; whereas the long are the ſeveral Branches or Shoots ariſing from them. That is eſteem'd beſt, which is recent, freſh, thick, heavy, and hard to be broken. It ſeems to conſiſt of an oleous volatile Salt, in Conjunction with a bitter Sal Salſum; both of which are involv'd and wrapt up in viſcid and earthy Parts. Abſtracting from its ſaffron-colour'd Juice, which it yields when chew'd, it ſeems to be poſſeſs'd of Virtues very much reſembling thoſe of Ginger, though its Taſte is ſomewhat more faint and languid. It communicates its Colour to the Urine, which, by the Uſe of it, aſſumes a ſaffron Colour, and tinges Linen. Hence we may eaſily deduce its medicinal Virtues, and conclude, that it is moderately ſtimulating, reſolvent, and aperient. For this Reaſon, it is highly extol'd as an efficacious Remedy in Obſtructions of the Lungs, Liver, and Spleen; in Infarctions of the meſeraic Veins; as alſo againſt the Stone in the Kidneys and Bladder; and for provoking the Menſes, and facilitating Labour: According to *Juncker*, it is of very conſiderable Service in cold Diſorders ariſing from a mucid and corrupted Serum; as alſo in Cachexies, Dropſies, and œdematous Swellings of the Feet. But it is a precarious Medicine, when uſed againſt the Stone, or in difficult Labours, ſince, in theſe Caſes, the only good Effects it can produce, are to be aſcrib'd to its diuretic Virtue. But it is moſt of all extol'd on account of its Efficacy in the Jaundice; for which Purpoſe, the *Chineſe* preſerve it in Sugar. But *Wedelius*, in his *Amœnitates Materiæ Medicæ*, gives the Preference to its Powder, mix'd with an equal Quantity of the Salt of Wormwood. *Juncker*, when treating of the Virtues of Turmeric, uſes the following Words: "It is juſtly cele-"brated for curing the Jaundice, provided it is exhibited at a "proper Time, when the Body is not intenſely hot, and "when there is no violent Congeſtion of Blood to the Liver; "but, at the ſame time, I could never find any ſpecific "Virtue in it againſt this Diſeaſe." That this Root is of ſingular Efficacy againſt Stones in the Gall-bladder, we learn from *Hoffman*, in his *Clavis Schroderiana*, where we have an Account of a Man afflicted with moſt acute Pains in his Right Hypochondrium, who, by taking half a Dram of Turmeric-root in a Draught of warm butter'd Ale, was in two Hours time freed from his Pains, and voided ſome ſmall Stones, of a

clayiſh reſplendent Colour, by Stool, by which means he was reſtor'd to perfect Health. For internal Uſe, its Doſe in Subſtance is, from a Scruple to a Dram; but, in Decoctions and Infuſions, two Drams of it are generally preſcrib'd. The *Pulvis*, or the *Species Diacurcumæ*, does not in the leaſt partake of the Turmeric, but derives the Name from the Saffron.

CURMI, κόρμι. *Dioſcorides*, *Lib.* 2. *Cap.* 110. informs us, that this is a Drink made of Barley, which is frequently uſed inſtead of Wine; but that it cauſes Pains of the Head, generates bad Juices, and prejudices the Nerves. Such a Kind of Liquor, ſays he, is alſo prepared of Wheat, in the Weſtern Parts of *Iberia*, and in *Britain*.

CURSUS is ſometimes employed to expreſs any Flux of Humours.

CURTUMA, or CURSUMA. The *Chelidonium minus*. *Rulandus*.

CURURU-APE. The Name of a ſcandent Tree which grows in *Braſil*, bearing Pods, which contain Seeds like Beans. Theſe Seeds, thrown into the Water, deſtroy Fiſh. The green Leaves, bruis'd, and apply'd to recent Wounds, are ſaid to cure them by the firſt Intention, that is, by uniting their Lips.

CURUTU-PALA. H. M. The Name of a Shrub which grows in *Malabar*. The Bark of the Root bruiſed, and drank with warm Water, cures a Diarrhœa; and, taken with Milk, is of Service in a Dyſentery: Bruis'd with Water, and apply'd to Apoſtemations, it is ſaid to reſolve them.

CUSCULIA. See COSCULIA.

CUSCUTA, Offic. Park. Theat. 10. Merc. Bot. 1. 31. Phyt. Brit. 33. Raii Hiſt. 2. 1903. *Cuſcuta major*, C. B. Pin. 219. Raii Synop. 3. 281. Tourn. Inſt. 652. Elem. Bot. 513. Dill. Cat. Giſſ. 143. Rupp. Flor. Jen. 21. Buxb. 89. *Cuſcuta ſive Caſſutha*, Ger. 462. Emac. 577. Mer. Pin. 32. *Caſſuta ſive Cuſcuta*, J. B. 3. 266. Chab. 422. DODDER.

This is a Plant that differs from all others, in having no Leaves, but conſiſting of a Number of long, ſlender, red Filaments or Threads, by which it takes hold, and twiſts about the Plants that are near it, ſucking its Nouriſhment from them. It has ſeveral monopetalous or ſingle-leav'd Flowers, divided generally into four ſhort and narrow Segments, to which ſucceed little round Seed-veſſels, containing each four ſmall Seeds. It grows frequently upon Heaths and Commons, upon the Furze and Nettles, as alſo in the Fields, upon Flax and Tares, doing great Damage, and almoſt choaking them; whence it is call'd by the Country People *Hell-weed*, and *Devil's-guts*.

Dodder is opening and cleanſing, accounted good to purge melancholy and bilious Humours, to open Obſtructions of the Liver and Spleen, good for the Jaundice, and ſerviceable againſt the Itch.

CUSCUTA MINOR. This is thus diſtinguiſh'd:

Epithymum, Offic. Park. Theat. 10. *Epithymum ſive Cuſcuta minor*, C. B. Pin. 219. Raii Hiſt. 2. 1903. *Cuſcuta minor*, Tourn. Inſt. 652. Elem. Bot. 513. Rupp. Flor. Jen. 21. *Cuſcuta minor, ſeu Epithymum*, Buxb. 89. DODDER OF THYME.

This is reckon'd by ſome to be a leſſer Sort of Dodder, growing upon Thyme, as the larger does upon Nettles, Flax, Tares, and the like. It is compoſed of a Number of very ſmall Threads, of a reddiſh-brown Colour, matted together, having frequently the Tops and Stalks of Thyme amongſt it, of a pretty ſtrong Scent. It is brought to us from *Leghorn* and *Turky*.

It is accounted a Purger of Melancholy and ſerous Humours, and to be uſeful in hypochondriac and melancholy Diſorders, and for thoſe affected with the Spleen and Vapours; as alſo for the Itch, and other cutaneous Diſtempers.

The only officinal Preparation, taking the Name from this Plant, is the *Decoctum Epithymi*.

The Dodder of Thyme is found upon almoſt all Plants. It cannot live without their Aſſiſtance, for the Roots periſh ſoon after the Seed is come up; and then this Plant, which is nothing but a Tuft of reddiſh Hairs, nouriſhes itſelf by twiſting about the neighbouring Plants. Its Fibres do not only embrace them, but faſten themſelves ſtrongly to them by rough Nipples. Theſe Nipples inſinuate their Points into the Pores of the Bark, burſt the Veſſels of which it is compoſed, and receive the extravaſated nutritious Juice. The Flowers grow in round Bunches. Each Flower is a little Cup, of about two Lines Diameter, perforated at the Bottom, expanded, cut into four or five Segments, and adorn'd with ſome very ſhort Chives, loaded with yellow Summits. The Empalement is cut after the ſame manner with the Petal, and ſends forth a Pointal, which faſtens itſelf in the Hole of the Petal, and afterwards becomes a membranous Fruit, almoſt round, raiſed with three or four rounded Ribs. This Fruit is perforated at the Bottom, and faſtened to a little Capſule at the Bottom of the Empalement, which wraps up the lower Part of the ſame Fruit: It contains ſome ſmall brown Seeds. That which is brought from the *Levant*, under the Name of *Venetian* Dodder, does not purge, as I have experienced ſeveral times. It is rather ſtomachic and aperitive. *Martyn's Tournefort.*

Decoctum Epithymi.

DECOCTION *of* DODDER *of* THYME.

Take of the Chebulan, and Indian Myrobalans, of each half an Ounce; of Arabian Stœchas, and Sena, of each one Ounce; of Fumitory, half an Ounce; of Eupatorium, five Drams; of Polypody of the Oak, ſix Drams; of Turpeth-root, half an Ounce; of Spring-water, two Quarts: Boil all together to one Quart; and then add, of the Dodder of Thyme, and ſtoned Raiſins, of each one Ounce; and give them another Boil together. When taken from the Fire, add of black Hellebore-root, of Agaric, and Salt of Tartar, of each half an Ounce. Let them ſtand in Infuſion together ten Hours, and then preſs out the Liquor.

CUSPIDATED Plants are ſuch Plants, the Leaves of which are pointed like a Spear.

CUSPIS. Properly the Point of a Spear, but applied to the Glans Penis. Alſo a ſort of Bandage.

CUTAMBULI. Certain Worms, either under the Skin, or upon it, which, by their creeping, cauſe an uneaſy Senſation. Alſo wandering ſcorbutic Pains, which are very ſevere, and cauſe a Senſation, ſomewhat like that produc'd by theſe Worms.

CUTICULA. The Scarf-ſkin. See CUTIS.

CUTICULARIS MEMBRANA. The Dura Mater.

CUTILIÆ. Certain cold Fountains in *Italy*, mention'd by *Celſus* and *Pliny*, which were uſed as Baths.

CUTIO. A Wood-louſe. See MILLEPEDES.

CUTIS. The Skin.

All the Parts of the human Body are inveſted by ſeveral common and univerſal Coverings, to which Anatomiſts give the Name of Integuments.

There have been many Diſputes about the Number of theſe Integuments: The Antients reckon'd five, the Epidermis, Skin, Membrana Adipoſa, Panniculus Carnoſus, and Membrana Muſculorum Communis.

The firſt three of theſe Coverings are truly common or univerſal, that is, extended over all the Parts of the Body; but, properly ſpeaking, they ought to be reduc'd to two; for I look upon the Epidermis rather as a Part, or an Epiphyſis of the Skin, than as an Integument.

The two other Coverings, mentioned by the Antients, are not univerſal, but confin'd to particular Parts of the Body.

The TRUE SKIN.

The Skin is a Subſtance of very large Extent, made up of ſeveral Kinds of tendinous, membranous, vaſcular, and nervous Fibres, the Intertexture of which is ſo much the more wonderful as it is difficult to unfold; for their Directions are as various as thoſe of the Stuff of which an Hat conſiſts.

This Texture is what we commonly call Leather, and it makes, as it were, the Body of the Skin. It is not eaſily torn, may be elongated in all Directions, and afterwards recovers itſelf, as we ſee in fat Perſons, in Women with Child, and in Swellings; and it is thicker, and more compact, in ſome Places than in others.

Its Thickneſs and Compactneſs are not, however, always proportionable; for on the poſterior Parts of the Body it is thicker, and more lax, than on the fore Parts; and on the Palms of the Hands, and Soles of the Feet, it is both very thick, and very ſolid. It is generally more difficult to be pierced, by pointed Inſtruments, in the Belly than in the Back.

The outer Surface of this Subſtance is furniſhed with ſmall Eminences, which Anatomiſts have thought fit to call Papillæ, in which the capillary Filaments of the cutaneous Nerves terminate by ſmall radiated Pencils.

Theſe Papillæ differ very much in Figure and Diſpoſition, in the different Parts of the Body, and they may be diſtinguiſhed into ſeveral Kinds.

The greateſt Part of them is flat, of different Breadths, and ſeparated by Sulci, which form a kind of irregular Lozenges. The pyramidal Figure aſcribed to them is not natural, and appears only when they are contracted by Cold, Diſeaſes, by Boiling, or by ſome other artificial Preparation, which alters their ordinary Structure.

The Papillæ of the Palm of the Hand, of the Sole of the Foot, and of the Fingers and Toes, are higher than on the other Parts of the Body; but they are likewiſe ſmaller, cloſely united together, and placed, as it were, endwiſe, with reſpect to each other, in particular Rows, which repreſent on the Skin all kinds of Lines, ſtrait, crooked, waving, and ſpiral. Theſe ſeveral Lines are often diſtinctly viſible in thoſe Parts of the Palm of the Hand which are next the firſt Phalanges of the Fingers.

The red Part of the Lips is made up of Papillæ, repreſenting very fine Hairs or Villi, cloſely united together.

There

There is another particular Kind under the Nails; the Papillæ being there more pointed, or, in a manner, conical, and turned obliquely toward the Ends of the Fingers. Thoſe which are found in the hairy Scalp and Scrotum, are ſtill of other Kinds.

The Papillæ of the firſt and ſecond Kinds appear to be ſurrounded at their Baſes by a ſoft, mucilaginous, and pretty viſcid Subſtance, which fills the Interſtices between them, and repreſents a kind of Net-work, or Sieve, the Maſhes or Holes of which ſurround each Papillæ. This Subſtance is commonly call'd Corpus Reticulare or Mucoſum.

The Origin of this reticular or mucous Body has not hitherto been ſufficiently explain'd; and it has not been determin'd, whether it forms an univerſal Integument, or whether it belongs more properly to the Skin than to the Papillæ or Epidermis.

To demonſtrate this reticular Subſtance in public Courſes, the common Method is to take the boil'd Tongues of Oxen or Sheep; but this Method is fallacious, and may lead the greateſt Number of the Spectators into Miſtakes.

In Inflammations we obſerve a reticular Texture of capillary Veſſels, more or leſs extended on the Surface of the Skin; and curious Anatomiſts demonſtrate the ſame thing, by fine Injections, which may be looked upon as artificial Inflammations. But neither of theſe Methods proves, that, in the natural State, theſe Veſſels are Blood-veſſels; that is, that they contain the red Particles of the Blood.

It is more probable, that its vaſcular Texture is only a Continuation or Production of the very ſmall Capillaries of the Arteries and Veins, which, in the natural State, tranſmit only the ſerous Part of the Blood, while the red Part continues its Courſe through wider Ramifications, which more properly retain the Name of Blood-veſſels.

This vaſcular Texture is of various Forms and Figures, in the different Parts of the Body. It is not the ſame in the Face with what it is elſewhere, neither is it alike on all the Parts of the Face, as may be diſcover'd by the moſt ordinary Microſcopes; and from hence we might, perhaps, be enabled to give a Reaſon, why one Part of the Body turns red more eaſily than another.

The inner Surface of the Skin is covered by very ſmall Tubercles, call'd commonly cutaneous Glands; and they are likewiſe term'd Glandulæ Miliares, becauſe of ſome Reſemblance which they are ſuppoſed to bear to Millet-ſeeds.

Theſe Tubercles are partly fixed in ſmall Foſſulæ, in the Subſtance of the Skin, which anſwer to the ſame Number of ſmall Cavities in the Corpus Adipoſum. Their excretory Ducts open on the outer Surface of the Skin, ſometimes in the Papillæ, and ſometimes on one Side of them, as may be ſeen in the Ends of the Fingers, even without a Microſcope.

The greateſt Part of them furniſhes Sweat, and others a fatty oily Matter, of different Thickneſſes, as in the hairy Scalp, in the Back, behind the Ears, and at the lower Part of the Noſe, where this Matter may be ſqueez'd out in form of ſmall Worms. On the Head this is call'd Dandriff, and Filth or Naſtineſs on the other Parts of the Body.

By macerating the Skin in Water, or in any other proper Liquor, theſe Corpuſcles become more viſible, eſpecially in the Skin of the lower Part of the Noſe, and of the Axilla. The late M. *Duverney* demonſtrated to the Royal Academy, that the Structure of ſome of theſe cutaneous Glands reſembled the Circumvolutions of ſmall Inteſtines, plentifully ſtored with capillary Veſſels. The illuſtrious M. *Morgagni*, Profeſſor at *Padua*, has given the Name of Glandulæ Sebaceæ to thoſe which furniſh the unctuous Matter above-mention'd.

Beſides theſe Corpuſcles, there are other ſmall ſolid Bodies, almoſt of an oval Figure, contain'd in the Subſtance of the Skin. Theſe are the Roots or Bulbs from whence the Hairs ariſe, and ſome of them are ſituated within the inner Surface of the Skin.

The Skin has ſeveral conſiderable Openings, ſome of which have particular Names, ſuch as the Fiſſure of the Palpebræ, the Nares, the Mouth, the external Foramen of the Ears, the Anus, and Openings of the Parts of Generation.

Beſides theſe, it is perforated by an infinite Number of ſmall Holes, call'd Pores, which are of two Kinds: Some are more or leſs perceivable by the naked Eye; ſuch as the Orifices of the milky Ducts of the Mammæ, the Orifices of the excretory Canals of the cutaneous Glands, and the Paſſages of the Hairs.

The other Pores are imperceptible to the naked Eye, but viſible thro' a Microſcope; and their Exiſtence is likewiſe proved by the cutaneous Tranſpiration, and by the Effects of topical Applications; and, from theſe two Phenomena, they have been divided into arterial and venous Pores.

We ought likewiſe to obſerve the Adheſions and Folds of the Skin. It is every-where united to the Corpus Adipoſum; but it adheres to it much more cloſely in ſome Parts than in others, as in the Palm of the Hand, Sole of the Foot, Elbow, and Knee.

Some Plicæ, or Folds in the Skin, depend on the Structure of the Membrana Adipoſa, or Cellularis, as thoſe in the Neck and Buttocks; others do not depend on that Membrane, ſuch as the Rugæ in the Forehead and Palpebræ, which are form'd by cutaneous Muſcles, and diſpoſed more or leſs in a contrary Direction to theſe Muſcles. Theſe Folds increaſe with Age.

There is, beſides, a particular kind of Folds in the Elbow, Skin of the Knee, and Condyles of the Fingers and Toes, which are owing neither to the Conformation of the Membrana Adipoſa, nor to any Muſcle.

Laſtly, there is a kind of Plicæ, or rather Lines, which croſs the Palm of the Hand, Sole of the Foot, and correſponding Sides of the Fingers and Toes, in different Directions.

The CUTICULA, *or* EPIDERMIS.

The Outſide of the Skin is covered by a thin tranſparent Web, cloſely joined to it, which is call'd Epidermis, Cuticula, or the Scarf-ſkin.

The Subſtance of the Cuticula appears to be very uniform on the Side next the Skin, and to be compoſed, on the other Side, of a great Number of very fine, ſmall, ſquamous Laminæ, without any Appearance of a fibrous or vaſcular Texture, except ſome ſmall Filaments, by which it is connected to the Papillæ, and which perhaps are detach'd from thence.

This Subſtance is very ſolid and compact, but yet capable of being extended and thicken'd, as we ſee by ſteeping it in Water, and by the Bliſters raiſed on the Skin by Veſicatories, or any other Means; and from thence it ſhould ſeem, that it is of a ſpongy Texture. It yields very much in Swellings, but not ſo much as the Skin, without breaking or cracking.

The Origin of the Epidermis is as obſcure as its Regeneration is evident, ſudden, and ſurpriſing; for let it be deſtroy'd ever ſo often, it ſtill grows again. It probably ariſes from a Subſtance which tranſudes from the Papilla, and therefore the Antients were in the right to call it an Efflorescence of the Skin.

We muſt not, however, imagine, that it is the Air which dries this mucilaginous Matter, and gives it the Form of the Epidermis; becauſe it is found equally in the Fœtus, which ſwims continually in Water; and it grows even on the Palate, when it has been deſtroy'd by too hot Food; and under Plaiſters applied to any Part of the Body.

Hard and reiterated Frictions looſen it inſenſibly, and preſently afterward a new Stratum ariſes, which thruſts the firſt outward, and may itſelf be looſen'd, and thruſt outward by a third Stratum, and ſo on.

It is nearly in this manner that Calloſities are formed on the Feet, Hands, and Knees; and the ſeveral Laminæ or Strata, obſervable at the ſame time on many other Parts of the Body, are owing to the ſame Cauſe, tho' many Anatomiſts have look'd upon them to be natural. It muſt be acknowledged, however, that, on the Palms of the Hands, and Soles of the Feet, the Epidermis is commonly thicker than on any other Part.

The Epidermis adheres very cloſely to the cutaneous Papillæ, from which it may be ſeparated by Boiling, or, which is a much better Way, by ſteeping for a long time in cold Water. It is not impoſſible to ſeparate it with the Knife; but this Management teaches us nothing of its Structure.

It adheres ſtill cloſer to the Corpus Reticulare, which is eaſily raiſed along with it; and they ſeem to be true Portions or Continuations of each other.

It is generally believed, that the Colour of the Epidermis is naturally white, and that the apparent Colour thereof is owing to that of the Corpus Mucoſum. But, when we examine ſeparately the Epidermis of Negroes, we find no other Whiteneſs in it, than in a thin tranſparent Lamina of black Horn.

The Epidermis covers the Skin thro' its whole Extent, except at the Places where the Nails lie. It is mark'd with the ſame Furrows and Lozenges as the Skin, and has the ſame Openings and Pores; and though it may be ſaid to paſs the Bounds of the Skin, where it is continued inward, through the great Openings, yet, at theſe Places, it loſes the Name of Epidermis.

When we examine narrowly the ſmall Pores or Holes through which the Sweat paſſes, the Epidermis ſeems to inſinuate itſelf into theſe, in order to complete the excretory Tubes of the cutaneous Glands. The Foſſulæ of the Hairs have likewiſe the ſame Productions of the Epidermis; and it ſeems to give a ſort of Coat or Bark to the Hairs themſelves. Laſtly, the almoſt imperceptible Ducts of the cutaneous Pores are lined by it.

Having macerated the Skin for a long time in Water, the Epidermis, with all its Elongations, may be ſeparated from it; and, in that Caſe, theſe Productions carry along with them the Hairs, the Bulbs, and even the axillary Glands.

By this Obſervation we may explain, how Bliſters may remain for a long time on the Skin, without giving Paſſage through theſe Holes, to the Matter which they contain; which Holes ought to be increaſed, one would think, by the Dilatation and Tenſion of the Epidermis.

For when the Epidermis is ſeparated from the Skin, it carries along with it ſome Parts of theſe cutaneous Fibres, which

being compreſs'd by the Matter contained in the Bliſter, ſhut the Pores of the ſeparated Epidermis, like ſo many Valves; and it is probably theſe ſmall Portions which have been taken for Valves of the cutaneous Tubes.

USES OF THE SKIN.

It is principally and properly the filamentary Subſtance, call'd the Body of the Skin, which is the univerſal Integument of the Body, and the Baſis of all the other cutaneous Parts, each of which has its particular Uſes.

The Skin is able to reſiſt external Injuries to a certain Degree, and ſuch Impreſſions, Frictions, and Strokes, to which the human Body is often liable, as would hurt, wound, and diſorder the Parts of which it is compoſed, if they were not defended by the Skin.

The Papillæ are the Organ of Feeling, and contribute to an Evacuation, call'd inſenſible Tranſpiration. They likewiſe ſerve to tranſmit from without, inwards, the ſubtle Particles or Impreſſions of ſome Things applied to the Skin. The firſt of theſe three Uſes depends on the Extremities of the Nerves; the ſecond, on the arterial Productions; and the third, on the Productions of the Veins.

The cutaneous Glands ſecrete an oily Humour of different Conſiſtences, and they are likewiſe the Origin of Sweat. But, without the Epidermis, both Papillæ and Glands would be diſturb'd in their Functions, on which great Diſorders muſt enſue.

In order to explain the Mechaniſm of Feeling, or of the Touch, we ſhould firſt be made acquainted with the Senſes in general, for which this is not a proper Place; and, therefore, all that I ſhall obſerve here is, that there are at leaſt two Sorts of Feeling, one general, the other particular.

Particular Feeling is accompanied with a certain determinate Impreſſion, by which we are enabled to diſcern Objects in a very diſtinct Manner, and this is properly what is call'd the Touch; the proper Organ of which is at the Inſide of the Ends of the Fingers. General Feeling is indeterminate and indiſtinct, not being accompanied with the ſame Impreſſion as the former.

Theſe Differences in the Senſe of Feeling, depend on thoſe of the Papillæ, which, in Effect, appear to be more cloſe, and made up of a greater Number of nervous Filaments, at the Ends of the Fingers, than any-where elſe; for the nervous Ropes that go to the Fingers, are proportionably larger than thoſe that go to any other Part of the Body.

The Epidermis ſerves to keep the Pencils, or nervous Filaments of the Papillæ, in an even Situation, and without Confuſion; and it likewiſe moderates the Impreſſions of external Objects. Particular, as well as general Feeling, is more or leſs perfect, in proportion to the Thinneſs of the Epidermis; Calloſities in which weaken, and ſometimes deſtroy, both.

Another Uſe of the Epidermis is, to regulate the cutaneous Evacuations already mentioned; the moſt conſiderable of which is inſenſible Tranſpiration. By this we underſtand a fine Exhalation, or a kind of ſubtle Fume, which flows out of the Body imperceptibly, and in different Quantities. It might be call'd cutaneous Tranſpiration, to diſtinguiſh it from pulmonary Tranſpiration.

This cutaneous Exhalation becomes ſenſible, by applying the End of the Finger, or Palm of the Hand, to the Surface of a Looking-glaſs, or of any other poliſh'd Body; for it preſently looks dull, and appears to be cover'd with a condenſed Vapour. It ſeems to me, that the convex Side of the Hand and Fingers does not furniſh ſo great a Quantity of this Exhalation, as the Palm of the Hand, and the Inſide of the Fingers, eſpecially the Extremities, which points out one Uſe of this Tranſpiration; which is, to keep the nervous Filaments in due Order for particular Feeling.

Another Proof of inſenſible Tranſpiration is the famous Experiment of *Sanctorius*, continued for thirty Years without Interruption; by which he found, that this Evacuation, in one Day, was equal to all the ſenſible Evacuations for fifteen Days.

This Calculation is not agreeable to what has been made in other Countries; particularly thoſe from the like Experiments made by M. *Dodart*, and *Morin*, of the Royal Academy of Sciences; and by Dr. *James Keill*, as publiſh'd in his *Statica Britannica*. Neither can the Balance inform us, whether the cutaneous Tranſpiration is greater or leſs than the pulmonary.

A long time ago, I diſcover'd a Method to render this Tranſpiration viſible, to the Diſtance of about half a Foot from the Body; and I mention'd it in a Theſis printed at *Copenhagen*. If we look at the Shadow of a bare Head, on a white Wall, in a Sun-ſhiny Day, and in the Summer Seaſon, we ſhall perceive, very diſtinctly, the Shadow of a flying Smoke, riſing out of the Head, and mounting upward; though we cannot ſee the Smoke itſelf. We may try the ſame Experiment with a Dog or Fowl.

It is much in the ſame manner, that the inviſible Exhalations from burning Charcoal throw a very diſtinct Shadow; and that the inviſible Smoke of a Chafing-diſh, Warming-pan, or Stove, make all diſtant Objects appear trembling, when view'd either over, or on either Side of thoſe Utenſils.

The inſenſible cutaneous Evacuation is perform'd ſimply, and without any Artifice, through the ſmall Pores already mentioned, much in the ſame manner as we obſerve the Smoke to ariſe from the Entrails of an Animal newly kill'd and open'd. It is a particular and continual Diſcharge of the Serum of the Blood through the capillary Veſſels of the Skin.

It is naturally very moderate, and it is more abundant in the Summer, before a good Fire, after ſtrong Exerciſe, and during the Diſtribution of the Chyle, than in the Winter, in cold Places, during Inaction, and before Meals.

The tranſpir'd Matter appears to be, in ſome Degree, ſaline, as may be obſerv'd by applying the Tongue to the Palm of the Hand, when it has not been waſh'd lately. This is, perhaps, the Reaſon, why we feel leſs Pain when a Wound is touch'd with the Finger cover'd with Silk, than with the naked Finger; but this Inconveniency might eaſily be prevented by waſhing the Hands and Fingers very well, immediately before we begin to dreſs Wounds.

The Matter of the other two Evacuations, the Sweat, and thick oily Subſtance, comes principally from the Glands of the Skin. Each of them differs according to the different Parts of the Body where they are found, as may be obſerv'd both of the Filth and Sweat of the Head, Armpits, Hands, and Feet.

This Filth or Naſtineſs of the Skin is an unctuous or fatty Matter, collected inſenſibly on the Epidermis, where it thickens, and forms a ſort of Varniſh, which in time becomes prejudicial, by ſtopping up the Paſſages of cutaneous Tranſpiration.

This Collection is more readily made in Winter, than in Summer; and this is the Reaſon why it is more difficult to keep the Hands clean in cold, than in warm Weather. *Winſlow.*

CYAMUS. A Bean. See FABA.

Cyamus alſo ſignifies a Woodlouſe roll'd up in the Form of a Bean; which Form theſe Inſects put themſelves into, upon the Apprehenſion of any Danger.

CYANUS. The Blue-bottle.

The Characters are,

The Extremity of the Pedicle runs into a very ſcaly Calyx, and the Sides of the Scales are hairy; the Diſk is almoſt flat and fungous, on which grow oblong, and almoſt cylindrical Ovaries, ſurrounded with an Annulus, or Ring, on the upper Part, on which ſtand erected downy Hairs. Within theſe Hairs, round the Border of the Ovary, grows a large Flower, tubulous, and running into the Figure of a *Cornu copiæ*. Theſe Flowers are almoſt always barren, having no Tube or Stamina. The interior Flowers are leſs tubulous, bellied on the upper Part, with a quinquefid Border; from the inferior Part of theſe Flowers, on the Inſide, ariſe Stamina, which, uniting in a Tube, cloſely embrace a long Pointal, furniſh'd with a bifid Apex, and proceeding from the Centre of the Apex of the Ovary. The Floſcules which conſtitute the Border of the greater Flower, are of a larger Size, monopetalous, and, in a manner, bilabiated; the Floſculés about the Middle are leſs, and equally divided. *Boerhaave, Ind. alt.*

1. Cyanus; montanus; latifolius; vel verbaſculum Cyanoides. *C. B.* 273. *Boerh. Ind. A.* 145. *Cyanus major.* Offic. Ger. 592. Emac. 732. The Leaves of this Blue-bottle are but three or four Inches long, and about an Inch broad, ſharp-pointed at the Ends, not at all ſerrated about the Edges, of a green Colour above, and white and woolly underneath. It grows about a Foot or more high, bearing at the Top of the Stalks (which are not much branched) ſcaly Heads, each of whoſe Scales is border'd with a black Edge; their Heads are thinly ſet about with a Row of hollow wide-mouth'd Flowers, jagged at one End, and ſlender and narrow at the other, of a deep-blue Colour, ſet about a reddiſh-purple Thrum. The Seed is round and long, incloſed in Down. It grows in Gardens, and flowers in *June*. The Leaves and Flowers are the Parts in Uſe, and thoſe but ſeldom.

This is reckon'd among the vulnerary Plants; the Juice being commended againſt Bruiſes and Contuſions from Falls, though a Vein be broken, and the Party ſpit Blood; as alſo to heal any Cut, or green Wound.

SMALL BLUE-BOTTLES.

The ſmall Blue-bottle grows to be two or three Foot high, and is much more divided into Branches than the great Blue-bottles, with many ſlender whitiſh-corner'd Stalks; the lower Leaves are long and narrow, having three or four long Laciniæ ſet on each Side, green above, and whitiſh underneath. Thoſe which grow on the Stalks, are more narrow and Graſs-like, and wholly white, without any Laciniæ; on the Tops of the Stalks grow ſmaller ſcaly Heads, more thickly beſet with Flowers, in Shape like the great Blue-bottle, but much ſhorter, of a pure azure Blue. The Seed is ſmall, white, and ſhining. The Root is woody, with many Fibres, periſhing yearly. It grows every-where among the Corn, flowering in *June* and *July*.

Camerarius affirms, that in *Saxony* they give a Glaſs of Beer, in which a Handful of it has been boil'd, to thoſe who have the Jaundice, and Retention of Urine. The ſame Author bathed the Gums of young Children with the diſtil'd Water of the *Cyanus*, mix'd with the Juice of Cray-fiſh, to make them cut their Teeth eaſy: The Powder of this Plant, according to the ſame Author, reſolves the *St. Antony's Fire* in the Face. *Tragus* ſays, that half a Dram of the Powder of the Seed of Blue-bottles is a pretty good Purge; and that the diſtil'd Water of its Flowers is excellent for the Redneſs and Inflammation of the Eyes; ſome Saffron and Camphire may be added to this Water, to render it more active. In fine, the Decoction of *Cyanus* is diuretic and emmenagogic. *Martyn's Tournefort.*

According to *Ettmuller*, the Root of this Plant, kept in one's Hand till it becomes warm, is by ſome ſaid to ſtop Hæmorrhages of the Noſe; and, if it is gather'd on the twenty-eighth Day of *May*, call'd *Corpus Chriſti Day*, all Hæmorrhages whatever. According to *Tragus*, half a Dram of its Root, reduced to Powder, and exhibited internally, evacuates the Bile by Stool. According to *Pontedera*, it abounds with reſinous Parts; for which Reaſon ſome, when the Intention is to purge, exhibit a Dram and an half of its Powder in ſome proper Liquor.

The Flowers are uſed in Medicine, and have many repugnant, and in *Geoffroy*'s Opinion, uncertain and precarious Virtues aſcrib'd to them: Thus, for Inſtance, they are ſaid to be exhibited with Succeſs, in order to extinguiſh feveriſh Heats; to prevent the bad Effects ariſing from the Stings and Bites of venomous Animals; to reſiſt Putrefaction, and remove Contagion. They are alſo ſaid to be beneficial to thoſe who are diſorder'd by Falls from Eminences, and Contuſions, and to ſuch as, by any Misfortune whatever, have internal Concretions of Blood. By ſome Authors, they are recommended in the Jaundice, the Dropſy, Suppreſſions of Urine, Retentions of the Menſes, the Itch, and Ulcers of all Kinds. *Tragus* informs us, that the Flower and Seeds, made into a Decoction with Wine, and drank, are an excellent Remedy againſt the Wounds inflicted by Spiders and Scorpions. One Dram of the Flowers and Heads reduced to a Powder, and exhibited for ſome time in Wine, is by ſome extol'd as a Remedy of ſingular Efficacy in the Jaundice. According to *Camerarius*, the Natives of *Saxony* boil a Handful of the Flowers in Ale and Butter; which Preparation they exhibit in the Jaundice, and Suppreſſions of Urine. *Hoffman*, in his *Clavis Schroderiana*, informs us, that he found a Decoction of the Flowers effectual for carrying off the Waters by a Diaphoreſis in a beginning Dropſy; and, that the ſame Effect was produced by them in a confirm'd Dropſy, we find in the *Ephemerides, Nat. Curioſ. Decad.* 3. *a.* 5. *o.* 20. The celebrated *Frederic Hoffman*, in his *Diſſertatio de Remed. Domeſticorum Præſtantia*, affirms, that, in a Suppreſſion of Urine, nothing is more effectual for promoting its free Diſcharge, than a Decoction of the Flowers of the ſmall Blue-bottle, eſpecially when mix'd with Nettle-ſeeds. According to *Ettmuller*, the Flower, either alone, or in Conjunction with the Flowers of Larkſpur, infuſed in Wine, or made into a Decoction with Water, gently provokes Urine, the Menſes, and Lochia, when ſuppreſs'd. Hence *Agricola*, in his *Chirurgia Parva*, recommends a Decoction of the Flowers of Blue-bottle, and Larkſpur, in all Diſorders of the Urine. And if to theſe the Flowers of Marigold are added, the Decoction will be appropriated to Diſeaſes of the Uterus. Putrid Ulcers are ſaid to be cured by dropping the expreſs'd Juice of the Flowers into them, or ſprinkling them with their Powder. Linen Cloths, ſays *Pontedera*, impregnated with the Juice of theſe Flowers, are to be applied to putrid Ulcers; by which Remedy, the Ulcer is not only cleanſed, but the Contagion hinder'd from ſpreading to the adjacent Parts. According to *Bauhine*, the Juice of this Flower, if uſed as a Gargle, contributes to the Cure of putrid Ulcers in the Mouth. The ſame Author alſo informs us, that the *Italian* Women uſe a Fumigation of theſe Flowers, in order to remove a Strangulation of the Uterus. According to *Camerarius*, the Flowers and Heads dried, and reduced to a Powder, are, with uncommon Succeſs, ſprinkled upon an Eryſipelas. Theſe Flowers are ſo efficacious in quickening the Sight, that they are by ſome ſaid to render the Uſe of Spectacles and Microſcopes ſuperfluous; for, according to the celebrated *Boerhaave*, when gently dry'd in a Shade, where the Air is not moiſt, and either reduced to a Conſerve with Sugar, or uſed by way of Infuſion, like Tea, they are ſingularly beneficial; firſt, in Caſes where the Eyes are darken'd, and render'd dull, by a Superfluity of thick and ſordid Moiſture. Secondly, in Caſes where the natural Humours of the Eye are inſpiſſated, and become too viſcid. And, thirdly, in Caſes where the Intention is to remove Lippitude. *Timæus* affirms, that in hot, ſaline, and acrid Defluxions of the Eyes, ſingular Relief is afforded by a Liquor prepared in the following Manner:

> Take of the Flowers of Blue-bottle, gather'd before the Riſing of the Sun, as much as you pleaſe: Bruiſe them in a Marble Mortar; put them into a wide-mouth'd Glaſs Veſſel, which is to be cloſe-ſtopt, and expoſed to the Heat of the Sun for a whole Month. Then let the Glaſs be cover'd over with Leaven, put into a Baker's Oven, and bak'd along with Bread; by which means an excellent ophthalmic Oil, or rather Liquor, will be yielded.

The Water of the Flowers of Blue-bottle, diſtil'd with common Water, is by many extol'd as an efficacious Remedy for Inflammations, Redneſs, and Lippitude of the Eyes; as alſo for quickening and ſtrengthening the Sight, if the Eyes are frequently waſh'd with it every Day; but it is ſtill more efficacious in removing Inflammations of the Eyes; if, as *Tournefort* adviſes, a proper Quantity of Saffron and Camphire are added to it. *Ettmuller* informs us, "That the Water of "Blue-bottle-flowers may ſerve as a Vehicle, when, in a Sup-"preſſion of Urine, and in the Stone, an Emulſion of the "Seeds of Violets is to be exhibited. The external Uſe of "theſe is ſaid to be of ſingular Advantage in all Diſorders of "the Eyes, eſpecially thoſe ariſing from the Small-pox. The "Water of Blue-bottle-flowers, mix'd with that of Chervil, "is an excellent Remedy in Cataracts, when applied warm "with Linen Cloths; but it will be more efficacious, if a "little, either of Camphire or Saffron, is mix'd with it." With this Water, the Juice is extracted from a live Crab bruiſed, for anointing the Gums of Children in Dentition. This Water, for Diſorders of the Eyes, ought, according to *Geoffroy*, to be prepar'd in the following Manner:

> Take any Quantity of the Flowers of Blue-bottle, gather'd with their Cafices; bruiſe and macerate them for twenty-four Hours in a ſufficient Quantity of Snow-water; then diſtil in a gentle Sand-heat. The Water, yielded, is that celebrated Water, to which the *French* have given the Name of *Eau de Caſſe-Lunette.*

The celebrated *Fabregou* informs us, that a Water diſtil'd from the Flowers of Blue-bottle, in Conjunction with Eye-bright, is an excellent Remedy for Inflammations of the Eyes; and if an Addition is made of Muſk, Benjamin, and Orange-flowers, he recommends it for procuring a florid Colour of the Countenance, eſpecially when mix'd with Virgin-honey. Some Authors are of Opinion, that this Plant, and more eſpecially its Flowers, are aſtringent and drying, like Plantain, and that they conſequently act by refrigerating. But *Caſpar Hoffman*, in his Treatiſe *de Medicamentis Officinalibus*, ſeems, with more Juſtice, to maintain the contrary Opinion, in the following Words: "The Bitterneſs, which is ſuffi-"ciently manifeſt, as alſo the acrid Taſte of the Leaves, are "ſufficient Proofs, that the Cyanus is not cold, but hot: "The penetrating and deobſtruent Virtues of a Decoction "of it in Wine, or Ale, in Dropſies, the Jaundice, in Falls "from Eminences, Contuſions, and Caſes where there are "internal Concretions of Blood, are alſo ſufficient Proofs of "its hot Qualities, which are ſtill confirm'd by its Power of "evacuating the Waters in Dropſies, which I have expe-"rienced during a long Courſe of Practice." For 'tis cer-

tain,

tain, that the bitter and acrid Taſte diſcovers Qualities which act by ſtimulating, reſolving, and opening, provided the above-mention'd Effects are founded upon genuine and real Obſervations. *Geoffroy*, upon ſubjecting the Flowers of the *Cyanus* to a chymical Analyſis, found that they yielded a large Quantity of an acid, and ſomewhat auſtere Phlegm, a ſmall Quantity of an urinous Spirit, a conſiderable Quantity of an Oil as thick as an Extract, ſome fix'd alcaline Salt, and ſome Earth. The Flowers have but a very faint Smell, and a ſubaſtringent Taſte; from which Circumſtance they ſeem to contain an eſſential vitriolico-tartareous Salt, mix'd with a large Quantity of Oil. Of theſe Flowers there are ſeveral Shop-Preparations, ſuch as the *Aqua Ophthalmica inſignis* in *Lemery*'s *Pharmacopée univerſelle*, the *Potio Philomedica* in the *Collectan. Leydenſia*, and ſome others, ſufficiently celebrated for their Virtues.

I ſhall take notice of another Uſe of this Plant, which, tho' it does not belong to Medicine, is curious, and may be turn'd to ſome Advantage, in Countries where there is great Plenty of the *Cyanus Segetum Flore cæruleo*. According to Mr. *Boyle*, the recent Flowers of this Plant yield a Juice, which, when immediately expreſs'd, aſſumes a pretty deep and agreeable bluiſh Colour, and which, by dropping Spirit of Salt into it, is chang'd into a reddiſh Colour; but, by the Addition of a ſtrong Solution of alcaline Salt, inſtead of the acid Spirit, it aſſumes a grateful greeniſh Colour. *Gottſchedus*, in his *Flora Pruſſica*, acquaints us with the Uſes, to which they are applied by Painters, in the following Words: "Theſe "Flowers are to be bruis'd in a Stone Mortar, with a wooden "Peſtil, with the Addition of a ſmall Quantity of Alum. A "Part of the Leaves thus bruis'd are wrapt up in a clean "Linen Cloth; then another Portion of them is wrapt up in "another Part of the ſame Cloth; and thus the Whole of "the Flowers are to be diſpos'd of, Layer above Layer. Then "the Portions thus wrapt up are to be gently preſs'd with the "Hand, that the whole Cloth may be equably impregnated "with the Juice; then the Flowers are thrown away, and "the Cloth, when dry'd, is immers'd in a ſmall Quantity of "Water, in which Gum Arabic has been diſſolv'd; by which "means the Water aſſumes a beautiful bluiſh Colour."

Boerh. Ind. alt. Plant. Vol. 1.

CYAR, κύαρ. The Eye of a Needle, or the Orifice of the internal Ear.

CYATHISCUS, κυάθισκος. The hollow Part of a Probe, form'd in the Shape of a ſmall Spoon, as in an Ear-picker.

CYATHUS, κύαθος, ſo call'd from the Verb χέω, to pour out. It was a common Meaſure, both of the liquid and dry Kind, among the *Greeks* and *Romans*, and contain'd the ſixth Part of a *Cotula*, or the twelfth Part of a *Sextarius*; for the *Sextarius*, as well as the *As*, was divided into twelve *Cyathi*, each of which is equivalent to an Ounce: Hence the *Sextans* was equal to two *Cyathi*, the *Quadrans* to three, the *Triens* to four, the *Quincunx* to five, the *Semis* to ſix, the *Septunx* to ſeven; the *Bes* to eight, the *Dodrans* to nine, the *Dextans* to ten, and the *Deunx* to eleven. Theſe were the ſeveral Names given to the Cups or Veſſels, which contain'd two, three, four, or more *Cyathi*. The leaſt Veſſel was therefore a *Cyathus*, which was a kind of Ladle, with which they took Wine, or any other Liquor, out of Bowls, and pour'd it into Cups, for one Draught, as is obſerv'd by *Caſaubon in Athen. Lib.* 8. *Cap.* 9. Hence *Plautus* in his *Menæchmus* uſes the Word *Cyathiſſare*, for meaſuring any Liquor in *Cyathi*. This the *Greeks* call'd κυαθίζειν, which they appropriated to thoſe, who did not, at one Draught, drink whole *Sextarii*, but, by repeated Evacuations of the *Cyathus*, fell upon Means to intoxicate themſelves. From the Smalneſs of the *Cyathus*, thoſe are proverbially ſaid *to meaſure the Sea in a Cyathus*, who undertake impracticable Things. In theſe earlier Ages, the *Cyathus*, or one Ounce, was not the Meaſure appropriated to the Abſtemious and Valetudinary, but the *Sextans*, or two Ounces. Beſides, the Cups moſt generally us'd for common Drinking were the *Trientes*, which contain'd four *Cyathi*, or Ounces. The *Deunx*, on the contrary, which contain'd eleven Ounces, was the Cup us'd by the Topers, who drank it off at one Draught. Hence *Suetonius in Cap.* 77. commends *Auguſtus Cæſar*, for his Frugality and Temperance, becauſe, after Supper, he only drank three *Sextantes*, which were equivalent to ſix *Cyathi*, or Ounces; and, even when he was inclin'd to indulge himſelf over the ſocial Bowl, he is ſaid never to have exceeded ſix *Sextantes*, or twelve *Cyathi*. It was alſo cuſtomary among the *Romans*, when they were inclin'd to indulge themſelves at any Entertainment, to drink as many *Cyathi*, as there were Letters in the Name of their Patron, whether Man or Woman. This Practice, together with that of drinking nine *Cyathi*, in Honour of the Nine Muſes; and three, in Honour of the three Graces, are alluded to in ſeveral Paſſages of the *Latin* Claſſics.

Both among the *Greeks* and *Romans*, the *Cyathus* was a dry, as well as a liquid Meaſure. Thus *Pliny*, in *Lib.* 21. *C.* 34. informs us, that the *Cyathus* of the *Greeks* weigh'd ten Drams. *Galen*, in his Treatiſe *de Ponderibus & Menſuris*, *Cap.* 15. aſſerts the ſame; but in *Cap.* 4, 13, and 14. he informs us more explicitly, that a *Cyathus* contains twelve Drams of Oil; thirteen Drams and one Scruple of Wine, Water, and Vinegar; and eighteen Drams of Honey. In the twelfth Chapter alſo of the ſame Book, he tells us, that among the *Veterinarii*, a *Cyathus* conſiſted of two Ounces. The modern Phyſicians make a *Cyathus* contain an Ounce and an half.

CYBITON, κύβιτον. See CUBITUS.

CYBIUM, κύβιον. A large Sea fiſh, cut into cubical Slices. *Pliny.*

CYBOIDES, κυβοειδὴς. See CUBOIDES.

CYCEON, κυκεών, from κυκάω, to mix. Among *Latin* Authors it is call'd *Cinnum*, and is commonly ſaid to have been a Mixture, of the Conſiſtence of a Pap, us'd by the *Greeks*, and compos'd of Wine, Honey, fine Flour, Water, and Cheeſe. In theſe remote Ages there ſeem to have been two Kinds of it; a leſs valuable one, compos'd of a Mixture of Water and Meal; and another, more rich and delicate, made up of Wine, various Kinds of Meal, Cheeſe, and ſometimes Honey. In the Account *Homer*, in *Iliad.* 11. gives us of *Hecamede*'s preparing *Cyceon*, raſp'd Cheeſe and Barley-meal [τὸ ἄλφιτον, which *Caſaubon in Athen. L.* 11. *C.* 12. explains by *Polenta*, or fine Flour] are only mix'd with Wine, without the leaſt Mention of Honey and Water. And *Ovid*, in the fifth Book of his *Metamorph.* when ſpeaking of the Draught of *Cyceon*, preſented by an old Women of *Athens* to *Ceres*, only makes mention of Water, mix'd with fine Flour. Hence 'tis obvious, that the *Cyceon* conſiſted of Water mix'd with Meal alone; for the *Polenta* only differs from the *Farina Hordei*, in that the former is dry'd. If we conſult the Writings of *Hippocrates*, we alſo find, that he gave the Name of *Cyceon* to a Mixture of Water and Meal; for in his ſecond Book *de Diæta*, after having treated of the Virtues of a certain Mixture of fine Flour, and Water, or Wine, he adds the following Words: "But a *Cyceon*, pre-"par'd with Water alone, refrigerates and nouriſhes; when "prepar'd with Wine, it heats, nouriſhes, and renders the "Patient coſtive; when prepar'd with Honey, it is leſs heat-"ing and nouriſhing, but more purgative, if the Honey is "genuine and unadulterated; but if it is otherwiſe, it is ſo "far from purging, that it rather renders coſtive. All *Cy-"ceons*, prepar'd with Milk, are highly nouriſhing; but, with "that of Sheep, it renders coſtive; with that of Goats, it is "more purgative; with that of Cows, leſs; and that of Mares "and Aſſes, more." *Janus Cornarius*, in his Interpretation of this Paſſage, after the Words *all Cyceons*, inſerted, *that is, of Meal*, intending, no doubt, by the Addition, to inſinuate, that Meal alone, of any Kind, was ſufficient to make a *Cyceon*, when mix'd with any Liquor; at leaſt, from the Text we may without any Conſtraint infer, that in thoſe Days, not only Water and Wine, but alſo ſeveral Species of Milk, were us'd in preparing *Cyceons*. *Galen*, in the ninth Chapter of his firſt Book *de Alimentorum Facultat.* does not heſitate to give the Name of *Cyceon* to that ordinary Piſan which ſome prepare, by mixing Rob, Honey, and Cumin, with Water which has been a little boil'd. That Salt was alſo an Ingredient

dient ſometimes us'd in *Cyceons*, we may gather from *Hippocrates*, in ſome Paſſages of whoſe Works an unſalted *Cyceon* is ſaid to be an attenuating Diet. The Seeds of white Poppy and Linſeed were alſo us'd by *Hippocrates* in preparing *Cyceons*, as we find in his Book *de Diæta*. From what has been ſaid, 'tis obvious, that the *Greeks* by the Word *Cyceon* underſtood any miſcellaneous Draught, or confus'd Mixture, prepar'd of Ingredients of different Natures, according to the Deſign and Intention of the Phyſician. Hence *Cyceon* is proverbially us'd for a turbulent and perplex'd State of Affairs, as alſo for a Perſon who turns all Things *topſy-turvy*. *Charterius* explains the κυκεὼν by *Moretum*, which, among the Antients, was a kind of Sallad, made of Herbs, Milk, Wine, Oil, Cheeſe, and Garlick. *Duretus*, in his Commentary upon the Book of Regimen in acute Diſeaſes, takes *Cyceon* for a certain Aliment prepar'd of a Mixture of Milk, Honey, Water, Wine, and Cheeſe; to which *Heurnius* alſo adds, Herbs. *Hieronymus Mercurialis* is of Opinion, that the *Cyceon* was a certain Species of Aliment prepar'd of Meal, Eggs, Honey, Wine, and Cheeſe. As for the medicinal Virtues of *Cyceons*, 'tis certain that nothing general can be advanc'd, which extends to all Preparations of this Kind, ſince, in the very Nature of the Thing, we muſt judge of their Virtues from the Qualities of their Ingredients. We have already ſeen what Diſtinctions *Hippocrates* made with reſpect to this Affair: But, when he ſpeaks ſimply of *Cyceon*, 'tis highly probable he only meant a Mixture of fine Flour with Wine: Thus, for Inſtance, when in the ſixth Book of his *Epidemics*, *Sect.* 6. he recommends a *Cyceon* againſt Pains, he means a Mixture of Meal and Wine. In his ſecond Book *de Morbis*, he orders a like *Cyceon* to be drank in a *Hydrocephalus*, after the Exhibition of a Vomit: But when, for Patients labouring under a quartan Fever, he intends an aqueous, and not a vinous Draught, he adds, *Let the Patient drink a* Cyceon *prepar'd with Water*. When the *Cyceon* is to be compos'd both of Water and Wine, as alſo of other Ingredients beſides the Meal, he explicitly mentions theſe Ingredients. Thus in his Treatiſe *de internis Affect.* when the Patient is afflicted with Thirſt, after Evacuations, and the Uſe of the Bath, he orders him to drink a cold *Cyceon* prepar'd of black auſtere Wine, mix'd with an equal Quantity of Water: And in his firſt Book *de Morbis Muliebr.* thinking that medicated Aliments, of a drying Quality, contributed to the Cure of Exulcerations of the Uterus, he orders the Exhibition of a thick *Cyceon* prepar'd of Cheeſe, roaſted Linſeed, fine Flour, white Poppy-ſeeds, and thin auſtere Wine. In his Treatiſe *de internis Affect.* for ſuch as labour under Conſumptions, he orders what he calls *a florid Cyceon*, prepar'd of the Roots of Smallage, Dill, Rue, Mint, Coriander, young Poppies, Baſil, Lentils, the Juice of ſweet and vinous Pomegranates, black auſtere Wine, the Meal of Vetches, and fine Flour; together with the Shavings of old Cheeſe, made of Goats-milk.

CYCIMA, Litharge. *Rulandus.*

CYCLAMEN. Sow-bread. See ARTHANITA.

CYCLISMUS. A Troche. It ſignifies, alſo, a ſort of Rugine, of a circular Form.

CYCLOPION, κυκλώπιον. The White of the Eye.

CYCLOS, κύκλος. A Circle. But in *Hippocrates* it imports the Cheeks, and the Orbits of the Eyes.

CYCLUS METASYNCRITICUS. See DIATRITAS, and METASYNCRISIS.

CYCNARION, κυκνάριον. The Name of a Collyrium, mentioned by *Galen*, and *Paulus Ægineta*. It was ſo call'd becauſe of its white Colour, reſembling that of a Swan.

CYCNUS, κύκνος. A Swan. See CYGNUS.

CYDAR. Jupiter; that is, Tin. *Rulandus.*

CYDONATUM, κυδώνατον. The Name of a Preparation of Quinces, with an Addition of Aromatics, deſcrib'd by *Paulus Ægineta*, *L.* 7. *C.* 11.

CYDONIA. The Quince-tree.

The Characters are;

It is low, with ſpreading and contorted Branches; the Calyx reſembles that of the Pear-tree; the Flower is roſaceous, and pentapetalous like that of the Pear-tree; the Ovary alſo reſembles that of the ſame Tree; and the Fruit is much like a Pear, carnous, harſh, umbilicated, containing ſeveral glutinous Seeds, within five membranous Cells; and cover'd with a hoary Down. *Boerhaave*, *Index alter*, *Part* 2. *p.* 247.

1. Cydonia; fructu oblongo, læviori. *T.* 632. *Boerh. Ind. A.* 2. 247. *Malus Cydonia*, *Cotonea*, Offic. *Malus Cotonea*, Ger. 1264. Emac. 1452. Raii Hiſt. 2. 1452. J. B. 1. 27. Chab. 2. *Malus Cotonea vulgaris*, Park. Theat. 1504. *Cydonia ſativa*, Jonſ. Dendr. 8. *Mala Cotonea majora*, C. B. Pin. 434. *Mala Cydonea*, Aldrov. Dendr. 538. THE QUINCE-TREE. *Dale.*

The Quince is the Fruit of a Tree, which ſcarcely grows ſo big as an Apple-tree, having uſually a crooked Body, with many weak Branches, whoſe Leaves reſemble thoſe of the Apple-tree; but they are rounder pointed, and whitiſh and hoary underneath. The Bloſſoms are pretty large, of five whitiſh purple Leaves, each of which are ſucceeded by a pretty large Fruit, cover'd over with a Down or Woolineſs, being but of an unpleaſant Taſte, and not fit to be eaten raw. There are two Sorts of them; one being in Shape more like an Apple, the other more like a Pear, which is accounted the beſt. It grows in moiſt Places, hanging over Ponds and Moats; flowering in *May*; the Fruit being ripe about *Michaelmas*. The Fruit and Seed are uſed.

Quinces are cordial, and agreeable to the Stomach; ſtrengthening it, and helping Digeſtion, and ſtaying Vomiting and Hiccough. They are likewiſe reſtringent and binding, and good for all Sorts of Fluxes and Looſeneſſes. The Seed is balſamic and mollifying, tempering the Acrimony of the Humours, and ſerviceable againſt ſore Mouths and Throats, and a Thruſh; for which a Mucilage made of them is frequently preſcribed. The ſame outwardly us'd is very healing to ſore chopt Nipples.

Officinal Preparations of Quinces are the Syrup, the *Electuarium Diacydonium*, and *Rob.*

The Hiſtory of Plants, aſcribed to *Boerhaave*, ſays thus farther of them, that

The Juice of Quinces, before they are quite mature, is very friendly and ſtrengthening; when mature, it is leſs aſtringent, and ſo it is when well boiled. The Seeds are of a quite contrary Quality, being emollient. Infus'd cold in Roſe water, they are of excellent Service in Ophthalmies, and in allaying the Heat of the Tongue and Fauces. An Emulſion of the Seeds with pure Water eaſes the Pains of Combuſtions, if the Tendon be injur'd; whence it appears, that the Seeds are anodyne: They are alſo of ſignal Uſe in ſpitting of Blood, Ulcers of the Lungs, and the Hæmorrhoids.

Syrupus Cydoniorum:

SYRUP *of* QUINCES.

Take ſix Pints of the clear Juice of Quinces; boil it gently till Half is evaporated, and at times take off the Scum that riſes upon it; then put to it three Pints of red aſtringent Wine, and of fine Sugar four Pounds; which boil into a Syrup, that may be aromatized with Cinamon, one Dram and an half; of Cloves and Ginger, each two Scruples.

This hath *Meſue* for its Author, and hath been retained in all the Diſpenſatories of the College; tho' the preceding to this gives the Liberty of making it with one Pint of the Juice of Quinces only, and two Pounds of Sugar, and only melting them together, as the other ſubacid and auſtere Syrups; and that way the Shops have been of late moſt accuſtomed to make it.

Diacydonium.

Take of the clean Pulp of Quinces, cut into Slices, and boiled up to Thickneſs, in fair Water, eight Pounds; of the whiteſt clarify'd Sugar, boil'd up alſo to a due Conſiſtence, ſix Pounds; and boil them together into a thick Subſtance.

This hath, for a long time, had a Place in moſt Diſpenſatories; but it is now altogether made by the Confectioners, by the Name of Marmalade.

Rob Cydoniorum:

ROB *of* QUINCES.

Take of the depurated Juice of Quinces, as much as you pleaſe; and, after it is gently boil'd to the Conſumption of a third Part, add to it half a Pound of the fineſt Sugar, and continue a ſlow Heat, till it becomes of a due Conſiſtence.

The other Species are,

2. Cydonia; fructu breviore & rotundiore. *T.* 633. THE APPLE-QUINCE.

3. Cydonia; anguſtifolia; vulgaris. *T.* 633. THE COMMON QUINCE-TREE, WITH NARROW LEAVES.

4. Cydonia; latifolia; Luſitanica. *T.* 633. THE BROAD-LEAV'D PORTUGAL QUINCE.

Boerh. Ind. alt. Vol. 2.

CYDONIA EXOTICA is the COVALAM.

CYEMA, κύημα. A Conception, or Fœtus.

CYGNUS REGINÆ. The Name of a Collyrium deſcrib'd by *Aetius*, *Tetrab.* 2. *Serm.* 3. *Cap.* 104. and mention'd by *Actuarius*, *Meth. Med. L.* 6. *C.* 5.

CYGNUS, Offic. Aldr. Orn. 3. 8. Bell. des Oyſe. 152. Charlt. Exer. 103. Geſn. de Avib. 327. Jonſ. des Avib. 90. *Cygnus Manſuetus*, Raii Ornith. 355. Ejuſd. Synop. A. 136. Mer. Pin. 174. *Olor*, Schrod. 5. 321. Will. Ornith. 271. THE SWAN.

The Part of a Swan uſed in Medicine is the Fat, which is eſteem'd emollient, attenuating, and lenient; and is therefore ſaid to be good for the Piles, and Indurations of the Uterus. Mix'd with Wine, it removes Freckles of the Skin, if theſe are anointed with them.

The Skin of a Swan is ſometimes directed to be apply'd to Parts affected with a Rheumatiſm; and to other Parts. It is ſaid to fortify the Nerves and Stomach, to diſpel Flatulences, and to aſſiſt Digeſtion, when apply'd to the Stomach.

CYITES. A Name for the *Lapis Aetites*. See AETITES.

CYLICHNE, κυλίχνη. A ſmall Veſſel, or Box, for holding Medicines. A Gally-pot, or Pill-box.

CYLLOS, κυλλὸς, in *Hippocrates*, is one affected with a kind of Luxation, which bends outwards, and is incurvated or hollow'd inwards. Such a Defect in the Tibia is call'd κύλλωσις *(Cylloſis)*; and the Perſon to whom it belongs is, by the *Latins*, call'd *Varus*, and oppoſed to *Valgus*, βλαισὸς, *(Blæſſus)* one who has his Legs bent the other Way. See *Hippocrates de Articulis*, with *Galen*'s Comment thereon. Κυλλομένη κοιλίη, *in Coac.* is the ſame as ὑγκυμένη *in Prorrhet.* and ſignifies a ſwelling, protuberant, gibbous Belly. Κυλλὸν, in *Hippocrates de Articulis*, frequently alſo imports maim'd, mutilated, contracted, weak, and imperfect.

CYMA, κῦμα, and, by the Figure *Synæreſis*, κύημα, Fœtus, and Fœtura, are Names for what we call a Sprout, or little Shoot. This, in Botany, ſignifies the ſuperior ſmall tender Stalk, which Herbs ſend forth in the Beginning of the Spring; and it is, in a particular Manner, applied to thoſe delicate and tender Shoots produced at the firſt Budding of Cabbage. Some *Latin* Authors have call'd it *Turio* and *Aſparagus*. In a more extenſive Senſe, the Word *Cyma* ſignifies the Tops of any Plants whatever, according to *Ray* in his *Hiſt. Plantar.*

CYMATODES, κυματώδης, from κύμα, a Wave. Undulating. It is apply'd to the Pulſe. See PULSUS.

CYMBALARIA. A Name for the *Linaria*; *folio glabro, ſubrotundo*; *Hederæ folio Clematitis*. See LINARIA.

CYMBALARIS CARTILAGO. A Name for the Cricoide Cartilage.

CYMBIFORME OS. The Name of a Bone in the Heel. See CRUS.

CYMINUM, Cumin. See CUMINUM.

CYNANCHE, κυνάγχη. A Species of Quinſey. See ANGINA.

CYNANCHICA MEDICAMENTA are thoſe Medicines appropriated to that terrible Species of Quinſey, which is accompanied with an Inflammation of the Fauces, an incredible Difficulty of Breathing, and which is call'd *Cynanche*, from the *Greek* Words κύων, a Dog, and ἄγχω, to ſuffocate; for when Dogs are hang'd, becauſe their Bodies are not ſufficiently heavy to produce a ſtrong Compreſſion of the Rope, they generally do not die ſuddenly, but ſtruggle for a conſiderable time with Death, with their Eyes turgid, and their Tongues, which are now of a leaden Colour, hanging out of their Mouths, which are open, grinning, and foaming; and becauſe, in this Diſorder, a Set of ſimilar Symptoms afflict the Patient, 'tis therefore call'd *Cynanche*. The Remedies, appropriated for its Removal, are ſuch Antiphlogiſtics as ſpeedily produce their Effects, liberal Veneſections, and powerful Evacuations by Stool; together with other refrigerating and relaxing Medicines, both exhibited internally, and applied externally. See ANGINA.

CYNANTHEMIS. A Name for the *Cotula fœtida*. *Blancard.*

CYNANTHROPIA, from κύων, a Dog, and ἄνθρωπος, a Man. A kind of melancholy Delirium, in which the Perſons affected believe themſelves to be changed into Dogs; and, in conſequence thereof, endeavour to act like them.

CYNCHNIS, κυγχνὶς. A ſmall Veſſel, or Box, to hold Medicines, or to exhibit them in.

CYNICUS, κυνικὸς. Canine. Certain Convulſions are call'd *Cynic Spaſms*. See SPASMUS.

CYNIPHES, in *Helmont*, ſignifies Gnats, or Flies.

CYNNABAR. The ſame as CINNABAR.

CYNNIA, CYMIA, or CARORA. A Veſſel in the Shape of an Urinal. *Rulandus.*

CYNOBOTANE. A Name for the *Cotula fœtida*. *Blancard.*

CYNOCEPHALUS, κυνοκέφαλος. A Species of Monkey, with a Head reſembling a Dog.

CYNOCOPROS, from κύων, a Dog, and κόπρος, Dung. The Dung of a Dog. See CANIS.

CYNOCRAMBE. Dog's Mercury. See MERCURIALIS.

CYNOCTONON. The *Aconitum*. *Oribaſius.*

CYNOCYTIS. The Dog-roſe. See CYNOSBATOS.

CYNODECTOS, κυνόδακτος. Bitten by a mad Dog. *Dioſcorides, L. 2. C. 99.*

CYNODES, κυνώδης. Canine.

CYNODESMION, κυνοδέσμιον, from κύων, which ſometimes imports the inferior Part of the Prepuce; and Δέω, to bind. A Ligature, by which the Prepuce is bound upon the Glans. *Gorræus.*

CYNODONTES, from κύων, a Dog, and ὀδὼς, a Tooth. The Canine Teeth.

CYNOGLOSSUM.

The Characters are,

The Calyx conſiſts of one Leaf, which is deeply cut into five Parts: The Flower is monopetalous, Funnel-ſhaped, and alſo deeply cut into five Segments. Where it begins to expand, appear five hairy little Heads erect, like cylindrical Columns, and under them are five Stamina, proceeding from the Tube of the Flower. The Fruit conſiſts of four rough, and, for the moſt part, lappaceous Cells, affix'd to a pyramidal quadrilateral Placenta, and containing a flat Seed. *Boerhaave's Index alter, Part 1.*

Boerhaave mentions nine Species of this Plant.

1. Cynogloſſum; majus vulgare. *C. B. Pin.* 257. *Ger. Emac.* 804. *Park. Theat.* 511. *Hiſt. Oxon.* 3. 448. *Buxb.* 91. *Tourn. Inſt.* 139. *Elem. Bot.* 116. *Mer. Pin.* 32. *Merc. Bot.* 1. 31. *Phyt. Brit.* 33. *Boerh. Ind. A.* 192. *Rupp. Flor. Jen.* 9. *Cynogloſſum*, Offic. *Cynogloſſum*, Ger. 659. Raii Synop. 3. 226. *Cynogloſſum vulgare*, J. B. 3. 598. Raii Hiſt. 1. 489. Dill. Cat. Giſſ. 89. HOUNDS-TONGUE. *Dale.*

The Root of the common Hounds-tongue is thick and long, of a dark-brown Colour on the Outſide, and whitiſh within: The lower Leaves are near a Foot long, and two or three Inches broad, pointed at the Ends, being ſoft and woolly in handling: The Stalk grows to be two or three Foot high, beſet with ſmaller and narrower Leaves, and having on their Top ſeveral Flowers, growing together, of a ſullen red Colour, in Shape like Bugloſs, but much leſs, appearing but little above the green Calyces they ſtand in; each Flower is follow'd by four flat rough Seeds, ſtanding about the Piſtillum, appearing, as they are all join'd together, like a Shield or Buckler. The whole Plant has a fetid Smell, like the Urine or Dung of Mice. It grows by Hedges and Road-ſides; and flowers in *June* and *July*. The Root only is uſed.

The Root of this Plant is cold, drying, and binding, uſeful in catarrhous Defluxions upon the Lungs, and to temper the Sharpneſs of the Blood; and, by conſequence, good for all kind of Fluxes and Hæmorrhages, as well as for a Gonorrhœa.

It is likewiſe reckon'd among the Vulneraries; and good againſt ſcrophulous Tumors, both taken inwardly, and applied outwardly as a Cataplaſm.

The only officinal Preparation from this Root is the *Pilulæ de Cynogloſſo*.

The Bark of its Root is a little bitter, ſaltiſh, ſtyptic, and glutinous: It gives a pretty deep-red Colour to the blue Paper. It is likely, that the Sal Ammoniac, which is naturally in the Salt of the Earth, predominates in this Plant, where it is temper'd with a great deal of Phlegm, Earth, and fetid Oil.

The Hounds-tongue, analyſed, gives ſtrong Indications of an acrid Salt and Sulphur: Thus the Root of it is proper to ſtop all ſorts of Defluxions, and to correct acrid Humours. It is uſed in Ptiſans and Broths. It has given Name to the *Pilulæ de Cynogloſſo*, which *Faventinus* recommends very much for Catarrhs; but thoſe which are deſcrib'd in *Renodæus*'s Diſpenſatory muſt be uſed. *Faventinus* mix'd half a Dram of theſe Pills with one Dram of Aloes, two Drams of the Juice of Liquorice, and as much Syrup of Violets as was neceſſary to form them into Pills. The Leaves of this Plant are vulnerary and deterſive. *Martyn's Tournefort.*

PILULÆ DE CYNOGLOSSO: *Compound Pill of Hounds-tongue.*

Take of the dried Roots of Hounds-tongue, white Henbane-ſeeds, and Opium, of each half an Ounce; of Maſtich, ſix Drams; of Olibanum, five Drams; of Saffron, Caſtor, and Storax, of each one Dram and a half: Let the Hounds-tongue-root, the Henbane-ſeeds, and Caſtor, be powder'd together; but the Maſtich, Saffron, Olibanum, by themſelves ſeparately: Let the Opium be cut into thin Slices, and diſſolved in Roſe-water; afterwards put in the Powders, and make into a Maſs of a Conſiſtence fit for Pills, with a ſufficient Quantity of Diacodium.

2. Cynogloſſum; majus; vulgare; flore albo. *C. B. P.* 257. *T.* 139. *b.* COMMON HOUNDS-TONGUE, WITH A WHITE FLOWER.

3. Cynogloſſum; floribus ex albo & rubro variegatis. *H. L. Flor.* 2. 62. *b.*

4. Cynogloſſum; montanum; maximum. *T.* 139. THE LARGEST MOUNTAIN HOUNDS-TONGUE.

5. Cynogloſſa; media; argentea; Apula; campeſtris; caliduarum regionum. *Col.* 1. 172. *Deſcr.* 171. *Ic.*

6. Cynogloſſum; ſempervirens. *C. B. P.* 257. *Prodr.* 119. *M. H.* 3. 449. EVER-GREEN HOUNDS-TONGUE.

7. Cynogloſſum; minus. *C. B. P.* 257. *Bugloſſum, anguſtiſolium, ſemine echinato.* T. 134. *Lappula ruſticorum.* Lugd. 1240.

8. Cynogloſſum; Creticum; latifolium; fœtidum. *C. B. P.* 257. *M. H.* 3. 449.

9. Cynogloſſum; Narbonenſe. *H. Eyſt. Æſt. o.* 8. *F.* 6. *T.* 3. *b. H. Boerh. Ind. alt. Plant. Vol.* 1.

CYNOLOPHA, κυνόλοφα. *Pollux* calls theſe certain Aſperities of the Vertebræ, in the Beginning of the Spine of the Back.

CYNOLYSSA. The ſame as Lyſſa, λύσσα, that Species of Madneſs which is cauſed by the Bite of a mad Dog.

CYNOMORON. A Name for the *Cynocrambe* in *Paulus Ægineta.* See MERCURIALIS.

CYNOMYJA. A Name for the PSYLLIUM in *Oribaſius.*

CYNORRHODON, from κύων, a Dog, and ῥόδον, a Roſe. The Dog-roſe. See CYNOSBATOS.

CYNOSBATOS.

Roſa canina, Cynoſbatos, Cynorrhodon, Offic. *Roſa ſylveſtris, canina, Cynorrhodon, Cynoſbatos,* Mont. Ind. 51. *Roſa ſylveſtris, inodora, ſeu canina,* Park. Theat. 1017. Raii Hiſt. 2. 1470. Synop. 3. 454. *Roſa canina inodora,* Ger. 1087. Emac. 1270. Mer. Pin. 105. *Roſa ſylveſtris vulgaris, flore odorato, incarnato,* C. B. Pin. 483. Tourn. Inſt. 638. Elem. Bot. 501. Jonſ. Dendr. 402. Dill. Cat. Giſſ. 90. *Roſa ſylveſtris vulgaris, flore odorato,* Buxb. 285. *Roſa ſylveſtris,* Merc. Bot. 1. 65. Phyt. Brit. 105. *Roſa ſylveſtris, variorum colorum, foliis glabris, inodoris,* Rupp. Flor. Jen. 111. *Roſa ſylveſtris alba cum rubore, folio glabro.* J. B. 2. 43. Chab. 108. THE COMMON BRIAR, OR DOGS-ROSE.

The wild Briar, or Roſe, that grows on the Hedges, has winged Leaves, like Garden Roſes, but ſmoother and greener. The Flowers are ſingle, of five white, and ſometimes pale-red Leaves; and, when they are fallen, there ſucceed roundiſh red Seed-veſſels, full of Pulp, incloſing white corner'd Seed, cover'd with ſhort ſtiff Hairs. It grows every-where in the Hedges, and flowers in *June*; and the Hips are fit to be gather'd about the latter End of *September.* On the Stalks of this Plant grows the *Bedeguar*, which is a reddiſh-green ſpongy hairy Excreſcence, made by ſmall *Ichneumon* Flies.

The Flowers of the wild Briar are accounted rather more reſtringent than the Garden Roſes; and, by ſome, are reckon'd as a Specific for the Exceſs of the Catamenia. The Pulp of the Hips has a pleaſant grateful Acidity, ſtrengthens the Stomach, cools the Heat of Fevers, is pectoral, good for Coughs, and Spitting of Blood, and the Scurvy. The Seed is accounted extraordinary good againſt the Stone and Gravel; and the ſame Virtues are attributed to the BEDEGUAR, which ſee.

The only officinal Preparation is the *Conſerva Cynoſbati.* See CONSERVA. See HYDROPHOBIA. *Ehrenfridus Hagendornius* wrote a Treatiſe expreſly on the Subject of this Plant, which is intitled *Cynoſbatologia, Jenæ,* 1679.

CYNOSORCHIS. A Plant call'd Dogs-ſtones. See ORCHIS.

CYON, κύων. A Dog. It imports alſo the inferior Part of the Prepuce, and the Penis.

CYOPHORIA, κυοφορία, from κύημα, the Fœtus, and φέρω, to carry. Geſtation, ſpoken of a Woman with Child; or the Time of Geſtation.

CYPARISSUS. The ſame as CYPRESSUS, which ſee.

CYPERI. See GRAMEN CYPEROIDES.

CYPEROIDEA GRAMINA. See GRAMEN CYPEROIDES.

CYPERUS.

The Characters are,

The Stalk is triangular, and bears, on the Top, a Panicle, conſiſting either of a Multitude of ſull, or narrow ſcaly and compreſs'd Spikes, in cloſe Order, or of numerous ſmaller Locuſtæ. *Boerhaave's Index alt. Part* 2.

The Species are,

1. Cyperus; odoratus; radice longâ; ſive Cyperus officinarum. *C. B. Pin.* 14. *Theat.* 216. *Boerh. Ind. A.* 2. 165. *Tourn. Inſt.* 527. *Elem. Bot.* 419. *Cyperus longus,* Offic. Ger. 28. Emac. 30. Raii Hiſt. 2. 1299. Synop. 3. 425. *Cyperus longus odoratus,* Park. Theat. 146. *Cyperus longus odoratus,* Hiſt. Oxon. 3. 237. *Cyperus, paniculâ ſparſâ ſpecioſâ,* J. B. 2. 501. *Cyperus,* Chab. 194. LONG-ROOTED CYPERUS.

The long Cyperus has a great many narrow graſſy Leaves, rough and hard in handling, among which ariſes a triangular Stalk, about two Foot high; on the Top of which grows a Tuſt, or Panicle, conſiſting of ſmall brown ſcaly Spikes, with a few ſhort Leaves ſet on at their Bottom. The Root is long and ſlender, of a dark-brown Colour on the Outſide, and lighter within, of a pleaſant Scent, and a little hot and bitter in Taſte. It grows in ſome Parts of *England* in the Marſhes; but we have it generally brought from *Italy. Miller's Bot. Off.*

2. Cyperus; rotundus; eſculentus; anguſtiſolius. *C. B. Pin.* 14. *Theat.* 222. *Hiſt. Oxon.* 3. 236. *Tourn. Inſt.* 527. *Elem. Bot.* 419. *Boerh. Ind. A.* 2. 166. *Traſi,* Offic. J. B. 505. *Tarſi Malinathalle Theophraſti,* Chab. 195. *Cyperus eſculentus,* Raii Hiſt. 2. 1301. *Cyperus rotundus, eſculentus, anguſtiſolius,* C. B. Pin. 14. Theat. 222. Hiſt. Oxon. 3. 236. Tourn. Inſt. 527. Elem. Bot. 419. Boerh. Ind. A. 2. 166. *Cyperus eſculentus ſive Traſi Italorum,* Ger. Emac. 32. *Cyperus dulcis rotundus, Traſi dulce vocatus,* Park. Theat. 146. SWEET CYPERUS, OR RUSH-NUT.

It grows in *Italy*, and other Parts. The Root is uſed, and agrees with the other Species in Virtues.

3. Cyperus; rotundus; inodorus; Germanicus. *C. B. P.* 15. *Th.* 215. *Boerh. Ind. alt. Vol.* 2.

Beſides the preceding Species of the *Cyperus*, *Dale* mentions the following:

CYPERUS ROTUNDUS, Offic. *Cyperus rotundus Orientalis major,* C. B. Pin. 13. Theat. 208. Raii Hiſt. 2. 1299. Hiſt. Oxon. 3. 206. *Cyperus rotundus Syriacus,* Ger. Emac. 31. No. 3. *Cyperus rotundus, odoratus, Syriacus,* Park. Theat. 145. *Cyperus Syriacus & Creticus rotundior,* J. B. 2. 502. Chab. 194. ROUND-ROOTED CYPERUS.

The Roots of the round *Cyperus* are of the Bigneſs and Shape of a Nutmeg, rough and brown on the Outſide, and whitiſh within, of a pleaſant fragrant Sweetneſs, faſten'd together by ſlender Strings: In its Leaves, Stalks, and Manner of growing, it pretty much reſembles the long *Cyperus*, and is brought from *Turkey.*

The long and round *Cyperus* are much of a Nature, and have the ſame Virtues, being heating and drying, expelling Wind, and ſtrengthening the Bowels: They help the Colic, provoke Urine, and the Terms, and prevent the Dropſy: They are cephalic, and good for the Swimming of the Head, and Giddineſs; and are ſometimes uſed in abſterſive Gargariſms for Ulcers in the Mouth and Gums. *Miller's Bot. Off.*

Geoffroy adds, that the round *Cyperus* is carminative, emmenagogue, ſtomachic, and diuretic. *Hippocrates* recommends it in Diſeaſes of the Uterus; and *Simon Paulli* in Ulcers of the Bladder, mix'd with the *Schœnanthe.*

CYPHI, κῦφι, is a Compoſition of ſixteen Ingredients, which are Honey, Wine, Raiſins, Cyperus, Roſin, Myrrh, Aſpalathus, Seſeli, Juncus odoratus, Bitumen *Judaicum*, Thryon, [θρύον, a ſort of Ruſh, *Xylander* reads θεῖον, a Fig-leaf] Lapathum, both ſorts of Juniper-berries, which they name the great and the ſmall Juniper-berries, Cardamoms, and Calamus. Theſe Simples are not compounded in a careleſs Manner, but the ſacred Writings are read to the Apothecaries, while they are mixing them. There ſeems to be ſomething extraordinary in the very Number, being the Square of a Square, and the only evenly even Number, which has its Area equal to its Circumference. But theſe, it muſt be confeſs'd, are the leaſt Reaſons for its ſalutary Effects, which are more to be aſcrib'd to the aromatic Qualities of the ſeveral Ingredients. *Cyphi* emits a ſweet and wholſome Fragrancy, by which the Air, being changed, produces, by means of Reſpiration, due Motions in the Body, and receives itſelf a mild and pleaſing Temperature; by which every thing, which ſits uneaſy upon the Thoughts, is gently removed; and thoſe daily Cares, which are as ſo many Fetters of the Mind, are, without the Help of Ebriety, relax'd and diſcharged; and the Imagination, and that Faculty within us, which is the Seat of Dreams, are purify'd, and brighten'd up like a Glaſs; and all this is done as effectually as by the Sound of a Harp, which the *Pythagoreans* uſed in order to compoſe themſelves to Sleep; and by whoſe lulling Melody the irrational Part of the Soul, the Seat of the Paſſions, was charm'd and reduced to due Moderation and Obedience: For Odours oftentimes recal the fainting Senſes; and, on the contrary, as often blunt, and compoſe them to Reſt; the Exhalations, by their Smoothneſs, diffuſing themſelves over the Body; as ſome Phyſicians ſay, that Sleep is procured by Vapours, proceeding from the Aliment, and ſmoothly creeping about the Viſcera, where they excite a kind of Titillation.

The *Egyptians* uſe the *Cyphi* in a medicinal Potion, on account of its clearing the internal Parts, and relaxing the Belly.

It is alſo to be conſider'd in this Compoſition of the *Cyphi*, that the Roſin is the Work of the Sun, and that the Myrrh is a Tear which diſtils from Plants by the Light of the Moon. Of the Ingredients ſome delight in the Night-ſeaſon, being nouriſh'd with cold Spirits, Shades, Dews, and Humidities: For the Light of the Day is ſingle and uniform, and the Sun, as *Pindar* ſays, "is ſeen thro' the void Æther;" but the nocturnal Air is mix'd and temper'd with various Lights and Qualities, which, from a general Conflux from all the Stars, unite like Seeds in one. It is not without Reaſon, therefore, that the former, as being of a ſimple Nature, and procreated by the Sun, are burnt in Sacrifice in the Day-time; but the others, which

are

are a Mixture endued with all kinds of Qualities, are offer'd in the Beginning of the Night. *Plutarch de Iſide & Oſiride.*

Suidas, under the Article κῦφι, ſays, that this was made by *Manæthos*, the *Egyptian*; but confeſſes, that he does not know the Compoſition. Under the Article Μανάθως, he informs us, that he was an *Egyptian* Prieſt, who wrote upon the Compoſition of the *Cyphi*.

The Compoſition call'd *Cyphi* was much uſed in the *Egyptian* Sacrifices; and hence the Troches, call'd *Trochiſci Cypheos*, acquired their Name.

TROCHISCI CYPHEOS.

Take of the Pulp of fat Raiſins, well cleanſed from the Huſks and Stones, and of *Cyprus* Turpentine, of each three Ounces; of Myrrh and Schœnanth, of each one Ounce and an half; of Cinnamon, half an Ounce; of Calamus Aromaticus, three Drams; of round Cypreſs-root, Spikenard, Caſſia-wood, Juniper-berries, fat Bdellium, and Wood of Aloes, of each two Ounces and a half; of Saffron, one Dram; a ſmall Quantity of Canary; and of the beſt deſpumated Honey, a ſufficient Quantity. Let the Myrrh and Bdellium be reduced in a Mortar, with Wine enough, to the Conſiſtence of a thin Honey; then ſtir in the Turpentine, the Pulp of the Raiſins, and the Powders; and let all together be well ſimmer'd, with Honey well deſpumated, into a due Conſiſtence to be formed into Troches.

This is but a troubleſome Compoſition; but, as it is made a ſtanding Ingredient in the Mithridate, its Preſcription is ſtill neceſſarily retained here, as it is likewiſe in the *Auguſtan*, and all other officinal Diſpenſatories of Note. It is originally aſcrib'd to *Damocrites*, who, it ſeems, attempted to reform the Mithridate, and contrived theſe Ingredients into this Form on purpoſe for that. It is taken notice of by *Galen*, *de Antidotis*, and recommended, in ſome Caſes, by itſelf; but modern Practice knows no other Uſe for it, than what it was originally deſign'd for.

CYPHOMA, and CYPHOSIS; κύφωμα, or κύφωσις, from κυρτόω, to bend. An Incurvature of the Spine of the Back, when the Vertebræ incline preternaturally outwards.

CYPRESSUS. The Cypreſs.

The Characters are,

The Leaves are ſquamous and flat: The Male Flowers, which are ſquamous, grow at remote Diſtances from the Fruit, on the ſame Tree: The Fruit is of a ſpherical Form, and is compoſed of many woody Tubercles, in which are contain'd hard angular Seeds. *Miller's Dictionary.*

Boerhaave mentions three Species of this Plant; which are,

1. Cypreſſus; metâ in faſtigium convolutâ; quæ Fœmina Plinii. *T.* 587. THE COMMON CYPRESS-TREE.

This grows to be a large, tall, high Tree, covered all over, almoſt from the Ground, with ſlender Branches, growing cloſe together, making the Tree have a pyramidal Shape, with ſmall, ſhort, ſharp, and, as it were, ſcaly Leaves, which cover over all the young Twigs. The Flowers are ſmall and ſtamineous, ſucceeded by Cones or Nuts, as they are call'd, which are round, near as big as a Walnut; when ripe, opening with ſeveral Clefts, in which lie brown, flattiſh corner'd Seeds. It is planted in Gardens for its pleaſant Verdure, being a Perennial or Evergreen, holding its Leaves all Winter, and ſhooting out freſh in the Spring. We have two Species growing in our Gardens, whereof the *Fœmina*, or that whoſe Branches grow cloſer together, is the moſt common, having ſomewhat longer Nuts than the *Mas*, whoſe Branches are more expanded, and Cones or Nuts rounder.

The Cones or Nuts are principally uſed; the Leaves but ſeldom: They are accounted very drying and binding, good to ſtop Fluxes of all Kinds, a Spitting of Blood, Diarrhœa, Dyſentery, the immoderate Flux of the Menſes, and involuntary Diſcharge of Urine: They prevent the Bleeding of the Gums, and faſten looſe Teeth: Outwardly they are uſed in ſtyptic reſtringent Fomentations and Cataplaſms.

2. Cypreſſus; ramos extra ſe ſpargens; quæ mas Plinii. *T.* 587. THE MALE SPREADING CYPRESS.

3. Cypreſſus; Virginiana; foliis Acaciæ deciduis. *H. L. H. A.* 1. 113. THE VIRGINIAN CYPRESS-TREE, WITH LEAVES LIKE THE ACACIA, WHICH FALL OFF IN WINTER. *Boerh. Ind. alt. Plant. Vol.* 2.

CYPRINUM OLEUM, κύπρινον ἔλαιον.

Take of Oil of unripe Olives, (ἐλαίν ὀμφακίνη) waſh'd, one Ceramium (a Meaſure containing about ten Gallons two Pints); Rain-water, one Ceramium and a half; of which mix one Half with the Oil, and reſerve the other to be mixed with Spices. Then take of Aſpalathos, five Pounds and a half; of Calamus, ſix Pounds and a half; of Myrrh, one Pound; Cardamoms, three Pounds nine Ounces; Elecampane, nine Pounds five Ounces. Bruiſe the Bitumen Judaicum, and macerate it in Water; then ſet it over the Fire with the Oil till they boil. Diſſolve the Myrrh in odoriferous Wine, bruiſe the Calamus, and, mixing them together, take out the Aſpalathus, and put in this Mixture of the Calamus into the Oil; and, when they have juſt boiled together, remove the Veſſel from the Fire, and ſtrain it off. Then, having bruiſed the Cardamoms, and mixed them with the reſt of the Water, pour thereto what was boiled, and continually ſtir it with a Spatula till it be quite cold. Afterwards ſtrain off the Oil, and to forty-eight (I read μά inſtead of κά, with *Cornarius*) Pounds of Oil put forty-ſix Pounds eight Ounces of Flowers of Cypreſs; and, having let them alone to macerate, paſs them thro' a Wicker Baſket. If you deſire more of it, you may put in the ſame Quantity of freſh Flowers, and ſtrain it off in like manner; for you may make a ſecond or third Maceration, if you pleaſe, the Preparation being the ſtronger for it. In chuſing it, you ought to regard its Goodneſs, and the ſtriking Fragrancy of its Smell. Some mix Cinnamon with it.

Cyprinum is of a heating and mollifying Quality, and opens the Mouths of the Veſſels, on which account it is proper in Affections of the Uterus and Nerves, and alſo for Pleuriſies and Fractures, either by itſelf, or mixed with Cerate. It is alſo an Ingredient in Malagmas for the Opiſthotonos, Quinſey, and Inflammations in the Groins; and alſo enters the Compoſition of Acopa. *Dioſcorides*, *Lib.* 1. *Cap.* 65.

CYPRUS. See PHYLLAREA; *folio Liguſtri.*

CYPSELE, or CYPSELIS; κυψέλη, or κυψελίς, The Wax of the Ears.

CYPTARION. The Name of an Antidote in *Myrepſus*, *Sect.* 5. *Cap.* 9.

CYRÆNIA. In *Rulandus* the Fæces of Saffron infus'd in Oil.

CYRBASIA. Properly the *Tiara*, a Sort of Cap worn by the *Perſian* Monarchs. *Hippocrates* makes uſe of this Word, in his Treatiſe of the Diſeaſes of Women, in deſcribing a Sort of Covering which he directs for the Breaſt.

CYREBIA, κυρέβια. The Huſks of Barley, or of other Corn, which fall off whilſt they are torrifying, or ſoaked in Water.

CYRENAICUS SUCCUS. The ſame as LASERPITIUM.

CYRSEON. The Podex, or Anus.

CYRTOIDES, κυρτοειδής. Gibbous.

CYRTOMA, κύρτωμα. Any preternatural Tumor, Protuberance, or Gibbolity.

CYSSAROS, κύσσαρος. The Podex, or Anus.

CYSSITES. A Name for the *Lapis Ætites*.

CYSTEOLITHOS, from κύστις, the Bladder, and λίθος, a Stone. The Stone in the Bladder.

CYSTHEPATICI DUCTUS. The Cyſthepatic Ducts, that is, Ducts which convey the Bile from the Liver to the Gall-bladder.

CYSTICAPNOS.

The Characters are,

It hath an annual fibrous Root; the Leaves, Branches, and Flowers, have the Appearance of climbing Fumitory; the Fruit is an oval Bladder, pierced thro' by an Axis, to which are faſten'd round Seeds on every Side, incloſed again with one common Veſicle, which is expanded about the Axis.

Boerhaave mentions but one Species of this Plant, which is,

Cyſticapnos; Africana; ſcandens. *Fumaria, Africana, veſicaria, ſcandens.* Par. Bat. App. 7. *Fumaria, alba, veſicaria, capreolis donata, ſub exitura autumni ſtorens, Æthiopica*, Plukn. 400. a. AFRICAN CLIMBING BLADDER FUMITORY. *Boerh. Ind. alt. Plant. Vol.* 1.

CYSTINX, κύστιγξ. A ſmall Bladder.

CYSTIS, κύστις. The Bladder of Urine; but *Cyſtis Fellea* is the Gall-bladder. Hence *Cyſtis* is applied to any Receptacle of morbid Humours reſembling a Bladder.

CYSTOTOMIA, from κύστις, the Bladder, and τέμνω, to cut. The Operation of Lithotomy.

CYTHION. The Name of a Collyrium mentioned by *Celſus*.

CYTINUS. The Flower of the Pomegranate.

CYTISO-GENISTA.

The Characters, according to *Miller*, are,

It hath papilionaceous (or Butterfly) Flowers, which are ſucceeded by compreſſed Pods, in which are contain'd many Kidney-ſhap'd Seeds: The Branches are flexible, and have ſometimes ſingle Leaves, and at other times three Leaves join'd together.

Boerhaave mentions but one Species of this Plant, which is,

Cytiſo-geniſta ſcoparia; vulgaris; flore luteo. *Tourn. Inſt.* 649. *Boerh. Ind. A.* 2. 27. *Geniſta*, Offic. Ger. 1130. Emac. 1311. Chab. 83. Mer. Pin. 44. *Geniſta vulgaris*, Merc.

Mere. Bot. 1. 37. Phyt. Brit. 45. *Geniſta vulgaris & ſcoparia*, Park. Theat. 228. *Geniſta anguloſa & ſcoparia*, C. B. Pin. 395. *Geniſta non ſpinoſa anguloſa & ſcoparia*, Jonſ. Dendr. 372. *Geniſta anguloſa trifolia*, J. B. 1. 388. Raii Hiſt. 2. 1723. Synop. 3. 474. *Cytiſus ſcoparius vulgaris*, Elem. Bot. 508. COMMON BROOM. *Dale.*

This has a large, thick, woody Root, running deep in the Earth, whence it is with Difficulty extirpated; from which ſpring a great Number of Stalks, growing pretty cloſe together, which are very tough, ſomewhat welted and angular, growing two Foot or more high. It bears at every Joint three ſmall oval Leaves, growing on a common Foot-ſtalk, which quickly fall away, appearing bare of Leaves for a great Part of the Year. The Flowers grow on the Branches from the Middle upwards, being large and papilionaceous, of a bright-yellow Colour, and are ſucceeded by flat very hairy Pods, containing ſmall, brown, Kidney-like Seed. It grows in Fields and Commons, and flowers in *April* and *May*. The Flowers and Stalks are us'd.

Broom is an aperitive and hepatic Shrub, opening Obſtructions of the Liver and Spleen, provokes Urine, and is accounted very good for the Dropſy, being infuſed in the common Drink. The Aſhes likewiſe, infuſed in Ale or Wine, are uſed againſt the ſame Diſtemper, cauſing great Diſcharges of Water by Urine. The Flowers, before they are grown to any Bigneſs, are pickled with Salt and Vinegar, and are eaten for Sauce, like Capers, and are eſteemed by many as wholſome for the Stomach, and good againſt Diſeaſes of the Spleen and Liver.

Cordus has obſerved, that this Plant ſtinks like the Elder: Its Smell ſeems ſtronger to me, and to approach to that of the fetid Oils: Its Leaves are bitter, and give no Redneſs to blue Paper; whence we may conjecture, that they contain a Salt reſembling the natural Salt in the Earth, mixed with a great deal of fetid Oil: Thus this Plant is aperitive and diuretic. *Pena* and *Lobel* affirm, that, in *Guien* and *Auvergne*, the People eat Broom-flowers in Sallad, without any Provocation to vomit. *Simon Paulli* has obſerved, however, that two Drams of theſe Flowers, infuſed in Hydromel, purged very well. If it be ſo, it is probable, that the Vinegar ſtops their purgative Quality; for every body knows, that Acids weaken Purgatives. Theſe Authors alſo have obſerved the Seeds of Broom to be very little emetic. *Tragus* recommends the diſtil'd Water of Broom-flowers for the Stone: He ſays, that a Scruple of the Seed, powder'd, is ſudorific; and that a Glaſs of the Juice of the Branches, macerated in Water, gives great Relief in the Sciatica and Quinſey. *Dodonæus* preſcribed the Infuſion of the young Shoots to bring off the Seroſities of hydropical and cachectic Perſons by Urine: He alſo gave them to drink the Aſhes of the ſame Plant, infuſed in White-wine; but he gives notice, that they are very acrid. They may be corrected with Cream of Tartar. *Julius Cæſar Claudianus* mixed them with the Salt of Wormwood, and has publiſhed this Secret as an excellent Remedy for the Dropſy. The Extract of the Leaves has the ſame Virtues. The Conſerve and Extract of the Flowers are good for the Diſeaſes of the Stomach. They are uſed in the balſamic Pills, which are taken before Meals. Theſe Pills are ſtrengthening, and keep the Belly open: They are made after the following Manner:

> Mix the Extract of eight Ounces of Rhubarb, that of the like Quantity of Aloes, four Ounces of Maſtich, ſix Ounces of Myrrh, two Ounces of Saffron, one Ounce of the Extract of Broom-flowers, and as much Balſam of *Peru*; make them into Pills, and let a Dram be the Doſe. *Martyn's Tournefort.*

It is remarkable, that Sheep are preſerved from the Rot, by browſing upon young Broom.

CYTISUS.

The Characters, according to *Miller*, are,

It hath papilionaceous (or Pea-bloom) Flowers, which are ſucceeded by compreſſed Pods, in which are contain'd ſeveral Kidney-ſhap'd Seeds. To which may be added, the Leaves are, for the moſt part, roundiſh, and ſomewhat like thoſe of the Nettle-tree.

Boerhaave mentions ſixteen Species of this Plant.

1. Cytiſus Alpinus; latifolius; flore racemoſo, pendulo. *Elem. Bot.* 508. *Tourn. Inſt.* 647. *Boerh. Ind. A.* 2. 26. *Laburnum*, Offic. Chab. 78. *Laburnum trifolium Anagyridi ſimili*, J. B. 1. 361. *Anagyris*, Ger. 1239. Emac. 1427. *Anagyris non fœtida ſive Laburnum majus*, Parkinſ. Theat. 245. *Anagyris non fœtida major vel Alpina*, C. B. Pin. 391. *Anagyris non fœtens major vel Alpina*, Jonſ. Dend. 364. BEAN-TREFOIL-TREE. *Dale.*

The Leaves are refrigerating, and diſcuſs Tumors; and the Decoction thereof provokes Urine.

2. Cytiſus Alpinus; latifolius; flore racemoſo, pendulo; foliis variegatis. *T.* 648. *Anagyris, non fœtida major, Alpina, foliis ex albo & viridi eleganter variegatis.* Plukn. Alm. Bot.

3. Cytiſus Alpinus; anguſtifolius; flore racemoſo, pendulo, longiori. *T.* 648. *Anagyris, non fœtens, minor.* C. B. Pin. 391. *Egelo.* Dod. p. 785. *Anagyris anguſtifolia.* H. Eyſt. o. 1. F. 7. Fig. 1. THE NARROW-LEAV'D LABURNUM, OR BEAN TREFOIL, WITH LONG PENDULOUS FLOWERS.

4. Cytiſus Alpinus; flore racemoſo, pendulo, breviori. *T.* 648. *Anagyris, non fœtida, latifolia, floribus denſius congeſtis in breviorem uvam.* Schol. Bot. BROAD-LEAV'D LABURNUM, OR BEAN-TREFOIL, WITH VERY SHORT PENDULOUS FLOWERS.

5. Cytiſus; glabris foliis, ſubrotundis; pediculis breviſſimis. *C. B. P.* 390. *Trifolium arboreſcens.* H. Eyſt. Vern. o. Arb. & Fr. F. 10. Fig. 2. H. R. D. ROUND-LEAV'D SMOOTH BASE TREE-TREFOIL, WITH SHORT FOOT-STALKS.

6. Cytiſus; glaber; nigricans. *C. B. P.* 390. THE BLACK BASE TREE-TREFOIL.

7. Cytiſus; glaber; viridis. *C. B. P.* 390. SMOOTH GREEN BASE TREE-TREFOIL.

8. Cytiſus; ſecundus Cluſii. *H.* 94. *Pſeudo-Cytiſus alter.* Dod. p. 570. H. R. D.

9. Cytiſus; minoribus foliis; ramulis tenellis, villoſis. *C. B. P.* 390.

10. Cytiſus; ſupinus; foliis infrà & ſiliquis molli lanugine pubeſcentibus. *C. B. P.* 390.

11. Cytiſus; Africanus; argenteus; flore atro purpureo. *Oldenl. T.* 648. H. R. D. SILVER AFRICAN BASE TREE-TREFOIL, WITH A DARK-PURPLE FLOWER.

12. Cytiſus; hirſutus; flore luteo purpuraſcente. *C. B. P.* 390. HAIRY BASE TREE-TREFOIL, WITH A PURPLISH-YELLOW FLOWER.

13. Cytiſus ſpinoſus. *Herm. Cat. Hort. Lugd. Bat.* 218. *Tourn. Inſt.* 648. *Elem. Bot.* 508. *Boerh. Ind. A.* 2. 27. *Aſphalathus altera*, Offic. *Aſphalathus ſecunda trifolia, quæ Acacia ſecunda Matthiolo trifolia*, J. B. 1. 375. *Aſphalathus ſecunda trifolia, Acacia ſecunda quorundam.* C. B. Pin. 392. Jonſ. Dendr. 366. *Acacia altera trifolia*, Ger. 1149. Emac. 1330. *Acacia Dioſcoridis*, Ger. 1149. *Acacia ſecunda ſeu altera Dioſcoridis*, Park. Theat. 1544. *Cytiſus ſpinoſus Acacia dictus*, Raii Hiſt. 2. 1723. *Cytiſo-Spartium, aculeatum, Acacia trifolia dictum*, Plukn. Almag. 129. TREFOIL ACACIA.

The Juice of this Cytiſus is aſtringent, and a good Medicine for the Eyes. *Dioſcorides.*

14. Cytiſus; humilis; argenteus; anguſtifolius. *T.* 648. *H. R. D.* SILVERY DWARF BASE TREE-TREFOIL, WITH NARROW LEAVES.

15. Cytiſus; Monſpeſſulanus; Medicæ folio; ſiliquis denſe congeſtis & villoſis. *T.* 648. BASE TREE-TREFOIL OF MONTPELIER, WITH MEDIC-LEAVES, AND HAIRY PODS GROWING IN BUNCHES.

16. Cytiſus; argenteus; linifolius; inſularum Stœchadum. *T.* 648. SILVERY FLAX-LEAV'D BASE TREE-TREFOIL OF THE STECHADES ISLANDS. *Boerh. Index alt. Plant. Vol.* 2.

Beſides the foregoing Species of the *Cytiſus*, *Dale* mentions the following; which is,

PSEUDO-CYTISUS, Offic. *Pſeudo-cytiſus hirſutus*, Ger. 1126. Emac. 1308. *Cytiſus hirſutus*, J. B. 1. 372. Chab. 79. Tourn. Inſt. 647. Elem. Bot. 508. *Cytiſus Hiſpanicus arboreus*, Park. Theat. 1475. *Cytiſus foliis ſubruſa lanugine hirſutis*, C. B. Pin. 390. Raii Hiſt. 1. 971. Jonſ. Dendr. 361. Hort. Cath. Supp. A. 25. HAIRY SHRUB-TREFOIL.

The Leaves are uſed in the ſame Intentions as thoſe of the other Species.

CYZICENUS, Κυζικηνός. An Epithet of a Plaiſter deſcrib'd by *Galen*, *de Comp. M. p. G.* and recommended for Chironian Ulcers, and Wounds of the nervous Parts.

D.

DAC DAI

D, in the chymical Alphabet, imports Vitriol.

Δ. The Figure of the Letter *Delta*, the fourth in the *Greek* Alphabet, was uſed by the Antients, as *Galen* ſays, *Com.* 3. *in* 3. *Epid. Tit.* 71. as a Symbol to expreſs a Quartan Fever.

DABESTIC. A Tortoiſe. *Johnſon.*

DABURI. *Cluſii.* A Name for the ACHIOTL, which ſee.

DACETON, δακτὸν, from δάκνω, to bite, is an Epithet of ſuch Animals as hurt by biting.

DACHEL. A Name in *Boerhaave's Index alter*, for the PALMA MAJOR.

DACNERON, δακνηρὸν, from δάκνω, to bite, biting, is an Epithet of a Collyrium in *Trallian*, call'd alſo *Oxydorcia* and *Cynopticon*, much recommended by him for clearing the Sight, helping weak Eyes, and diſcuſſing a beginning Cataract. It conſiſts of thirty Drams of burnt Copper, ſixteen Drams of Pepper, eight Drams of Cadmia, four Drams of Myrrh, the like Quantity of Saffron, twenty-four Drams of Gum Arabic, and five Drams of Opium; uſe them in Water. *Trallian, Lib.* 2. *Cap.* 5.

DACRYDIUM. The ſame as DIAGRYDIUM, which ſee.

DACRYODES HELCOS, δακρυῶδες ἕλκος, from δάκρυ, or δάκρυον, a Tear, is uſed by *Hippocrates, Lib. de Fract.* to ſignify an Ulcer running with a thin and undigeſted Sanies.

DACRYON, δάκρυον, a Tear, is an excrementitious, ſerous, or lymphatic Liquor, diſtilling from the *Glandulæ lacrymales*. Tears are diſtinguiſh'd into natural or voluntary, and preternatural or involuntary: The firſt flow from the Eye, on occaſion of ſome extraordinary Paſſion of the Mind, as Grief, ſudden Joy, and the like. The preternatural, or involuntary, are call'd by *Hippocrates* δάκρυα ἀκούσια, *Lib.* 1. *Epid.* where he ſays, that, in burning Fevers, they prognoſticate an Hæmorrhage from the Noſe. In *Lib.* 4. *Epid.* he expreſſes the ſame by ἀκουσίως παραῤῥέοντα, "flowing involuntarily." In *Progn.* he uſes the Phraſe ἀπεραιρέως δακρύοντες ὀφθαλμοὶ, "Eyes weeping undeſignedly;" to which, *Aph.* 52. *Lib.* 4. are oppos'd καθ' ἁπεραίρεσιν δακρύοντες, "weeping ſpontaneouſly." And, *Lib.* 6. *Epid. Sect.* 1. *Aph.* 16. we are told, "that, in acute Diſeaſes, when the Caſe is dangerous, voluntary Tears are a good Sign, but involuntary, the contrary." *Galen, de Cur. Rat. ad Glauc.* reckons involuntary Tears among the Signs of an Hæmorrhage.

DACRYOPOEOS, δακρυοποιὸς, from δάκρυ, a Tear, and ποιέω, to make, or cauſe, is an Epithet of ſome acrimonious Subſtances, which excite Tears; as the Onion, Sea-radiſh, and the like.

DACTILETUS. The Hermodactyl. *Rulandus.*

DACTYIDEUS, according to *Johnſon*, is the *Lapis Lyncis*. See BELEMNITES.

DACTYLETHRAI, DACTYLITHRAI, δακτυλήθρα, δακτυλίθρα, from δάκτυλος, a Finger, from its Figure, is a ſort of topical Medicine intruded into the Stomach to provoke Vomiting; and is deſcrib'd by *Oribaſius, Collect. Med. Lib.* 8. *Cap.* 6. "I know ſome, he ſays, who anointed their Fingers "with the Juice of Scammony, and, by that means, pro"voked the Stomach to caſt up its Contents; but, if this had "no Effect, they took eight or ten Feathers out of the Tail "of a Gooſe, and, rubbing them with Oleum Cyprinum, or "Irinum, intruded them." After this follows what relates immediately to this Article: "There is a Method alſo of "ſewing *Dactylethrai* of *Carthaginian*, or ſome other Kind, "of very ſoft Leather, ten or twelve Digits in Length, in "the Shape of a Finger. They filled this with Wool, to the "Length of ſix Digits, and left the reſt empty, to be adapted "to the Finger; then they rub'd it with one of the before"mentioned Oils, and ſo introduced it into the Stomach."

DACTYLIOS, δακτύλιος, in *Hippoc.* περὶ γυναικ. φύσ. is expounded by κύκλος, τροχίσκος, a Troche.

DACTYLODOCHME, δακτυλοδόχμη. See DOCHME.

DACTYLOS, δάκτυλος. The Fruit of the Palm-tree, call'd alſo by the *Greeks* φοινικοβάλανος, and φοινὶξ, as *Galen, Lib.* 2. *de Alim. Fac.* aſſures us; for which Reaſon, as *Foeſius* obſerves, we very rarely meet with δακτύλους in *Hippocrates*, but often with φοίνικας. In the Paſſage (*Lib.* 1. περὶ γυναικ.) τοῖσι δακτύλοισι χὴ ὄψοισι θαλασσίοισι μᾶλλον ἢ κρέασι χρήσθω, "Let her Food be *Dactyli*, and ſuch as the Sea affords, rather "than Fleſh-meats," the Word δακτύλοισι ſeems to import ſomething belonging to the Sea, rather than the Fruit of the Palm-tree, becauſe it reſpects a drying Regimen of Diet: For the *Dactylus* is a Sort of Shell-fiſh, which has the Name alſo of *Unguis*, from its Reſemblance to a Man's Nail; and is uſually eaten, *Pliny, Nat. Hiſt. Lib.* 9. *Cap.* 61, & 33. For the ſame Reaſon it was call'd by the *Greeks* ὄνυξ (*Onyx*). See BLATTA BYZANTIA. But ſince theſe Fiſh abound with a bad and viſcous Juice, according to *Athenæus*, and are of a hard Fleſh, *Foeſius* ſuſpects the Place to be corrupted, and reads with *Cordæus*, περὶ δακτύλους, connecting it to the foregoing Sentence; other Interpreters read τοῖσι δ' ἄλλοισι.

Δάκτυλος is alſo the ſhorteſt Meaſure among the *Greeks*, being the fourth Part of a Palm, and the ſixteenth Part of a Foot, the ſame as *Digitus* among the *Latins*.

DACTYLOTHECE, δακτυλοθήκη, from δάκτυλος, a Finger, and θήκη, a Caſe, is a Name given, by *Paré*, to a chirurgical Inſtrument for raiſing a Finger or Thumb, when pendulous from ſome Hurt received.

DACTYLUS, in *Boerhaave, Index alter*, is a Name for the *Palma Major*.

DACTYLUS IDÆUS. See BELEMNITES.

DÆDALUS. A Name for Mercury, or Quickſilver, in ſome chymical Authors.

DÆDION, δαιδίον, is a Diminutive of DAIS, a Torch, which ſee.

DÆMONIS. Ordure, Aſphaltus. *Caſtellus.*

DAIB, DEHEB, DEHEBEB, DEAB. Gold. *Rulandus.*

DAIS, DAS, δαὶς, δὰς, in *Hippocrates*, is the Tæda, a ſort of Pine-tree, and alſo the Subſtance of that Tree. In *Lib.* 1. περὶ γυναικείων, he preſcribes δαίδα πιοτάτην, "very "fat Tæda," for the Expulſion of the Fœtus; and, in the ſame Book, in a Suppreſſion of the Menſes, he orders drinking of Crethmon ἐν οἴνῳ τῷ ἀπὸ δαΐδος, "in Wine made of the "Tæda," or Wine in which the Tæda is boil'd. And again, for a Retention of the Lochia, he preſcribes a Potion, prepared of the Tæda, to be drank every Morning faſting, till the Diſorder be removed. In *Lib.* περὶ ἀφόρων, he directs δαίδα πιοτάτην, very pinguious Tæda, to be cut in thin Slices, and boil'd in the ſweeteſt white Paſſum, [γλυκεῖ, Wine made of dry'd Grapes] and ſo drank; and, in ſeveral other Places of the ſame Book, he orders Shavings of the Tæda, macerated in white Wine, or Water, and drank.

Dædion, δαιδίον, is an oblong, round, and ſmoothed Tæda, cut in the Form of a Peſſary, and introduced into the Uterus, in order to open its Orifice, when cloſed; and commonly preſcrib'd with a leaden Cannula, in many Places of *Hippocrates, Lib.* 1. περὶ γυναικ.

Dioſcorides, Lib. 1. *Cap.* 86. ſpeaking of the Pine, and the Pitch-tree, ſays, that a *Tæda*, [δαδίον] of them, cut into thin Slices, cures the Tooth-ach.

The *Dais*, or *Tæda*, is the Mountain Pine, wholly converted into a pinguious Subſtance. Hence, ſays *J. Bauhine*, *Pliny* is miſtaken in making the *Tæda* a particular Kind of Tree, and the ſixth of the coniferous Kinds. *Pliny* is alſo cenſured, on the ſame Account, by *Matthiolus, Bellonius, C. Hoffman, Bodæus a Stapel*, and others. *Ray* is of Opinion with *Dalechampius, Cluſius*, and *Parkinſon*, that the Word *Tæda* is homonymous, and ſometimes ſignifies the fat and reſinous Wood [τὴν δᾷδα] of the Pine, which is burnt inſtead of a Torch or Candle; and ſometimes a particular Kind of Tree, unknown to *Theophraſtus*.

From the lower Parts of the Mountain Pine, which are next to the Root, they cut thoſe pinguious Pieces of Wood, which ſerve to kindle a Fire, and to give Light, and are of great Uſe in many Countries of *Germany*; for the Humour, deſcending to the Root, cauſes a Suffocation; by which means the Tree is converted into a *Tæda*. Sometimes the Pitch-tree, and the Larch-tree, are converted into a *Tæda*, but very rarely; for it is a Diſeaſe peculiar to the Mountain Pine. From this Uſe of the Pieces of the *Tæda* in giving Light, the Word *Tæda* came to be uſed for any ſort of Torch, and eſpecially a nuptial one. *Raii Hiſt. Plant.*

Δαὶς, or δὰς, properly ſignifies a Taper or Torch, from δαίω, to kindle; whence comes the *Latin Tæda*, as from δάσκω, *teſcum*, δίνη, *tina*. All the antient Copies write *Tæda*, not *Teda*; ſo they properly call'd a Torch made of thin Splinters of Wood, bound together, and daubed over with Pitch. But, for the moſt part, the δᾷδες, or *Tædæ*, were made of the pinguious Woods of the Pine and Pitch-tree, as being very ſubject to kindle from their native Pitch; but they were moſt frequently made of the Pitch-tree, as being the moſt plentifully furniſhed with that Subſtance. Hence πίτυη, the Pitch-tree, came to ſignify the ſame as δαὶς, a Torch, as ap-

pears from *Pollux*, *Heſychius*, and *Ariſtophanes*. The *Greeks* then, and eſpecially the Poets, frequently uſed πεύκη for δᾷς. But we never find, on the contrary, that they made uſe of δᾷς to ſignify πεύκη, which would be juſt as if they ſhould uſe *Navis* to ſignify *Pinus*; though *Pinus* is frequently put by the Poets for *Navis*, which is made of the Subſtance of the Pine. The *Latins*, however, ſeem to have taken the δᾷς, and the λαμπάς, for the Picea, or Pitch-tree; becauſe the Picea was moſt ἰνδᾳδὲς, or had the Qualifications of a δᾷς to an extraordinary Degree. *Pliny* every-where, by the Word *Tæda*, means a Tree. *Vitruvius*, *Lib.* 7. *Cap.* 10. does the ſame; and, in the Gloſſaries, *Tæda* is the δαὶς, πεύκη, ἢ λαμπάς. And hence *Juvenal*, in the Hemiſtich——*Si ſit latiſſima Tæda*, uſes it as others do *Pinus*, or *Picea*, to ſignify *Navis*, a Ship: Becauſe, therefore, the *Greeks* confound δᾷς, and πεύκη, in making them both to ſignify a Torch, the *Latins* have confounded *Tæda* and *Picea*, taking them both for a Tree; which, however, is abſurd: And hence *Pliny* renders τὴν δᾶδα, and τὸ ἰνδᾳδὲς, of *Theophraſtus*, as ſpoken of the Tree *Tæda*, which is extremely abſurd. He errs alſo in making the *Tæda* a ſixth Kind of coniferous Tree diſtinct from the Pitch-tree, and accommodated for Illuminations in ſacred Solemnities. A *Tæda* is, indeed, a Torch proper enough on ſuch Occaſions; but if there were any Tree called *Tæda*, from whence the *Tædæ* or Torches were taken, it could be no other than the *Picea*: Beſides, the *Tædæ* were not taken from a particular Tree call'd the *Tæda*, but from the *Picea*, the *Pinus*, and, *ex omnibus δαδοφόροις*, "from all tediferous Trees." *Salmaſii Plin. Exercitationes.*

DAITIDES, δαΐτιδες, is expounded by *Galen*, in his *Exegeſis*, μεγάλαι λαμπάδες, "great Torches;" but is made by Metaphor, he ſays, to ſignify Heads of Garlick, becauſe they conſiſt of many Cloves, as Links and Torches are compoſed of coarſe Flax and Paper, bound up, and compacted together, παρὰ τὸ συνδεδέσθαι. But *Erotian* reads δίτιδα, and expounds it τὴν λαμπάδα, "a Torch," παρὰ τὸ δισμεύεσθαι, from binding. But I rather think, ſays *Foeſius*, thoſe to be in the right, who read *Galen* δαΐτιδα, μικρὰν λαμπάδα, "*Daitis*, a ſmall Torch;" both becauſe *Daitis* is a Diminutive, and as it comes nearer to the Reading of *Erotian*. Δαΐδες, in *Heſychius*, are λαμπάδες, λυχνοὶ, "burning Torches," from δαίω, to kindle. Δῖται, from δέω, to bind, ſignify Torches, Fetters, Handfuls; δῖται are alſo δεσμοὶ δᾳδῶν, τινὲς λαμπάδων, "Bundles of Torches," becauſe they are bound together. *Foeſius.*

DALECHAMPIA. A Name given by Father *Plumier* to a Plant found in *Martinico*, which he named thus in Honour of *J. Dalechampius*, a curious Botaniſt. It is call'd *Dalechampia*, *ſcandens*, *Lupuli foliis*, *Fructu tricocco glabro*, *Calyce hirſuta*. Climbing *Dalechampia*, with Leaves like Hops, a three-ſeeded Fruit, and a prickly Cup. *Miller's Dictionary*, *Vol.* 2.

DAMA, Offic. Bellon. Obſ. ed. Cluſ. 57. *Dama vulgaris*, Mer. Pin. 166. Aldrov. de Quad. Biſul. 741. Jonſ. de Quad. 55. *Dama vulgaris*, *ſive Recentiorum*, Geſn. de Quad. 307. *Cervus Platyceros*, *vel Platyceros ſimpliciter dictus Plinio*; *Dama vulgaris*, Raii Synop. A. 85. *Mas* THE BUCK, *fœmina* THE DOE, *hinnulus* THE FAWN *dicta*. THE FALLOW DEER.

This Animal is too well known to require a Deſcription.

As the Fallow-deer lives entirely on Vegetables and Water, the Salts are not highly exalted; nor is it much inclined to an alcaline Putrefaction, on account of its Aliment. But the habitual Exerciſe of the Animal exalts and volatilizes the Salts in ſome degree. The Veniſon of a Deer, kill'd when cool, differs very much from that of one kill'd when heated with Exerciſe: The Fibres of the firſt are more hard, the Fleſh more tough, and conſequently leſs eaſily diſſolvable in the Stomach. The ſecond is more tender, more eaſily diſſolvable, but has a greater Tendency to an alcaline Putrefaction; which, however, may be, in a great degree, prevented, by ſuffering the Deer to bleed plentifully when kill'd; as the *Jews* were directed to do with reſpect to all ſorts of Beaſts and Fowls, in *Leviticus*, *C.* 17. *V.* 13.

Upon the whole, however, Veniſon is eſteem'd, and that juſtly, an excellent Aliment.

The recent Blood of the Fallow-deer, drank immediately after being taken from the Vein, is ſaid to remove Dizzineſs of the Head.

The Gall is ſaid to be deterſive, to cure Dimneſs of Sight, and take away Films of the Eyes.

The Liver is recommended againſt a Diarrhœa.

The Horns are uſed exactly in the ſame Intentions as thoſe of the Stag; and the Fat or Suet agrees in Virtues with that of the ſame Animal.

DAMASCENA PRUNA NOSTRATIA. Damſons. See PRUNUS GALLICA.

DAMASCENA PRUNUS. The Damaſk Prune. See PRUNUS, *fructu magno*; *dulci*, *atro-cæruleo*.

DAMASONIUM. See HELLEBORINE, and ALISMA.

DAMNATA TERRA. The ſame as *Caput Mortuum*. See CAPUT.

DAMSIR, or DENSIR. Sand. *Johnſon.*

DANAIS. A Name for the *Conyza*. *Oribaſ. Coll. Med. Lib.* 11.

DANICH. A Weight of eight Grains. The Word is *Arabic*. See LUPINUS.

DANTA. The Name of a large *American* Animal, the Hoofs of which, ſcrap'd and powder'd, are eſteem'd ſudorific, good for the Epilepſy, and an Antidote againſt Poiſons, taken from a Scruple to a Dram.

DAPHNE. The Bay-tree.

DAPHNELÆON, δαφνέλαιον, (from δάφνη, the Bay-tree, and ἔλαιον, Oil) Laurinum, or Oil of Bay, is prepared of the Berries when full ripe, and ready to fall off, by boiling them in Water, during which they tranſmit through the Huſks a fat Subſtance, which, after compreſſing the Berries with the Hand, is taken off with Shells. Some, after they have inſpiſſated Oil of unripe Olives with Cyperus, Juncus odoratus, and Calamus, caſt therein the tender Leaves of the Bay, and boil them together; and ſome add the Berries, till it ſmells ſufficiently ſtrong; and others mix with them Styrax and Myrrh. The mountainous and broad-leav'd Bay is the fitteſt for the Preparation of this Oil, which is beſt in its kind when recent, of a green Colour, very bitter, and acrimonious.

Laurinum has heating and mollifying Virtues, opens the Mouths of the Veſſels, (διαπεμπτικὸν) and removes Laſſitudes. It is beneficial in all nervous Diſorders, Pains of the Ears, and Diſtillation; and it is an excellent Remedy, inferior to none, in Diſtempers of the Kidneys, contracted from Cold, the Parts being anointed with it; but, taken inwardly, it excites a Nauſea. *Dioſcorides*, *Lib.* 1. *Cap.* 49.

DAPHNIA. A Gem mentioned by *Pliny*, ſaid to cure the Epilepſy.

DAPHNITIS. A Name by which the *Alexandrian* Merchants call'd the beſt Species of Caſſia. *Oribaſ. Collect. Med. Lib.* 11.

DAPHNOIDES. A Name for the *Thymelæa*; *Laurifolia*; *ſempervirens*; *ſeu Laureola Mas*. *Boerh. Ind. alt. Plant.*

DARATOS, δάρατος. An Epithet for Bread in *Nicander*, which imports its being unfermented.

DARCHEM. The choiceſt Cinnamon. *Johnſon.*

DARSIS, δάρσις, from δέρω, to excoriate. Excoriation, or ſtripping off the Skin. It is ſometimes uſed as an anatomical Term.

DARTA. A Tetter, Ringworm, or the Itch.

DARTOS, δάρτος. The Dartos, or fleſhy Portion of the Scrotum, is a true cutaneous Muſcle, the Fibres of which are, for the moſt part, ſtrongly connected to the Skin, running thro' the cellular Subſtance, which lies between theſe two Portions, in place of a Membrana Adipoſa, but without the leaſt Appearance of Fat. This Muſcle is thin, and, by the Diſpoſition of its Fibres, forms a Bag with two Cavities, or two ſmall Bags, joined laterally to each other, and contained within the cutaneous Portion.

The lateral Parts of theſe two Bags, which are turn'd from each other, are longer than thoſe which are joined together; and, by this Union, a Septum is form'd between the Teſtes, which may be call'd the Mediaſtinum of the Scrotum.

The Raphe, or Suture, adheres to the Edge of this Septum, and thereby braces down the Middle of the cutaneous Portion, which, from thence, appears to be divided into two Portions. The other Edge of the Septum adheres to the Urethra.

Theſe two Bags of the Dartos are lined, on the inner or concave Side, by a cellular Subſtance, more conſiderable than that between the convex Side and the Skin; ſo that the fleſhy Fibres, all the Way to the Septum, lie between two cellular Strata. They run thro' the outer Stratum, to be inſerted in the Skin; and, by their Contraction, they form the natural Rugæ of the Scrotum.

Theſe fleſhy Fibres have likewiſe a ſtrict Connection with the internal cellular Membrane, eſpecially at the upper Part, below the Groin, where the anterior and external lateral Portions of the Dartos terminate by a kind of tendinous or ligamentary Expanſion, which is ſtrongly united to the internal cellular Membrane. I have often ſhewn this, as a particular Faſcia lata, which gives Inſertion to the Portions of the Dartos, and as a broad Frænum, which keeps the ſame Portions together.

The aponeurotic or ligamentary Expanſion of the Dartos is fixed in the Branch of the Os Pubis, between the Muſculus Triceps and the Origin of the Corpus Cavernoſum of the ſame Side, all the Way to the lower Part of the Symphyſis of theſe Bones. The internal Portion of theſe muſcular Bags, or that which forms the Septum Scroti, is fixed to the Urethra by means of a Communication between the ſame ligamentary Expanſion, and another, which is explained in its proper Place. *Winſlow's Anatomy.*

DAS. The ſame as DAIS, which ſee.

DASYMMA, δάσυμμα, from δασὺς, rough, is a Diſeaſe of the Eyes, the ſame as TRACHOMA, which ſee.

DASYPUS, δασύπους, from δασὺς, rough or hairy, and πούς, a Foot. An Epithet in *Galen*, *de C. M. S. L. Lib.* 5. *Cap.*

Cap. 9. for a Rabbet or Hare. *Caſtellus.* It generally imports a Hare.

DASYS, δασὺς, denſe, thick, cloſe, rough; in *Prorrhet.* and *Coac.* is an Epithet for a Tongue condenſed, contracted, and exaſperated with Heat and Dryneſs, as it happens in Phrenſies. *Galen* would rather have the Epithet τραχὺς uſed in ſuch a Caſe, and adds, that δασὺς is, by ſome, apply'd to a Tongue which is the Cauſe of a Denſeneſs or Roughneſs, that is, a Hoarſeneſs of the Voice. Δασεῖα γλῶττα alſo mean the ſame as πτερυγῶδη, (rigid) in *Coac.* and may import as much as when it is ſaid of the Tongue, under a burning Fever, πίπτει, σκληύνεται, ἢ τραχύνεται, ἢ παχύνεται, "It becomes rigid, hard, "denſe, and rough;" tho' *Galen* aſſerts, that, by δασεῖα γλῶττα, we are to underſtand no more than a moderate Roughneſs and Dryneſs of the Tongue.

Δασέα ὦρα, and διδασυμένα, in *Prorrhet.* and *Coac.* are denſe, thick, and very turbid Urines, with a rough or denſe Superficies; tho' this Phraſe is reckon'd by *Galen* among the obſcure and purpoſely affected; of which there are many ſuch in the *Prorrhetica*, and other ſuſpected Works of *Hippocrates.* "Some," he ſays, "by δασέα τῶν οὔρων underſtand "Urine of an unequal Superficies, exaſperated with ſmall "white Eminences like Hairs. Others take them to be frothy "Urine, which have a thin Spume unequally diſperſed over its "Superficies; and others again will have them to be thick "Urine, with ſomething hard on the Superficies as fine as Sand." In *Coac.* δασυνόμενον οὖρον is Urine which becomes denſe or thick, and is oppoſed to very thin Urine, being reckon'd among the foul or turbid Sorts. It indicates, that Nature attempts a Concoction of the Juices; and portends a Sweat. In *Lib.* 7. *Epid.* πάνυ δασέα ὦρα ἢ ἀνεσταλμένα, "a very denſe, and much "alter'd Urine," are join'd together, and portend a violent Pain of the Head, and Convulſions. Interpreters read ἀνατεταγμένα, tho' all the Copies have it ἀνατετραμμένα, for which we ought to read ἀνεσταλμένα. In *Coacis*, οὖρον δίσσὸν ἔχον διαστάμενον, "Urine whoſe thick Contents are divided "into two Parts," prognoſticates a Return of the Diſeaſe.

Δασεῖα ἀναπνοὴ, "a denſe Reſpiration," in *Galen, Com.* 3. in *Lib. de Art.* is ſuch as paſſes with a Noiſe, when the Organs of Reſpiration, either through the Straitneſs of the Place, or the Redundance of the Humours, or on both Accounts, are too much compreſſed, as it happens in hard, indigeſted, and laſting Tubercles of the Lungs. They who labour under this Diſorder are call'd κιρχάδες (*Cerchades*) ἀπὸ τῦ κίρκου, as *Galen* ſays, where all the Copies corruptly read κιγκλίδες and κίγκλου.

Δασεῖς, *Aph.* 34. *Lib.* 6. are thoſe who have their Heads adorned with Hair, in Oppoſition to the φαλακροὶ (*Phalacri*) the Bald and Smooth. The Epithet is uſed in the ſame Senſe by *Ariſtotle, Hiſt. Animal. Lib.* 3. *Cap.* 2.

Δασέα βλέφαρα are expounded by *Galen, Com.* 1. in *Prorr.* τὰ τραχύτητα ἔχοντά τινα μετρίως, "Eyelids which have a "moderate Degree of Roughneſs."

DATURA. See STRAMONIUM.

DAUCITES VINUM. Wine of the *Daucus* is prepared by putting ſix Ounces (I read ὐγγίας, with *Saracenus*, not ≺, Drams) of bruiſed *Daucus* into a Ceramium of Muſt, and ſtraining it off.

It is good for Pains of the Thorax, Hypochondria, and Uterus; provokes the Menſes and Urine; excites Eructations; and is ſerviceable in Coughs, Convulſions, and Ruptures of the capillary Veſſels. *Dioſc. Lib.* 5. *Cap.* 70.

DAUCUS.

The Characters are,

It hath, for the moſt part, a fleſhy Root: The Leaves are divided into narrow Segments: The Petals of the Flower are unequal, and ſhaped like a Heart: The Umbel, when ripe, is hollow'd and contracted, appearing ſomewhat like a Bird's Neſt: The Seeds are hairy, and in Shape of Lice.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Daucus; vulgaris, *Raii Synop.* 3. 218. *Merc. Bot.* 1. 32. *Phyt. Brit.* 34. *Tourn. Inſt.* 307. *Elem. Bot.* 257. *Boerh. Ind. A.* 62. *Daucus vulgaris ſeu noſtras*, Offic. *Paſtinaca ſylveſtris tenuifolia*, Ger. 873. Emac. 1028. Merc. Pin. 901. *Paſtinaca ſylveſtris tenuifolia Dioſcoridis, vel Daucus Officinarum*, C. B. Pin. 151. Mor. Umb. 31. Hiſt. Oxon. 3. 305. *Paſtinaca ſylveſtris ſive Staphylinus Græcorum*, J. B. 3. 61. Raii Hiſt. 1. 465. Chab. 390. *Staphylinus*, Dill. Cat. Giſſ. 150. *Staphylinus ſylveſtris*, Rivin. Irr. Buxb. 313. Rupp. Flor. Jen. 224. WILD CARROT, OR BIRD'S-NEST. *Dale.*

The wild Carrot has a Root ſomewhat thick and fleſhy, but much leſs than the Garden Kind, with many pretty large, hairy, winged, and finely divided green Leaves, finer and more hairy than Garden Carrots: The Stalk grows two or three Foot high, divided into ſeveral Branches, full of ſmaller Leaves, and having at the Tops pretty large flat Umbels, of white ſmall Flowers; and, when theſe are fallen off, the Umbels cloſe themſelves into a hollow round Form, like a Bird's Neſt, containing a great many Seeds, which, when ripe, are flattiſh, rough, and hairy. It grows frequently in paſture Grounds, and in fallow Fields, flowering in *June*, and the Seed is ripe ſoon after, which is the only Part uſed.

The Seed, infuſed in Ale, is accounted an excellent Diuretic, and good to prevent the Stone, and to render its Fits leſs violent: It brings away Gravel, and provokes Urine, as it does alſo the Menſes; and is uſeful in uterine and hyſteric Diſorders.

Helmont informs us, that he knew a Lawyer, who was ſeized with a Fit of the Stone every fifteen Days, freed from the Attacks of his Diſorder for ſeveral Years, by means of an Infuſion of Daucus-ſeed in clear Malt Liquor. Two Drams of the Seeds, infuſed in White-wine, and drank, are ſaid to cure hyſteric Paroxyſms. *Tragus*, and ſeveral others, warmly recommend the ſmall purple Flower, in the Middle of the Umbel, as an infallible Antidote againſt an Epilepſy. *Raii Hiſt. Plant.*

2. Daucus; ſativus; radice albâ. *T.* 307. *Paſtinaca, tenuifolia, ſativa, ſeu hortenſis, radice alba.* M. U. 31. C. B. P. 151. M. H. 3. 305. *Paſtinaca, ſativa, ſive Carota alba.* J. B. 3. 2. 64. b. THE WHITE CARROT.

3. Daucus; radice, & umbellâ, luteis. *T.* 307. *b.*

4. Daucus; ſativus; radice aurantii coloris. *T.* 307. *b.* THE ORANGE-COLOUR'D CARROT.

5. Daucus; ſativus; radice atrorubente. *T.* 307. *Paſtinaca, tenuifolia, ſativa, radice atrorubente.* C. B. P. 151. M. H. 3. 305. *Paſtinaca, ſativa, ſive Carota rubra.* J. B. 3. 2. 64. *Paſtinaca, ſativa, rubens.* Dod. p. 678. b. DARK-RED ROOTED GARDEN-CARROT.

The Virtues of the Seeds and Herb are the ſame with thoſe of the *Daucus Officinarum.* According to *Schroder*, it is accounted a Specific in hyſteric Fits.

The Roots are uſed in Kitchens, and the Method in which ſome prepare them is, to cut them into Slices, boil them, and eat them with Butter, Pepper, and Salt. But, in *England*, the moſt common Method of preparing them is, to boil them with Fleſh-broths, eſpecially thoſe prepared with Beef; and, when thus managed, they are eaten along with the Fleſh inſtead of Turneps. They are ſomewhat flatulent, but are thought to render the Body ſoluble, and contribute to the Cure of a Cough. *Quercetan* affirms, that half a Dram of the Seeds of white Carrot dry'd and powder'd, exhibited with Balm-water, is a Specific againſt hyſteric Fits. *Raii Hiſt. Plant.*

6. Daucus; folio tordylii; flore albo; altiſſimus. *Cauralis, daucoides, altiſſima, Paſtinacæ ſylveſtris folio, flore albo.* H. Maur.

7. Daucus; maritimus; lucidus. *T.* 305. *Paſtinaca tenuifolia, marina, foliis obſcurè virentibus, & quaſi lucidus.* Bot. Monſp. *Paſtinaca, folio œnanthes.* Bocc. Rar. 74. *Gingidium, folio Chærophylli.* C. B. P. 151. *Boerh. Ind. alt. Vol.* 1.

In the *Hiſtoria Plantarum*, aſcrib'd to *Boerhaave*, we read that the Root is much celebrated for its Virtues againſt the Stone, and nephritic Diſorders, and for provoking the Menſes. The Seeds, gather'd in the right Seaſon, are endu'd with an Acrimony; and, being infus'd in Beer, are highly beneficial in the fore-mention'd Diſtempers. The Roots of the firſt, ſecond, third, and fourth Species, afford excellent Nutriment, and are very proper Food for conſumptive Perſons. Empirics raſp the Root, and boil the Raſpings in Milk; than ſweeten it with Honey, and exhibit it in all Diſeaſes of the Breaſt, and in Quinſeys, and externally, to prevent Ulcers from contracting a Cruſt: They give it alſo in Pains after the Birth, the Colic and Strangury. It is one of the moſt conſiderable culinary Roots, and ſtrengthens and fattens the Body.

DAVERIDON. Oil of Spike. *Johnſon.*

DAULONTAS, *Daulontas Frutex (G. Piſon.)* is an *American* Shrub, about a Man's Height, and very full of Branches, which ſo ſpread and extend themſelves in Gardens, that they are obliged to reſtrain them by Lopping and Burning. The Leaves reſemble thoſe of the Balſam-tree, being jagged at the Edges. The Flowers grow in Cluſters, like thoſe of the Elder-tree, and are ſucceeded by Flowers of a bitter Taſte.

This Plant has the Smell, and other Properties, of Chamomile; and the Flowers are uſed in Fomentations and Cataplaſms, as emollient, diſcutient, and reſolvent. The Berries are of Service, taken inwardly, for the Aſthma, to provoke the Menſes, and in the Colic. *Lemery des Drogues.*

DAUMUR. A Species of Serpent, entering the Compoſition of the *Theriaca. Johnſon.*

DAURA. A Term uſed by *Paracelſus* for black Hellebore. Some call it DURA.

DEACUMINATA. The ſame as APOXE, which ſee.

DEALBATIO, λευκασμὸς, λεύκωσις. A Whitening. It is a Part of Coſmetica, as when we ſay, a Whitening, or Dealbation, of the Teeth, Cicatrices, or the like. It is alſo a Term in Uſe among ſome Profeſſors of the ſpagirical Art, for the third Operation of the Proceſs of the Philoſophers Stone. *Paracelſus*, in his *Manual*, teaches artificial Ways of whitening Metals; and *Junker*, in his *Lexicon Chymicum*, ſhews two Ways of whitening Copper. *Caſtellus.*

DEARGENTATIO. A Tincturing of the baſer Metals, for Inſtance, Copper, with the Colour of Silver.

DEARTICULATIO, διάρθρωσις. The ſame as ABARTICULATIO, which ſee.

DEASCIATIO. The ſame as APOSCEPARNISMUS, which ſee.

DEAURATIO. A ſuperficial Tincturing of Metals, Money, and the like, with the Colour of Gold. I don't know, that it relates to Medicine, unleſs becauſe Pills and Boluſes are ſometimes gilt.

DEBESSIS. A Tortoiſe. *Rulandus.*

DEBUS. A Term in *Paracelſus, Tract. Apocr. de Vulner.* by which he would ſignify a Remedy againſt Anger.

DECAMYRON, δεκάμυρον, from δέκα, ten, and μύρον, Ointment. The Name of a Malagma in *Oribaſius*, ſo call'd, becauſe it conſiſts of ten different Aromatics. It conſiſts, according to *Myrepſus, Sect.* 9. of *Indian* Leaf, Maſtich, Euphorbium, Spikenard, each four Scruples; Styrax Calamitis, Adarce, each ſix Scruples; common Pepper, four Scruples; Ointment of Nard, four Ounces; Opobalſamum, Wax, each five Drams one Scruple.

DECANTATIO, καταχυσις, the ſame as DEFUSIO, is when a Liquor is gently pour'd off from ſome precipitated Matter, without Straining or Filtration. *Caſtellus.*

DECANUS, δεκανὸς, in former times was taken in a bad Senſe, to ſignify a Juggler; as appears from *Galen, Lib.* 6. *de S. F. a little after the Beginning. Caſtellus.*

DECATORTHOMA, δεκατόρθωμα, from δέκα, ten, and ὀρθόω, to direct, or prepare, is a Medicine compounded of ten ſimple Ingredients. *Caſtellus.*

DECEMBER. *Aetius, Tetrab.* 1. *Serm.* 3. *Cap.* 163. places the Winter Solſtice on the twenty-third of this Month; which, if not exact, is yet ſufficient to ſhew, that we are fallen back at leaſt ten or eleven Days in our Computation of Time according to the *Julian* Year.

DECIDENTIA, καταπτωσις. See CATAPTOSIS. It is alſo a Word by which we render μεταπτωσις, which, in *Galen, Com.* 1. *in Prognoſt. Hippocr.* and in other Places, ſignifies ſome Turn or Alteration in acute Diſeaſes, whereby they are prolonged from fourteen to twenty, and ſometimes to forty Days.

DECLARATIO, INTERPRETATIO, EXPLICATIO, ἑρμήνεια, ἐξήγησις. The ſame as EXEGESIS, which ſee.

DECLINATIO, παρακμὴ, the Decline, is that Time of a Diſeaſe in general, or of a particular Paroxyſm, when Nature gets the upper Hand of the Diſeaſe, and there is a Remiſſion of the Symptoms; it ſucceeds the State or Vigour of the Diſtemper. *Declinatio*, in *Avicenna*, is a State of Diſlocation, or imperfect Luxation, when the Bone is not totally remov'd from its Seat.

DECOCTA, δήκοκτα, is Water once boil'd or heated, and cool'd in Snow, for the ſake of quenching the Thirſt in a more grateful manner. *Galen* gives an Account of it in *Lib.* 7. *Meth. Med.* And *Pliny, Lib.* 31. *Cap.* 3. ſays, "It was an Inven-"tion of the Emperor *Nero*, and a very ſubtile one, firſt to "boil Water, and then to cool it by ſinking it in a Glaſs "Veſſel in Snow, by which means he had all the Pleaſure of a "cooling Draught, freed from the ill Qualities of the Snow; "for it is agreed, that Water boil'd is moſt ſalutary; and it is "capable of the greateſt Refrigeration after it is heated."

DECOCTIO, ἕψησις, ἕψεσις. Decoction.

The Word *Decoction* comes from the *Latin* Word *Decoquere*, which ſignifies to *boil.* The End of Decoction is either to diſſolve the active and ſerviceable Parts of mixed Bodies in a proper Liquor, or to mollify theſe Bodies, by boiling to ſuch a Degree, as that we may be able to ſeparate their pulpous Parts from them.

The general Subjects of Decoction are Animals and Vegetables, and ſometimes Minerals, as Antimony and Quickſilver. The Liquors which ſerve to boil them are Water, Wine, Vinegar, Milk, and Whey.

As Decoctions ought to be as different as the Purpoſes for which they are deſigned, it would be difficult to eſtabliſh Rules concerning the Proportion of the Water to the Ingredients boil'd in it; only we may ſay in general, that the harder and more compact the Drugs are, the greater is the Quantity of the Liquor in which they require to be boil'd.

Decoction ought ſometimes to be preceded by Infuſion, that the Liquor may have ſufficient time to extract the Subſtance of the compound Body; as when we make a Decoction of the Roots of Sarſaparilla, or the Woods of Guaiacum, or Box.

We muſt avoid, as much as poſſible, boiling of Aromatics, becauſe their volatile Principles, which are the moſt eſſential, are diſſipated in Boiling: The beſt Way is, to infuſe them in hot Liquor in a Veſſel well cover'd.

When we deſign to make a Decoction of ſeveral Sorts of Ingredients, we begin with boiling Barley, Shavings of Hartſhorn and Ivory, and the Roots of Quich-graſs, over a moderate Fire, for half an Hour; then we put thereto other Roots, newly gathered, as thoſe of Succory and Sorrel, waſhed and cleanſed from their Strings, and cut in ſmall Bits, ſuffering them to boil together for one Quarter of an Hour; after which we put in Fruits, firſt cleanſed from their Rinds and Kernels, and cut in Pieces, if they are large: To theſe we add chopped Herbs, and bruiſed Seeds, and then Flowers and Liquorice, letting them boil gently. After a ſufficient time we pour the Whole into a Veſſel of Earth or Tin, into which we had put bruiſed Cinnamon, yellow Sanders, Raſpings of Saſſafras-wood, and other Aromatics; we cover the Veſſel, and, when the Decoction is cool, ſtrain it, ſqueezing the Ingredients; and then let it ſtand in order to depurate, and become clear.

If you think fit to have your Decoction enriched with Animals, as Cray-fiſh, Frogs, or Vipers, you muſt put them in at the Beginning, always avoiding to make too great a Fire, for fear of cauſing too great a Diſſipation of the volatile and eſſential Salts. *Lemery Pharmacopée.*

Boerhaave has, in the ſecond Volume of his Chymiſtry, laid down ſome excellent Rules both for the Preparation and Uſe of Decoctions, Infuſions, Robs, Sapas, *&c.* from Vegetables.

Take the Remains, ſays he, of Roſemary, after a Water has been procured from it, by the cold Still, in the manner directed under the Article AQUA, which have now loſt their Verdure, Plumpneſs, and Succulency, and are become brown, contracted, ſhrivel'd, lighter, and almoſt without the natural Smell, and of a Taſte ſomewhat foreign from that of Roſemary. The whole is now brittle, which before was ſupple, ſoft, and viſcous; all which may appear by comparing this Remainder with the recent Plant. Inſtead hereof we may take a Plant gently dry'd, but not too long, in the open Air of a ſhady Place, or even what is freſh-gathered; for this will make no conſiderable Difference, becauſe the Water, which comes over in the Diſtillation above-mention'd, is always loſt in the Boiling.

To the Subject, put into a clean Veſſel, pour pure clean Rain-water, heated from eighty-five Degrees to the Degree immediately under Ebullition, which is, that of two hundred and eleven. Let the whole Plant be well cover'd with the Water, which muſt now ſtand together, in a cloſe Veſſel, in this Degree of conſtant Heat, for the Space of half an Hour or more. Then pour off the Liquor, which will now appear brown-colour'd, and have but little Odour, being deprived of the Taſte of the Roſemary, found in the Water of the Proceſs above-mention'd.

This is call'd the Infuſion of Roſemary, and contains the Virtue of the Plant but little alter'd. If the Water above-mention'd be mixed with it, it will advantageouſly contain the peculiar Virtue of the Plant for Medicinal Uſes. And, perhaps, this is the beſt Manner of conveying the Medicinal Virtues of Herbs into the Body, unleſs it be in the Form of expreſs'd Juices.

If the Plant be boil'd for ſome Minutes with Water, the Liquor then pour'd off is call'd a Decoction, or Apozem. If this be made in an open Veſſel, all the Water of the Proceſs above referred to is loſt, beſides much other Matter. If the Operation be here perform'd in a very tall Chymical Veſſel, fitted with a Still-head and a Receiver, and the Water that comes over be afterwards added to the Decoction, the Whole will then have the principal Medicinal Virtue of the Plant; and, if the Operation be performed in *Papin*'s Digeſter, the Decoction will then have the united Virtues of the Plant, without any Loſs of the Spirit or Water above referred to. But the peculiar Virtue of the Plant is here changed, as appears both by the Smell and Taſte, and, in ſome degree, by the Effect; and it is extremely difficult, in all theſe Caſes, to preſerve the Odour, Taſte, and Colour perfect.

Upon the Remains of the firſt Decoction pour boiling freſh Water; make it conſtantly boil; then pour off the Decoction, and carefully take off, with a clean Spoon, all the Froth which riſes in the Boiling, ſetting it apart in a clean Veſſel. This Matter is unctuous, and, when gently dry'd, burns in the Fire. Continue to pour on freſh Water, pour off the Decoction, and collect the Froth, taking care to avoid the Admixture of any foreign Matter, as Soot, Smoke, or the like, till the Water, at laſt pour'd on, comes off, after a long-continu'd Boiling, as pure, taſteleſs, and colourleſs, as it was when put on, which will happen about the twentieth Repetition. After this, it will be ſurpriſing to obſerve the Leaves of the Roſemary remaining entire, turgid with Water, of their original Form and Size, but having exchang'd their green Colour for a brown, and being ſunk to the Bottom of the Water, wherein they floated before.

The denſer the Plant is, and the more reſinous, the more oily Froth is thrown to its Surface; and the leſs of the reſinous or oleaginous Virtue communicated to the Water, becauſe not diſſolved therein; and therefore, for preparing a Decoction of this Kind, a long previous Digeſtion, or the Addition of a fix'd alcaline Salt, and, afterwards, a longer Boiling, are required, as in making the Decoction of Guaiacum-wood.

But the native ſaponaceous Virtue of ſuch Vegetables, rich in Reſin, preſerves their reſinous Parts in a State capable of Solution, if boil'd whilſt freſh, green, and ſucculent; but this Reſin, when dry, acquires a firmer Texture, and becomes more difficult of Solution. This has been obſerved by thoſe, who, in *America*, have boiled the Chips of green Guaiacum in Water; whereby they ſoon obtain'd a very

penetrating Liquor, which cures the Venereal Diſeaſe; whilſt the Wood, that has been long kept, being now leſs ſoluble in Water, has a leſs Effect.

Since, therefore, Plants loſe, by Boiling, all that which goes off in the Form of Vapour, with two hundred and twelve Degrees of Heat, all thoſe Plants are unfit for this Operation, whoſe Virtue required is volatile with this Degree of Heat. But thoſe, whoſe Virtues reſide in a more fix'd Matter than can be ſeparated by this Heat, are fit for Decoction. Of this Kind are the following acid, aſtringent, viſcous, aromatic, emollient, cooling, nutrimental, reſtorative, and ſaponaceous Vegetables, and all viſcid ones, that are not too reſinous.

Acacia,	Nettles,
Barberries,	Plantain,
Brook-lime,	Periwinkle,
Cinquefoil,	Poppies,
Comfrey,	Purſlain,
Cranes-bill,	Quinces,
Currants,	Rhubarb,
Dandelion,	Roſes,
Dwarf Elder.	Scordium,
Endive.	Shepherds-purſe.
Fern.	Sloes.
Fumitory.	Sorrel,
Gentian,	Speedwell,
Graſs,	Succory,
Ground-ivy,	Sumach,
Hellebore,	Tamarinds,
Hypociſtis,	Tormentil,
St. John's-wort,	Water Lily,
Knot-graſs,	Wood Sorrel,
Myrtle,	Wormwood.

To theſe may be added the freſh expreſs'd and unfermented Juice of Summer-fruits.

Let it, however, be carefully obſerved, that I do not ſuppoſe, that the peculiar Virtue of a Plant, which commonly reſides in its preſiding Spirit, ſhould always ſhew itſelf by ſome remarkable Odour, Fragrance, or aromatic Taſte: On the contrary, it may happen, that the Spirit ſhall be extremely active, without remarkably affecting the Senſes; as appears in the black Hellebore-root, the *Cicuta aquatica Geſneri*, the *Solanum maniacum*, and the like: Whence all theſe Particulars are very cautiouſly to be conſider'd, before any general Rule is laid down.

The Nature, Virtues, and Effects, of theſe Infuſions and Decoctions.

1. Theſe Preparations may paſs thro' the lacteal and meſenteric Veſſels, and mix with the venous Blood in the Vena Cava; and thus, by the vital Motion, be mix'd with the Humours of the Body, received into all the larger kinds of Veſſels, reach to the Viſcera, and all the other Parts of the Body; for they are ſaponaceous, penetrating, and miſcible with every Humour.

2. And here they may act by their own peculiar Force, remaining in the Liquor of the Infuſion or Decoction; which Faculty of Action is then greatly increaſed by the Force of the vital Motion, and thus produces ſudden Effects.

3. But they want that Efficacy which depends upon the fine volatile Spirit, that reſides in the Water, procured by Exhalation, as deſcrib'd under the Article AQUA; tho' the Infuſion contains more of it than the Decoction. But in the Decoction, however, this Want is ſupply'd by a greater Efficacy, which the boiling Heat communicates thereto, by enabling it to diſſolve, and intimately mix the Virtues of the Plant with the Water, by long boiling: Whence, if the Operation were perform'd in a Still, with its Alembic-head, and the exhaling Water return'd to the remaining Decoctions, then theſe Decoctions would become exceedingly rich in the Virtues of the Plant.

4. It muſt be well conſider'd, that the medicinal Virtue of Infuſions and Decoctions depends as much upon the Efficacy and Quantity of the hot Water received, as upon the Virtue of the Plant. This is known to Phyſicians. Were it not an Error, in condemning the Uſe of Tea, to attribute the Miſchief wholly to the Leaves, when the larger Part is hot Water? And again, when we attribute the Virtue of enlivening the Spirits to the drinking of Tea, is the diluting Virtue of hot Water to be omitted?

5. Hence may be underſtood the pharmaceutical Law, Method, Inſtrument, Subject, and Effect, of preparing Infuſions and Apozems; as alſo the Efficacy of the hotteſt Water upon the Solids of a Plant. Who, but an Eye-witneſs, would believe, that a two Days boiling ſhould not, with all its Force, deſtroy the tender Leaves of Roſemary? And, what is more, tho' the tendereſt Flower were to be ever ſo long boil'd in Water, yet, upon taking it out, and carefully examining it by the Eye, or even with a Microſcope, it will be found perfectly unalter'd. I have made the Experiment, and continued the Boiling for a very long time; yet, at length, found all the Hairs, little Riſings, Tubercles, and Fibres, the ſame, without any Difference: From hence Phyſicians may underſtand, why the ſmalleſt Veſſels of our Bodies are not diſſolved by the hot Juices they convey. Some may ſuſpect, that the mechanical Triture, which the Force of the Pulſation makes againſt the Sides of the Canals, ſhould rather break them than the Power of Heat and Moiſture; but the laſt Elements of our Solids are not ſo much ſaline, ſaponaceous, or oily, as merely terreſtrial, and join'd together by a certain Cement. For what we have above ſaid, concerning the Force of boiling Water upon Vegetables, is alſo true of the Parts of Animals, treated in the ſame manner.

6. If the Leaves, remaining after this Operation, be dried, they become ſhrunk and ſmall; but, if again ſteep'd in hot Water, they exactly recover their former Size and Figure.

7. But ſome of the peculiar Virtues of Plants are alter'd by the Boiling. *Arum* grows milder by Decoction; the crude Juice or Infuſion of *Aſarabacca* proves ſtrongly emetic; but this Virtue, by long-continued Decoction, is changed to another, which is diuretic and aperient. *Boerhaave's Chymiſtry, Vol.* 2.

The SAPA, DEFRUTUM, EXTRACT, ROB, *and* JELLY.

Having examined the Infuſions and Decoctions of Plants, it will be proper to try, firſt, what will remain upon evaporating the Water employ'd in theſe Preparations; for thus that Part of the Plant will gradually appear, which gave it its Virtues; and thence may alſo be chymically known the Nature of all thoſe Parts of Vegetables, which are ſoluble in hot Water, and may be extracted by its means.

Let the Infuſions or Decoctions, mention'd above, ſtand at Reſt for ſome Hours, in a cool quiet Place, and in a clean Veſſel, cover'd on the Top, that they may thus depoſite their gravelly Earth, and other groſs or ponderous Feculencies, not belonging to the Plant itſelf. They may alſo be paſs'd thro' a Strainer, till they become clear; but, then the gummy, ſomewhat reſinous, and viſcous Parts belonging to the Plant, will be alſo ſeparated; and thus, indeed, they may be obtain'd the purer for medicinal Uſe, tho' they loſe ſomething requiſite in their chymical Examination. The Apothecaries, requiring them extremely pure, have another Method: They intimately mix the recent White of Eggs with their Decoctions, by long whiſking them together; then boil the Whole, whereby the White of the Eggs, now harden'd by the Boiling, concretes together in the Decoction, and, at the ſame time, entangles the groſſer Matter with itſelf; ſo that now the Liquor, being ſtrain'd, leaves much groſs Feculency behind, and paſſes ſufficiently clear. And theſe are the three Ways of purifying Decoctions, that is, by Reſt, by the Strainer, and by Whites of Eggs; the former whereof is ſuited to chymical Examinations.

Let the Liquors, thus purified, be put into a clean cylindrical open Veſſel, or one which widens upwards, and ſet over a clear Fire, and there kept nearly in a State of Boiling, ſo as to exhale, and acquire the Conſiſtence of thick Honey; with Care to avoid boiling ſtrongly, for fear of exhaling off what ſhould be left behind, and to prevent Burning at the laſt, which would deſtroy the Virtue.

The ſame Preparations may be likewiſe obtain'd from the freſh expreſt Juices of Plants; particularly the Juices of Summer Fruits, and ſucculent Roots, ſuch as Liquorice:

Theſe Subjects being taken ripe, recent, and perfect, and being firſt cleanſed and bruiſed, the Juice is to be expreſs'd, diluted with Water, and purified by Reſt, and the Strainer; and then to be exhaled, in the Manner above-mention'd, to the natural Conſiſtence they had upon Expreſſion. The Juice, thus freſh expreſs'd, or reduced to its natural Conſiſtence, after having been diluted and ſtrain'd, may be call'd Muſt; and, when this Muſt is boil'd to one Half, ſo as to be long preſerved, and poſſeſs'd of its natural Taſte, it has been call'd Sapa; but, if boil'd, till only a third Part remain'd, it has been call'd *Defrutum*, which may be preſerved ſtill longer, without loſing its former Nature: But when the Liquor is at firſt extremely well purified, and again gently boil'd, till a Drop, let fall on a cold Plate, grows firm and tranſparent, almoſt like Ice, it is call'd Jelly. If it have the Conſiſtence of thin Honey, it is call'd a Syrup; if ſomewhat thicker, a Rob. All theſe Preparations are indifferently call'd Extracts, which are therefore term'd liquid, thick, or ſometimes ſolid.

The Nature, Virtues, and Uſes, of the preceding Preparations.

1. All the foregoing Preparations may be diſſolved in warm Water, and then they reſemble the Decoctions from whence they were made; tho' they have, by their Boiling, loſt ſome of their former Virtue.

2. They may be long kept without ſpoiling, even for Years.

3. They retain much of the Taſte of the Vegetable, tho' the volatile Part is loſt in the Preparation.

4. They long preſerve the Virtues of Plants entire, and free from the Incumbrance of their vaſcular Parts; ſuch Virtues, we mean, as remain'd in them after this Preparation; for ſo much they long preſerve uncorrupted.

5. Hence it appears, what it is that Plants loſe by long keeping, and corrupting with Age; for hot Water extracts nothing from the Plants ſo corrupted, all the Juices being gradually waſh'd out of ſuch dead Plants, which are reciprocally penetrated, diſſolved, agitated, and dried by the Moiſture of the Air, Dew, Rain, and Heat of the Sun; whence they become effete and dry Skeletons of Plants. The Worm alſo conſumes the Juices of Vegetables, ſo as, at length, to leave nothing but a mere ſolid, inſoluble, ſluggiſh, and terreſtrial Plant.

6. They who make long Voyages may receive great Advantage from the Productions of this Proceſs. Sailors are ſubject to Diſeaſes from the Uſe of Meats much ſalted, dried, and ſmoked, which Diſeaſes are remedied by the Juices of Fruits; and thus, by diſſolving the Jelly of Oranges, Barberries, Cherries, Quinces, Lemons, *China* Oranges, Currants, Grapes, Rob of Elder, Rob of Juniper, and the like, in Water, they may have a preſent Remedy. Theſe Preparations are alſo eaſily recruited, when they touch at any Fruit-iſland; and, perhaps, nothing would more conduce to the Health of the *Britiſh* and *Dutch* Sailors, than a due Proviſion of this Kind.

It muſt, however, be obſerved, that the Juices abounding with Salt are difficultly preſerved, when thus thicken'd, from running in the Air, Salt being attractive of Water. The Method, therefore, is to keep them in well-ſtopt Glaſſes. And, laſtly, thoſe vegetable Subjects are unfit for this Operation, whoſe medicinal Virtue is volatile. *Boerhaave's Chymiſtry, Vol.* 2.

DECOLOR, ἄχροος. See ACHROI.

DECOMPOSITUM. A Word which augments the Signification of *Compoſitum*. In the *Phyſica Triſmegiſti*, *Theat. Chym. Vol.* 1. we are told, that *Compoſita* are ſuch Things as ſuffer Corruption, and are compounded; but *Decompoſita* are Things united in Compoſition, by means of Corruption and Generation. *Caſtellus.*

DECORATIO, κόσμος. A Preſervation or Reſtoration of natural Beauty, either in the whole Body, or in ſome Part of it. *Caſtellus.*

DECORTICATIO, Decortication, is when any Thing, as a Root, Seed, Fruit, or the like, is deprived of its Bark, Shell, Rind, Skin, or any of its containing Huſks. *Blancard.*

DECOSTIS. The ſame as APLEUROS, which ſee.

DECREMENTUM, παρακμὴ, a Decreaſe, is either ſpoken of that Time of Age which ſucceeds the *Ætas continens*, "the "ſtaid Age;" and is otherwiſe call'd *Ætas decreſcens*, "the "decreaſing Age;" or elſe of a Diſeaſe, in which Senſe it is the ſame as DECLINATIO, which ſee.

DECREPITATIO, or ſimply CREPITATIO, ψόφος, is the crackling Noiſe which Salts make, when ſubjected to the Fire. Hence common Salts, when expoſed to a gentle Fire, till it will decrepitate no longer, is call'd decrepitated Salt.

DECRESCENS, παρακμαστικὸς. See DECREMENTUM.

DECRETORIUS. The ſame as CRISIMOS, which ſee.

DECRUS. The ſame as ASCELES, which ſee.

DECUBITUS. The Manner of Lying.

Every Phyſician knows, that the principal Indications of the Strength or Weakneſs of the motive Faculty are taken from the Decubiture; and, indeed, we may, with very good Reaſon, judge of the State of that Faculty by the Decubiture itſelf; for the Motion, which is exerted at the time of Decubiture, depends on two Things; that is, the Faculty which moves the Members, and the Body itſelf, with its Members, moved of themſelves. This latter Motion is obſerved in Carcaſes, and Perſons expiring, who are impel'd downwards by the Force of Gravity; the former belongs to Perſons in Health, or juſt beginning to recover out of Sickneſs. *Diocles* was certainly in the Right, when he ſaid, that the Bodies of Animals conſiſted ἐκ τοῦ φέροντος καὶ τοῦ φερομένου, "of the *carrying* and "the *carried*." For it is the Soul which *carries*, and the Body that is *carried*: This laſt is naturally carried downwards by its Gravity; the other moves the Members upwards or downwards, forwards, backwards, or ſideways, at Pleaſure; or holds them in a manner ſuſpended in the Air, while it contracts, extends, or ſtops the Muſcles, leſt they ſhould ſlide downwards by their proper and elementary Motion. When, therefore, it happens, that Bodies are ſcarcely moved, turn'd, or erected, but eaſily ſlide downwards on account of their Gravity, it indicates to us, that the Animal Faculty is, in a very great meaſure, extinguiſh'd and reſolved; for, while it remains entire, without Diminution, the Body is eaſily moved, turn'd, and erected at the Pleaſure of the Patient, and the Arms, Hands, and Head ſuſtain'd in the Air: And this it is to live, or this is Life, which continues ſo long as the Soul remains firmly united to the Body; but a Diſunion between them is ſucceeded by Death. In Caſes, therefore, where the Soul has great Power and Prevalence, we obſerve Decubitures of good Preſage; but the contrary, when the Faculties of the Soul are weak and languid. But, firſt, let us treat of good Decubitures, and ſhew how to form our Prognoſtics from them in acute Diſorders. In *Coac. Prænot.* 497. it is written, that the beſt Decubiture is ſuch as is uſual in Health, and very juſtly; for a Perſon, who labours under a dangerous Diſtemper, can by no means lie down in the ſame Manner, or lie in the ſame Poſture, as when in a State of Health. Where the Strength is broken, the Patient is delighted with a ſupine Decubiture, the Legs and Arms diſtended, reſtleſs, and uneaſy, incapable of continuing in one Poſture, or keeping the ſame Form of Decubiture. Perſons in a Delirium throw themſelves out of Bed, expoſe their Feet, and even Pudenda, and ſometimes leap out of Bed on a ſudden. Dying Perſons, by reaſon of Weakneſs, ſlide downwards towards the Feet. Wherefore a Decubiture uſual in Time of Health, or like that of healthy Perſons, may juſtly be reckon'd the beſt, and ſignifies, that the Diſeaſe is not malignant or dangerous. Such a Decubiture is commended alſo by *Hippocrates*, in *Prognoſt.* where he ſays, "That to lie in the Poſture "of healthy Perſons, is very ſalutary; but beſt of all, when the "Patient can eaſily turn his Body, and raiſe it with Alacrity," can lie down, or ſtand, and ſupport his Members; for a prompt and expeditious Performance of theſe Actions declares Strength in the Nerves, Plenty of Spirits, and Soundneſs of the Animal Faculty. The Author of the *Coac. Prænot.* 494. thus expreſſes it: "It is good, ſays he, when the Patient can turn his Body "with Eaſe, and raiſe himſelf up with Alacrity." And *Hippocrates, in Progn.* ſpeaking of the beſt Decubiture, ſays, "That "the Phyſician ought to find the Patient lying on the Right or "Left Side, with the Arms, Neck, and Legs, a little retracted, "and all the Body in a lax and eaſy Poſition, as is uſual with "moſt who are in Health: Now to lie in the Poſture of healthy "Perſons, is a moſt ſalutary Sign." Hence we conclude, that there are three Things requiſite in a very good Decubiture; firſt, that the Patient lie on either Side; becauſe, as *Galen* teaches, in his Comment on the Paſſage, ſuch a Decubiture indicates the Strength of the Faculty, which fixes the Body by the Muſcles; as the Weakneſs of the ſame is ſignify'd, when the Patient is incapable of lying on his Side. A ſecond Requiſite is, that the ſick Perſon lie with the Arms, Neck, and Legs, ſomewhat retracted, becauſe this is the uſual Poſture of Perſons in Health. The third and laſt Thing requiſite is, that the Body be diſpoſed in a ſoft and eaſy Poſition. *Galen*, in his firſt Book of *Humours*, *Text.* 24. ſays, that "the whole Body "ought to be moiſt, not dry;" not, as ſome think, that all Parts of the Body ought to be equally warm and ſoft; but, as *Galen* rightly obſerves on the before-quoted Paſſage, *in primo Progn.* as to the ſecond Thing required, that the Body of the Patient ought to have the Arms, Neck, and Legs, a little retracted, or drawn in, but by no means to have them retracted or extended to an immoderate Degree: And, becauſe all Things which are in a State of immoderate Tenſion, ſeem to be dry, he therefore commended a Body in a ſoft Poſition, that is to ſay, a moiſt, and not a dry State of the Body. *Galen*, in *Comment.* expreſſes the ſame thus: "Immoderate Poſ-"tures, ſays he, ſuch as an extraordinary Extenſion of the "Nerves, are pernicious; as we have before declared in our "Treatiſe of muſcular Motion." Now a Medium, between two immoderate States is by no means a State of exceſſive Tenſion; therefore he call'd it eaſy, becauſe Bodies remarkably eaſy are not in an extraordinary Degree of Tenſion. He explains himſelf yet more clearly, *Lib.* 1. *de Humoribus*, *Com.* 24. Wherefore, as he ſays, the Arms and Legs ought to be a little retracted, that the whole Body may lie in a Poſture free from Extremes: I call Extremes in Poſture, or Figure, ſuch as are form'd by a long Extenſion, or Flexure, either of the Joints or Spine, which are not effected without an immoderate Extenſion of the Nerves. So much for the beſt Ways of Decubiture, which, with other good Signs, prognoſticate a happy Event. See ACAMATOS. We proceed to treat of a bad Decubiture.

We know, in general, from the Premiſſes, that every Decubiture, or Poſture of lying, which is unlike that of Perſons in a State of Health, is to be condemned: For, as it has been already obſerved, that it is a pretty good Sign when the Patient riſes up with Alacrity, or turns in his Bed with Eaſe, becauſe it indicates the Vigour of the animal Faculty which moves; ſo when theſe Motions are performed after a dull, heavy,

heavy, and painful Manner, it ſhews the weak and languid State of the ſame Faculty. Agreeably to this, we read, *Coac. Prænot.* 493. "that a Heavineſs of the whole Body, and "of the Hands and Feet, is an ill Sign;" and eſpecially if the Muſcles are not oppreſs'd with a Plenitude, or there has not preceded a ſudden Evacuation, or ſome other manifeſt Occaſion. If with this Heavineſs, which ſhews an Injury to to the motive Faculty, ſays the Author of the *Coac. Præſag. Ibid.* "there be joined a Lividneſs of the Nails, Death "is at hand;" becauſe the Heavineſs of the Body ſhews a Defect of the animal Faculty; and a Lividneſs of the Fingers and Nails is an evident Proof, that the natural Heat, which proceeds from the Heart, is extinguiſhed. A ſupine Decubiture, by *Hippocrates*, *in Prognoſt.* where he ſays, "that "to lie in a ſupine Poſture, with Legs and Arms extended, "is but an indifferent Sign;" but, *in Coacis* 497. it is more properly pronounced "no good Sign." And *Galen*, in *Comment.* ſays, that ſuch a Sort of Poſture can by no means be accounted a good Prognoſtic, which he demonſtrates from *Hippocrates*; he alſo ſays, in the ſame Place, that if this ſupine Poſture be attended with a ſliding downward, the Danger is the greater; as if ſuch a Poſture was not without Danger. But as for *Galen*, he thinks a ſupine Decubiture of no great Moment, ſo as to prognoſticate Death or Recovery from it.

Some, however, judge a ſupine Decubiture to be good, becauſe the Sick, under the vehement Fatigues occaſion'd by the Diſtemper, find moſt Relief in that Poſture; under which all the Muſcles, except thoſe of the Thorax, are at Reſt; and by this ſupine Poſition of the Body we reſt ourſelves on the loweſt and heavieſt Part, as a Ship on its Keel; and, beſides, the exhauſted animal Strength and Spirits can by no other Decubiture be better ſupported, and ſuch a Poſture alſo conduces to the Expulſion of Stones from the Kidneys and Bladder. But if, on theſe Accounts, it may be called a good Decubiture, there are many other Reaſons why it ſhould be judged a bad and pernicious Poſture of lying: For the Muſcles of the Thorax, which under this Poſition aſcend in Inſpiration, are more fatigued when a Man lies on his Back, than when he is erect, or lies in any other Poſture. This Decubiture alſo, if long continued, is the Cauſe of Diſorders, and thoſe of the moſt dangerous kind; as the Epilepſy, Incubus, Palſy, and Apoplexy: For in this ſupine Poſition the Humours and Vapours are more eaſily attracted to the hindermoſt and nobleſt Ventricle of the Brain, and Diſtillations fall upon the Thorax and Kidneys. However, our preſent Buſineſs is not to conſider this Poſture as the Cauſe of good or ill Effects to the Body, but as a Sign conducing to Prognoſtics: in which reſpect we ſay it always ſignifies a Weakneſs of the motive Faculty; for all who lie in a ſupine Poſture, unleſs they are accuſtomed to it, are in a weak State. But then this ſupine Decubiture is ſometimes arbitrary, and choſen out of a kind of Softneſs or Indolence of Mind, or from Sorrow; and ſometimes the Patient lies in this Poſture thro' the Vehemence of the Paroxyſm, or, to mention no more, on Account of ſome extraordinary Evacuation: In ſuch Caſes nothing certain can be prognoſticated from a ſupine Decubiture. But if, excluſive of theſe Caſes, the Patient lies in a ſupine Poſture, with his Legs and Arms extended, it is a bad Sign: And it is the ſame according to *Hippocrates in Prognoſtic.* if the Legs in this Poſture are very much retracted, or drawn in, or, on the contrary, much diſtended or thrown abroad; for we are taught by *Galen*, that they ſignify a Delirium: "But if, ſays *Hippocrates*, the Pa-"tient, moreover, lie in a Poſture of Proclivity, and ſlide "downwards inſenſibly towards the Feet, the Danger is the "greater." We may juſtly pronounce ſuch a Decubiture fatal; but ſtill the worſt Decubiture of all is, when the Body lies on the Back like a projected Carcaſe, with all its Members proſtrate, and the Head reflected on the Pillow; or when, the Chin being elevated, all the Fore-part of the Neck appears eminent; or if the Chin is contiguous to the Clavicles; theſe are Signs that Death is juſt at hand: For the Soul having loſt its Power, the Body lies like a dead Weight on the Back, with the Arms and Legs projected, rolling down inſenſibly towards the Feet, and the Head either falling back towards the hinder Parts with the Chin and Throat erected, or in a nodding Poſture reſting on the Clavicles. Such a Decubiture ſignifies, that Death is very near. *Galen*, *de Humoribus*, *Lib.* 1. *Text.* 24. ſpeaks of this Decubiture when he ſays, "You muſt know "that we call it a *Dejection* when the Patient is incapable of "lying like a living Perſon, but is carry'd downwards like a "dead and inanimate Carcaſe." When the Body in the Decubiture ſlides down towards the Feet, it is, in the Judgment of *Hippocrates*, a Sign that the Strength is exhauſted to an extreme Degree. To be incapable of ſtanding, ſitting, or riſing, is certainly a more tolerable State; but to lie along in the Manner of a dead Body, univerſally deprived of all Strength in every Part, is what the ſame Author, *Com.* 1. *in* 6 *Epid. Text.* 33. *Cap.* 4. informs us, ἐμπίπτειν, "to be precipitated," to be utterly caſt down, or in a State of utmoſt Dejection. This *Decubitus ad pedes*, "Decubiture towards the Feet," is by *Galen*, *de Motu Muſc. Lib.* 3. demonſtrated to be of the utmoſt Fatality, from the Example of Carcaſes; for if you incline a dead Body any Way, it will not reſt a Moment, but will immediately fall either prone or ſupine, as its Gravity directs it.

To lie with the Mouth gaping, is a no leſs fatal Prognoſtic, as we are aſſur'd by *Hippocrates*, *in Prognoſt.* where he ſays, "If the Patient ſleep with his Mouth gaping, it is a "mortal Sign." The Author of the *Coac. Præſag.* 497. expreſſes this Prognoſtic after a different Manner: "It is "fatal, he ſays, to lie on the Back, and ſleep continually "with the Mouth gaping, and the Legs much incurvated "and complicated." The Gaping of the Mouth is cauſed either by the Weakneſs of the Faculty, which moves the lower Jaw, or a violent Æſtuation at the Heart, or both theſe Cauſes united, or from a particular Reſolution of the Muſcles, which ſerve to pull up the lower Jaw to the ſuperior. *Galen* ſays, that the Gaping of the Mouth without Sleeping has a much more fatal Signification; and, *de Mot. Muſc. Lib.* 7. *Cap.* 4. he writes, "that to lie on "the Back with the Mouth gaping, is a Sign either of a "Stertor, a Reſolution, Drunkenneſs, or Lazineſs." It is of as bad a Prognoſtication for a Perſon in a Delirium, or out of a Delirium, which is known by the Speech, to roll himſelf towards the Margin of the Bed, and firſt to ſhoot out his Feet, then to riſe up in Bed, to erect his Body, and, if not prevented, to fall off the Bed, or riſe. Under this obſcure Delirium, attended with the before-mention'd Sign *Hollerius*, *in Coac. Præſag.* ſays he never knew one Perſon recover. We add out of *Hippocrates*, *Prognoſt.* that for a Perſon under an acute Diſtemper to deſire to ſit upright, is a bad Sign, but worſe under a Peripneumony or Pleuriſy. The Words of *Hippocrates* are theſe: "In every acute Diſorder, "ſays he, if the Patient deſires to ſit up in the Height of the "Diſtemper, it is a bad Sign, but worſt in a Peripneumony." Thoſe who are afflicted with a Peripneumony, ſays *Galen*, in *Comment.* are ſenſible of a great Oppreſſion of the Thorax while they lie in a ſupine Poſture, but breathe more freely when they ſit up; for when they lie on their Backs, Part of the Thorax reſts on the Spine, by which means the Lungs are ſtraighten'd, and debar'd from receiving the Air they want, by Inſpiration. In other Diſeaſes, *during the Height of the Diſorder* (which Limitation is principally to be regarded) it is a very bad Prognoſtic when the Sick deſire to ſit up: For, while they are labouring under the Violence of the Diſtemper, they deſire to lie without Motion; and, if any one endeavours to rouſe them, they fight and reſiſt: We may, therefore, well ſuppoſe, that when the Patient, in ſuch a State, deſires to ſit up, it muſt be on account of an extraordinary Difficulty of Reſpiration, or Reſtleſſneſs, or Delirium. Another Decubiture, like this, is deſcribed by *Hippocrates*, *in Prognoſt.* in the following manner: "If the Patient lies with his Feet "bare, but not very hot, and throws about his Arms, "Neck, and Legs, at random, it is a bad Sign; for it "ſignifies a Reſtleſſneſs." In thoſe indeed, who are of a ſoft and delicate Conſtitution, theſe Signs afford no certain Prognoſtic; for the ſlighteſt feveriſh Diſorder diſpoſes them to ſuch a Decubiture; but, in others, it is owing either to ſome Diſorder in the Mouth of the Stomach, or a great Weakneſs. In the *Coac. Præſag.* 497. this Decubiture is thus expreſſed: "If the Patient lies with his Hands and Feet bare, and is "not moleſted with any vehement Heat, but throw his "Legs abroad, it is a bad Sign; for it ſhews an Anxiety." In the laſt place, *Hippocrates*, *in Prognoſt.* condemns a Decubiture on the Belly, in ſuch as are not accuſtomed to ſleep in that Poſture, as ſignifying either a Delirium, or a Pain ſomewhere about the Region of the Belly. *Proſper Alpinus de præſagienda Vita & Morte.*

DECURSUS, ἀποδρομὴ, generally ſignifies the Duration of any thing, as of Time, or a Diſeaſe. *Caſtellus.*

DECURTATUS, *(Pulſus)* μείωσις, or μειοῦσθαι, corruptly μύωσις, is a kind of weak and deficient Pulſe, which is perpetually diminiſh'd, till it wholly fails; but, if it returns, and increaſes anew, it is call'd *Decurtatus reciprocus*, μείωσις παλινδρομοῦσα. *Galen. de Diff. Pulſ. Lib.* 1. *Cap.* 11. If it be unequal, as well as deficient, it is call'd *Deficiens inæqualis*, μείωσις ἀνώμαλος. *Idem de Cauſ. Pulſ.*

DECUSSORIUM. A Surgeon's Inſtrument, which, by gently preſſing on the *Dura Mater*, cauſes an Evacuation of the Pus collected between the Cranium and the before-mention'd Membrane, thro' the Perforation made by the Trepan. *Blancard.*

See a Figure of this Inſtrument in *Paré*, *L.* 6. *C.* 21.

DEFECTIO ANIMI. The ſame as *Syncope*, or *Lipothymia*, Fainting.

DEFENSATIVUM EMPLASTRUM. A defenſative Plaiſter.

DEFENSIVUM. An Epithet for ſome chirurgical Topics, which, apply'd to the Part affected, repel; or intercept the Humours, when laid upon a Part adjacent to that affected. *Defenſiva*, in *Paracelſus*, ſignifies Cordials, exhibited internally. *Caſtellus*.

DEFERENTIA VASA are two white ſolid flatted Tubes, one lying on the Right Side, the other on the Left; from the Epididymis of which they are Continuations: Each of them runs up, in the cellular Vagina of the ſpermatic Veſſels, as high as the Openings in the abdominal Muſcles; the Blood-veſſels lying forward, and the Vas Deferens behind them.

This Faſciculus, thus form'd by the Blood-veſſels, Vas Deferens, and their common Covering, is term'd the ſpermatic Cord. The Covering is ſmoother on the outer than on the inner Side, and, for that Reaſon, it has been look'd upon as a Vagina; the internal Subſtance, which is more cellular than the external, connects all the Veſſels together, while the external forms a Covering to inveſt them.

The Vas Deferens, having reach'd the membranous Lamina of the Peritonæum, where that Lamina runs over the Orifice of the Vagina, ſeparates from the Blood-veſſels, and runs backward, in form of an Arch, in the cellular Subſtance of the Peritonæum, as far as the neareſt Side of the Bladder.

It paſſes afterwards behind the Body of the Bladder, to which it adheres very cloſely; as alſo to the Lamina of the Peritonæum, which covers it; and then continues its arch'd Courſe towards the Neck of the Bladder, where both Vaſa Deferentia meet, and their Arches terminate.

In this Courſe the Vas Deferens paſſes behind, and croſſes the neighbouring umbilical Artery, croſſes the Extremity of the Ureter of the ſame Side; in its Paſſage, between that Extremity and the Bladder, and, having got behind the Bladder, it meets the Vas Deferens of the other Side, between the Inſertions of the Ureters, and they run down together to the Neck of the Bladder.

This Canal, which, at the Origin of the Epididymis, is pretty large and plaited, becomes immediately afterwards ſmaller and ſmoother, and continues in that Form, till it gets behind the Bladder, where it begins again to be larger, and more uneven.

It ariſes from the angular Portion, or poſterior Extremity, of the Epididymis; and from thence runs forward, in a very oblique Courſe, on the poſterior Half of the Epididymis; where it is a little incurvated, as it joins the back Side of the ſpermatic Veſſels.

The Texture of the ſmooth Portion of this Canal is very ſolid, and in a manner cartilaginous, eſpecially near the Surface of its Cavity; which, tho' very narrow, is ſtill kept open by means of the Solidity and Thickneſs of its Sides.

The Cavity of the Vas Deferens is cylindrical, tho' the whole Tube is flat, and its external Circumference oval, as may be ſeen by cutting it tranſverſly; and the Cavity enlarges, as it paſſes behind the Bladder.

The Paſſage of the Vaſa Deferentia, into the Veſiculæ Seminales, is very particular. Theſe Canals are incurvated behind the Bladder, and their contracted Extremities unite at that Place. They unite in an Angle, and run between the contiguous Extremities of the Veſiculæ; and this Union is ſo cloſe, that the adhering Portions ſeem to form only one middle Septum, between two ſmall Tubes, each of which is form'd partly by the Extremity of one Vas Deferens, and partly by that of the neighbouring Veſicula.

This lateral Union of the Extremities of the Vas Deferens, and Veſicula Seminalis, on each Side, forms likewiſe a kind of ſhort Septum, which terminates in a Creſcent, like a ſmall ſemilunar Valve; and the Extremity of the Vas Deferens is narrower than that of the Veſicula. By this Mechaniſm the Fluid, contain'd in each Vas Deferens, has Liberty to enter the contiguous Veſicula; but that contain'd in the Veſicula cannot return into the other Canal.

If we blow into one of the Vaſa Deferentia, after having compreſs'd the Urethra, the Air inflates the contiguous Veſicula Seminalis, and the Bladder of Urine, without paſſing into the Veſicula, or Canal, of the other Side; except we blow with too great Violence.

Afterwards the two ſmall Tubes, form'd each by the Extremities of the Vas Deferens and Veſicula, run in between the Baſis of the Proſtate, and Canal of the Urethra; and, perforating the Sides of that Canal obliquely, they terminate in the Caruncle. See GENERATIO.

DEFIXUS. Impotent, with reſpect to Venereal Enjoyments.

DEFLUVIUM *Capillorum*. A Falling-off of the Hair.

DEFLUXIO. A Defluxion. It is defin'd a Falling of a Humour upon an inferior from a ſuperior Part. See CATARRHUS.

DEFRUTUM. Properly Muſt, boil'd to the Conſumption of one Half, or, according to others, of one Third. See DECOCTIO, and CARDENUM.

DEGLUTITIO, Deglutition. See PEPSIS.

DEGMOS, *δηγμὸς*. A biting Pain at the Orifice of the Stomach, from *δάκνω*, to bite.

DEHENE, Blood. *Rulandus*.

DEHENES, Ink. *Rulandus*.

DEHENEZ, *Roman* Vitriol. *Rulandus*.

DEJECTIO. A Diſcharge of the Excrements by the Anus. A Stool. See ALVUS.

Among the ſeveral Circumſtances, from which Life and Death are prognoſticated, Stools are none of the leaſt conſiderable; and, in handling this Subject, we ſhall firſt conſider thoſe, which are ſaid to be good, and from which the Phyſician concludes the probable Safety and Recovery of the Patient. Whether the Nature of Stools in general be good or bad, may be diſcovered,

Firſt, from their Degree of Concoction or Crudity.

Secondly, from the particular Times in which they appear.

Thirdly, from their Subſtance.

Fourthly, from the large or minute Quantity in which they are diſcharged.

Fifthly, from the Time during which they continue, or the Time when they ceaſe.

Sixthly, from the Advantage with which they are attended, and the Eaſe and Freedom from Pain with which the Patient diſcharges them. And,

In the ſeventh and laſt Place, from the Train of good or bad Signs, from which Prognoſtics from Stools derive their Certainty.

But to return: Stools of the good and ſalutary Kind may indicate Health in two Manners; either with reſpect to their due Concoction, in which Caſe they indicate not only the due State of the Stomach and Inteſtines, but alſo of the adjacent Parts, ſuch as the Liver and Spleen; for *Galen* determin'd, that thoſe Stools denoted the laudable and ſalutary State of the Stomach and Inteſtines, which, according to *Hippocrates*, in Prognoſt. *were ſoft, of a due Conſiſtence, diſcharged at the particular Time generally obſerv'd by Nature in a State of Health, and whoſe Quantity bears a due Proportion to that of the Aliments taken:* Another Manner, in which good Stools indicate Health, is with reſpect to the Defluxion of Humours from the Viſcera into the Stomach and Inteſtines; for *Galen* affirms, that good Stools not only indicate the due and natural State of the Stomach and Inteſtines, but are alſo a Sign, that there is no Defluxion of Humours into theſe Parts from the Liver or Spleen; for, when there is a Defluxion of this kind, not only the Colour, which is the Sign of a due Concoction, but alſo the Conſiſtence of the Stools, is vitiated. In both theſe Manners, Phyſicians form Prognoſtics from Stools; firſt, in Diſorders of the Stomach and Inteſtines, the due and natural State of which, according to *Galen*, in the ſeventh Chapter of his firſt Book *de Criſibus*, is ſignified by Stools, which are ſoft, of a due Conſiſtence, diſcharged at the Time generally obſerv'd by Nature in a State of Health, and in a Quantity bearing a due Proportion to that of the Aliments; and, as the ſame Author has added, laudable Stools ought to be of a brown Colour, and not very fetid. But the Stools, which want all or any of theſe Marks, are bad; ſuch, for Inſtance, as are hard, rough, too thin, of too high a Colour, diſcharged in a Quantity too large, or too ſcanty, in proportion to the Aliments, of an unequal Conſiſtence, fetid, frothy, or not evacuated at the Time obſerv'd by Nature in a State of Health. But, when Patients are about to recover, the Stools are changed from theſe Conditions to that laudable State, which we call Concoction. Hence *Hippocrates*, in his Prognoſtics, juſtly affirm'd, *that the Stools became of a thicker Conſiſtence, when the Diſeaſe was about to be determined.* And, in the fourteenth Aphoriſm of his ſecond Section, he aſſerts, that, *in Fluxes of the Belly, Changes of the Excrements are good, unleſs they change for the worſe.* But we far more certainly and infallibly prognoſticate the Events of Diſeaſes by the Evacuation of thoſe Humours, which fall upon the Inteſtines. The Diſorders hence ariſing, *Hippocrates* calls Abſceſſes, Dyſenteries, Teneſmi, Fluxes, Diſturbances of the Belly. Concerning Patients labouring under theſe Indiſpoſitions, in the firſt Book of his Epidemics, he tells us, *that many had their Bellies diſturb'd, but without any conſiderable Uneaſineſs, and in ſuch a manner, as to create them no great Trouble.* And afterwards he tells us, that *ſome were, on the ſixth Day, ſeized with the Jaundice; but that theſe were, in ſome meaſure, relieved by an increaſed Diſcharge of the Urine, and the Excrements.* With reſpect to Dyſenteries, he afterwards uſes theſe Words: *But ſuch Patients, as were pretty far advanced in Years, were either ſeized with a Jaundice, Diſturbances of the Belly, or a Dyſentery, which was the Caſe of* Bion, *who lay ſick in the Houſe of* Silenus; *but that many others, whoſe Diſeaſes were determined by a Criſis, were ſeized with a Dyſentery, ſuch as* Xenophanes *and* Critias. With reſpect to ſome, who recovered in the peſtilential Conſtitution, he uſes the following Words: *But, in this peſtilential State, ſuch as eſcaped, owed their Safety to theſe four Circumſtances: Either there was a plentiful Diſcharge of Blood from their Noſe; or a copious Evacuation of Urine, in which there was a large*

Quantity

Quantity of a laudable Sediment; or turbid and bilious Excrements were evacuated in the Beginning of the Diſorder; or the Patients were ſeized with a Dyſentery: So that, in many Caſes, Diſeaſes may happen to be determin'd by Diſturbances of the Belly, by Diſcharges of pituitous and bilious Excrements, and by Dyſenteries. With reſpect to *Clazomenius*, *Hippocrates*, in the firſt Book of his Epidemics, uſes the following Words: *On the thirtieth Day, a large Quantity of aqueous Excrements, like thoſe generally evacuated in a Dyſentery, were diſcharged.* With reſpect to the Patient in the Garden of *Dealces*, in the third Book of his Epidemics, Patient 3. he informs us, that, *on the fortieth Day, he went very frequently to Stool, voided a pituitous and white Matter, a profuſe Sweat at the ſame time appearing over all his Body.* In the ſame Book of his Epidemics, Patient 9. he tells us of one *Heropytus*, *that, about the hundredth Day, he began to void many bilious Stools, which continued for a conſiderable Time, till at laſt he became dyſenterical.* But we know, that theſe, and other Stools, are of the laudable and critical Kind, when, with the Signs of a manifeſt Concoction, they begin to appear on the critical Day; when the Diſeaſe is at its Height; or when they are liquid, of a yellow Saffron-colour, brown, livid, or blackiſh. But, in the Beginning of the Diſeaſe, ſuch Stools, appearing without the Signs of Concoction, prognoſticate the Death of the Patient; whereas, when they are attended with the Signs of Concoction, they prove critical and ſalutary. *Galen*, in his Comment upon the twenty-firſt Aphor. of Sect. 4. informs us, that, during a certain long Plague, he obſerv'd liquid Stools, which were firſt yellow, then brown, afterwards black, and, as it were, reſembling the Fæces of Blood, not only in thoſe who were on the Brink of Death, but alſo in thoſe who were upon the Recovery. In theſe latter, he ſays, that ſuch Stools followed after the Height of the Diſeaſe, and were ſo many Efforts of Nature to free herſelf from a ſuperfluous Load; whereas, in ſuch as died, thoſe Stools appeared either in the Beginning, or Increaſe of the Diſorder. The ſame Author, in his Comment upon the following Aphoriſm of the ſame Section, ſays as follows: "When, "therefore, after the Concoction of the Diſeaſe, any peccant "Humour is evacuated, then the Body is purged, as it were, "by Nature; and for this Reaſon black Bile, and every other "Humour of the like kind, portend a ſalutary Evacuation, "when the Signs of Concoction appear in the Progreſs of the "Diſeaſe. But, if any ſuch Humour ſhould be diſcharged "without the Signs of Concoction, the Death of the Patient is "thereby prognoſticated. Humours, therefore, of any Colour, "however prejudicial they ſhould ſeem to be in that reſpect, "nevertheleſs prognoſticate a ſalutary Termination of Diſ-"eaſes, provided they are evacuated with the Signs of Con-"coction, in the Height of the Diſeaſe, and on the critical "Day." This Doctrine *Galen* borrowed from *Hippocrates*, who, in the forty-ſeventh Aphoriſm of the fourth Section, tells us, *that, in Fevers which are not of the intermitting kind, ſpitting or vomiting Matter, which is either livid, bloody, fetid, or bilious, is a bad Sign; but that, if ſuch a Matter is duly evacuated, either by Stool or Urine, it is a good Sign.* The Author of the *Coacæ Prænotiones* 183. tells us, *that thoſe, who, labouring under a Coma, become deaf, have a Diſcharge of brown Excrements about the Criſis, by which they are relieved.* Phyſicians are alſo enabled to form Prognoſtics from the Quantity of the Stools, and the Time during which they continue. *Hippocrates* therefore, in the firſt Book of his Epidemics, writes, that many were affected with Dyſenteries and diſturbed Bellies, by which their Diſorders were critically determined. Thus, concerning *Heropytus*, *in Epidem. L.* 3. whoſe Diſorder was determin'd in a ſalutary Manner, *Hippocrates* obſerves, that, about the hundredth Day, he began to have many bilious Stools; that they continued in the manner of a Dyſentery for a conſiderable Time, and were accompanied with a Pain, by which means all his other Symptoms were alleviated. Beſides, I myſelf have known ſeveral Patients, who have been preſerv'd by bilious, porraceous, and ſaffron-colour'd Stools, together with a Diſcharge of well-concocted Urine, made by little and little, and continued for a conſiderable Number of Days. Stools of this kind, in Diſeaſes which are to terminate well, and thoſe, in which no fatal Signs appear, are, for the moſt part, accompanied with a ſalutary Hæmorrhage, copious Sweats, or ſome other Sign of a like Nature. *Hippocrates*, in the ſecond Aphoriſm of his firſt Section, lays down two Signs, by which a Phyſician may know when Stools prove a ſalutary and uſeful Evacuation, and when not; which are, when the Patients not only bear them with Eaſe, but are alſo relieved by them. Hence the beſt and moſt ſalutary Stools either put an entire Termination to Fevers, and their Symptoms, or at leaſt alleviate and abate them. With reſpect to this Subject, *Hippocrates*, in the 28th Aphor. of Sect. 4. affirms, "That, in Fevers, an Evacuation of bilious Excre-"ments is removed by a ſupervening Deafneſs, which, in its "Turn, is removed by a Diſcharge of bilious Excrements." In the ſeventeenth Aphoriſm of the ſixth Section, he informs us, *that, in an Ophthalmia, a ſupervening Looſeneſs is a Circumſtance of a lucky and ſalutary Nature.* In the forty-eighth Aphoriſm of the ſame Section, he affirms, that *a Dyſentery, ſeizing thoſe who labour under Obſtructions of the Spleen, is a good Circumſtance.* In the 29th Aphor. of Sect. 7. he alſo aſſerts, that *a violent Diarrhœa happening to a Perſon afflicted with a Leucophlegmatia, removes the Diſeaſe.* What has been already ſaid, is ſufficient for diſcovering and determining what Stools are of the good and ſalutary Kind.

But there are others of a fatal and pernicious Nature; and ſuch as prognoſticate the Death of the Patient. Theſe are known either from their Subſtance, their Quantity, their Colour, their Smell, the Manner in which they are diſcharged, the Time of their Appearance, the Changes they undergo, the Signs, which either precede, accompany, or follow them, the Degrees of Eaſe with which they are evacuated, and the Advantages they procure to the Patient. Stools then of the bad Kind differ very conſpicuouſly from each other with reſpect to their Subſtance, ſince ſome are hard, ſome rough, ſome liquid, ſome viſcid, ſome aqueous, ſome pinguious, ſome frothy, ſome mix'd with a certain Ichor, ſome unmix'd, and ſome what we call of the colliquative Kind. With reſpect to Quantity, theſe Stools vary no leſs conſiderably, ſince they ſometimes flow immoderately, and at other times in a ſmaller Quantity; ſometimes ceaſe, and at other times are totally ſuppreſſed. With reſpect to Colour, ſome are white, ſome bilious, ſome yellow, ſome of a Saffron-colour, ſome brown, ſome green, ſome porraceous, ſome livid, ſome bloody, ſome black, and ſome ting'd with various Colours. Stools alſo vary with reſpect to the Manner in which they are evacuated, ſince there is one Manner of Evacuation in a Lientery, another in a Diarrhœa, another in a Dyſentery, and a fourth in a Teneſmus. Stools alſo differ with reſpect to the Time in which they appear, ſince ſome are diſcharg'd in the Beginning of the Diſeaſe, without any manifeſt Signs of Concoction, and others in the Increaſe of the Diſeaſe. With reſpect to the Alterations they undergo, they may be chang'd for the worſe, either as to their Subſtance, their Quantity, their Colour, or their Smell. Such Stools as prognoſticate Death, may alſo be diſcover'd from their preceding, concomitant, and ſubſequent bad Signs. And, laſtly, with reſpect to the Eaſe with which Stools are voided, thoſe are accounted bad, which are evacuated with Difficulty or Pain, which afford no Relief, or which render the Patient worſe. That we may, therefore, be able to prognoſticate from Stools with the greater Certainty, I judg'd it expedient accurately to inquire into theſe Differences, beginning with thoſe Stools, which are hard or rough, ſoft or liquid. With reſpect to hard Stools, the Author of the Prorrhetics, *in* 1 *Prorr.* 41. uſes theſe Words: "When the Belly is coſtive, if a ſmall Quantity of "black Excrements, as it were, like Goats Tricklings, are "diſcharged, and if, at the ſame time, there is an Eruption of "Blood from the Noſtrils, this is a bad Sign." *Galen* affirms, that the σπυρχθῶδες, or Excrements like Goats Tricklings, are produced by the Length of their Retention, and the exceſſive Heat of the Parts; and if theſe Excrements ſhould be of a blackiſh Colour, they denote a Heat and Burning about the Centre of the Body, which is a Sign of a malignant Diſeaſe; and, if this Diſeaſe is violent, and accompanied with other bad Signs, theſe Excrements certainly prognoſticate the Death of the Patient. Liquid Stools ſometimes proceed from a moiſt Conſtitution, a State of Childhood, a wet State of the Weather, humid Aliments, or Crudities of the Stomach; or liquid Stools are produced, when moiſt Aliments are not conveyed from the Stomach through the Lacteals; or when ſome Subſtance, of a fluid Nature, falls from the Liver or Spleen into the Inteſtines; or when the Liver, or the Spleen, or the whole Body, is purged by the Liver. Among liquid Stools, *Hippocrates* pronounces thoſe of the aqueous Kind bad; becauſe, as *Galen* ſays, they are a Sign of Crudities. Stools of this Nature are perpetually bad, and prognoſticate Death in violent and bilious Diſorders, if, at the ſame time, a due Quantity of good and laudable Urine is not diſcharged; whereas, in milder and more benign Diſtempers, which are accompanied with no fatal Symptoms, they only denote a Superfluity of crude Humours, for the Correction and Alteration of which, Nature requires a long Time. But, as *Galen* informs us, pinguious Stools are diſcharged in acute Diſeaſes, when the Fat is melted down by the intenſe Heat of the Parts; but, when theſe Stools are alſo viſcid, they import, that not only the Fat, but alſo the ſolid Parts of the Animal, are colliquated. When this is the Caſe, Stools, which are pinguious, viſcid, white, ſmall in Quantity, and highly fetid, are diſcharged. But they may be diſtinguiſhed from ſuch as are diſcharged under theſe Appearances, in conſequence of eating any particular Species of Aliments; for theſe latter are more copious, and not always white. And, according to *Galen*, a fetid Smell is a Sign of Colliquation. With reſpect to Stools of this Kind, *Hippocrates*, in his Prognoſtics, informs us, *that ſuch as are ſmall in Quantity, glutinous, white, of a pale Saffron-colour, and ſmooth, are bad.* Theſe muſt perpetually, and in the very Nature of the thing, be bad; ſince a Waſting of the ſolid Parts of the Body, and a Colliquation of the Fat, are fatal Circumſtances, which, in acute Diſ-

orders, indicate an intenſe Heat, and certain Death, if the Diſeaſe is very violent, or accompanied with bad Signs. But, in milder Diſeaſes, theſe Stools, inſtead of the Death of the Patient, prognoſticate the Protraction of the Diſeaſe. Thus, with reſpect to the Patient in the Garden of *Dealces*, *Hippocrates*, in the third Book of his Epidemics, informs us, *that, on the ſixth Day, his Stools were black, pinguious, frothy, viſcid, and fetid*; and the Diſeaſe of this Patient was only determin'd on the fortieth Day. But the Stools, in this Caſe, were not the Effects of a Colliquation of the ſolid Parts, but of the Fat, and of the ſuperfluous putrified and viſcid Humours. But ſuch Stools as are produced by a Colliquation and Waſting of the Solids, are abſolutely fatal, and are diſcharged pure and unmix'd. Thus, with reſpect to *Silenus*, *Hippocrates*, in the firſt Book of his *Epidemics*, informs us, *That, on the fifth Day, his Stools were ſincere, bilious, ſmooth, and highly pinguious.* Sincere Stools are alſo juſtly to be condemn'd in acute Diſorders; becauſe, according to *Galen*, they indicate an intenſe internal Heat, by which the ichorous Parts of the Humours are exhauſted and conſumed. Thus the Author of the *Prorrhetics* juſtly aſſerted, that *ſuch Stools as became pure and unmix'd, heighten'd the Diſorder*; and, according to *Galen*, theſe render'd it worſe. Such were thoſe of *Silenus*, *Epidem.* 1. *Patient* 2. on the fifth Day; thoſe of *Phylinus*'s Wife, *Epidem.* 1. *Patient* 4. on the ſixth; thoſe of *Euryanactes*'s Daughter, *Epidem.* 3. *Patient* 6. on the twelfth; thoſe of *Hermoptolemus*'s Wife, *Epidem.* 7. on the fifth; thoſe of *Parius*, *Epidem.* 3. *Patient* 1. on the ſeventh; thoſe of *Pythion*, *ibid. Patient* 3. and others, the Hiſtories of whoſe Diſeaſes are to be found in the *Epidemics* of *Hippocrates*.

Frothy Stools are in like manner condemn'd, becauſe they either indicate an intenſe Heat, by which the Fæces contract a Froth, like that produced on a Fluid boiling in any Veſſel; or ſome flatulent Principle, mix'd with the Humours, and reſembling that Foam of the Sea produced by tempeſtuous Winds. The former of theſe Stools are the Effects of a Heat, melting down the Body; whereas the latter are produced by an unequal Perturbation. Hence *Hippocrates*, 2 *Prorrhet.* juſtly pronounces highly frothy Stools bad, becauſe they either denote a Colliquation, or an Inequality. But thoſe are worſt, which indicate an intenſe colliquating Heat; and this Species may be known from the acute Fever, and the intenſe Heat of the Excrements themſelves, which are frothy and ſincere. Thus, in the firſt Book of the *Prorrhet.* 21. we are told, "That, in bilious and unmix'd Stools, frothy Efflorescences "are a bad Sign." In the ſame Book, 50. 'tis aſſerted, *That Stools, becoming frothy and unmix'd, heighten the Diſorder*; or, as *Galen* expreſſes himſelf, render it worſe. In the ſame Book alſo, 53. frothy Stools are ſaid to be bad in acute and bilious Diſorders. In the *Coacæ Prænotiones*, 602. we are inform'd, *That, in acute Diſtempers, frothy and highly bilious Stools are bad*; and afterwards, 613. we are told, *That Stools, which become frothy and ſincere, increaſe and heighten the Diſeaſe.* Thoſe Stools alſo, which are render'd frothy by an Admixture of a flatulent Principle, are bad; becauſe they indicate a Crudity in the Excrements.

Stools either immoderately large, or preternaturally ſmall, in Quantity, are alſo to be condemn'd. The former impair the Strength, and weaken Nature. Thus, in his *Prognoſtics*, *Hippocrates* uſes theſe Words: "But Stools, "too often diſcharged, and in too large Quantities, endanger "Faintings." The Author of the *Coacæ Prænotiones*, 609. informs us, That liquid Stools, diſcharged in large Quantities, and frequently, are bad, partly becauſe they induce Watchings, and partly becauſe they impair the Strength. Thus alſo, in the fourth Aphoriſm of the fifth Section, we are told, that "Convulſions, or a Hiccough, brought on by immode-"rate Purging, are bad."

Stools diſcharged in too ſmall a Quantity are alſo bad, both becauſe they are inſufficient for removing the Cauſe of the Diſeaſe, and becauſe they indicate a Superfluity of Humours, which, in a violent Diſorder, generally prove fatal; or becauſe they import, that the vital Powers are inſufficient to expel the noxious Humours, notwithſtanding their Efforts for that Purpoſe. This Circumſtance *Hippocrates* obſerved in the firſt peſtilential Conſtitution; with reſpect to which, in the firſt Book of his *Epidemics*, he ſays, "Theſe Symptoms "were ſucceeded by Stools, which were either greater "than the Patients could bear, or too ſmall to produce any "happy Effects; for which Reaſon the former Symptoms im-"mediately return'd, and were heighten'd." Thoſe Evacuations by Stool, which ceaſe as ſoon as they are begun, are bad, and, in acute Diſorders, fatal. Thus *Hippocrates*, in the firſt Book of his *Epidemics*, tells us, *That thoſe Patients, whoſe Bodies were ſoluble, had the Misfortune to have their Evacuations by Stool ſuppreſs'd in a malignant Manner:* And, when enumerating thoſe Symptoms, and Signs of burning Fevers, which, in the Beginning, prognoſticate the Death of the Patient, he adds, their Evacuations by Stool were ſtopt: Hence it is by no means ſafe to ſuppreſs Diarrhœas and Dyſenteries, ſince, by this means the noxious Humours are determin'd to other Parts, induce conſiderable Injuries, and, in acute Diſorders, Death.

We know Stools of a bad Kind not only from their Quantity, but alſo from their Colour. The white, thin, the bilious, the yellow, the Saffron-colour'd, or thoſe reſembling the Yolks of Eggs, the red, the bloody, the aqueous, the green, the æruginous, the livid, the black, and thoſe diverſify'd with a Variety of Colours, are all bad in acute Diſorders, unleſs critically diſcharged. White Stools are either the Effects of the Aliments taken, ſuch as Bread alone, Milk, Ptiſan, Lupins, Alica, Almonds, and other Subſtances; or, as *Galen* informs us, in 1. *Prorrh. Comment.* 13. and in 2. *Prognoſt. Comment.* 17. and 19. they are produced when the Bile is not convey'd to the Inteſtines, either on account of an Obſtruction of the biliary Duct, as in thoſe affected with the Jaundice; or in conſequence of its not being ſecreted from the Maſs of Blood, by the Glands of the Liver; or, laſtly, white Stools are produced by a Colliquation of the ſoft and recent Fat. But Stools of this Kind are ſmall in Quantity, viſcid, and highly fetid; and all of them, except ſuch as are white, in conſequence of eating ſome ſorts of Aliments, are highly condemn'd in acute Diſeaſes, and more eſpecially ſuch as are white, in conſequence of an inflam'd Brain. With reſpect to which, *Hippocrates*, in the firſt Book of his *Prorrhetics*, 13. uſes the following Words: "In phre-"netic Patients white Stools are bad, as is plain from the Caſe "of *Archecrates*." And in the ſame Book, 53. we are told, "That, in acute and bilious Diſorders, Stools which are white, "frothy, and bilious, only on the Surface, are bad." *Hippocrates*, in his *Coacæ Prænotiones*, 36. tells us, "That "thoſe who are ſeverely affected with the Jaundice, diſ-"charge white Stools, and die." This happens on account of a Retention of the Bile in the Blood; whence an Inflammation of the Brain, or Liver, which is a fatal Circumſtance; becauſe the Congeſtion of Humours to theſe Viſcera is productive of the worſt of Conſequences. We have already obſerved, that ſuch Stools as are white, ſmall in Quantity, viſcid, and fetid, are equally bad; becauſe, according to *Galen*, they import a malignant Colliquation. Thoſe Stools alſo, which are yellow, bilious, acrid, Saffron-colour'd, or reſembling the Yolk of an Egg, and ſuch as are green, are bad, unleſs critically diſcharged. The Saffron-colour'd, however, the æruginous, and the green, are the worſt; becauſe they indicate a violent internal Heat. All bilious Stools, not critically diſcharged, are alſo bad; ſince, in acute Diſeaſes, they prognoſticate Death, and, in Diſorders of a milder Nature, a Protraction of the Diſeaſe, Relapſe, and uncommon Pain.

Thus *Hippocrates*, in the ſecond Book of the *Coacæ Prænotiones*, 43. informs us, *That it is a bad Sign to have a Bitterneſs, and a biting Pain, produced by Bile, about the Mouth of the Stomach*; becauſe this Circumſtance denotes a Redundance of Bile, not only about the Mouth of the Stomach, but alſo in the Inteſtines. And *Hippocrates*, in the 47th *Aphor.* of *Sect.* 4. condemns all bilious Evacuations. Acrid Stools of this Kind, diſcharged in burning Fevers, approaching to a Dyſentery, or Teneſmus, if theſe Diſorders are as yet crude, are generally fatal; for I have, ſays *Proſper Alpinus*, obſerved them in many Patients, who all died, after having ſtruggled for a long time under their Diſtemper. Laſt Year, ſays he, I had a mournful Inſtance of this Truth in my dear Wife *Guadagnina*, who, on the ſeventeenth Day, died of a burning Fever, attended with a bilious Diarrhœa, approaching to a Dyſentery. This is beautifully obſerved by *Hippocrates*, in the firſt Book of his *Epidemics*, where we have theſe Words: "They frequent-"ly diſcharged Stools, which were bilious, ſmall in Quantity, "ſincere, and acrid." And afterwards he informs us, "That, "in the Summer and Autumn, Lienteries, Dyſenteries, Te-"neſmi, and Fluxes, raged; and that the Stools diſcharged "were bilious, thin, acrid, frequent, crude, and, in ſome "Patients, aqueous." In the ſame Book he tells us, "That "all thoſe Patients had Diſturbances of the Belly, and Stools "of the worſt Kind." And, a little after, he informs us, "That the Diſeaſes, with which they were afflicted, were "Dyſenteries, Teneſmi, Lienteries, and Fluxes." Of this we have an Inſtance in the Daughter of *Eryanax*, with reſpect to whom *Hippocrates*, in the third Book of his *Epidemics*, ſays, that "On the twelfth Day ſhe diſcharged Stools, "which were bilious, ſmall in Quantity, ſincere, thin, acrid, "and frequent."

Hippocrates, in his *Prognoſtics*, obſerves, that red and bloody Stools are not of leſs bad Preſage; for, ſays he, *in Prognoſt.* "thoſe which are aqueous, or white, or green, or "highly red, or frothy, are all bad." The Author of the *Prorrhet.* in *Lib.* 1. 2. affirms, "That, in all Diſeaſes, red "Stools are bad." Again, he condemns ſuch as are highly red. And, in the *Coacæ Prænotiones*, 330. 611. 613. 632. we have the following Words: "Highly red Stools are bad, eſpecially when "produced by a Fault of the Liver, as happens in Patients labour-"ing under Diſorders of that Organ." But from theſe we except Stools of this Kind, which are critical, and relieve. Green and porraceous Stools are alſo highly bad, provided they are ren-

der'd ſo by the Violence of a Diſeaſe; becauſe, according to *Galen*, in his firſt Book *de Criſibus*, *Cap.* 11. they indicate an æruginous Bile, and an intenſe Heat.

Hippocrates, in his *Prognoſtics*, and in the 47th *Aphor.* of *Sect.* 4. pronounces livid Stools fatal in continual Fevers; becauſe, according to *Galen*, theſe denote an intenſe Cold, and, as it were, a Mortification of the inferior Parts. No leſs fatal than theſe are black Stools. According to *Galen*, in acute Diſeaſes, black Stools either indicate a Redundundance of black Bile, or a parch'd and torrid State of the Blood. With reſpect to black Stools, *Hippocrates*, in *Aphor.* 21. *Sect.* 4. tells us, that "black Stools, reſembling black "Blood, and diſcharged ſpontaneouſly, either with or without "a Fever, are very bad."

Galen, in his Commentary on this Aphoriſm, aſſerts, that black Stools indicate a great Weakneſs of the Spleen and Liver, in which they alſo denote the Generation of a large Quantity of groſs and melancholic Blood: For this Reaſon black Stools are, in acute Diſeaſes, juſtly accounted fatal Prognoſtics, ſince Nature requires a long time to concoct and correct this Humour. *Galen*, in a peſtilential Conſtitution, obſerved many Stools of this Kind, which were diſcharged not only by thoſe who died, but alſo by thoſe who recover'd; but, in the former, they appear'd either in the Beginning, or the Increaſe, of the Diſeaſe. When treating of good Stools, we have ſhewn, that black Stools are ſometimes beneficial; tho' when they appear, whilſt the Diſeaſe is crude, and before the Signs of a due Concoction, they never fail to prove fatal; for then, according to *Galen*, they indicate, that an irreparable Injury is done to the Viſcera. According to *Hippocrates*, in the 23d *Aphor.* of his 4th *Section*, "If thoſe who have been emaciated by acute or "lingering Diſeaſes, by Wounds, or any other Cauſe, diſ-"charge, by Stool, black Bile, reſembling black Blood, they "die next Day."

According to *Galen*, all Stools tinged with various Colours are alſo bad, becauſe they indicate a Variety of Humours in the Body; to correct which Nature requires a long time, which ſhe cannot poſſibly have in acute and violent Diſorders, which quickly impair the Strength. *Hippocrates*, therefore, in his *Prognoſtics*, juſtly affirms, "That Stools tinged with different "Colours, tho' the Patients might ſtruggle for a long time "with their Diſeaſe, yet never fail to prove fatal." And, in the 21ſt *Aphor.* of *Sect.* 4. he tells us, that they are the more fatal, the worſe and more numerous the Colours, with which they are tinged, are. This was the Caſe of *Apollonius*, concerning whom *Hippocrates*, in the third Book of his *Epidemics*, ſays, "That he diſcharged Stools of various Colours and "Qualities, ſuch as black, virulent, pinguious, crude, and "acrid, and at laſt reſembling Milk."

Fetid Stools are alſo bad; becauſe, according to *Galen*, they are a Sign of Putrefaction. Thus *Hippocrates*, in his *Prognoſtics*, and in the 47th *Aphor.* of *Sect.* 4. condemns all fetid Stools. But ſuch as are very fetid, liquid, yellow, pinguious, and what we call colliquative, are obſerved to be ſo highly fatal in acute Fevers, that very few Patients, who diſcharge ſuch Stools, have been found to recover; becauſe they denote a predominant Putrefaction, and a Loſs of Strength. They are alſo a highly fatal Sign in continued Fevers; and Stools of this Kind reſemble the Yolk of an Egg, diluted in fat Broth; only with this Difference, that they are highly fetid. With reſpect to theſe, *Hippocrates*, in the 3d Book of his *Epidemics*, affirms, "That thoſe who labour'd under either acute "or chronical Diſeaſes, were taken off principally by Stools of "a bad Kind." And *Galen*, in his Comment on this Paſſage, uſes the following Words: "That long-continued Plague, "which appear'd in our own Age, cut off moſt of thoſe who "fell the Sacrifices of its Fury, in conſequence of their Eva-"cuations by Stool; for the Matter diſcharged was the Effect "of Colliquation." Of this Kind were the Stools of the Concubine of *Nicolaus*, as *Hippocrates*, in the ſeventh Book of his *Epidemics*, informs us.

Theſe are the various Kinds of Stools, which threaten Death, either with reſpect to their Subſtance, their Quantity, their Colour, or their Smell. Stools alſo diſcharged in a preternatural Manner, and ſuch as are either continued too long, or evacuated without the Conſciouſneſs of the Patient, are fatal; becauſe, according to *Galen*, in acute Diſeaſes, they either prognoſticate a Delirium, or a fatal Loſs of Strength. With reſpect to this, the Author of the *Prorrhet.* in the firſt Book, 78. uſes theſe Words: "Thin Stools, diſcharged without the "Conſciouſneſs of the Patient, if he is not delirious, are bad, "as it ſometimes happens in an hepatic Flux." In like manner, in continual Fevers, thoſe Stools which continue too long, either with or without a gnawing Pain, ſuch alſo as are copious, and afford no Relief, are highly bad. By theſe *Hippocrates*, in his *Epidemics*, tells us, that many were taken off: Thus, in the firſt Book, he uſes theſe Words: "In the Summer and "Autumn, Lienteries, Dyſenteries, Teneſmi, and bilious "Fluxes, raged; and the Stools diſcharged were thin, frequent, "crude, acrid, and in ſome aqueous." And, in the third Book, he tells us, "That, with reſpect to the Evacuations by "Stool, many Patients were ſubjected to terrible Diſorders, "eſpecially to a Teneſmus, which was principally incident to "Children, and thoſe who had not as yet arrived at Puberty, "many of whom died lienteric." *Hippocrates* alſo, in the 43. *Aphor.* of *Sect.* 6. informs us, "That Perſons, weaken'd "by a long-continued Dyſentery, unleſs they die of it, fall "into a Lientery, or Dropſy, which proves fatal to them." All Stools, therefore, of this Kind, are fatal, if they appear at the Beginning of the Diſeaſe, without any Signs of a previous Concoction; at which time no Evacuations are good and laudable, but ſymptomatical and bad. Stools of this Kind *Hippocrates* had in his View, when, in the third Book of his *Epidemics*, he uſes theſe Words: "Moſt had their Bellies diſturb'd, "and were ſeiz'd with Horrors and Sweats, which were not "critical." With reſpect to Stools of this Kind, in *Hippocrates*, in *Epidem. Lib.* 3. we find theſe Words: "Two Brothers, "the Companions of *Cecrops*, from the Beginning, diſcharged "Stools which were black, feculent, in Colour reſembling Ali-"ments prepared of Blood, (κεχυκέδια) highly bilious, and "frothy."

Bad Stools are alſo known from their preceding, their concomitant, and ſubſequent Signs, and from their being ſo far from determining the Fever, that they rather render the Patients worſe. Thus *Hippocrates*, in the third Book of his *Epidemics*, ſays, "The Stools diſcharged did not alleviate the Sym-"ptoms." And, in the firſt Book of the *Prorrhetics*, 129. theſe Words occur: "In acute Diſeaſes, after a moderate "Eruption of Blood and black Stools, Deafneſs is bad." In the ſame Book, 81. we are told, "That, in burn-"ing Fevers, attended with ſome Degree of Shivering, "and frequent Diſcharges of aqueous Bile by Stool, a Diſtor-"tion of the Eyes is a bad Sign, whether the Patients are "ſeiz'd with a Catalepſis or not." And, in the ſame Book, 108. we are told, "That ſublivid Stools, accompanied with Per-"turbations of the Inteſtines, and a Diſcharge of thin and aque-"ous Humours, are bad." In the ſame Book, 127. after Eruptions of Blood, black Stools are ſaid to be bad; ſuch were theſe obſerved in *Silenus*, *Hermocrates*, the Daughter of *Eryanax*, the Youth lodged in the *Forum Mendacium*, the Woman at the Houſe of *Panthimides*, another Woman who ſuffer'd Abortion, another Woman in the *Forum Mendacium*, *Parius*, *Pythion*, *Apollonius*, and many others, whoſe Hiſtories occur in the Writings of *Hippocrates*; the beſt Source from which we can poſſibly learn to draw Prognoſtics from the Characteriſtics of Stools, whether of the good or bad Kind.

DEJECTORIA. Purging Medicines. See CATHARTICA.

DEINOSIS, δείνωσις, from δεινόω, to exaggerate. It ſignifies ſtrictly Exaggeration; but is by *Hippocrates*, in his Treatiſe *de Ratione Victus in Acutis*, applied to the *Supercilia*, where it imports their being enlarged and diſtended.

DEIPNON, δεῖπνον. A Supper, properly; but it implies any Meal in general.

DEIRA, δειρή. The Neck. See CERVIX.

DELATIO. The ſame as INDICATIO. *Caſtellus* from *Mich. Gaveſſetius.*

DELETERION, δηλητήριον, from δηλέω, to injure. I don't know, that the *Greeks* uſe this Word as an Epithet to any thing, except φάρμακον, having never met with it in any Gender, but the Neuter. It imports pernicious, injurious, or poiſonous. *Galen* defines *deleterious Medicines* ſuch as agree with no one, either in Sickneſs, or in Health.

DELIGATIO. The Application of Bandages.

That Bandages are very uſeful, and even neceſſary, for curing the Diſorders of the human Body, is evident, not only from the Teſtimonies of *Hippocrates*, *Galen*, and other eminent Phyſicians; but alſo from this, that there can ſcarcely be any Operation, in Surgery, perform'd ſucceſsfully without their Aſſiſtance: For, ſhould a Surgeon perform an Operation with the greateſt Judgment and Care, but miſcarry in the Application of the Bandage, all his Endeavours would be to no Purpoſe; and more eſpecially in the Treatment of Wounds, Fractures, Luxations, and Amputations. And we often find, that, in Fractures and Luxations, after a proper Reduction of the Parts, the Cure depends more on a ſkilful Application of the Bandage to the Part affected, than on the Medicines. And, in the Caſe of violent Hæmorrhages, a proper Application of the Bandage and Compreſſes proves the moſt effectual and ſpeedy Remedy, as muſt be acknowledged by every one, who has any Skill in Surgery; not to mention, that the making and applying a Bandage, after a genteel and ready manner, is juſtly reckon'd among the good Qualifications of a Surgeon, as it gains him the Eſteem of the Spectators, and the Confidence of his Patient, which is of great Influence in forwarding the Cure; for both one and the other judge of a Surgeon's other Abilities, by his Performance on ſuch Occaſions.

By

By a Bandage, we underſtand a Piece of Linen Cloth, of a Shape and Size ſuitable to the Part of the Body it is to be applied to: They are ſometimes of a ſquare Figure, not unlike a Napkin; but generally they are long and narrow, when deſign'd for Fractures, Luxations, and Wounds; or for retaining Compreſſes, Plaiſters, Lint, or the like. The *French* make a Diſtinction betwixt a Band and Bandage: By the firſt, they underſtand the looſe Cloth, before it be applied; and, by the other, the Band, when applied to the Body.

There are various Kinds of Bandages; ſome are peculiar to one, and others common to ſeveral Parts of the Body: Some, again, are ſimple, and others compound. Thoſe are call'd ſimple, which are made of one entire Piece of Linen, without any other Pieces join'd to them. With reſpect to theſe, we are to obſerve, to make them of Linen, cut according to the Length of the whole Piece, and commonly three or four Fingers Breadth, ſuitable to the Part of the Body they are to be applied to. Theſe ſimple Bandages may be roll'd up at one or both Ends, as the Surgeon ſhall think moſt proper or neceſſary.

There are four different Ways of applying the ſimple Bandage, which are diſtinguiſh'd by as many different Names. 1. The circular or annular Bandage is, when the upper Rounds come exactly over the undermoſt. 2. The obtuſe or *Aſcia*, in *French Doloires*; when the Rounds aſcend or deſcend upon each other, in the Form of a Screw. 3. The Repent, in *French Rampant*; when the Bandage is applied to the Part affected in Rounds ſeparate, and at a little Diſtance from each other. 4. Reflex, call'd by the *French Renverſé*; when the Bandage muſt be inverted, and turn'd back, as in thoſe applied to the Legs, or other Parts of the Body, of different Thickneſſes.

Compound Bandages are made of ſeveral Pieces of Cloth, ſew'd together, or of one Piece of Cloth, cut into more Heads than two, with more artificial Rounds than the former; and are commonly uſed in Fractures of the Jaw-bone, Clavicle, and Patella; ſuch are thoſe with four Heads, which are commonly call'd *Fundæ*. Some Figures of theſe Bandages may be ſeen *Tab.* 23. *d*, *e*, *f*, *g*, *h*. Add to this the Bandage of eighteen Heads, which ſome call *Aſcialis*, which is uſed in compound Fractures, repreſented in *Tab.* 30. *Fig.* 4. B, B. and many others. Of compound Bandages, ſome are applied to the Breaſt, others to the Abdomen, and others again to the Arms and Legs; and from theſe different Parts they receive their reſpective Denominations. Some take their Names from the Things they reſemble, as *Scapha*, *Stella*, *Stapes*, *Spica*; and others, again, have their Names from their principal Uſes.

The Matter of which Bandages are generally compoſed, is Linen Cloth; the neceſſary Conditions of which are, firſt, that it be clean, partly for Decency, partly that it may not be offenſive to the Wound; for, as *Galen* obſerves, a Surgeon ought to ſtudy Cleanlineſs and Neatneſs, as well as Uſefulneſs, in his Dreſſings. Secondly, that it be not quite new, but wore for ſome time, which will render it more ſoft and ſmooth; for new Cloth, by its Hardneſs and Aſperity, would irritate, inflame, and make the Parts itch; at the ſame time, it ought not to be wore thin, becauſe that would make the Bandage too weak, and ſubject to break. Thirdly, it ſhould be ſtrong, conſiſting of Threads neither very coarſe, nor very fine; ſince the firſt will make it uneaſy to the Patient, and the other will render it liable to ſtretch. Fourthly, it ſhould have no looſe Threads, Knots, or Hems, nor any Seams, that can be avoided; but, if the Length of the Bandage ſhould make Seams neceſſary, they ſhould be as even, and as few, as poſſible. Fifthly, and laſtly, as to the Length and Breadth required in a Bandage, that muſt be left to the Diſcretion of the Surgeon.

With reſpect to Bandages, it ought to be obſerv'd, that they be neither drawn too tight, nor too looſe, but retain a moderate Tenſion; for, when they are too looſe, they are of no Uſe in Fractures, or violent Hæmorrhages; and, when too tight, they will create violent Pains, Tumors, and Inflammations, a Gangrene, and even a Mortification of the Part. We may eaſily judge whether the Bandage has a proper Tenſion, by trying to put our Fingers under it, by the Feeling of the Patient, and the Appearance of the Part affected. If the Patient does not complain of the leaſt Swelling or Uneaſineſs, you may conclude the Bandage to be too ſlack; but, on the contrary, if the Part affected ſwells, and creates any great Uneaſineſs to the Patient, the Bandage, in that Caſe, muſt be too tight; or a Surgeon may eaſily diſcover, by the Swelling of the Parts neareſt to the Bandage, whether he has obſerved a due Medium in applying it; for if the Extremities, eſpecially thoſe of the Arms or Feet, in the Morning, or at Night, are hard, turgid, and affected with an acute Pain, and if, at the ſame time, the Veins of theſe Parts are preternaturally turgid, you may conclude, that the Bandage is too tight; as, on the other hand, it muſt be too lax, if there be no Swelling, ſo that you can eaſily ſlip your Finger under it. If you are to apply a Bandage, with one Head, to the Hand or Foot, it is neceſſary to fix its Beginning with two or three circular Rounds, one above another, to prevent its ſlackening; but, if the Bandage be two-headed, you muſt then apply the Middle of it firſt, and then roll the two Ends of it tight about the Limb with both your Hands; but, for the greater Security, the Extremities of the Bandage ſhould be folded in, before they be faſten'd, in order to ſecure it the better. Bandages and Compreſſes for Fractures and Luxations ought never to be applied dry, but ſhould be moiſten'd with warm Vinegar, burnt Wine, or Oxycrate, which will make the Bandage adhere more cloſely, and will both ſtrengthen the Parts, and alleviate, or prevent an Inflammation. Laſtly, if the Parts under the Bandage itch exceſſively, as they often do, the Bandage may be a little relaxed; or, if that cannot be done with Safety, the Bandage and Dreſſing muſt be frequently moiſten'd with the above-mention'd Liquors, till the Itching ceaſes. Whenever you renew a Dreſſing, great care muſt be taken not to pull it away too roughly or haſtily, leſt the Part affected be thereby greatly injured; for, if you uſe not the utmoſt Caution in taking off the Bandages, Compreſſes, and Pledgets, there will be Danger leſt the Lips of the Wound, and the Fragments of the Bone, ſhould, by ſuch Precipitation, cauſe a dangerous Hæmorrhage, and other bad Symptoms: And, for this Reaſon, whenever the Bandage adheres too cloſely to the Skin, being glued thereto by Blood, or other Matter dry'd, it is neceſſary to moiſten it with Wine, or the warm Spirit of Wine, which will make it come off more eaſily. In like manner, you ought to take care to have all the Apparatus for a new Dreſſing ready and prepared, before you take off the old; leſt the Part affected, by being long expoſed to the Air or Cold, be thereby injured.

I have above hinted at ſome general Uſes of Bandages; but, for a diſtinct Conſideration of the ſame, it will not be amiſs to ſpecify ſome of their more particular Uſes: And, firſt, they ſometimes perform a Cure of themſelves, and ſo ſupply the Place of Medicines, as in Fractures, Luxations, and violent Hæmorrhages; and they are often applied to retain the Medicines, and other Dreſſings, on the affected Parts. Sometimes Bandages are uſed to repel Swellings of the Feet; and then they are call'd *Expellents*, and, by the *French*, *Expulſives*. The Manner of applying them, for this End, is, to begin at the lower End, and, by degrees, aſcend with every Round. See *Tab.* 24. *Fig.* 1. *Let.* F. And theſe expulſive Bandages are not only uſed for ſwell'd Legs, but alſo to diſcharge the noxious Matter in Fiſtulas. Bandages are alſo of very great Uſe for reſtoring deform'd Parts to their natural State; and it is no uncommon thing to ſee Bandages, when applied to freſh Wounds, eſpecially in the fore or hinder Parts of the Head and Abdomen, unite them ſurpriſingly; and then the Bandage is commonly call'd *Uniting*. See FASCIA.

DELIQUIUM. This has two Significations in Medicine; for, firſt, it implies a Fainting, and is the ſame as SYNCOPE, which ſee. Secondly, it implies the Solution of any Body, when expoſed in a cool and damp Place, by the Humidity it attracts ſpontaneouſly from the Air. Thus Salt of Tartar, diſſolved in the manner above-mention'd, is called Oil of Tartar *per Deliquium*.

DELIRIUM, from *Deliro*, to rave, or talk idly; which is derived from *Lira*, a Ridge, or Furrow of Land. Hence *Deliro* properly imports, to deviate from the Right, that is, right Reaſon. We have no good Word in *Engliſh* to expreſs *Delirium*, unleſs *Lightheadedneſs* may be admitted.

As it is good for the Patient, under all Diſorders of the Body, to have his Mind untouched, or to have all his Actions under the Command of the ruling Faculty, as at other times; ſo, on the contrary, to be in any manner delirious, or to be deprived, in whole or in part, of the Uſe of his Reaſon, is a bad Prognoſtic, and, in acute Diſeaſes, often portends Death. For the Illuſtration of the Method of prognoſticating from this Head, it will be neceſſary to ſhew, firſt, what we mean by a Depravation of Reaſon; ſecondly, by what Signs we diſtinguiſh the preſent, or predict any future Defect of this Kind; and, in the laſt Place, to treat ſomewhat largely of the different Kinds of Madneſs and Deliriums.

As to the firſt, *Galen* calls thoſe deſtitute of Reaſon, or delirious, who neither ſpeak or do any thing agreeable to Reaſon; but he ſeems not to have comprehended all delirious Perſons under this Deſcription, ſince not only thoſe, who, in their Speeches and Action, are inconſiſtent with Reaſon, but ſuch as, in any particular Affair, talk and act after an unuſual and irrational Manner, tho' ſeemingly wiſe in many things, are to be reckoned among thoſe who are mad, beſide themſelves, and delirious: For the great Founder of Medicine, *Hippocrates*, frequently diſcovered and judged a Delirium from a ſingle deprav'd Action of the ruling Faculty: As, for Inſtance, *Aph.* 6. *Lib.* 2. from an Inſenſibility of Pain: "They who are affected "with Pain in any Part of their Body, but are inſenſible of "the ſame, are diſorder'd in their Reaſon." And, in *Progn.* he paſſes the ſame Judgment from only the Decubiture: "To "lie on the Belly," he ſays, "not being accuſtom'd to it in "Health, prognoſticates Ill to the Patient; for it ſignifies a "Delirium, or a Pain about the Region of the Belly." *Galen* himſelf, alſo, *in* 1. *Prorrhet.* has told us, that a Delirium

may

may be known merely by the Patient's Spitting; and, in *Prognoſt.* that it may be diſcover'd by the indecent Geſticulation of the Hands, picking of Motes, or fruitleſs Hunting of Flies. The Author alſo of the *Prorrhet.* 1. ſays, "That a fierce "Anſwer from a Patient of a mild Temper, or a mild An- "ſwer from one of a fierce Spirit, ſignifies a Delirium; as "does alſo Garrulity in a Perſon of Taciturnity, and Silence "in one much given to Talking." Theſe and many other Examples prove, that a Perſon may be denominated delirious from the Depravation of one ſingle Action. We conclude, therefore, that they are to be eſteemed as labouring under a Diſorder of Reaſon, who have ſome one of the voluntary Actions exceſſive or deficient, contrary to Reaſon, and all due Decorum; as when the Hand, for Example, is employ'd after a ridiculous manner in fruitleſs picking of Motes, or catching of Flies; or when any thing is done by the Patient contrary to Cuſtom, and without a Cauſe, as when he talks much or little, contrary to his uſual Cuſtom, or talks obſcenely, or utters his Words after an incoherent and broken Manner, or fetches his Breath ſlower than Neceſſity requires, or expoſes his Pudenda to the Byſtanders. We call thoſe delirious, alſo, whoſe Mind, thro' ſome Defect of the Senſes, is incapable of receiving Ideas, or is regardleſs of them when receiv'd; among whom are certainly to be reckon'd thoſe who labour under ſome unuſual Deficiency of the Senſes without a Cauſe, or employ them in an unuſual manner; as when the Patient is either depriv'd of ſome voluntary Action, or puts it to an ill Uſe. Theſe Marks of a delirious Perſon ſeem to be very elegantly expreſs'd in *Coac. Præſag.* 47. as follows: "To do any thing contrary to "Cuſtom, as to undertake or deſire ſuch things as never before "entered into his Thoughts, or are contrary to his uſual In- "clination, is a very bad Symptom, and next in degree to "Madneſs." Every Alteration, therefore, in Motions, Geſtures, Voice, Speech, or the Judgment of the Senſes, ſhews a Man to be delirious, and out of his right Mind.

We proceed, in the ſecond Place, to treat in particular of the Signs which indicate a Delirium; where we ſhall deſire the Reader to obſerve, what *Hippocrates*, as well as *Galen*, in various Places, have ſaid on this Subject, particularly the former, 1. *Prorrhet.* 44. where we are informed, "That a fierce An- "ſwer from a Perſon of a meek and compoſed Temper, or an "unuſual Meekneſs in one of a fierce and ungovernable Spirit, "ſignify a Delirium." And, in the ſame Book, we are told, that a bold and fierce Aſpect indicates a Phrenſy; the ſame is alſo ſignify'd when the Patient is inſenſible of his Pain, or is free from Thirſt when his Tongue is ſcorched with Heat, or is contented with ſmall Draughts. Other Signs are, a Pulſation of the Hypochondria, and frequent Twitching of the Eyes, which *Galen*, on 1. *Prognoſt.* explains by ſtaring and unſteady Eyes. A lying on the Belly, contrary to Cuſtom, is accounted by *Hippocrates*, *Lib. Prognoſt.* a Sign of Deliriouſneſs; and *Galen*, in *Comment.* tells us, that the ſame is ſignify'd by a ſupine Poſture, with the Legs very much retracted, or ſpread, and an unuſual Grinding of the Teeth, which is mention'd by *Hippocrates* in the Place before quoted; alſo when the Patient, under the Height of the Diſtemper, deſires to ſit up, it denotes a Delirium; and the ſame is indicated, as was before obſerv'd, by Geſticulation of the Hands, bringing the Hands to the Mouth, fruitleſs hunting of Flies, picking of Motes, pulling Threads out of the Clothes, or Straws out of the Wall, as *Hippocrates* obſerved in the Wife of *Dealces*, who lay ſick in *Leium*. It is a moſt evident Sign of a Delirium, when modeſt Patients, eſpecially of the Female Sex, for no Reaſon, expoſe the Pudenda without any Senſe of Shame. *Hippocrates*, in *Prognoſt.* and *Galen*, in 2. *de Reſpirat. Cap.* 5. and on 3. *Epidem.* reckon a great and full Reſpiration, at Intervals, among the Marks of a Delirium; and, in *Coac. Præſag.* 282 we find a Palpitation of the Hypochondria, and the Patient's not knowing his familiar Acquaintance, to be Indications of the like Diſorder. In *Coac. Præſag.* 99. 233. the Author mentions, among theſe Signs, a Trembling of the Tongue, or tremulous Voice, frequent Spitting, Emiſſion of Urine, without remembering it, and very high-colour'd Urine, with an Enæorema. Whoever is verſed in the Writings of *Hippocrates* and *Galen*, muſt obſerve alſo, that a Shrilneſs of the Voice, Roughneſs and Dryneſs of the Tongue, æruginous Vomitings, with a Deafneſs, Ringing in the Ears in acute Fevers, throbbing Pains about the Navel, unuſual Pain of the Sides, profound Pain of the Hips, Urine with an elevated Enæorema, white aqueous Urine, with a round and elevated Enæorema, and a Pain of the Head in Patients who are reſtleſs, and afflicted with want of Sleep, indicate a Loſs of Reaſon. The Author of the *Prorrhet.* 1. 17. adds, "A Shrilneſs "the Voice, after much Loathing and Vomiting, with a dry "Concretion in the Eyes, indicate Madneſs; as it happen'd to "the Wife of *Hermozygus*, who, being ſeized with an acute "and violent Delirium, died ſpeechleſs." And, immediately after, theſe Words occur: "If, in burning Fevers, the Pa- "tients are ſeized with a Ringing of the Ears, a Dimneſs of "Sight, and a Defluxion from the Noſe, they become deliri- "ous." *Galen*, in his fifth Book *de Locis affectis*, tells us, that, to phrenitic Patients, a Delirium does not happen inſtantaneouſly, but gradually; that it does not ceaſe ſuddenly; and that it is preceded ſometimes by Watchings, and ſometimes by turbulent Sleeps, attended with ſtrong Impreſſions of the Fancy in Dreams, during which ſome Patients cry out and ſtart. Sometimes this Diſorder is accompanied with a Forgetfulneſs ſo ſurpriſing and unaccountable, that the Patients, after they have taken up the Chamber-pot with a View to make Water, forget to do ſo. Some, on the other hand, who are naturally courteous and affable, make Anſwers to the Perſons who addreſs them, with a preternatural Kind of Diſorder and Raſhneſs. Another Circumſtance, obſervable in Patients of this Kind, is, that they drink very ſparingly. They have alſo a large, but ſlow Reſpiration. Sometimes the poſterior Part of their Head is in Pain, and their Pulſe is ſmall and hard; but, when they approach nearer to a *Phrenitis*, their Eyes become highly ſqualid, and an acrid Tear ſtands in one of them. Lippitude enſues, and the Veins of the Eyes are obſerved full of Blood. Drops of Blood are alſo diſcharged from the Noſe; at which time they are incapable of making rational and coherent Anſwers, pull the Knap off the Clothes, and pick at Straws: The Fever becomes more intenſe, more equal, more uniform, and leſs ſubject to Changes: The Tongue becomes rough, and the Patients ſometimes become deaf, and ſometimes melancholy: They can ſcarce make Anſwer to any Queſtion propos'd, and are inſenſible of Pain. Theſe Signs are ſufficient for diſcovering when any Patient labours under a Delirium.

Many Circumſtances prognoſticate, that Patients will become delirious; ſuch as Watching, for Inſtance, which often precedes a Delirium, as *Hippocrates* obſerves in his Book of *Prognoſtics*; and *Galen*, in his fourth Book *de Præſag. ex Pulſibus*, informs us, that both Watchings and a Delirium are the Reſults of an over-heated and over-dry'd Brain. Sleeps which are tumultuous and diſturb'd, as alſo thoſe unſound Slumbers, during which the Patient is, as it were, half awake, or cries out, and ſtarts up, are the Forerunners of a future Delirium. Thus, in the *Coac. Prænot.* 83. we are told, "That "turbulent and ſudden Startings out of Sleep bring on a Deli- "rium." The Author of the *Prorrhetics*, *Lib.* 1. 18. obſerves, that a Noiſe and Ringing of the Ears, as alſo Deafneſs, eſpecially when attended with Urine, near the Surface of which Clouds are ſuſpended, often precede Madneſs. *Galen*, in his fifth Book *de Locis affectis*, obſerves, that Forgetfulneſs often precedes a *Phrenitis*. An intenſe and uninterrupted Pain of the Head, in acute Fevers, alſo portends a Delirium, eſpecially the Pain ſometimes obſerved in the Ears, according to *Hippocrates*, in his Book of *Prognoſtics*. It alſo prognoſticates a *Phrenitis*, when this Pain of the Head is accompanied with a Retraction of the Præcordia. Thus, in the *Coac. Prænot.* 119. we are told, "That, in acute Diſeaſes, a Pain "of the Head, accompanied with a Retraction of the Præ- "cordia, if an Hæmorrhage does not happen, terminates in a "*Phrenitis*." Watchings alſo, accompany'd with a Noiſe, and Ringing of the Ears, or with Deafneſs, prognoſticate the ſame, unleſs an Hæmorrhage happens. In the firſt Book of the *Prorrhetics*, 38. the following Symptoms, appearing together, are ſaid to prognoſticate a Delirium: "Thoſe Patients, "afflicted with a Looſeneſs, a Pain of the Head, Thirſt, "Watchings, Dimneſs of Sight, and Weakneſs, will, in all "Probability, become delirious." The Author of the ſeventh Book of the *Epidemics* affirms, that a continued Pain of the Head prognoſticates a Delirium; of which alſo a Pain of the Hypochondria is frequently the Forerunner; which Circumſtance is there remarked in a Woman three Months gone with Child. A Palpitation of the Heart, and long-continued Pains about the Navel, in acute Diſeaſes, prognoſticate the ſame Diſorder, as we are informed in the third Book of the *Epidemics*. From ſeveral Paſſages of the firſt Book of the *Prorrhetics*, we learn, "That this Diſorder is prognoſticated "by a Pain in the ignoble Parts." And, in the ſame Book, we are informed, that repeated, but not continued, Pains of the Sides portend a Delirium. And, in the ſecond Book, theſe Words occur: "If any Matter in the Urine riſes to the "Surface, if, at the ſame time, there is a latent Pain of the "Hip, it prognoſticates a Delirium, as does alſo a Ringing of "the Ears;" which *Hippocrates*, in *Epidem. Lib.* 3. tells us happen'd to a bald Man at *Lariſſa*, who, having a ſudden Pain in his Right Thigh, was forthwith ſeized with a *Delirium*. In the firſt Book of the *Prorrhetics*, 97. we are told, that, in pleuritic Patients, a Pain of the Side, vaniſhing, without ſufficient Reaſon, prognoſticates a Delirium. In the firſt Book of the *Prorrhetics*, 6. we are informed, that round Spits, and frequent Spitting without a Cauſe, indicate the ſame. *Hippocrates* alſo, in the fourth *Aphor.* of *Sect.* 5. aſſerts, that Blood, collected in the Breaſts of Women, prognoſticates Madneſs. *Galen* tells us, that Urine which is pellucid and white is bad, and generally portends a *Delirium*; as does alſo turbid Urine in acute Diſeaſes, but more eſpecially Urine with Clouds near its Surface, in Patients afflicted with turbulent Sleeps and Watchings. A Pulſation alſo under the Arm-pits, and in the Hypochondria, as alſo a

large, but ſlow, Reſpiration, denote the ſame, as we learn from the Book of *Prognoſtics*. And, in the *Prorrhetics*, *Lib.* 1. 11. the following Words occur: "In acute Diſeaſes, when the "Fauces are ſeized with Pain, become narrow, and perceive "a Senſe of Suffocation; and when the Patient, upon opening "his Mouth, cannot eaſily ſhut it again; theſe Signs portend "a Delirium, which proves fatal." Æruginous Vomitings alſo, accompanied with continual Head-achs, Watchings, and Deafneſs, are infallible Signs of an approaching *Delirium*; ſince any one of them by itſelf, much more all, or ſome of them, appearing together in an acute Fever, are Signs of this Diſorder.

Having thus enumerated the Signs of an approaching *Delirium*, we ſhall now conſider the ſeveral Species and Differences of *Deliriums*, together with the reſpective Cauſes which produce them, ſince, without a perfect Knowledge of theſe, we cannot with Judgment prognoſticate the Fate of delirious Patients. By a diſorder'd Mind, then, we mean all the ſeveral Degrees of Aberration, Inconſtancy, Hallucination, Madneſs, Privation of Judgment, Delirium, and Phrenitis; and Patients labouring under any of theſe, we call diſorder'd in Mind. In theſe Diſorders, the Powers of Reaſon and Imagination are principally affected; for, according to *Galen*, in his Book *de different. Symptom. Cap.* 3. the Imagination is either defective and ſlow in its Operations, as in a Coma and Lethargy; or it is totally deſtroy'd, as in that Species of Catalepſis call'd *Caros*; or, laſtly, it is vitiated, and its Functions are deprav'd and unſteady, as in a *Delirium* and *Phrenitis*. Juſt ſo with reſpect to Reaſon, it is either defective, diminiſh'd, or, in ſome meaſure, deſtroy'd; this is by the *Greeks* call'd *Moroſis*, and imports nearly the ſame with our *Engliſh* Word *Fooliſhneſs*; or Reaſon is entirely deſtroy'd, which is call'd *Madneſs*; or, laſtly, it is vitiated, and its Operations corrupted, which is call'd a *Delirium*. In Conjunction with the Reaſon and Imagination, it alſo frequently happens, that the Memory is affected in the ſame different Degrees and Manners. In ſome Patients, whoſe Minds are diſorder'd, the Imagination alone is affected, whilſt the other mental Powers remain entire and untouch'd, as *Galen*, in his Book *de Symptom. different. Cap.* 3. obſerved in *Theophilus*. Sometimes, on the contrary, Reaſon alone is affected, whilſt both Imagination and Memory remain ſound, and in a due State; which, as *Galen*, in the laſt-quoted Book, informs us, happened to a phrenitic Patient. But, for the moſt part, both the Powers of Reaſon and Imagination are equally vitiated, as is obſervable in thoſe delirious Patients, who either imagine ſuch things as have no real Exiſtence in Nature; or, on the contrary, imagine, that things actually exiſting do not exiſt; in conſequence of which, both their Actions and Words are entirely inconſiſtent with Reaſon, and the natural Workings of a ſound and well-regulated Fancy. All this formidable Train of Diſorders are either divided into what we call Madneſs, Ecſtaſy, Folly, Aberration, Inconſtancy, and Alienation of Mind; or into what the *Greeks* call *Paraphreneſis*, and the *Latins Delirium*; or, laſtly, into a *Phrenitis*, which *Galen*, in Imitation of *Hippocrates*, diſtinguiſhes from all theſe other Diſorders by this Circumſtance, that it is the Concomitant of a Fever. When any of the above-mention'd Diſorders happens with a Fever, it is call'd *Phrenitis*; and, without a Fever, *Mania*, or Madneſs, which is diſtinguiſhed from a Delirium by the Perpetuity or Duration of the Diſorder; for tho' a Delirium, or Paraphreneſis, happens with a Fever, yet it is not continual, as a Phrenitis is. *Galen* affirms, that, in ſeveral Paſſages, *Hippocrates* calls thoſe Patients *phrenitic*, who are perpetually delirious; whereas he calls a Paraphreneſis that Species of *Delirium*, which only appears in the Height of the moſt acute Fevers, and gradually goes off as they decline. For this Reaſon phrenitic are diſtinguiſh'd from delirious Patients, by the Continuation of the Delirium, and its appearing gradually; except in thoſe Patients who become delirious in conſequence of an Inflammation of the Diaphragm; for Deliriums of this Kind are not eaſily diſtinguiſhed from a Phrenitis, becauſe they both happen with a Fever, and laſt as long as it; from which Circumſtance the Antients imagin'd, that Perſons became phrenitic in conſequence of an Inflammation of the Diaphragm; and, for that Reaſon, call'd this Part *Phrenes*, φρένας, as tho' it were aſſiſtant τῷ φρονοῦντι, "to the "intelligent Part." *Galen*, however, makes a Diſtinction between this kind of delirious Perſons, and thoſe who are in a Phrenſy; for theſe latter have a great and full Reſpiration, and at long Intervals; whereas in thoſe who are under a *Delirium*, occaſioned by the Diaphragm, Reſpiration is obſerved to be unequal, ſo as to be ſometimes ſmall and frequent, at other times to be great and ſtraiten'd; which does not happen in a Phrenſy, unleſs ſome Organ, ſubſervient to Reſpiration, be affected with a Pain or Inflammation, as *Galen*, in his ſecond Book of Reſpiration, has ſhewn with great Accuracy. Beſides, in a Delirium proceeding from the Diaphragm, there is an immediate Tenſion of the Hypochondria, which happens later in the Phrenſy; and this Tenſion of thoſe Parts, in the Beginning, is a Symptom peculiar to that ſort of Delirium: And, in ſhort, among all the Symptoms attending a Phrenſy, ſuch as red and inflamed Eyes, with a Face all over burning with Heat, and other Marks more fully deſcribed before, there are either none, or but few and inconſiderable, to be obſerved in that Diſorder, proceeding from an Affection of the Diaphragm, which, beſides, ſeizes the Patient, as it were, on a ſudden, whereas the Phrenſy comes on by degrees.

There are many other different Kinds of Phrenſy; for there is one which is call'd the μανιώδης, "the *maniac*," in which the Patients kick, ſpurn, and bite, are in a furious Paſſion, and take all who come near them for Enemies; but, when they begin to be raging, fierce, and very miſchievous, the Diſorder is ſaid to be vehement; and, in that State, is call'd by the *Greeks* θηριώδης, (from θὴρ, a wild Beaſt) and, by the *Latins*, *Ferina*. Of this Degree of Phrenſy the Author of the firſt of the *Prorrhetics*, 26. and 123. ſpeaks, when he ſays, "A Delirium "which ſoon increaſes, and is exaſperated into a Fierceneſs, is "of the *ferine* Kind." There is alſo a mild and obſcure ſort of Delirium, under which the Patients can hardly be known to have their Reaſon affected. Theſe, in *Coac. Prænot.* 65. are call'd ſilently delirious; and theſe low Kinds of mental Diſorders are deſcribed in the 1. *Prorrhetics*, 34. as "tremulous, obſcure, at-"tended with Gropings of the Hands, but very phrenitical *Deli-"riums*;" the *Greeks* call them ἀσαφεῖς, (obſcure) and the *Latins obſcuras*, which often eſcape the Notice not only of the Unſkilful, but of Phyſicians themſelves. The Patients, in ſuch Caſes, ſays *Galen*, in 1. *Prorrhet.* 33. are ſo far from making Exclamations, or endeavouring to leap out of Bed, that they lie very quiet, without Speech, or altering their Poſture of Decubiture, but give Hopes to the Attendants of ſleeping, if Silence were kept, for a little time. The Attendants, therefore, ſhutting the Windows, keep themſelves quiet, ſometimes for a long time together, imagining the Patient to be aſleep, becauſe he neither ſpeaks nor moves; whereas he continues all the time waking, and gently moving his Hands, as if he were groping or ſearching about for ſomething. Some, while they do this, have their Eyelids ſhut; and, if they are interrogated about any thing, open not their Eyes: Others, after they have opened them, ſoon ſhut them again, or hold them fixed in ſuch a manner as *Galen* calls a *hectic Affection*. But this Delirium, by its Characters, agrees with what proceeds from a Coma, or Lethargy. We ought, therefore, carefully to obſerve the Alterations and Diſtinctions which occur in theſe Caſes. A Delirium attending a Coma or Lethargy, and called by ſome *Greeks*, as *Galen* ſays, *Typhomania*, happens in the Beginning of the Diſtemper, and continues a long time; but the *aſaphes*, or obſcure, Delirium, or, as *Galen* calls it, *hectic*, never happens in the Beginning, but in the Progreſs, of the Diſeaſe, after ſome vehement Madneſs. However, a lethargic or comatous Delirium may often be excited by a cold Humour, or even by a Redundance of Blood, after the Beginning of the Diſeaſe; and is ſometimes antecedent and preparatory to a good or bad Criſis, being attended with a low, hard, ſtraiten'd, and ſmall Pulſe, which Kind is not obſerv'd in the Delirium before-mention'd. But now let us treat of the Cauſes of a *Delirium*.

All *Deliria*, according to *Galen*, *Lib.* 2. *de Sympt. Cauſ.* proceed from hot and acrimonious Juices, but principally from yellow Bile, and frequently from a hot Diſtemperature of the Brain. As all Kinds of *Deliria*, *Madneſs*, and *Phrenſy*, ariſe from ſome Diſorder of the Brain, ſo particularly two Sorts of *Deliria*, I mean thoſe which are excited in the very Height of acute Fevers, and thoſe occaſioned by hot and acrimonious Vapours aſcending to the Brain. There are other *Deliria*, which, if without a Fever, the Phyſicians call *Mania*, or Madneſs; if attended with a Fever, *Galen* calls them *Phrenſies*; though they are not true Phrenſies, unleſs there be a Phlegmon in the Brain, or its Membranes. *Galen*, *de Cauſ. Sympt. Lib.* 2. *Cap.* 7. But this is a Caſe which rarely happens, and not ſo frequently as that phrenitic *Delirium*, which is excited by a Conflux of hot Humours to the Brain, or its Membranes, according to the Obſervation of *Hippocrates*, 2. *Epid.* And thoſe *Deliria* may as well ariſe from Blood as Bile, in that Part of the Brain, which is the principal Seat of the animal Faculties, according to *Galen*, *Lib.* 2. *de Sympt. Cauſ. Cap. ult.* or they may proceed only from yellow Bile, which, torrefy'd by the Heat of a burning Fever, is converted into *black*, and excites that vehement *Delirium*, which the *Greeks* call *Maniodea*, *Theriodea*, and are raging, furious, and wild, proceeding from an immoderate Dryneſs of the Brain and its Membranes, thro' aduſt Bile, by which the Patients are often thrown into Tremblings and Convulſions, which Symptoms, as *Galen* informs us, attend none but the moſt violent and pernicious Phrenſies. Thoſe *Deliriums* attending a Fever, which are call'd *phrenitic*, ariſe not only from hot Humours, but, as *Galen*, in *Lib.* 3. *Epid.* ſuppoſes, from Cold; as, for Inſtance, from pituitous Humours putrifying in the Brain, by which they contract a Heat and Acrimony very injurious to the Brain, and its Membranes, and productive of a *Delirium*. But theſe Kinds of *Deliria* are diſtinguiſhed from thoſe which are excited by hot Humours, by a Drowſineſs or Sopor; for thoſe who are delirious from a cold Humour ſleep at the

ſame

ſame time, or have ſome lethargic Affection; whereas, on the contrary, a *Delirium*, from hot Humours, ſubjects to want of Sleep. It often happens alſo, that a Mixture of hot and cold Humours produces a kind of *Delirium*, compoſed of a Phrenſy and a Lethargy, as *Galen*, in 1. *Prorrhet.* obſerves. And theſe two contrary Effects accompany the Diſorder thro' its whole Courſe; for the Patient is ſometimes afflicted with want of Sleep, at other times is oppreſſed with a Drowſineſs, and is more or leſs phrenitic or lethargic, according to the Degree of mutual Predominance of the Bile and Phlegm over one another. Theſe, then, are all the Cauſes of phrenitic *Deliria*; whence alſo a true Phrenſy, which is excited by an Inflammation of the Brain and its Membranes, has its Original, and is mildeſt when from pale Bile, more violent from yellow Bile, and moſt violent when proceeding from the ſame Humour, rendered aduſt by a febrile Heat. That obſcure *Delirium*, called by the *Greeks* ἀσάφεια, (Aſaphia) which is attended by Silence, is owing to an extraordinary Languiſhment of the animal Faculty, and, as *Galen*, *in Prorrheticis*, calls it, a hectic Sort of Temperature; and is known principally by a very low, ſmall, and hard Pulſe.

This is *Galen*'s Way of explaining the Cauſes of a *Delirium*; but, for a more rational Account, ſee FEBRIS.

Of ſalutary PROGNOSTICS *from* DELIRIOUSNESS.

A *Delirium* is leaſt to be dreaded when it holds the Patient but a ſhort time, and is attended with good, or, at leaſt, not fatal Signs. The Strength alſo ought to bear ſome Proportion, that is, to have a good Degree of Firmneſs, ſince a *Delirium* requires an extraordinary Meaſure of Strength, and can hardly be ſubdu'd by Nature without it. No *Delirium*, as *Galen*, in 6. *Aph.* 53. teaches, is without Danger: "The moſt favour-"able is what is attended with Laughter; the moſt dangerous "is the raſh and fool-hardy; of a middle Nature between both "is that which is accompany'd with Meditation." But no *Delirium*, tho' it be one of the greateſt of Evils, is, in itſelf, a certain Prognoſtic of Death, no more than Soundneſs of Mind is a ſure Sign of Recovery. However, a *Delirium*, attended with good Signs, is the leſs to be feared, and eſpecially if it be not continual, nor violent and outrageous, but rather ſlight and inconſiderable, as when the Patient's Reaſon fails him but in few Particulars; for *Galen*, *Lib. de Diff. Sympt. Cap.* 4. calls it a great *Delirium*, when various Species of *Deliria* are obſerved together in the ſame Patient. A ſmall and ſlight *Delirium*, which diſcovers itſelf only in a few Actions, is leaſt of all to be dreaded, and eſpecially if it comes only by Fits. But, in order to denominate a *Delirium* of the mild and favourable Kind, it is not enough, that it be not continual, but it ought to be void of all Ferocity, ſince the Author of *Prorrhet.* 1. ſays, "That *Deliria* which increaſe in a ſhort time to a Degree of "Ferocity, end in exceſſive Raving." Of the Patients in ſuch Caſes *Galen* thus pronounces: "When you ſee a Perſon deli-"rious to a Degree of Ferocity, tho' ſoon after he appears "calm and compoſed, know for certain, that his Reaſon is "not injured on account of the Fever, but that there is ſome "growing latent phrenitic Affection, which will at length "break out into apparent Phrenſy." We may conclude, then, that an intermittent *Delirium*, which is not vehement, but ſlight, gentle, and inconſiderable, and eſpecially when it affects a Perſon only by Fits, can by no means be accounted a fatal Prognoſtic. But Caution is here neceſſary, that we impoſe not on ourſelves, in taking a *Delirium* for ſlight and gentle; for many have been thought in a Delirium of this favourable Sort when very near their End; for, as we read, *Prorrhet.* 34. "*Deliria* which are tremulous, obſcure, and attended with Grop-"ings of the Hands, are phrenitic in a high Degree." But ſuch Caſes are eaſily diſtinguiſhed from the Lowneſs of the Strength, the continual Duration of the Diſorder, and other deſtructive Signs; for, in a mild *Delirium*, the Strength is very firm, the Diſorder not continual, and none of thoſe fatal Signs appear. Of this Nature was the Caſe of *Milidia*, in *Hippocrates*. But in the other *Delirium*, before deſcribed, the Pulſe is low, the Diſorder continual, and the Signs portend Deſtruction. All Signs, therefore, both thoſe which commence with the *Delirium*, and thoſe which appear afterwards, are very carefully to be obſerved; for they frequently precede a ſalutary Criſis, and take their Riſe, as *Galen* ſuppoſes, *Lib.* 1. *ad Glauc. Cap.* 15. from a critical Recurrence of the Blood and bilious Humour to the Head. Now a *Delirium*, which portends a Criſis, is ſometimes attended with a Pain of the Head, a Heavineſs, Deafneſs, and many other Symptoms of the like Kind; with reſpect to which, *Galen*, in 1. *Epid.* commenting on the Caſe of a Patient who lay ſick in the Gardens of *Dealces*, ſays, "That a *Delirium* on the ninth Day, "with a Diſtortion of the Right Eye, are to be reckoned "among Symptoms uſually happening towards a Criſis." And, in the Caſe of the Virgin of *Abdera*, *Lib.* 3. *Epid. Stat. peſt. Ægr.* 7. a *Delirium*, with Deafneſs, preceded a Criſis, which was attended with Pains of the Feet, and an Hæmorrhage from the Noſe. And we have a much fuller Deſcription, to this Purpoſe, in the Caſe of the moroſe Woman of *Thaſus*, *ibid. Ægr.* 11. "The third Day, it is ſaid, the Convulſions "ceaſed, and were ſucceeded by a Coma and Drowſineſs, "from which ſhe awaked, grew reſtleſs, and highly delirious, "and had an acute Fever; the ſame Night a copious and hot "Sweat broke out over all her Body; the Fever left her; ſhe ſlept, "and had the free Uſe of her Reaſon." A *Delirium* alſo, obſerv'd on the ſixth Day, in the Virgin of *Lariſſa*, *ibid. Ægr.* 12. was the Sign of an approaching Hæmorrhage; which was alſo the Caſe of *Heropythus* of *Abdera*, *ibid. Ægr.* 9. A *Delirium*, therefore, attended with Pain and Heavineſs of the Head, want of Sleep, a Coma, Deafneſs, Dimneſs of Sight, a Splendor of the Eyes, involuntary Tears, Ringing in the Ears, Loſs of Underſtanding or Memory, Trembling, Anxiety, Reſtleſſneſs, Crying out, Starting up, Difficulty of Breathing, Suppreſſion of Urine, vehement Rigor, much Æſtuation, and intolerable Thirſt, or any of theſe ſurpriſing the Patient on a ſudden, is often the Forerunner of a Criſis, or an Hæmorrhage. As to an Hæmorrhage, the Author of *Coac. Prænot.* 184. ſays, "That, in "Diſeaſes where an Anxiety is ſuddenly ſucceeded by a *Deli-"rium*, it portends a Flux of Blood, or of Urine." Of this laſt *Hippocrates*, 6. *Epid. Sect.* 6. *Text.* 22. pronounces, "That Urine, with a copious Sediment, gives a Solution to a "*Delirium*, as in the Caſe of *Dexippus*." The ſame is effected by Sweat, according to *Galen*, *Lib.* 3. *de Criſibus*: "A "Phrenſy has its critical Solution, by a copious Eruption of "Sweat; and eſpecially if it flow plentifully, and hot, from "the Head, the reſt of the Body being, at the ſame time, in "a Sweat." And, a little after, he ſays, "Sometimes it "happens, that a Phrenſy is critically terminated by an Hæ-"morrhage from the Noſe." In *Coac. Præſag.* 483. we are told, that a *Delirium* terminates in Sweat and Sleep; and *Hippocrates*, *Sect.* 7. *Aph.* 5. has ſaid, "That, in the Caſe of "Madneſs, the Acceſs of a Dyſentery, Anaſarca, or violent "Commotion of Mind, is a good Sign." A *Delirium* then, as it is ſucceeded by ſome beneficial Evacuation, is a Prognoſtic of Health, and a kind of critical Sign; but it will prove of very bad Conſequence when preceding an Evacuation of a pernicious Kind, ſuch as Dropping of Blood from the Noſe, cold Sweats of the Head, and the like. Our Inquiry, therefore, muſt be, whether the Evacuations be good or bad; which may, no doubt, be known by a Multitude of Signs, particularly from their Quantity, Quality, Place by which they are diſcharged, the Time of the Diſeaſe, or Days in which they appear, and by the Alleviation of the Diſeaſe. They are obſerved to be beneficial, if ſufficiently copious in proportion to the Quantity of peccant Humours; if they are of the Quality of thoſe which require to be evacuated; are diſcharged by a convenient Paſſage, and in a proper Seaſon, that is, in the Height of the Diſeaſe, or on ſome critical Day; and are ſucceeded by an Alleviation of the Diſeaſe, and its Symptoms, or a total Delivery of the Patient from them. But there are three things of great Moment, which are principally to be regarded in all Predictions; and theſe are, the Pulſe, Reſpiration, and the Appetite to Food; which, if they continue firm and orderly, tho' joined with ſome pernicious Sign, afford a very good Foundation for predicting the Patient's Recovery. This appears to be the Opinion of *Galen*, who, in his third Comment on the third of the *Epidemics*, *Text.* 89. treating of the Caſe of *Heropythus*, ſays, "That a *Delirium*, attended with a ſtrong Pulſe, and a due "and orderly Reſpiration and Appetite, are undoubted Signs of "Strength of Nature ſufficient to ſupport the Patient during "the Courſe of the Diſtemper."

From the Premiſſes it appears what Judgment we are to paſs upon the Diſeaſe from Signs accompanying a *Delirium*: We are now to inquire what is to be prognoſticated from thoſe Symptoms, which are conſequent to a *Delirium*, and ſhew, in ſome meaſure, the Nature and Quality of it. Thoſe Evacuations, then, before-mention'd, are ſalutary; as copious Hæmorrhages from the Noſe, of which *Galen* treats, *Lib.* 3. *de Criſibus*, *Cap.* 8. Alſo menſtrual Purgations, attending and conſequent upon a *Delirium*; ſuch as were obſerv'd by *Hippocrates*, in the Virgin of *Lariſſa*, *Lib.* 3. *Epid. Stat. peſt. Ægr.* 12. and in the moroſe Woman, *ibid. Ægr.* 11. and were attended with a plentiful Sweat, in conſequence of which the Woman was freed from her Fever, ſlept, and recover'd the entire Uſe of her Reaſon. Hæmorrhoids alſo, conſequent upon a *Delirium*, prognoſticate Recovery, according to *Hippocrates*, *Sect.* 6. *Aph.* 21. where he ſays, "That if thoſe who are mad "come to be affected with the Varices or Hæmorrhoids, they "are freed from their Madneſs." Violent Pains in the Hips, Legs, Feet, and Hands, are of the ſame Signification, as ſhewing they are excited by an Expulſion of the Humours from the principal to the more ignoble Parts; which is a Criſis that Nature attempts by a Tranſlation of the Humours. To this Purpoſe *Hippocrates*, *Lib.* 1. *Epid. Sect.* 3. *Ægr.* 3. in his Deſcription of the Caſe of *Herophon*, ſays, "The eighth "Day he was feveriſh, his Spleen ſubſided, he underſtood "every thing, a Pain came firſt into his Groin on the ſame "Side with the Spleen, from whence it ſhifted into both "Legs." The ſame Pains, in the Wife of *Epicrates*, *ibid.*

Ægr. 5. were not the leaſt Part of the Criſis. The Patient alſo, who lay ill in the Garden of *Dealces*, *Lib.* 3. *Epid. Sect.* 1. *Ægr.* 3. on the fourteenth Day was quite delirious, on the fifteenth was ſeized with a Pain in his Knee and Legs, on the ſeventeenth had an Eruption of Sweat all over his Body, and was reſtored to his Reaſon: Thus alſo, in the Virgin of *Abdera*, *Lib.* 3. *Epid. Stat. peſt. Ægr.* 7. Pains in the Feet, on the twentieth Day, put an End to her *Delirium* and Deafneſs. Sleep, to a ſick Perſon under a *Delirium*, is always of great Moment, and eſpecially if it ſubſides, or, at leaſt, diminiſhes it, according to the ſecond *Aphor.* of *Sect.* 2. which ſays, "That if Sleep puts an End to a *Delirium*, it is a good "Sign." And there is good Reaſon for it, ſince a *Delirium* is always attended with want of Sleep, and both proceed from the ſame Cauſe: If, therefore, Sleep happens upon a *Delirium*, it is a Sign, that the Cauſe is removed. But then this Sleep is to be diſtinguiſhed from a violent or preternatural Propenſity to Sleep, as a Coma, Cataphora, or Lethargy; for, as Sleep is a good Sign, ſo any of the aforeſaid ſoporiferous Affections is a bad one, except that comatous Affection which is excited by the Influx of the Blood into the Brain, in order to a future Criſis. Sleep, therefore, is always good after a *Delirium*, and eſpecially if it be with Quietneſs, as *Hippocrates* obſerves in *Herophon*, the Wife of *Epicrates*, and in *Meton*, *Lib.* 1. *Epid. Sect.* 3. *Ægr.* 7. whoſe *Delirium* was reſolved by Sleep. For a *Delirium*, therefore, to be compoſed by Sleep, is always good, as the contrary is bad; for, according to *Aph.* 21. *Sect.* 2. Sleep, oppreſſing inſtead of relieving the Patient, portends Death. Diſtinct Dreams, ἐνύπνια ἐναργῆ, are alſo a good Prognoſtic in a *Delirium*, and eſpecially in a Phrenſy, as we read in *Coac. Præſag.* 90. which, tho' it ſeems to be contrary to 1. *Prorrhet.* 5. where it is ſaid, that ſuch Dreams ſhew a Phrenſy, is yet very true; as will appear from the following Diſtinction, which will prevent all Miſtakes in the Matter. Conſpicuous Dreams, then, which are not turbulent, but quiet and ſerene, are, in *Coac.* of good Signification, becauſe they can never be ſuppoſed, or are obſerved, to be clear and diſtinct, unleſs the Inflammation in the Brain, the febrile Heat, and the Motion excited in the Humours by the Vapours, are allay'd and appeas'd; which Effects are always reckon'd a good Prognoſtic; whereas conſpicuous, but turbulent Dreams, by which the Patient is affrighted, and ſtarts out of his Sleep, are not only owing to a Dryneſs, but indicate an Inflammation, a febrile Heat, and diſorderly Motion of the Spirits; which give Reaſon to fear, that the *Delirium* will increaſe to the Degree of a Phrenſy. But if the Queſtion, in ſhort, be, Whether a Mitigation, or a total Compoſure, of a *Delirium* be always a good Sign, we anſwer, that a *Delirium* mitigated, or totally compos'd, or reſolv'd by Sleep, a Tranſlation of the Humours to the Legs, Feet, or other ignoble Parts, or ſome critical Evacuation, gives always good Grounds for us to predict, with Confidence, the Patient's Recovery.

Of a DELIRIUM *prognoſticating Death.*

A *Delirium*, which threatens Death, is known by its diſtinguiſhing Marks, the Time in which it appears, the extraordinary Weakneſs of the Patient, and other mortal Symptoms, which accompany or ſucceed it. Phrenitic *Deliria* are, for the moſt part, mortal, tho' all phrenitic Perſons do not die. We call all thoſe *Phrenſies*, which the *Greeks* call μανιώδεις, θηριώδεις, and ἀσαφώδεις, "Maniac, raging in the manner of wild Beaſts, "and obſcure or mopiſh;" and the *Latins*, *feroces*, *tumultuoſas*, *furioſas*, *ferinas*, *melancholicas*, *atque obſcuras ſeu blandas*; the five firſt of which expreſs the two former *Greek* Words, and the two laſt the latter. The *Aſaphodes*, *Aſaphes*, or *Obſcure*, are obſerved in the Beginning of the Diſeaſe, or after a Mania; and, proceeding, as we obſerved before, from Blood, or Bile, or a Mixture of Bile and Phlegm, or from putrid Phlegm, are reckon'd not ſo fatal; whereas a Delirium from Weakneſs, or a hectic Diſtemperature of the Brain, is the moſt mortal of all: Whence the Author of the *Prorrhet.* calls thoſe Deliria highly phrenitic, tho' before he had named them mild, obſcure, and attended with groping, or fumbling with the Hand. A diſtinguiſhing Property of theſe latter is *Silence*; of which, in *Coac. Præſag.* 65. it is ſaid, "That "a high Delirium, attended with Silence, but not a Depriva-"tion of Voice, is mortal." In phrenitic Deliria we may obſerve three Kinds of Silence; one in which the Patient ſpeaks not at all, or but very little, tho' he is capable of ſpeaking; the ſecond is attended with a lethargic Affection, or an Extinction of the natural Heat; and the laſt with an Aphony, or Privation of Voice, thro' an Oppreſſion, or almoſt Extinction, of the Animal Faculty, a Convulſion of the Organs of Speech, or an Interception of the Air which forms the Voice. A Delirium, attended with Silence, the Faculty of Speech remaining entire, a Fumbling with the Hands, a low Pulſe, with the Eyes ſometimes cloſed, as in Sleep, and ſometimes half open, proceeds from the Weakneſs of the Faculty. Of theſe kinds of Delirium, beſides what was quoted before from the *Prorrhetica*, we find it thus pronounced, *Coac. Præſag.* 76. "A Delirium, attended with Trembling and Groping, or "Fumbling with the Hands, ſhews a Phrenſy." And in the ſame Treatiſe, *Text.* 486. "A Delirium, attended with Silence, "Reſtleſſneſs, Rolling of the Eyes, and vehement Expira-"tion, is of bad Preſage." Of this ſort *Galen*, on the *Prorrhetica*, ſpeaks, where he ſays, "This Affection of the Hu-"mours is of a very depraved Kind, like that of hectic Fevers, "which, when they begin to be form'd, can hardly be cured; "but, after they are completely conſtituted, are incapable of a "Solution." And theſe comatous Affections are the more formidable, when conſequent upon a very ſevere and hot Diſtemper: Thus, if a Patient falls into a Lethargy, from a Refrigeration of the Brain, after an Inflammation, the Event is moſt fatal; for, as we are told by *Galen*, in his 3. *Comment.* on the *Prorrhetica*, a cold, ſucceeding a hot Diſtemper, is reckon'd incurable. In a violent Delirium, or Mania, the Patient, both on account of the Malignity of the Humour, and the immoderate Dryneſs, becomes not only ſilent, but affected with an Aphony, or Deprivation of Voice; as it happen'd to the Wife of *Hermozygus*, who died highly delirious and mute, as we are inform'd 1. *Prorrhet.* 17. The ſame Event, from the like Prognoſtics, befel the Man under a Phrenſy, *Lib.* 3. *Epid. Ægr.* 4. and the Wife of *Dealces*, *ibid. Ægr.* 15. And *Galen*, *Com.* 2. *in Prorrhet.* tells us, "That, under a Fever, a con-"vulſive Aphony, ending in a Delirium, attended with Silence, "is pernicious." Some Symptoms are ſuppoſed to be proper to the moſt violent Deliria; ſuch as Tremblings, Convulſions, Droppings of Blood from the Noſe, bright aqueous Urine, Geſticulations of the Hands, and the like. Tremblings and Convulſions attend not all phrenitic Deliria, but only the moſt violent; as, for Example, the ferine or raving, as *Galen*, 1. *Com. in Prorrhet. Text.* 9. remarks; and are the uſual Conſequence of fatal Emotions. Perſons in a Phrenſy are ſeiz'd firſt with a Trembling, and then die in Convulſions. The Author of 1. *Prorrhet.* 9. ſays, "That violent Phrenſies end in Trem-"blings:" And a Trembling, as *Galen* ſays, ſucceeds only the moſt violent Phrenſies; for phrenitic Perſons are a long time afflicted with Infirmities of the Nerves, from the Dryneſs of the Diſeaſe. Now the Strength and Spirits being exhauſted with Want of Sleep, and Variety of Motions, and the Nerves at the ſame time immoderately dried, the Patient is ſeiz'd with a Trembling, which indicates a vehement Dryneſs of the Nerves, from a Conflux of aduſt Bile to the Brain. This is obſerved by the Author of 1. *Prorrhet.* 14. where he ſays, "That if thoſe "who are highly delirious, are ſeiz'd with Tremblings, "it is bad." And, a little after, *Text.* 16. he tells us, "That phrenitic Perſons, drinking little, and affected with "the leaſt Noiſe, are ſubject to a Trembling." And, *Text.* 19. he obſerves, "That a Delirium, attended with "a Shrilneſs of the Voice, and convulſive Tremblings of "the Tongue, portends a high Phrenſy: In this Caſe a Hard-"neſs and Aſperity are pernicious." And *Galen*, on *Text.* 20. remarks, "That the Trembling of the Tongue, in ſuch "Patients, indicates a Weakneſs of the Faculty, and a phre-"nitical Diſorder of Mind:" Hence, in his Comments on the *Prorrhetica*, he calls them tremulous Phrenſies, which proceed from the Faculty being almoſt extinct, and are obſerved to be attended with Silence; for three Symptoms are the uſual Attendants of an increaſing Phrenſy; an ecſtatical Silence, a Trembling under a very high Phrenſy, and Convulſions at the Approach of Death. Mortal Tremblings ſucceed burning Fevers, or vehement Madneſs, from aduſt Bile, which we juſt now call'd *Ferinam & Melancholicam*: But Tremblings preceding or attending Deliria, tho' there are none of them good, excepting ſuch as are critical, do not always portend Death; but are oftentimes, as well as Convulſions, removed by a ſupervening Fever. Tremblings, therefore, are only obſerved to be mortal, when coming upon a Delirium or Madneſs; and many, at the Beginning of a Diſtemper, are ſeiz'd with a Trembling, who do not die. Of this we have an Inſtance in *Pythio*, 3. *Epidem. Ægr.* 1. Nor are Tremblings fatal Prognoſtics in all Deliria, but only in violent ones, according to *Coac. Prænot.* 93. "In a violent Phrenſy, ſupervening "Tremblings are fatal;" and *Galen* juſtly obſerves, *Com.* 1. *in Prorrh.* that not all, but the moſt violent Phrenſies terminate in Tremblings. However, theſe Tremblings are not, like Convulſions, inſeparable from thoſe in a Phrenſy, ſince there are many phrenitic Perſons, who are never affected with them; but they are conſequent upon thoſe vehement and furious Phrenſies, in which the Strength is exhauſted by much Waking and Motion, and the Nerves beyond meaſure dried and harden'd: Wherefore this ſort of Trembling, as well as thoſe fierce and outrageous Phrenſies, which are the Cauſe of them, are ſeldom obſerved; whereas all phrenitic Patients are ſeiz'd with Convulſions before their Death, and all Convulſions, acceſſory to a Delirium, and excited by a Dryneſs of the nervous Parts, are mortal; ſo that we may ſafely affirm, that all mortal Phrenſies terminate in Convulſions; but that they are terminated in Tremblings, as it is aſſerted 1. *Prorrhet.* 9. *Galen*, in 1. *Epid. Ægr.* 4. cenſures as falſe. That they end in Convulſions and Death,

Death, is confirm'd by *Hippocrates* in many Inſtances, particularly the Wife of *Philinus*, 1. *Epid. Ægr.* 4. and the phrenetic Perſon, 3. *Epid. Stat. peſt. Ægr.* 4. of whom he ſays, "That the ſecond Day, in the Morning, he was ſpeechleſs, "had an acute Fever, and Sweats, without Intermiſſion; had "Palpitations over all his Body; and, at Night, Convulſions. "On the third Day all the Symptoms were exaſperated; and, "on the fourth Day, he died." And of the Woman in *Cyzicus*, *Epidem. L.* 3. *Ægr.* 14. he tells us, "That, on the "fourteenth Day, ſhe was much afflicted with Convulſions, "her extreme Parts were cold, ſhe was quite delirious, had a "Suppreſſion of Urine, and died." *Galen* alſo, *Meth. Med. Lib.* 12. *Cap.* 8. ſpeaking of Convulſions proceeding from an immoderate Dryneſs of the Nerves, tells us, "That they are "conſequent upon the moſt mortal kind of Phrenſy; and "that he never knew or heard of any one who recover'd, "when affected with them." And, in the fifth Book of the *Epidemics*, aſcrib'd to *Hippocrates*, *Text.* 84. we read, that the Maid-ſervant of *Conon*, labouring under a Phrenſy, was taken with Convulſions, and ſpeechleſs, on the fortieth Day of her Illneſs, and ten Days before her Death. There is alſo a kind of Palpitation near akin to Convulſions, which ſome call a convulſive Trembling, others a ſpurious Convulſion, others a Sultation; in which there is a Subſultus of the Parts under the Hand, when touch'd, as if they were vellicated by ſome pungent Humour or Vapour, the Nerves ſhrinking back, and retracting themſelves from the painful Senſation; ſuch is the Palpitation of Fiſhes on dry Land. Theſe Palpitations, when conſequent on a high Delirium, are no leſs mortal than Tremblings and Convulſions. But we are to make a Diſtinction in this Caſe, becauſe theſe Palpitations, as well as Convulſions, if excited by acrimonious Juices or Vapours, may not always be mortal; for which Reaſon we are to conſider the other concomitant and ſubſequent Signs, that we may form the better Judgment of the Event. Another Symptom, therefore, which we are to obſerve, is virulent Vomitings, in which aduſt, æruginous, or black Bile is diſcharged, as we are inform'd by *Hippocrates*, *Lib.* 1. *Epid. Sect.* 2. where he obſerves, in his ſecond State, or *Cataſtaſis* of the Seaſons, that, of thoſe who laboured under a Phrenſy, ſucceeded by Convulſions, and virulent Vomitings, ſome died ſuddenly. With ſuch Vomitings was *Philiſtes*, labouring under a mortal Phrenſy, moleſted, *Lib.* 3. *Epid. Ægr.* 2. Geſticulations of the Hands are alſo a Symptom attending a Phrenſy, when fatal, according to the Judgment of *Hippocrates*, *Lib. Prognoſtic.* where he ſays, "That as to Geſti-"culations of the Hands, we are to know, that in an acute "Fever, Phrenſy, Peripneumony, or Cephalalgia, to wave "the Hands before the Face, to ſeem to hunt after Flies, to "pick Straws, or pull Threads out of Clothes, or Motes out "of the Wall, are all bad and mortal Signs." Such were thoſe obſerved in the Wife of *Dealces*, before-mention'd. A Diſcharge of Blood, by Drops, from the Noſe, is another Symptom ſupervening on a Delirium, whoſe Event is fatal: For *Galen*, *Com.* 3. *in Prorrhet. Text.* 49. aſſerts, that ſuch an Evacuation not only implies ſome Difficulty in the Caſe, as the Author of the *Prorrhetica* pronounces it, when attended with Deafneſs and Liſtleſſneſs; but is a very bad Sign, and, if accompanied with others which indicate the Brain to be affected, is a mortal Prognoſtic.

White, aqueous, and lucid Urine alſo, with white Fæces, are very pernicious Signs in Phrenſies, according to *Hippocrates*, *Sect.* 4. *Aph.* 7. on which *Galen* ſays, "I never knew any one, "whoſe Urine anſwer'd that Deſcription, recover." Again, "Involuntary Emiſſions of Urine are of pernicious Significa-"tions," on the 1. *Prorrhet.* 29. as are alſo "white Excrements," *ibid.* 13. It ſeems alſo peculiar to the worſt Kinds of Phrenſies, that, tho' the Tongue be parch'd with Heat, the Patient feels no Thirſt, or at leaſt drinks but very little; which are bad Signs, *ibid.* 16. Among fatal Deliria are thoſe which are concern'd about the neceſſary Actions of Life, according to the Author of the *Coac. Præſag.* 98. who pronounces Deliria, about Neceſſaries, to be of the worſt Kind; and, if increaſed to an extraordinary Degree, mortal. Such are thoſe Deliria in which the Patients abhor Meat and Drink, tho' their Tongue be parch'd and dry'd with Heat. Thoſe Deliria are alſo fatal, in which the Patients undergo frequent and remarkable Alterations. Thus, 1. *Prorrhet.* "A Phrenſy, mild in "the Beginning, but often changing, prognoſticates a bad "Event." Now there are two Ways of Mutation, or Changing, one from a good to a bad State; the other, from one bad Symptom to another. To this Purpoſe we are told, *Coac. Prænot.* 101. "That frequent Mutations, in a Phrenſy, "are a bad Sign, and ſhew a Diſpoſition to Convulſions." For, certainly, ſuch a Variety of Changes ſignifies either a Redundance of Humours, or that the Brain labours under a Multiplicity of Affections; as when the Patient lies for a long time quiet, ſilent, and ſad, and, all on a ſudden, becomes talkative, laughing, and reſtleſs; as *Hippocrates* obſerved of the Wife of *Dealces* before-mention'd. "At the Beginning, he ſays, "ſhe was cover'd up, and lay continually ſilent; ſhe catch'd at "the Hairs of the Bed-clothes, and pluck'd and ſcratch'd; "now ſhe wept, then ſhe laugh'd, but did not ſleep:" And, at the End of the Relation, "ſhe was continually cover'd, "and was either full of Talk, or perpetually ſilent." All Deliria, proceeding from Weakneſs, were thought, by *Galen*, mortal, ſo as that none ever recover'd of them, as appears by his Comments on the firſt of the *Prorrhetica*: For all phrenetic Diſorders require a conſiderable Degree of Strength in the Patient, agreeably to what we read, *Coac. Præſag.* 100. "A Delirium, ſeizing a Perſon before debilitated and ex-"hauſted, threatens the worſt of Events." Deliria, in the Beginning of a Diſeaſe, are alſo juſtly formidable, as giving Suſpicion of a Phrenſy; for whatever, of this Nature, appears without Signs of Concoction, (which is the Thing to be regarded in the Beginning of any Diſorder) ſhews the Patient to be in a very bad State, as we are taught by *Galen*, in his firſt Book of *Criſes*. To proceed with our Judgment, on thoſe Signs or Symptoms which appear with a Delirium, or are excited afterwards; bad Signs appearing, together with a Delirium, ſeem to threaten Death; but mortal Signs not only Death with Certainty, but alſo, that it is near at Hand. Among the principal bad Symptoms, a total Deprivation of Sleep, or ſuch Sleep as excites, increaſes, or not, in the leaſt, alleviates a Delirium, is a very formidable Symptom in the Opinion of *Hippocrates* and *Galen*. So, alſo, to ſleep with the Mouth conſtantly gaping, in a Delirium, is a fatal Sign. *Hippoc. Progn.* and 2. *Sect. Aph.* 1. 3. An extreme Drowſineſs, or lethargic Affection, after perpetual Watchings, from a Refrigeration of the Brain, or Decay of Strength, is mortal, according to the Obſervation of *Hippocrates*, *Lib.* 3. *Epid. Stat. peſt.* where he ſays, "None of thoſe who had a Phrenſy were diſorder'd to "a vehement Degree of Madneſs, as is uſual in other Caſes, "but ſunk under a Cataphora, or Lethargy." But ſometimes theſe Affections appear as critical, or ſignificant of a *Criſis*, and are known to be ſo by the Signs proper to a *Criſis*. To proceed: A Delirium, accompany'd with a remarkable Forgetfulneſs, Liſtleſſneſs, and Stupidity, is an evident Prognoſtic of Death, *Galen in Prorrhet. Com.* 2. *Text.* 30. ſince for a Perſon not to know his familiar Acquaintance, or not to remember paſt Facts, ſhews a Refrigeration of the Brain, which, conſequent upon a hot Affection, by which the Delirium was excited, can prognoſticate nothing but Death, as was before obſerved. If, with the before-mention'd Symptoms, a Rigor or Coldneſs is join'd, the Fate of the Patient is inevitable, according to *Galen in Prorrhet.* Of the ſame Signification is Stupidity; for, in the Opinion of *Galen in Prorrhet. Text.* 1. they alſo are to be accounted phrenetic, who, being affected with a Coma, have not the Uſe of Reaſon, but talk in a delirious Manner; and, when they are awaken'd and rouſed by the Attendants, appear as if they were ſtupefy'd: For a delirious Patient not to ſee, is a moſt fatal Sign, and ſhews Death to be not far off. Eyes, alſo, avoiding the Light, involuntarily weeping, diſtorted, one bigger than another, the White turn'd red, or the Eyes replete with Blood, in the ſame Caſe, are mortal Signs, as we are taught by *Hippocrates*, *in Prognoſt.* The Face of a fiery Colour, or well-colour'd, but of a ghaſtly Aſpect, portends alſo a bad Event. 1. *Prorrhet.* 49. 67. Violent and continual Pains of the Head and Viſcera are bad Signs; as may be collected from *Aph.* 65. *Sect.* 4. A Heavineſs, Coldneſs, or Lividneſs of the whole Body, or of the Hands and Feet, are no leſs to be dreaded; as appears from *Hippocrates*, *in Prognoſt.* where, and in the *Prorrh. Coac. Prænot.* and *Aphor.* he alſo paſſes the ſame Judgment on a Loſs of Voice, the Silence of the Patient, a ſhrill Voice, a Tongue parch'd and dry, without any Manner of Thirſt, an unuſual Grinding of the Teeth, Convulſions, Palpitations, Shiverings, Rigor, Tremblings, Coldneſs of the extreme Parts, and frequent Alterations in thoſe Parts. Of no leſs mortal Signification are Reſtleſſneſs, Anxiety, Difficulty of Breathing, a Loathing of all Food, and an Averſion to Drink, virulent Vomitings, cold Sweats about the Neck and Scapulæ, and continual Sweats over all the Body, which Phyſicians call *Deſudations*, Blood flowing by Drops from the Noſe, white, aqueous, and pellucid Urine, white Stools, and a Diſcharge of great Quantities of pituitous and bilious Crudities, without alleviating the Delirium, Abſceſſes diverted inwards, Exanthemata, or other Puſtules and Efflorescences on the Skin, vaniſhing without a manifeſt Cauſe, or Pains ariſing in the ignoble Parts, and ſpeedily ceaſing: If many, or but a few, of theſe Symptoms accompany a Delirium, eſpecially of the phrenetic Sort, they prognoſticate Death. They portend the ſame Event, when conſequent upon a Delirium; and more eſpecially when it is ſucceeded by Tremblings, Convulſions, Hiccoughs, Loſs of Voice, with a Diſcharge of white, clear, and pellucid Urine, ſuch as happen'd to *Silenus* on the fifth Day. 1. *Epid. Ægr.* 2. But the moſt certain of all deadly Prognoſtics, ſupervening upon a Delirium, are an extreme Lowneſs of the Pulſe, a bad Reſpiration, a total Loſs of Appetite, and an Abhorrence of all Food, with no Senſe of Thirſt, tho' the Tongue be parch'd

with Heat and Dryneſs. And, indeed, theſe three laſt Symptoms, that is, an extreme Lowneſs of the Pulſe, an Abhorrence of Meat and Drink, and a bad Reſpiration, are of great Moment, in all Diſeaſes, for predicting Death, and eſpecially if accompany'd with ſome of the before-mentioned Signs, which, the more they are in Number or Conſideration, the more certain and ſpeedy is the fatal Event, which they portend. So that, above all the before-mention'd Signs, theſe three laſt-named, tho' accompany'd with many other good or ambiguous Signs, are of the greateſt Moment for predicting the Death of the Patient; as the contrary Signs to theſe, which are a high Pulſe, a good Reſpiration, and a laudable Appetite, tho' accompany'd with many pernicious and threatening Symptoms, are of chief Importance towards prognoſticating a happy Event to the Diſeaſe; as *Galen* has well demonſtrated in his Comment on the Caſe of *Heropytus* before-mention'd. *Proſper Alpinus, de præſagienda Vita & Morte.* See FEBRIS and PHRENITIS.

DELPHINIUM.

The Characters are,

The Leaves are laciniated: The End of the Pedicle, increaſing in Thickneſs, forms a Placenta, on which grows a pentapetalous Flower, of a very ſingular Contexture; for the four lower Petals are almoſt orbicular; but the fifth, which is erect, is divided into five Parts, that is, a bifid Galea, on the Back of which riſes another kind of Petal, with two Wings, and a hollow retroflected Spur, ſheath'd in a ſmall Vagina like it, and in the Form of a Cup. The Stamina are ſo numerous, that, at the lower Part, they grow together into a Silk-like Membrane. The Ovary growing on the Placenta conſiſts of long Sheaths, or Pods, collected into a Head, having each of them its Tube, with a white Apex, opening when ripe, and replete with angulous Seeds.

Boerhaave mentions nineteen Species of this Plant.

1. Delphinium; perenne; montanum; villoſum; Aconiti folio. *T.* 426. *Aconitum, cæruleum, hirſutum, flore Conſolidæ Regalis.* C. B. P. 183. M. H. 3. 464. *Aconitum, lycoctonum, cæruleum, calcari magno.* J. B. 3. 657. *Aconitum, lycoctonum, flore Delphinii I. Sileſiacum.* Cluſ. H. 94. *Aconitum, lycoctonum, flore Delphinii.* H. Eyſt. Æſt. o. 1. F. 11. Fig. 1. *Lycoctonum, flore Delphinii.* Dod. p. 441. PERENNIAL MOUNTAIN HAIRY LARKSPUR, WITH A MONK'S-HOOD-LEAF.

2. Delphinium; platani folio; Staphis agria dictum. *Tourn. Inſt.* 426. *Elem. Bot.* 379. *Boerh. Ind. A.* 301. *Staphis agria,* Offic. Ger. 398. Emac. 495. Raii Hiſt. 1. 705. Park. Theat. 222. J. B. 3. 641. C. B. Pin. 324. Hiſt. Oxon. 3. 461. *Staphis agria, Pedicularia,* Chab. 528. *Aconitum urens Ricini fere foliis, flore cæruleo magno, Staphis agria dicta,* Pluk. Almag. 357. STAVES-ACRE.

This Plant grows to be a Foot and half, or two Foot high: The lower Leaves are large, almoſt as big as Vine-leaves, but rounder in Circumference, divided uſually into ſeven ſharp-pointed Segments, deeply cut in. The Leaves that grow on the Stalk, which is round, and ſomewhat downy, are leſs, but alike in Shape. The Flowers grow on the Tops of the Stalk, of a blue Colour, much like the Flowers of Larkſpur, but having ſhorter Heels or Spurs. Each Flower is ſucceeded by three or four crooked Horns or Pods, in which are contain'd two or three large brown wrinkled angular Seeds. It grows in *Italy*, and other warmer Countries; and flowers in *July*. The Seed only is uſed.

It is ſeldom given inwardly, being of a hot burning Taſte; tho' *Sylvius de la Boe* commends it, from twelve Grains to a Scruple, in a Doſe, which purges upwards and downwards, cauſing a great Flux of Spittle; and is ſerviceable againſt the *Lues Venerea*. It is ſometimes uſed in Maſticatories and Gargariſms, for the Tooth-ach. *Miller's Bot. Off.*

The Powder of Staves-acre is ſprinkled upon the Head, with a View of killing Lice; or the Seeds are bruiſed in Oil, and the Head is anointed therewith, for the ſame Purpoſe.

The Seeds of Staves-acre, to the Number of fifteen, bruiſed and taken in Hydromel, are ſaid potently to expel pituitous and glutinous Humours by Vomit, not without Danger of Suffocation; for they cauſe a very burning Heat and Inflammation in the Fauces. The Seeds alſo, chew'd, attract Phlegm from the Head to the Mouth; from whence we may eaſily conclude, that, if theſe Seeds are boil'd in Plenty of Water, and the Mouth is waſh'd with the Decoction, a ſlight Salivation may be excited; which, perhaps, might be more happily effected by taking not fifteen of the Seeds at once, but one or two at a time, for ſeveral Days together, and ſo exciting a ſlight Salivation by Degrees: But this I look upon as a dangerous Experiment. *Raii Hiſt. Plant.*

3. Delphinium; latifolium; parvo flore. *T.* 426. *Conſolida Regalis, latifolia, parvo flore.* C. B. P. 142. Prodr. 74. M. H. 3. 466. *Conſolida Regalis, peregrina, parvo flore.* J. B. 3. 212. BROAD-LEAVED LARKSPUR, WITH A SMALL FLOWER.

4. Delphinium; ſegetum; flore cæruleo. *T.* 426. *Conſolida, Regalis, arvenſis, flore cæruleo.* C. B. P. 142. *Conſolida, Regalis, flore minore.* J. B. 3. 210. *Delphinium vulgare,* Cluſ. H. 205. *Flos Regius, ſylveſtris.* Dod. p. 252. *Conſolida, Regalis, flore cæruleo, minore.* Camer. *a.* CORN LARK-SPUR, WITH A BLUE FLOWER.

It grows plentifully amongſt the Corn by the Foot-way, from *Cambridge* to *Feverſham*; and flowers in *July*.

Tabernæmontanus ſays, the Conſerve of the Flowers eaſes the Gripes of Children; and *Simon Paulli* affirms, that the Flowers, macerated in Roſe-water, and applied as a Cataplaſm, aſſwage the Inflammation of the Eyes. The Plant is ſaid to be vulnerary and diuretic. *Martyn's Tournefort.*

5. Delphinium; ſegetum; flore violaceo. *T.* 426. *Conſolida, regalis, arvenſis, flore ſimplici, violaceo.* H. Eyſt. Æſt. o. 2. F. 11. Fig. 1. *a.*

6. Delphinium; ſegetum; flore rubro. *a.*

7. Delphinium; arvenſe; flore verſicolore. *Cluſ. H. App.* 2. *Conſolida, regalis, arvenſis, flore variegato.* H. Eyſt. Æſt. o. 2. F. 13. Fig. 1. *a.*

8. Delphinium; ſegetum; flore albo. *T.* 426. *a.*

9. Delphinium; vulgare; flore multiplici. *T.* 426. *Conſolida, regalis, vulgaris, flore multiplici.* C. B. P. 142. *Conſolida, arvenſis, flore rubro pleno.* H. Eyſt. Æſt. o. 2. F. 14. Fig. 1. *a.* COMMON LARK-SPUR, WITH A DOUBLE FLOWER.

10. Delphinium; hortenſe; flore majore, ſimplici, ex cæruleo, purpureo. *T.* 427. *Conſolida, regalis, hortenſis, flore majore, ſimplici cæruleo.* C. B. P. 142. *Flos regius.* Dod. p. 252. *Delphinium, elatius, flore cæruleo.* Cluſ. H. 206. *a.* LARK-SPUR.

The Root of Lark-ſpur is ſmall, and full of Fibres, periſhing after Seed-time: The Leaves are roundiſh in Compaſs, divided into very fine deep Sections, of a dark-green Colour. The Stalk grows to a Yard high, much divided, and cloath'd with the like Leaves, having on their Tops long Spikes of Flowers, of an irregular Shape, made of five Leaves, with a Spur or Heel on the back Part: When theſe are fallen, there come long roundiſh ſharp-pointed Horns, or Seed-veſſels, containing black rugged angular Seed.

It is ſown every Year in Gardens; and flowers moſt Part of the Summer.

This is reckon'd among the vulnerary and conſolidating Plants, and is ſaid to be of a healing Nature; but is ſeldom or never uſed in *England*. *Miller's Bot. Off.*

11. Delphinium; hortenſe; flore majore, ſimplici, rubro. *T.* 427. *Conſolida regalis, ſimplici flore, rubro.* H. Eyſt. Æſt. o. 2. F. 12. Fig. 1. *a.*

12. Delphinium; hortenſe; flore majore, & multiplici, cæruleo. *T.* 427. *Conſolida, regalis, flore majore, & multiplici, cæruleo.* C. B. P. 142.

13. Delphinium; hortenſe; flore majore, & multiplici, incarnato. *T.* 427. *Conſolida, regalis, multiplici, incarnato flore.* H. Eyſt. Æſt. o. 2. F. 11. Fig. 2. *a.* GARDEN LARK-SPUR, WITH A LARGE DOUBLE FLESH-COLOUR'D FLOWER.

14. Delphinium; hortenſe; flore majore; & multiplici violaceo. *Conſolida, regalis, multiplicato, violaceo flore.* H. Eyſt. Æſt. o. 2. F. 11. Fig. 3. *a.* GARDEN LARK-SPUR, WITH A LARGE DOUBLE VIOLET-COLOUR'D FLOWER.

15. Delphinium; hortenſe; flore majore, & multiplici rubro. *T.* 427. *Conſolida, regalis, flore pleno, rubro.* H. Eyſt. Æſt. o. 2. F. 12. Fig. 2. *a.* GARDEN LARK-SPUR, WITH A LARGE DOUBLE RED-COLOURED FLOWER.

16. Delphinium; hortenſe; flore majore, & multiplici albo. *T.* 427. *Conſolida, regalis, flore pleno, albo.* H. Eyſt. Æſt. o. 2. F. 12. Fig. 3. *a.* GARDEN LARK-SPUR, WITH A LARGE DOUBLE WHITE-COLOUR'D FLOWER.

17. Delphinium; hortenſe; flore majore, & multiplici, argenteo. *T.* 427. *Conſolida, regalis, multiplici flore, argenteo.* H. Eyſt. Æſt. o. 2. F. 13. Fig. 2. *a.*

18. Delphinium; hortenſe; flore majore, multiplici, cinereo. *Conſolida, regalis, flore multiplici, cinericeo.* H. Eyſt. Æſt. o. 2. F. 13. Fig. 3. *a.*

19. Delphinium; hortenſe; flore majore, & multiplici, purpureo. *T.* 427. *Conſolida, regalis, flore pleno, purpureo.* H. Eyſt. Æſt. o. 2. F. 14. Fig. 3. *a. Boerh. Ind. alt. Plant.*

DELPHINUS, Offic. Aldrov. de Piſc. 701. Rondel. de Piſc. 459. Charlt. Piſc. 47. Bellon. de Aquat. 9. Geſn. de Aquat. 319. Raii Icht. 28. Ejuſd. Synop. Piſc. 12. Jonſ. Piſc. 47. THE DOLPHIN.

The Parts of this Animal, appropriated to medicinal Uſes, are the Liver, the Aſhes, the Belly, and the Fat. The Belly dried, triturated, and exhibited in ſome proper Liquor, is ſaid to cure ſplenetic Patients. It is ſaid, that the Liver roaſted, and uſed with Aliments, perfectly cures tertian and quartan Fevers; as alſo, that Species of nocturnal Fever known by the Name of *Typhus*. The Aſhes are, by *Pliny*, enumerated among the Medicines which cure the Ringworm and Leproſies.

According to the ſame Author, the Fat melted, and drank with Wine, cures dropſical Patients. *Dale.*

DELPHYS, δελφύς. The Uterus.

DELTA, δέλτα. The external *Pudendum Muliebre. Suidas* from *Ariſtophanes.*

DELTOIDES, δελτοειδής. The Name of a very thick triangular Muſcle covering the upper Part of the Arm, and forming what is term'd the Stump of the Shoulder. It is broad above, and narrow below, in a triangular Form; and its Name is taken from the Reſemblance it bears to the *Greek* Letter Δ *Delta*; but, to make the Compariſon hold, either the Letter or the Muſcle muſt be inverted, and the Muſcle flatten'd.

It is made up of eighteen or twenty ſmall ſingle Muſcles, in an oppoſite Situation with reſpect to each other, and united by middle Tendons, ſo that, taken all together, they form ſeveral penniform Muſcles. The outer Surface appears almoſt wholly fleſhy, but, on the inner Surface, we ſee the ſeveral Tendons.

All theſe ſmall Muſcles are diſpoſed in ſuch a manner, as to form a conſiderable Extent at the upper Part; from whence they contract gradually in Breadth, till they end in a thick ſtrong Tendon, by which the whole Muſcle terminates in an Angle or Point.

Above, it is fix'd in the whole inferior Labium of the Spina Scapulæ, in the convex or long Edge of the Acromium, and in the third Part of the anterior Edge of the Clavicle, next that Apophyſis. It ſurrounds the Angle, form'd by the Articulation of theſe two Bones, by a particular Slope and Fold, contrived for that Purpoſe.

From thence it runs down, above one Third of the Length of the Os Humeri; where it is inſerted, by a thick Tendon, in the large, muſcular, rough Impreſſion, below the bony Ridge, which goes from the great Tuberoſity of the Head of the Bone, and forms the higheſt Border of the Groove or Chanel.

This Inſertion ſeems to be immediately implanted in the Subſtance of the Bone, paſſing through the Perioſteum, which is commonly the Caſe in all Inſertions in theſe Kinds of Impreſſions, Eminences, or conſiderable Tuberoſities. It lies below that of the Pectoralis Major, and a little more forward. Some of the Fibres of this Muſcle are fixed in the Aponeuroſis, common to all the Muſcles which cover the Arm.

This Muſcle may be diſtinguiſh'd into three principal Portions, one of which is fixed in the Spine of the Scapula, one in the Acromium, and one in the Clavicle. They are ſeparated from each other by a ſmall Quantity of Fat, or cellular Subſtance, chiefly near the Baſis of the Muſcle.

The middle and ſtrongeſt Portion runs down almoſt directly to its Inſertion in the Os Humeri. The lateral Portions ſeem to end ſooner, but it is only becauſe they turn inward toward the Bone, and thereby form the biggeſt and thickeſt Part of the Tendon. The anterior or clavicular Portion ſends off ſome Fibres to the Bone, before it reaches the Tendon.

The Portion fixed in the Spine of the Scapula ſends backward a thin Aponeuroſis, which is ſtrengthen'd by another tendinous or ligamentary Series of Fibres. This Aponeuroſis is fixed in the Baſis of the Scapula, below the Spine; and from thence is extended, toward the inferior Angle. The other Series begins at the Spine, and ends near the ſame Angle, at the Beginning of the inferior Coſta. Theſe, together with the great Tendon, ſeem to contribute to the Formation of the tendinous Expanſion which covers the Muſcles of the Arm.

At its upper Part, this Muſcle joins the Inſertion of the Trapezius, and below, that of the Brachialis. Anteriorly it joins the Pectoralis Major, being diſtinguiſhed from it only by a ſmall Line of Fat, or of cellular Subſtance, and a ſmall Vein call'd Cephalica. It covers the Head of the Os Humeri, and adheres to the capſular Ligament of the Joint; and it likewiſe covers the Inſertion of the Pectoralis Major. *Winſlow's Anatomy.*

DEM. Human Blood. *Rulandus.*

DEMENTIA. Madneſs. See MANIA. Or ſometimes it implies a DELIRIUM, which ſee.

DEMETRIOS, Δημήτριος, from Δημήτηρ. The Goddeſs *Ceres.* The ſame as *Cerealis.* See CEREALIA.

DEMOCRATIS THERIACA. A Theriaca deſcrib'd by *Aetius, Tetrab.* 4. *Serm.* 1. *Cap.* III.

DEMONSTRATIO. Demonſtration; that is, a certain, evident, and invincible Proof of the Truth of a Propoſition. But it relates no more to Medicine, than to any other Science. It is to be lamented, that Demonſtration is much more talk'd of by Phyſical Authors, than found in their Writings.

DEMOS. Δημός. Fat. But Δῆμος, with a Circumflex, ſignifies the People.

DEMOTIVUS LAPSUS. Sudden Death. *Rulandus.*

DEMUSCULATUS. The ſame as AMYOS, which ſee.

DENARIUS.

The *Denarius* was the chief Silver Coin among the *Romans.* As a Weight, it was the ſeventh Part of a *Roman* Ounce.

Mr. *Greaves* affirms, that having, in *Italy* and elſewhere, peruſed many hundred *Denarii Conſulares*, he found, by frequent and exact Trial, the beſt of them to amount to 62 Grains *Engliſh*, ſuch as he had carefully taken from the Standards of the *Troy* or Silver Weights, kept in the *Tower* of *London*, and in *Goldſmiths-Hall*, and in the Univerſity of *Oxford.* He arrives very near at the ſame Concluſion, by two Experiments that were made, of the Weight of Water contain'd in the *Congius* of *Veſpaſian*, which was 10 *Roman* Pounds. One Experiment was made by *Villapandus*, on the *Congius* itſelf; and the other by *Gaſſendus*, upon a Medal. By the firſt of theſe Experiments, the Weight of the *Denarius*, or the ſeventh Part of a *Roman* Ounce, comes out 62 Grains, by the ſecond $62\frac{11}{13}$: Neglecting the Fraction, he has ſtated the Value 62 Grains, or 7 Pence 3 Farthings *Engliſh*, allowing 8 *Engliſh* Grains to the Silver Peny. This Valuation *Arbuthnot* has follow'd in the Computation of Sums; that is, ſuppoſing Silver at 5 Shillings the Ounce, which, altho' not exactly true, (for, by the preſent Standard of the Coinage, 62 Shillings, or 3 Pounds 2 Shillings, is coined out of one Pound Weight of Silver) ſince we don't know the Fineneſs of the *Roman* Money, may be a Suppoſition as good as any other, and prevent ſome Trouble in Computation.

The *Roman* Ounce is certainly our *Averdupois* Ounce; but *Arbuthnot* owns, that he has differ'd, in a ſmall Matter, from Mr. *Greaves*, in ſettling the Quantity of *Troy* Grains contain'd in an Ounce *Averdupois*; for, ſuppoſing the *Averdupois* Pound to be to the *Troy* Pound as 175 to 144, and conſiſting of 16 Ounces, makes the *Roman* or *Averdupois* Ounce to be $437\frac{1}{2}$ *Troy* Grains, and the *Roman* Pound 5250 Grains. The Proportion that was given as a true one, was 17 to 14, neglecting the laſt Figures; and conſequently the Proportion of the *Roman Averdupois* Ounce, to the *Troy* Ounce, is preciſely as 51 : 56; and by this the *Roman* Pound will conſiſt of $5245\frac{1}{2}$ Grains *Troy*, which is $4\frac{1}{2}$ Grains leſs in the Pound; and, if it be a Miſtake, is a very conſiderable one. The *Denarius*, according to *Arbuthnot*'s Suppoſition, will come out $62\frac{11}{13}$ Grains. The Fraction is not to be neglected in reckoning the Pound. This makes it highly probable, that the *Romans* left their Ounce in *Britain*, which is now our *Averdupois* Ounce; for our *Troy* Ounce we had elſewhere.

That the *Denarius* was the ſeventh Part of the *Roman* Ounce, is clear from Multitudes of Paſſages. *Celſus, Lib.* 5. *Cap.* 17. *Sed & antea ſcire volo in uncia pondus denariorum eſſe ſeptem.*

Another Way that Mr. *Greaves* made uſe of to find the Weight of the *Denarii* was, by the Weight of *Greek* Coins, eſpecially *Attic Tetradrachms*; for the *Denarius* was always reckon'd equal to the *Drachm*: But thoſe Experiments bring out the *Denarius* heavier; for, weighing many *Attic Tetradrachms*, with the Image of *Pallas* on the fore Part, and of the *Noctua* on the Reverſe, he found the beſt of thoſe to be 268 Grains; that is, each particular *Drachma* 67 Grains, and from the Golden *Didrachms* much the ſame. He mentions one from *Snellius*, that weighed 134,5 of our *Troy* Grains, which makes it $67\frac{1}{4}$. That the antient *Roman Denarius* and *Attic Drachma* were reckon'd equal, appears partly from what has been obſerved before; and further from the Teſtimony of *Pliny*, who lived from the time of *Veſpaſian* to that of *Trajan*, who affirms expreſly, that the *Drachma Attica* had the Weight of the Silver *Denarius. Cleopatra* affirms, that the *Italic Denarius* was one *Drachm. Cicero*, naming the *Donative* of *Octavius* to the veteran Soldiers, call'd it 500 *Denarii*; and *Dion* calls the ſame 500 *Drachms. Galen* ſaith, that by a *Drachm* is meant the ſame Weight the *Romans* call a *Denarius.* This is plain from an Interpretation of *Aulus Gellius. Plutarch* computes the Sums which the *Romans* expreſs by *Seſtertii*, in *Drachms*, at 4 *Seſtertii* to the *Drachm*, that is, the Number of *Seſtertii* in the *Denarius. Strabo* ſaith, that, in the Siege of *Caſilinum*, a Mouſe was ſold for 200 *Drachms*; this *Valerius Maximus* tranſlates 200 *Denarii. Athenæus* ſaith, that 400 *Attic Talents* make 240 *Myriads* of *Denarii*, that is, 2,400,000 *Denarii*, = 400 *Talents*, or one *Talent* = 6000 *Denarii*, the Number of *Attic Drachms* in a *Talent. Feſtus Pompeius* ſaith in expreſs Terms, that an *Attic Talent* contains 6000 *Denarii.* The ſame appears by comparing *Livy* with *Polybius.*

Arbuthnot has been the more copious in Quotations upon this Subject, to ſhew the general Conſent of Authors, of all Ages and Times, in the Equality of Value of the *Attic Drachm*, and *Roman Denarius.* And it would bring in a great Confuſion to change that Way of reckoning; but then the Difficulty is, how to preſerve the Equality between two Coins, which appear ſo different in Weight as 62 and 67 Grains.

Arbuthnot, in the firſt Place, gives you *Greaves*'s Solution of this Difficulty, in his own Words; which are, firſt, "That "the *Denarius* and *Attic Drachm* being diſtinct Coins of "different States, and not much unequal in the true Weight, "it is no Wonder, eſpecially in *Italy*, and in the *Roman* Domi- "nions, that they ſhould paſs one for another, no more than that "the *Spaniſh Rials*, in our Sea-towns in *England*, ſhould paſs

"for

" for *Teſtars*, or the Quarter of the *Dolar* be exchang'd for " our Shillings; whereas the *Rial*, in the intrinſical Valua- " tion, is better than our *Teſtar*, by four Grains and ſome- " what more; and the Quarter of the *Dolar* is better than " our Shilling by more than eight Grains, or a Peny: But, " becauſe they want the Valuation, Character, and Impreſ- " ſion of our Princes, which I call the *Extrinſic* of Coins, " therefore doth the *Spaniſh* Money fall from its true Value " with us, and ſo would ours do in *Spain*. By the ſame Ana- " logy muſt we conceive the *Attic Drachms*, tho', in the " intrinſic, they were ſomewhat better worth than the *Dena-* " *rius*. And this ſeems to be implied by *Voluſius Metianus*: " *Victoriatus nunc tantundem valet, quantum quinarius olim.* " *At peregrinus nummus loco mercis, ut nunc Tetradrachmum &* " *Drachma, habebatur*; which Words of his, *loco mercis*, " plainly ſhew they made ſome Gain of the *Tetradrachmum* " and *Drachma*, as our Merchants and Goldſmiths do of the " *Spaniſh Rials*, and Quarters of a *Dolar*, which they could " not, if they were preciſely equal, but muſt rather be Loſers " in the melting or new coining of them: And therefore all " modern Writers, that have treated of this Argument, (ſome " of them making the *Drachma* leſs than the *Denarius*, others " equal, but none greater) have been deceived by a double " Paralogiſm, in ſtanding too nicely upon the bare Words of " the Antients, without carefully examining the Things them- " ſelves: Firſt, in making the *Denarius* and *Attic Drachm* " preciſely equal; becauſe all antient Authors generally expreſs " the *Attic Drachm* by the *Denarius*, or the *Denarius* by the " *Drachm*; either becauſe, in ordinary Commerce, and vulgar " Eſtimation, they paſſed one for another in the *Roman* State; " or elſe, if any were ſo curious to obſerve their Difference, " as ſurely the κολλυβισταὶ were; yet, by reaſon of their Near- " neſs, and to avoid Fractions, and having no other " Names for their Coins, that were preciſely equal, whereby to " render them, therefore all *Greek* and *Latin* Authors mu- " tually uſed one for the other. And, ſecondly, becauſe ſome " Writers, as *Dioſcorides* and *Cleopatra*, affirm that the " *Roman* Ounce contained eight *Drachms*; therefore modern " Authors infer, that the *Denarius* being equal to the " *Drachm*, and eight *Drachms* being in the *Roman* Ounce, " (as ſo many were in the *Attic*) that therefore there are eight " *Denarii* in the *Roman*, and conſequently that the *Roman* " and *Attic* Ounces are equal: Whereas *Celſus*, *Scribonius* " *Largus*, and *Pliny*, expreſly write, that the *Roman* Ounce " contain'd, in their Time, (which was after *Dioſcorides*) " ſeven *Denarii*; and, being natural *Romans*, and purpoſely " mentioning the Proportion of the *Denarius* to the Ounce, " thereby the better to regulate their Doſes in Phyſic, it is not " probable but they muſt better have known it than the *Gre-* " *cians*." But *Arbuthnot* ſeems to be afraid this Solution will not be ſufficient to anſwer about 5 *per Cent.* Difference in the Value of the Coins. If an *Attic Drachm* of 67 Grains paſſed for a *Roman Denarius* of 62, the Exchange muſt have been very much on the *Roman* Side.

The learned Biſhop *Hooper*'s ingenious *Inquiry into the State of antient Meaſures* has given a great many new Lights into this intricate Subject; and, perhaps, what he ſuggeſts may be an Anſwer to this Difficulty: His Words are as follows, *pag.* 44. " So is the Proportion, as well of the *Attic* Weight, as " of their Coin, well known; but the Value of each Piece " not ſo well aſcertain'd as one could wiſh: For the *Drachma*, " from whence all their Money is beſt eſtimated, and which " is alſo the principal Weight, is very differently ſtated. Our " accurate Mr. *Greaves*, upon the weighing of many *Attic* " *Tetradrachms*, found ſome (the beſt, he ſaith) of 268 " Grains, which give 67 for the *Drachma*: And, examining " the Golden *Didrachms*, coined after the Example of the " old *Darici*, by *Philip* and *Alexander*, as he mentions one of " each from *Snellius*, which weighed 134,5 of our Grains; " ſo he ſpecifies three of *Alexander*'s, which he had ſeen, that " wanted but half a Grain of 134, or twice 67 Grains. Such " too Dr. *Bernard* met with; but more commonly with thoſe " of 66 to the *Drachma*. The Generality of elder Coins that " remain give it at 65 Grains, ſome *Arabian* Phyſicians at " 64,28; and it is certain, that, in the time of the firſt " *Roman* Emperors, it came to be under 63 Grains, and not very " long afterwards to be under 55, and thus to be $\frac{1}{8}$ of a *Roman* " Ounce. Thus did the Money *Drachma*, in Proceſs of Time, " decreaſe, as is found by the Trial of a Balance, and will " appear by the Teſtimony of old Authors, comparing them " with the *Roman* Weight and Money. But, all the while, " we may ſuppoſe the ponderal *Drachm* to have continued the " ſame, juſt as it happen'd to us, as well as our Neighbours, " whoſe ponderal *Libra* remains as it was, tho' the nummary " hath much decreaſed."

And, *pag.* 55. " This gradual Decreaſe, the ſucceeding " Coins of the ſeveral Ages ſhew us: And it may be conve- " nient, therefore, for the Reduction of their Money to ours, " to form different Tables for them: To one, for Example, " after *Solon*'s Standard; which may ſerve, with ſome little " Allowance, till the Days of *Alexander*: Another, more " ſuited to the Times that follow'd, unto the Subjection of " the *Greeks* to the *Romans*, and at the Rate of 65 Grains, " or thereabouts, to the *Drachma*: And a third of 92,57; " which was equal, as we ſhall find, to the *Denarii* of that " Weight under the firſt *Roman* Emperors; and had been " equal, as I ſhall ſuppoſe, for ſome conſiderable time " before."

Mr. *Greaves* is of Opinion, that the Alteration mention'd by *Pliny*, in that forecited Paſſage, *Lib.* 30. *Cap.* 3. of the *Denarius* being ordered to paſs for 16 inſtead of 10 *Aſſes*, continued from the firſt Inſtitution of it, in the ſecond Punic War, without any Interruption, to *Juſtinian*'s time; but this Opinion is contrary to the whole claſſical Style, in which a *Denarius*, 4 *Nummi Seſtertii*, and 10 *Aſſes*, are Terms equivalent, and denote the ſame Sums. To change that Way of reckoning, would be to introduce nothing but Confuſion: It is not credible, that the Writers expreſſed the Valuation of the *Denarius* according to its firſt Inſtitution, without regard to the preſent Valuation.

He is ſurpris'd at the ſtrange and unadviſed Proportion betwixt the Braſs and Silver Monies of the firſt Times; that X Pounds of Braſs ſhould be but anſwerable to the 84th Part (for ſo much, or near it, was the *Denarius*) of a Pound of Silver; or, to ſpeak more clearly, that one Pound of Silver ſhould be equal in Valuation to 840 Pounds of Braſs.

I am of Opinion, that, tho' *Pliny* gives you the true Matter of Fact, he aſſigns a falſe Reaſon for it; for he ſeems to attribute the Cauſe of the Diminution of the Weight of the *Aſſes* to the Neceſſities of the Commonwealth, whereas it was undoubtedly the Change of the Balance of the two Metals of Braſs and Silver; and, for that Reaſon, the Commonwealth gradually reduced the Weight of their *Aſſes*, finding the former Proportions too high.

Another Method which Mr. *Greaves* takes to determine the Weight of the *Denarius*, and the gradual Diminution of it, is by the Weight of ſeveral *Aurei*; it being probable, that, as the *Athenians* made their χρυσοῦς or *Aurei* double in Weight to the Silver *Drachma*, ſo, in Imitation of them, the *Romans* made their *Aureus* double in Weight to the *Denarius*; from whence it is concluded, that the *Aureus Romanus* falling in its Weight, the *Denarius* likewiſe, of Neceſſity, muſt fall. In what manner the *Aureus* was firſt coined, and how afterwards it loſt of its primitive Weight, *Pliny* informs us, *Lib.* 33. *Cap.* 3. *Aureus nummus poſt annum* LXII. *percuſſus eſt quam argenteus, ita ut ſcrupulum valeret Seſtertiis vicenis, quod efficit in libras ratione Seſtertiorum, qui tunc erant, Seſtertios* IↃCCCC. *Poſt hæc placuit* XL. M *ſignari ex auri libris; paulatimque principes imminuere pondus, imminuiſſe vero ad* XLV. M. This Paſſage is corrected by *Greaves*, after the following Manner: *Poſtea placuit* X. XL. *ſignari ex auri libris, paulatimque Principes imminuere pondus, imminuiſſe vero ad* XLVIII.

It is to be obſerved, that *Pliny*, who mentions the Diminution of the Weight of the *Aurei* ſo nicely as to ſpecify the exact Proportions, ſays nothing of the Diminution of the Weight of the *Denarius*: I therefore think it is not perfectly evident, that the *Denarius* kept Pace with it, altho' it is generally agreed, that the *Denarius* fell from $\frac{1}{7}$ to $\frac{1}{8}$ of an Ounce; and the accurate Biſhop of *Bath* and *Wells* has made two different Tables for the Reduction of them to our Standard. But the *Denarius* of the claſſical Authors, which is allow'd to be the ſeventh Part of an Ounce, is made uſe of in the Computations of the *Roman* Money.

The Subdiviſions of the *Denarius* were, the *Quinarius*, or *Half-denarius*, ſo called from its Value of five *Aſſes*; the *Half-denarius* was likewiſe call'd *Victoriatus*.

Celſus divided the *Denarius* into ſix Parts, which he call'd *Unciæ*, *Uncia* being a general Word for the Diviſion of any Integer. This was done in Imitation of the *Greek* Phyſicians, who, after the manner of their Country, divided their *Drachma* into 6 *Oboli*.

The Stamp of the *Denarius* was the Image of the Conſul or Prince under whom it was coined; which is plain from thoſe now extant, and Paſſages of Authors.

The Inſcription commonly expreſs'd the Name of the Prince, and the Occaſion of the coining it.

The common Mark of the *Denarius* was an X, or ✠, in Imitation of which, among the *Latin* Phyſicians, it grew to an ✱ The *Greeks* uſed the Word Δηνάριον in the neutral Gender. *Arbuthnot of Weights*, &c.

DENDE. The Oriental Name for a Species of *Ricinus*, call'd alſo ABELMOLUCH.

DENDROIDES. A Name for Plants, which grow like Trees. Arboreſcent. *Blancard.*

DENDROLIBANUS. Roſemary. *Blancard.*

DENDROMALACHE. A Name for the *Malva arboreſcens*, a large Species of Mallows. *Blancard.*

DENDRON, Δένδρον. A Tree.

DENEQUAT. Borax. *Rulandus.*

DENODATIO. Diſſolution.

DENS. A Tooth.

Whoever has been afflicted ſeverely with the Tooth-ach, will think this an Article of ſome Importance; for which Reaſon I ſhall give their Anatomy, Diſeaſes, and Methods of Cure; having firſt ſpecify'd ſome Plants which are call'd by the Name of *Dens* among Botaniſts.

DENS CABALLINUS is the HYOSCYAMUS.

DENS CANINUS is a Name given to ſeveral Species of the *Panicum*; which ſee.

DENS CANIS.

The Characters are,

The Flower is ſhap'd like a Lily, hexapetalous, with long reflected Petals, naked, pendulous, and but one on a Stalk. The Fruit is roundiſh, and full of oblong Seeds; the Root is fleſhy, and ſhap'd like a Dog's Tooth; and the Leaves are like thoſe of the Cyclamen.

Boerhaave mentions five Species of this Plant; which are,

1. Dens Canis; latiore, rotundioreque, folio; flore candido. *C. B. P.* 87. *Var.* THE BROAD ROUND-LEAV'D DOG'S-TOOTH, WITH A WHITE FLOWER.

2. Dens Canis; anguſtiore, longioreque folio. *C. B. P.* 87.

3. Dens Canis; anguſtiore; longioreque; folio; flore ex albo purpuraſcente, minore.

4. Dens Canis; anguſtiore, longioreque, folio; flore ſuave-rubente. *H. R. Par.* LONG NARROW-LEAV'D DOG'S-TOOTH, WITH A FINE RED FLOWER.

5. Dens Canis; latiore, rotundioreque, folio; flore ex purpurâ rubente, majore. *C. B. P.* 87. *Var.* BROAD ROUND-LEAV'D DOG'S-TOOTH, WITH A LARGE PURPLISH RED FLOWER. *Boerh. Ind. alt. Plant. Vol.* 2.

Cluſius was told, that the Women in *Styria* uſe to ſprinkle the Flower of the dry'd Root of the firſt Species in their Childrens Pap, to kill and expel the ſmall Worms of the Belly. Drank in Wine, it is an approv'd Remedy for the Colic, and is found to be nutritive, and to reſtore loſt Strength; and, taken in Water, it cures Children of the Epilepſy.

Lobel informs us, that its hot and humid Subſtance, attended with ſomewhat of Acrimony, is a potent Provocative to Venery: Hence ſome take it for the *Satyrium Erythronium* of *Dioſcorides*, but erroneouſly, in *Parkinſon*'s Opinion, who will have the *Tulipa* to be the *Satyrium Erythronium*. *Ray*.

DENS LEONIS.

The Characters are,

It agrees, in all reſpects, with the Hawk-weed; but only in its having a ſingle naked Stalk, with one Flower upon the Top, whereas the Hawk-weed hath branching Stalks: To which may be added, the Flowers are for the moſt part fiſtulous or piped.

Boerhaave mentions twelve Species of this Plant, which are,

1. Dens Leonis; latiore folio. *C. B.* 226. *Tourn. Inſt.* 468. *Boerh. Ind. A.* 88. *Dill. Cat.* 50. *Buxb.* 96. *Dens Leonis, Taraxacum*, Offic. *Dens Leonis*, Ger. 228. Emac. 290. Raii Hiſt. 1. 244. Synop. 76. *Dens Leonis vulgaris*, Park. 780. Hiſt. Oxon. 3. 74. *Hedypnois ſive Dens Leonis, Fuchſii*, J. B. 2. 1035. *Sive Dens Leonis*, Chab. 323. DANDELION.

The Leaves of Dandelion are of a yellowiſh green Colour, ſmooth, and of four or five Inches in Length, to one of Breadth, cut into ſeveral Jags, which end in ſharp or Tooth-like Points. The Flowers grow upon round ſingle hollow Pipes or Stalks, compos'd of a great Number of ſlender, flat, yellow Petala, inclos'd in a green Calyx. This Seed is long and narrow, ſet about the Head in a globular Form, with a Tuft of long Down at the End, by which it is eaſily wafted about by the Wind from Place to Place. The Root is about a Finger thick, long and whitiſh within, and full of a bitteriſh Milk, as is the reſt of the Plant. It grows every-where in the Fields and Meadows, flowering the greateſt Part of the Year. The Roots and Leaves are uſed.

Dandelion is cooling and aperitive, good to cleanſe the Kidneys and Bladder, and to provoke Urine; it is boil'd in Poſſet-drink, and frequently us'd in all kinds of Fevers: The Leaves, beaten to a Cataplaſm, are likewiſe applied to the Wriſts in the ſame Diſtempers. *Parkinſon* commends a Decoction of the Leaves and Roots in Wine or Broth for a Conſumption, or any ill Habit of Body. The young Leaves, when they juſt appear above Ground, and are white and tender, are much coveted by many as a Sallad, early in the Spring. *Miller's Bot. Off.*

Its Leaves are very bitter, and give a faint Tincture of red to blue Paper; the Roots give it a much deeper; they are bitter, ſtyptic, and deterſive: Its Salt very much reſembles that which *Mullerus* has called *Terra foliata Tartari*; but, in the Dandelion, this Salt is much more acid in the Roots than in the Leaves, and is united in all theſe Parts with a great deal of Oil and Earth.

Thus this Plant is aperitive, diuretic, vulnerary, and febrifugous. *Tragus* preſcribes the Water of it in internal Inflammations. *Barbette* adviſes to take the Juice of it. It purges the Blood by Urine: The Juice is ſucceſsfully uſed in a Nephritic Colic, and Retention of Urine: The Leaves of Dandelion are eaten as a Sallad, with Oil and Sugar. To abate a violent Cough, and cure Rheums, they boil, Morning and Evening, a Quarter of a Pint of Cows Milk, and pour upon it an equal Quantity of the Decoction of Dandelion, boiling hot, and a little Sugar-candy: Its Extract is given from half a Dram to a Dram and a half: The Ptiſan of its Roots cools, provokes Urine, and is good for all Sorts of Fevers. *Martyn's Tournefort.*

2. Dens Leonis; anguſtiore folio. *C. B. P.* 126. *M. H.* 3. 75. *Aphaca, anguſtioris folii.* Cæſalp. 508.

This Species ſeems to be but a Variety of the former, which varies in the Bigneſs and Inciſure of its Leaves. *Martyn's Tournefort.*

3. Dens Leonis; Græcus; foliis Eryſimi craſſis et lucentibus. *T. Cor.* 35. *a.*

4. Dens Leonis; Monſpelienſium; Aſphodeli bulbillis. *Lob. Adv.* 83. *Obſ.* 117.

5. Dens Leonis; minimus; aſper. *T.* 469. *Hieracium, pumilum, ſaxatile, aſperum, radice præmorſa.* C. B. Prodr. 66. a.

6. Dens Leonis; ſubaſper; parvo flore. *Hieracium, dentis Leonis folio, monoclonum, ſubaſperum. C. B. P.* 127.

7. Dens Leonis; aſper; minor. *Hieracium, dentis Leonis folio, hirſutie aſperum, magis laciniatum.* C. B. P. 127. *Hieracium, dentis Leonis folio, hirſutie aſperum, minus.* C. B. Prodr. 63. 1. Ic. & Deſcr.

8. Dens Leonis; qui Piloſella Officinarum. *Tourn. Inſt.* 469. *Boerh. Ind. A.* 89. *Auricula muris, Piloſella*, Offic. Chab. 323. *Piloſella repens*, Ger. 513. Emac. 638. Raii Hiſt. 1. 242. Synop. 75. *Piloſella minor vulgaris repens*, Park. 689. *Piloſella major, repens hirſuta*, C. B. 262. Dill. Cat. 83. Buxb. 262. Dill. Cat. 83. Buxb. 260. *Piloſella majori flore, ſive vulgaris repens*, J. B. 2. 1039. *Piloſella monoclonos repens vulgaris minor*, Hiſt. Oxon. 3. 77. COMMON MOUSE-EAR.

This is a low creeping Plant, ſending from a ſmall ſtringy Root, ſeveral trailing Branches lying on the Ground, and ſhooting out Fibres from the Joints, by which it takes Root in the Earth. The Leaves grow alternately on the Stalks, of an oval Form, about an Inch long, and half ſo much broad, ſharp-pointed, green above, and whitiſh underneath, cover'd thick with ſtiff, long, brown Hairs: The Flowers ſtand upon Foot-ſtalks, four or five Inches long, of the Shape of *Dandelion*, but ſmaller, of a whitiſh yellow Colour above, with ſeveral purpliſh Streaks underneath: The Stalks, when broken, emit a whitiſh Milk, in a ſmall Quantity. The Flowers paſs away in a white Down, in which lies ſmall long Seed. It grows every-where upon Heaths and Commons, and flowers moſt Part of the Summer.

Mouſe-ear is of a bitteriſh ſtyptic Taſte, and is accounted to be drying and binding, and a good vulnerary Herb, and helpful for all Sorts of Fluxes: A Decoction of it, uſed as a Gargariſm, is commended for Ulcers in the Mouth. Dr. *Huſſe* made uſe of the Juice of Mouſe-ear, as a Remedy againſt the *Herpes miliaris*, or Shingles. *Ray*'s Catalogue.

In the old *Diſpenſatories*, there was a Syrup that took its Name from this Plant, which is now out of Uſe, and therefore left out in the new. *Miller's Bot. Off.*

This Plant is very bitter, and reddens blue Paper a little. By the chymical Analyſis, beſide ſeveral acid Liquors, it yields a good deal of Oil and Earth, a little urinous Spirit, and no concreted volatile Salt; which ſhews it to contain a Salt approaching to that of Alum, wrapped up in a good deal of Sulphur, and mixt with a little Sal Armoniac. Thus the Mouſe-ear is vulnerary and deterſive. *Tragus* affirms, that the Infuſion of it in Wine or Water, with a little Sugar, is good for the Jaundice, and to prevent the Dropſy. *Tabernæmontanus* ſays, the *Piloſella* is a Specific for Ruptures. The Extract of it is uſed for internal Ulcers and a Phthiſis. *Pena* and *Lobel* thought it to be admirable for the Stone: They affirm'd that Blades of Knives, quenched in the Juice or Decoction of Mouſe-ear, would cut Iron or Stone without blunting. *Martyn's Tournefort.*

9. Dens Leonis; præmorſâ radice; major. *Hieracium, nigrum, præmorſâ radice, majus.* C. B. P. Var. 128.

10. Dens Leonis; folio Cichorei glabro; ſeminis pappo rigido, flavo.

11. Dens Leonis; foliis Eryſimi vulgaris. *T. C.* 35. *Taraxacon humile.* Bocc. Muſ. Tab. 106. a.

12. Dens Leonis; minor; foliis radiatis. *C. B. P.* 126. *Prodr.* 62. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 88.

This Plant is of a drying, attracting, and purifying Nature: It is good for Wounds, whether external or internal: It alſo cleanſes and heals Ulcers and Wounds of the Head: It ſtops Fluxes, Dyſenteries, Vomitings of Blood, Bleedings at the Noſe, and too plentiful Diſcharges of the Menſes: It is excellent for the Breaſt and Lungs, cures the Jaundice and

Conſumption, diſſolves the Stone in the Bladder and Kidneys, and carries off Inflammations of the Spleen. *P. Poter. Pharm. Spag. L.* 1. *S.* 1. *C.* 2. A Decoction of it, drank for forty Days, is a ſovereign Remedy in obſtinate Itches. *Jul. Cæſ. Claud. Conſil. Med.* 47. The Country People boil it in Ale, which they drink, when they are indiſpos'd. The Powder of the Root, and of the Herb itſelf, is an admirable Remedy for the Ruptures of Children, if a little of it is given them every Day in their Food. See *Malach. Geſer. Delegraph. C.* 6. *K. Sennert. Tract. de inf. Cur. p.* 2. *C.* 24. This Herb, when boil'd in ſmall Beer, proves an excellent Remedy for the Tooth-ach, by waſhing the Mouth with it. If boil'd in Wine, it ſpeedily cures Ulcers of the Mouth, *Joh. Heurn. Meth. ad Prax. L.* 1. *p.* 125. The Herb, when bruis'd and apply'd by way of Cataplaſm, cures Runnings and Exulcerations of the Ears: The Juice is alſo excellent in Pains of the Ears. The Herb, reduc'd to Powder, and ſnuff'd up the Noſtrils, ſtops Diſcharges of Blood from the Noſe; and, if laid upon Wounds, ſtops Hæmorrhages. *Joh. Hocker. Prax. Aur. L.* 1. *Cap.* 17. The Water, diſtil'd from the Fruit, is good for Conſumptions, diminiſhes preternatural Heats, cures Vomiting of Blood, ſtops the exceſſive Diſcharges of the Menſes, and is good in Dyſenteries and the Jaundice. It alſo kills Worms. *Barthol. Zorn. Botanolog.*

Of the TEETH.

As every Part of the human Body loudly proclaims the ineffable Wiſdom, and diffuſive Goodneſs, of its glorious Architect and Contriver; ſo alſo the Teeth, their exquiſite Order, and curious Structure, are ſo many Proofs, richly pregnant with irrefragable Arguments for the ſtupendous and amazing Power of the Venerable Being, who form'd them. The firſt memorable Circumſtance which occurs with reſpect to the Nature of theſe Subſtances, is, that in Hardneſs, and a durable Texture, they far ſurpaſs all the other Parts of the Body. Hence, according to *Tertullian*, in his Treatiſe *de Reſurrectione*, the miſtaken Piety of the Antients induc'd them to bury the Teeth in the Earth, ſince they remain'd ſound for ſeveral Hundreds or Thouſands of Years; and their Deſign, in this Practice, was to render the Body entire at the Reſurrection. When we reflect upon the beautiful Order and Diſpoſition with which they are rang'd in the Extremities of both Maxillæ, or Jaw-bones, we cannot fail to be ſtruck with awful Impreſſions of the exquiſite Skill and ſuperior Contrivance, with which they are form'd; for they are ſo ſituated, that the ſuperior and inferior Rows are indeed capable of being join'd, tho' not all at one and the ſame time, that by this means the Actions of Inciſion and Maſtication may be varied at Pleaſure; for, when the *Dentes molares* are join'd, the anterior Teeth of the ſuperior Row project beyond, and partly cover their correſponding Teeth of the inferior Row: But when the Extremities, or Points of the anterior Teeth are join'd, the *Dentes molares* remain at a Diſtance from each other; by which means they enjoy Reſt, and are ſubjected to Action reciprocally, and by turns. This ſurpriſing Inſtance of Art and Deſign long ago appear'd to *Galen*, as we learn from his Treatiſe *de Oſſibus*, abundantly ſufficient to refute thoſe ludicrous Calumniators of Nature, who aſcribe the moſt curious of her Productions to a caſual and fortuitous Concourſe of Atoms. Without this Mill, as it may be call'd, of the Microcoſm, a due Maſtication, which, as *Helmont* excellently obſerves, in his Treatiſe *de Victus Ratione*, greatly contributes to the Preſervation of Life, cannot be perform'd. We ſhall therefore, at preſent, conſider their Nature and Structure, their Connection and Uſe, the ſeveral Cauſes by which they are injur'd, and the various Medicines accommodated to remove the Misfortunes and Indiſpoſitions to which they are ſubject.

Omitting, therefore, too minute and prolix Diſquiſitions with reſpect to the Name, we ſhall only obſerve, that in former Ages they were call'd *Dentes*, as it were, from *Edentes*. The Teeth, then, are bony Parts of the Body, conſiſting of two Subſtances; the one intenſely hard, and as it were of a ſtony Texture; and the other ſofter, but alſo of a bony Nature. Internally they are furniſh'd with a certain Cavity; they are fix'd into the Sockets of the Maxillæ, by that particular Species of Articulation, call'd *Gomphoſis*; and are deſtin'd for the Purpoſes of Maſtication, Articulation of the Voice, and Ornament. Firſt, then, we are to obſerve, that the Teeth conſiſt of two Subſtances, the exterior of which is highly hard like a Stone, tho' it does not partake of a ſtony Nature; as is obvious from putting an entire human Tooth into a ſufficient Quantity of Aqua-fortis, for ſome Hours, by which it is entirely diſſolv'd, whilſt there remains a very ſmall Quantity of a glutinous Subſtance, which ſeems to be a ſulphureous and ſomewhat pinguious Portion of the Teeth. If to the Solution, when ſufficiently ſaturated, we add Oil of Tartar *per Deliquium*, there is produc'd a highly white Magiſtery, in medicinal Virtues agreeing with that prepar'd from the Boar's Teeth, or the Elk's Hoof. But ſuch a chymical Solution cannot be produc'd with reſpect to Flints, and genuine Stones. The exterior Subſtance, however, of the Teeth is ſo hard and ſolid, that, by a violent Attrition or Concuſſion with Iron, it emits large Quantities of Sparkles. But this only holds true, with reſpect to the Dentes molares of the larger Animals, which are capable of making a conſiderable Reſiſtance: This hard and ſtony Part of the Teeth is only obſerv'd in thoſe Portions of them, which lie without the Sockets of the Gums; and, like a Bark or Covering, ſurround the bony Part of the Teeth; for the Roots of the Teeth, which are conceal'd in the Sockets and Gums, are only of a bony Nature, and, conſequently, of a Colour not ſo white and ſplendent, as the external Part which is uncover'd. But the external Part is the hardeſt, not only that, it may be Proof againſt Wounds and Injuries, but alſo that it may be the better qualified for inciding and breaking the Aliments. The interior bony Matter, on account of the greater Laxity of its Pores, is more eaſily diſſolv'd and conſum'd. Hence 'tis cover'd with an external harder Bark, leſt, perhaps, ſome of the more acrid and corroſive Parts of the Aliments ſhould injure or deſtroy it. This internal Subſtance of the Teeth is the Part principally affected in a Caries; for the external Covering is rarely ſeen totally, but only partially conſum'd. Beſides, the Structure of the external ſtony Covering of the Teeth differs from that of the internal Part; for, in the former, the Striæ or Furrows terminate obliquely in ſmall Circles: But the interior, ſofter, and principal Part of the Teeth conſiſts of ſeveral Layers of Fibres, longitudinally laid over each other. When a Reſolution is made by a long Maceration of the Bones, theſe Layers become ſufficiently conſpicuous; for the bony reticular Plates may by this means be ſeparated entire.

Above, we have obſerv'd, that a certain Cavity is found in the Teeth, which is ſufficiently conſpicuous when a Tooth is cut longitudinally in the Middle; on which Occaſion we obſerve, that all the Roots of the Teeth are furniſh'd with their peculiar Cavity, which is very conſiderable in the Baſe of the Tooth itſelf, or that Part of it which appears without the Gums; for, in the Cavities of the Teeth of every Animal, there is always found a certain mucous, membranaceous Subſtance, or a certain ſmall mucous Cord, in the Form of an oblong Bladder, compos'd of highly ſlender Blood-veſſels, nervous Membranes, and a certain glutinous Subſtance. This alſo reaches to the very Extremities of the Teeth; where its Membranes being more contracted, it appears ſomewhat harder and redder. In Fœtuſes and Children, this Cavity is ſufficiently large; and, according to *Euſtachius*, in his Treatiſe *de Dentibus*, divided till the ſeventh Year of their Age, like Honey-combs; but it is ſmaller in Adults. In Children, this Cavity is fill'd with a mucous Matter, ſurrounded with a Membrane, whoſe external Surface is reddiſh, but internally it appears more white; and the Mucus itſelf, being the genuine Nouriſhment of the Teeth, is, at laſt, converted into their Subſtance; for we obſerve, that the more ſolid and firm the Subſtance of the Teeth becomes, as in Adults, the ſmaller Quantity of this Mucus is found; whereas in Infants, whoſe Teeth conſiſt of ſmall and tender Laminæ, a larger Quantity of it is obſervable. In the Teeth of Calves, eſpecially what is call'd the *Sweet Tooth*, this Matter may be commodiouſly ſeen with the naked Eye. In its Surface ſome Traces of Blood diſcover themſelves by a reddiſh Colour; and, when the mucous Matter is compreſs'd, it actually diſcharges Blood.

It is of great Importance carefully to inveſtigate the Formation and Generation of the Teeth. Firſt, then, we muſt obſerve, that all Teeth, as well as the other Parts of the Body, have their Rudiments, and are form'd in the Womb; for the Evidence of Senſe muſt, in this Caſe, as well as all others, be ſuperior to the imaginary Force of any Arguments that can be brought to the contrary. *Euſtachius*, in his Treatiſe *de Dentibus*, informs us, that upon dividing the Jaw-bones, not only of Abortives, but alſo of Children brought into the World at the due Period, he found the *Dentes inciſores*, the *Canini*, and the three *Molares* as yet ſoft, diſtinguiſh'd by a ſmall bony Interſtice, and each having a mucous and tenacious Follicle, perforated at its Extremity, from which the Tooth proceeds. When theſe are ſkilfully ſeparated, another ſmall and latent Order of Teeth appears, which is, as it were, a Reſerve of another Set, to ſucceed the Row which firſt appears, and is afterwards ſhed; and *Veſalius*, in the eleventh Chapter of his firſt Book *de Corpore humano*, affirms, that he has found the *Dentes Sapientiæ* in Perſons who have died before theſe Teeth appear'd. *Columbus*, alſo, in the tenth Chapter of his firſt Book informs us, that in Abortives of ſeven or eight Months, as alſo in new-born Children, he found the ſeveral Teeth contain'd in their reſpective Sockets. From what has been ſaid, 'tis obvious, that no new Teeth are produc'd upon the Shedding of the old; but that ſuch as were before latent and conceal'd, appear in their ſtead. Hence it happens, that Men advanc'd in Years have Teeth appearing

ſometimes

ſometimes with a very intenſe Pain, and ſometimes with none at all. It is remarkable, that in Fœtuſes the *Dentes inciſores* are, more conſpicuouſly than the reſt, furniſh'd with a white and pretty ſolid Lamina; the *Dentes Canini* with one more ſlender, and leſs ſolid; and the *Molares* with one, which is highly ſlender, and almoſt cartaceous. For this Reaſon it is not to be wonder'd at, if ſome have their complete Number of Teeth ſooner than others; and if they are diſtinguiſh'd, in the Order of their Appearance, in the ſame Manner with their Rudiments, whilſt inclos'd in the Womb. But generally the *Dentes inciſores* appear firſt, ſometimes in the ſeventh, ſometimes in the tenth, and ſometimes after the twelfth Month; the *Dentes Canini* in the ninth or tenth Month; and the *Maxillares* ſome time or other, either in the firſt or ſecond Year. Sometimes, alſo, the inferior Teeth appear ſooner than the ſuperior; and, at other times, the latter ſooner than the former. Ten generally are ſhed of each Jaw-bone, about the fourth, fifth, or ſixth Year; that is, the *Dentes Inciſores*, the two *Dentes Canini*, and the four *Dentes Maxillares*: But the ſucceeding Teeth generally appear, either about the ſeventh or the fourteenth Year.

We have already obſerv'd, that the Matter, which ſupplies the Teeth with Nouriſhment, is of a mucous Nature. This Matter is found not only in the Teeth of Children, but more conſpicuouſly in thoſe of Fœtuſes and Abortives; in which three Parts occur, that is, firſt, A membranous, or rather a mucous Follicle, including the whole Tooth, without Difficulty ſeparated from it, and perforated at the Baſe, as well as the Root. Secondly, The Root, which is mucous, pellucid, abounding with Veſſels, diſcharging Drops of Blood, when compreſs'd, furniſh'd with a conſiderable Cavity, and, in Proceſs of Time, gradually offifying from the Circumference to the Centre; but, in ſuch a Manner, that a ſmall Cavity always remains. Thirdly, The Baſe itſelf, which appears like a white, tender, and excavated Lamina. This mucous and glutinous Matter is the true genuine Nouriſhment of the Teeth, by which they grow, are extended, and acquire a proper Degree of Solidity. That the Solids are produced by the Fluids, is confirm'd by Experience. This is alſo obvious from the moſt ſolid Bones of the Body, which are form'd of the terreſtrial, though fluid, Juices of the Blood; and that, in ſubterraneous Vaults, Stones are form'd of dropping Waters, is a Phenomenon well enough known to the Curious. I myſelf have found by Experiments, that common Water, by the Effuſion of any petrifying Liquor, has a Part of it been indurated, and, in Proceſs of Time, converted into a Stone. In like manner, 'tis not to be doubted, but this mucous Matter, contained in the Teeth, is converted into their bony Subſtance. The chymical Analyſis of the Teeth is an additional Proof of this; for, by *Papin*'s Digeſtor, now much improved, not only all the Bones, but alſo the Teeth, may be ſoften'd and reſolv'd into a gelatinous Juice, whilſt there remains a certain terreſtrial and mucous Subſtance; by which means the Elements or Principles of the Bones may be clearly diſcovered: For, 'tis certain, that theſe, as well as the other Solids, are made up of a terreſtrial, thick, and gelatinous Juice; whereas the ſofter Parts, ſuch as the fibrous, for Inſtance, are form'd of a more fluid and gelatinous Humour, into which all muſcular Fleſh is reſolved in the above-mentioned Machine. The mucous Matter, which nouriſhes the Teeth, is derived from the Blood, and is conveyed through their Pores by ſmall Ramifications of Arteries, ariſing from the external Carotid. We have already obſerved, that this mucous Matter, found in the Teeth, is contained in a pretty ſtrong Membrane, in which there appear Veſſels which bring the Blood to it, and convey it back. But the high red Colour of this Membrane appears moſt conſpicuouſly in the lower Parts of the Cavities of the Teeth of Animals. Hence the Reaſon is obvious, why frequently a bloody Serum drops, or may be ſuck'd, from a carious Tooth; which is an infallible Proof, that the Blood-veſſels penetrate into the Cavities of the Teeth. In my Opinion, therefore, a pellucid lymphatic Juice ouſes through the Pores of the ſmall Arteries, ſtops in the Cavity of the Membrane, and is gradually concreted; becauſe the lymphatic Veſſels, entering the Cavities of the Teeth, according to *Schenckius*, abſorb, and carry back the thinner and more liquid Part, whilſt that which is thicker, and more fit for Concretion, remains, and, by a continued Secretion of its thinner Parts, becomes ſolid; firſt, on the Surface and Circumference; and freſh Juices being pour'd into its Interſtices, it gradually acquires a greater Degree of Solidity; for the bony Parts of the Teeth are nouriſhed by the Juices conveyed through the Pores. We are convinced, that Bones are nouriſhed; becauſe, in Proceſs of Time, Tendons and Cartilages are offified, and the ſoft Bones of Children at laſt become hard. Beſides, the Juice, ouſing from broken Bones, is eaſily concreted, and contributes to the Generation of a Callus. We may therefore affirm, that Bones are not only increaſed to their juſt and ſtated Bulk, but alſo that they are nouriſhed till old Age, by a freſh Acceſſion of nutritive Matter through the Blood-veſſels: And this is the Reaſon why, by an Acceſſion of new Matter, the Teeth of Children, being gradually enlarged, at laſt appear without the Gums. The Teeth are continually nouriſhed and increaſed; otherwiſe they would ſoon be worn away by the Attrition requiſite in Maſtication. They are, therefore, increaſed in proportion as they are worn away by this Attrition. And, when the Teeth are wanting, or fall out, the Juice deſtin'd for their Nutrition is conveyed into the empty Socket, and fills it with a bony Subſtance, the Fleſh of the Gums being at the ſame time render'd harder, that it may, in ſome meaſure, ſupply the Place of the Teeth.

Having thus conſider'd the Generation and Nutrition of the Teeth, it now remains, that we explain in what manner they are poſſeſſed of Senſation, or a Power of Feeling. The Teeth, then, are veſted with this Power, not as they are bony Subſtances, for 'tis abſurd to aſcribe Senſation to Bones ſo hard, that they will ſcarcely yield to the Impreſſions of Fire or Steel, but becauſe, through the minute Pores of the Roots of each Tooth, which, in adult Perſons, are ſcarcely conſpicuous, particularly in the *Inciſores*, and the *Canini*, but ſufficiently obſervable in larger Animals, there are ſmall Nerves, ariſing from the fifth Pair, conveyed. Theſe ſmall Nerves, being wrapt up with the Blood-veſſels by means of a Membrane, run under the Teeth, and enter their Cavities. On account of theſe minute, but highly ſenſible nervous Ramifications, 'tis highly probable, that the Teeth are poſſeſſed of their ſenſitive Faculty. The all-wiſe Author of Nature knew, that, as the Teeth were naked and uncovered, they were frequently expoſed to various Accidents, Corroſions, and Fractures; for which Reaſon, that they might be longer nouriſhed and increaſed, he furniſhed them with Nerves appropriated for an Influx of the Spirits, and, conſequently, for their Accretion and Nutrition. The Nerves diſtributed through the ſuperior and inferior Jaw, and inſerted in the Teeth, ariſe from the fifth Pair; for this Nerve is diſtributed into various Ramifications, the principal of which are, the Ramus Ophthalmicus, which, entering the Orbit of the Eye, diſtributes its ſmall Ramifications to the Tunica Adnata, to the Glandula Lacrymalis, to the Eye-lids, to the Muſcles which draw the Noſe upwards, and to the Muſcles of the Forehead. The thicker and interior Branch of the Ramus Ophthalmicus, by paſſing through a particular Hole in the Orbit, and entering the Cranium, juſt by the Criſta Galli, penetrates the Dura Mater; and then emerging from the Cranium, and paſſing through a Hole in the Os Cribriforme, it enters the Noſe, and is diſtributed through its Membrane. Another maxillary Branch of the fifth Pair, through a third Hole, emerges from the Cranium, conſpicuous in ſeveral ſmall Ramifications; the firſt of which, after it has diſtributed Branches to the Maſſeter Muſcle, to the Fleſh of the Gums, and to the Roots of the Teeth of the upper Jaw, through ſmall Holes, ſufficiently conſpicuous in their poſterior Parts, enters a particular Sinus of the Bone, which conſtitutes the inferior Part of the Orbit: And, as ſoon as it emerges from the Perforation, lying under the Orbit, it is ſometimes divided into three, and ſometimes into four Ramifications, which diſtribute ſmall Branches to the Integuments of both Sides of the Face, to the ſuperior Lip, to the Muſcle which draws the inferior Part of the Noſe to one Side, as alſo to the internal Muſcle of the Noſe. Another Branch, running almoſt directly downwards about the poſterior Region of the Ducts, which go to the Fauces, is divided into two Branches; the ſuperior of which is diſtributed to the Membrana Pituitaria, which lines the internal Parts of the ſphenoidal, ethmoidal, frontal, and maxillary Sinuſes. The inferior Branch, emerging from a peculiar Perforation in the *Os Palati*, paſſes through the ſpongious Fleſh lying under the Oſſa Palati, where, in my Opinion, the ſmall nervous Ramifications enter the anterior Teeth of the ſuperior Jaw. The third maxillary Branch, commonly call'd the *Ramus Inferior*, or *Guſtatorius*, emerges through a fifth Foramen on both Sides, and is divided into three Ramifications; the firſt and interior of which is inſerted into both Sides of the Tongue, a little above its Root; and paſſes through the Middle of the Tongue, and the maxillary Glands. The ſecond Ramification enters a Sinus excavated in the Bone of the lower Jaw, where it ſends off ſeveral nervous Fibres, which penetrate the Roots of the Teeth; and, when this Nerve reaches the Root of the fifth of the *Dentes Molares*, it emerges through a Perforation in the anterior Part of the Jaw-bone, and is diſtributed to the Lip, and its Muſcles. The third Branch of this large Ramification enters the Parotid Glands, and terminates in them. From this Diſtribution, or Ramification, of the fifth Pair, we can eaſily account, why the Teeth ſhould, by Conſent, affect other Parts; and why Medicines, applied to the Noſe, the Temples, and poſterior Part of the inferior Jaw-bone, are of ſingular Efficacy in removing the Tooth-ach.

As to the Number, Bulk, Figure, and Office, of the Teeth, they are generally thirty-two in Number, ſixteen in each Row; but Women have only fourteen, for the moſt part. Nature has bountifully beſtowed on the human Species a large Number of Teeth, ſo diſpoſed, that in each Jaw-bone there

is a Row appointed for attenuating the Aliments, and preparing them for Chylification. Some are of Opinion, that the Length or Shortneſs of Life may be determined from the greater or ſmaller Number of the Teeth; for *Hippocrates*, long ago, obſerved, in the ſixth Section of the ſixth Book of his *Epidemics*, "That thoſe who were furniſh'd with a large Number "of Teeth, liv'd to a great Age:" And *Bartholine*, in his *Inſtitut. Anatomic.* uſes the following Words; "The Fewneſs "of the Teeth is a Sign both of a Penury of nutritive Mat-"ter, and a weak productive or forming Force; or it is the "Cauſe why the Aliments cannot be ſufficiently prepared, by "which means both the firſt and ſecond Concoctions are "vitiated." The Number of the Teeth is not only conſiderably large, but they are alſo ſeparate, that they may not, at the Time appointed for their Shedding, come out of their Sockets all at once, which would create an intolerable Pain. Beſides, by this Contrivance, it happens, that when one ceaſes to perform its Office, it may be eaſily removed, without injuring the adjacent Teeth; which could not happen, if the Teeth conſiſted of one continued Bone; for, in this Caſe, if one Part of it was injured, the Diſorder would eaſily be communicated to the Whole. The Teeth, in Mankind, are of a middle Size. From their Figure and Office, they have different Names beſtowed upon them. The four anterior Teeth in each Row are call'd *Dentes Inciſores*. Theſe are broad and ſharp, that they may the more ſpeedily divide the Aliments in Maſtication. They are alſo call'd *Dentes Riſorii*, becauſe in laughing they are more diſcovered than the others. They are alſo call'd *Dentes Lactei*, becauſe they appear firſt. Theſe are ſucceeded by two in each Jaw, call'd the *Canini*, which lie next to the Inciſores, have a large Baſe, and a long Root. They are call'd *Canini*, becauſe in Shape they reſemble the correſpondent Teeth in Dogs. They are by ſome call'd *Dentes Oculares*, becauſe the pulling them out is generally thought to prove injurious to the Eyes. But Anatomiſts are not agreed with reſpect to the Cauſe of this Phenomenon. Some are of Opinion, that their large Roots are extended to the Orbit of the Eye; whereas they ſcarce reach to the lower Part of the Noſtrils. Others affirm, that the Nerve, which comes from the inferior Orbit of the Eye, and paſſes through the Perforation of the Jaw-bone, is in ſome meaſure propagated to theſe Teeth; which Opinion ſeems to be ſomewhat more probable; but, becauſe the *Dentes Canini* of the inferior Jaw receive no Portion of this Nerve, they cannot, for this Reaſon, be called *Oculares*. After theſe ariſe the five maxillary or grinding Teeth on each Side. Theſe have their Points rough, broad, and unequal, that they may ſufficiently triturate what is cut and broken by the *Inciſores* and *Canini*. Sometimes on both Sides there appear five of the Molares, and ſometimes only four; ſometimes four on the Left Side, and five on the Right; or five on the Left, and four on the Right; or four in the lower, and five in the upper Jaw: Which Difference is generally produced by the laſt Teeth, which are by ſome call'd *Genuini*; though *Cicero* call'd the *Molares* by that Name. Theſe are the Teeth which appear after Puberty, and the Uſe of Venery, ſometimes with intolerable Pain. Phyſicians, little adverting to this Circumſtance, either pull out other Teeth, or, imagining they are pain'd by a Peccancy of the Humours, order large Numbers of Medicines and Applications for removing the Pain; which, without creating any additional Pain, might be more effectually and ſpeedily done by a gentle Scarification of the Gums about the laſt Tooth, or even a ſlight Penetration of the Jaw-bone; As I myſelf have experienced, ſays *Veſalius*, when my thirty-ſecond Tooth began to grow out in the twenty-ſixth Year of my Age. As for the Colour of the Teeth, the whiter they are, ſo much the better, and the ſurer Sign of their Soundneſs. Their Whiteneſs is injured by Neglect, by old Age, and by Diſeaſes. *Verheyen*, in his Anatomy, affirms, that the yellow or black Colour of the Teeth is preternatural, and ordinarily produced by Corruption. The Teeth are generally pretty white till about the thirtieth Year of one's Age, after which they begin to aſſume a yellowiſh Colour, which is gradually heighten'd in proportion as the Perſon advances in Years. But the Teeth are never deprived of their white Colour, except by ſome preternatural Cauſe; and *Helmont* informs us, that Peoples Ages may be determined by the Colour of their Teeth. This Colour alſo varies according to different Climates. Thus, the Inhabitants of the Eaſtern Countries have whiter Teeth than thoſe of the more Northerly Climates. The *Egyptians* and *Ethiopians* excel all others in this reſpect: Of this *Helmont* takes notice, as alſo *Petrus Johannes Faber*; and *Proſper Alpinus*, in his Treatiſe *de Medicina Ægyptiorum*, informs us, that the Teeth of the *Egyptians* are always ſound and vigorous, free from Caries and Pain.

All the Teeth, without Exception, are ſo firmly fixed in their Sockets, like ſo many Wedges, by that Species of Articulation call'd *Gomphoſis*, that they remain ſteady and immoveable in Maſtication. Beſides, the Teeth are not all fix'd into their Sockets by an equal Number of Roots; for the *Inciſores* are only ſecured by one. The *Canini* have alſo but one, which, however, is deeper than thoſe of the *Inciſores*, and larger in Proportion to the Strength of the *Canini*. And among the *Inciſorii*, the two in the Middle are ſecured by deeper Roots than the two lateral ones contiguous to the *Canini*, becauſe they are broader and larger. The *Dentes Molares* differ from each other with reſpect to their Roots. The ſuperior, and eſpecially the two poſterior, are ſometimes fixed with three Roots. But the inferior have only two, partly becauſe the Subſtance of the ſuperior Jaw is ſofter, and leſs compact, than that of the inferior; for which Reaſon, they could not be ſo ſecurely fixed by two, as by three Roots; and partly, becauſe the inferior preſs upon their Roots by their own Weight; whereas the ſuperior are pendulous, and conſequently require more Roots to ſecure them. The other *Dentes Molares*, ſucceeding the *Dens Caninus*, in the upper Jaw, have two Roots, and thoſe in the inferior only one. Beſides, 'tis to be obſerv'd, that the Teeth of Children are only furniſhed with imperfect, ſoft, and, as it were, medullary Roots. Hence they are generally looſe, eſpecially the Inciſores, which may be pulled out with one's Nails, or by a Piece of Thread twiſted about them. It is alſo to be obſerved, that the Roots of the Teeth are internally ſurrounded with membranous and nervous Ligaments, by which the Teeth are firmly ſecured in their Sockets; and externally the Teeth are encompaſſed by the Subſtance of the Gums, which are a kind of hard Fleſh, conſiſting of ſmall fibrous Laminæ plac'd cloſe to each other, and intermix'd with a large Number of Blood-veſſels; for which Reaſon they are intenſely red. They are, beſides, liberally furniſhed with ſlender Membranes, Glands, and Ramifications of Nerves: Hence they derive their Power of Senſation, and are obſerved to be moiſten'd with a due Humidity. This Fleſh ſurrounds the Teeth like a Rampart, and fortifies them as Muſcles do. Hence, when it is either eat away, or become preternaturally flaccid, the Teeth generally become looſe, or drop out. But the Membrane which ſurrounds the Roots of the Teeth, and that Part of them which is cover'd, as *Clopton Havers*, in his Oſteology, juſtly obſerves, is not a Continuation of the maxillary Perioſteum, but rather a Propagation of that Membrane which is contiguous to the Gums, and is common to the whole Mouth, which is really glandular, and which does not terminate with the Gums, but, as ſoon as it arrives at their Margins, is intorted and reflected betwixt the Inſide of the Gum and the Tooth: But it deſcends into the Sockets, and adheres immediately to thoſe Parts of the Teeth, which are lodg'd in them. From the Root of ſome Teeth, eſpecially thoſe in the upper Jaw, together with this Membrane, there is ſomething of a hard and fleſhy Nature communicated to the Subſtance of the Gums, by which the Teeth are the more ſecurely fixed in their Sockets. And, though the Teeth themſelves do not partake of the common Perioſteum, yet their Sockets are furniſh'd with it, and it ſo coaleſces and unites with the Membrane which covers the Teeth, that they ſeem to form but one and the ſame Body.

But 'tis neceſſary to obſerve ſtill ſomething more with reſpect to the Uſe of the Teeth. We took notice, above, that they contributed not only to the Maſtication of the Aliments, but alſo to the Formation of the Voice. But their principal Uſe is Maſtication, or the inciding, breaking, and dividing the ſolid Aliments, to which all the Teeth are requiſite; and, for this Reaſon, they have always been eſteem'd highly valuable Parts of the Body. *Moebius*, in his *Fundament. Med. Cap.* 9. beautifully ſhews, that God, under the *Moſaic* Diſpenſation, not only ordered the Servants who had their Teeth broken or beat out by their Maſters, to be manumitted, and ſet at Liberty, but alſo that the Antients, in the Temple of *Apollo*, ſuſpended a leaden Inſtrument for drawing Teeth; intimating, that the Teeth were never to be pulled out, except they were ſo looſe and carious, that they would yield to a leaden Inſtrument.

The *Turks*, in like manner, according to *Menavius*, in *Lib.* 3. *Cap.* 22. durſt never attempt the Extraction of a Tooth, till they had firſt obtain'd the Sovereign's Licence. The ſecondary and leſs immediate Uſe of the Teeth, is the Articulation of the Voice, ſince they are wiſely placed as a kind of Rampart to the Tongue, and refluent Air. Hence Infants, who have as yet got no Teeth, utter indiſtinct and inarticulate Sounds; thoſe who have two or three, liſp out broken Words; and ſuch as are furniſh'd with more, ſpeak with proportionably more Diſtinctneſs; and Adults, who have loſt ſome of their Teeth, have their Voice and Speech injur'd by that unlucky Circumſtance. Beſides theſe two Uſes, the Teeth alſo contribute to Ornament; for the Face is conſiderably deform'd, when the fore Teeth are wanting. Hence ſome Inhabitants of the *Eaſt Indies* act a fooliſh Part, who, for the ſake of additional Graces, pull out their fore Teeth, as we learn from *Hieronymus Benzo*. Black and carious Teeth are alſo accounted a Deformity.

Having thus conſider'd the Teeth in their natural State, and inquired into their Subſtance; the Manner of their Generation;

tion; the Methods in which they are nouriſh'd; whence they derive their Power of Senſation; and by what means they are ſecured in their reſpective Sockets; we are the more eaſily enabled to diſcover the Indiſpoſitions and Misfortunes to which they are ſubject, and to remove their Cauſes, whether direct and immediate, or of the more remote and ſecondary Kind.

But, becauſe we at preſent intend to take an accurate Survey of the Pathology of the Teeth, we ſhall divide the Diſorders, incident to them, into ſuch as are accompanied with Pain; ſuch as are free from it; ſuch as proceed from a depraved Nutrition; or from a Weakneſs and Fault of the Nerves, Ligaments, and Gums, contiguous to the Teeth. But we ſhall firſt conſider that moſt general Diſorder, ariſing from the Subſtance of the Teeth; which is, a Caries or Corroſion. This is often ſucceeded, not only by a violent Pain and Mutilation, but alſo frequently by a putrid Stench, a Production of Vermin, and a Generation of Fiſtulas. A Caries of the Teeth draws its Origin principally from an internal Cauſe, whilſt the gelatinous Mucus, which fills the Cavity of the Teeth, by means of an impure ſcorbutic Lymph, is impregnated with a corroding and ſaltiſh Acrimony. Hence the adjacent Fleſh is, by the impure ſaline Lymph, deſtroy'd, corroded, and filled with ſmall Ulcers. The Tooth itſelf alſo, in conſequence of its peccant Nouriſhment, is ſoften'd, corroded, and gradually deſtroyed. But that all the Teeth do not ſuffer in this reſpect from the corrupted Lymph, ſeems to be owing to a Weakneſs of the Veſſels, of which particular Teeth conſiſt, or to ſome external Cauſe, which does not act upon ſuch as remain ſound; for a Caries generally begins on the external Side of the Teeth, by a ſmall black Speck or Hole, eſpecially in the maxillary Teeth, which are broad, and which, in Proceſs of Time, when the cortical Subſtance is removed, acquire Cavities in the Middle, in which ſome Parts of the Aliments remaining, and becoming acrid by their Continuance, by their putrid inteſtine Motion, eaſily excavate, and diſſolve the bony Subſtance of the Teeth. But as ſoon as, in any Part, there is a Cavity, or empty Space, form'd, there is forthwith a larger Influx and Acceſſion of Moiſture invited to it from the internal Parts; by which means the Tooth is gradually conſumed, and falls off by Bits. This Misfortune happens to the fore Teeth, without any previous Excavation; for the carious Portions, not finding a free Diſcharge, like ſo many Wedges, forthwith burſt their Sides.

When the Sanies of a carious Tooth cannot be freely enough diſcharged thro' a narrow Perforation, but is lodged near the Roots, and attacks the Sockets and Jaw-bones themſelves, a Fiſtula is produced; though, at the ſame time, this Misfortune does not always draw its Origin from the carious Tooth, but more frequently begins in the Jaw-bone, terminates in the Tooth, and renders it carious. *Zwingerus*, in *M. N. C. Dec.* 2. *a.* 7. *Obſ.* 233. gives us an Account of ſuch a Fiſtula produced by a carious Tooth; and the Fiſtula, in its Turn, render'd ſeveral Teeth carious. When the Teeth are excavated, a highly fetid Stench ſucceeds; and this proceeds from the cadaverous Sanies of the carious Tooth, which again draws its Origin from the Remains of the Aliments contracting a putrid Quality in the Cavity; for the ſalino-ſulphureous Sanies of the Tooth, in conſequence of its violent inteſtine Motion, acts upon the Remains of the Aliments, by diſſolving the Union of their component Parts. Hence a Putrefaction is produced, which is nothing but a Diſſolution of the Elements, or conſtituent Principles, of Bodies, by means of a violent inteſtine Motion; and this inteſtine Motion is always accompanied with a fetid Stench, ariſing from the Evaporation and Flying off of the minute ſalino-ſulphureous Particles. When ſuch a fetid Putrefaction of the Teeth happens, Vermin are generally obſerv'd to be produced; for nothing more directly and immediately contributes to the Production of theſe, than an inteſtine putredinous Motion, which actuates the Seeds of theſe Inſects, vivifies them, nouriſhes them, and, by its expanſive Force, ſoon excludes them. Now, as there is no Part of the human Body, in which Worms may not be generated, as we may ſee in *Foreſtus*, *Lib.* 14. and in other Authors, ſo there is no Reaſon to doubt of the Poſſibility of their being form'd in the Teeth, ſince we daily eat Aliments contaminated with the Seed of ſome Worms or Inſects. This is alſo confirm'd by Experience, ſince, upon breaking carious Teeth when extracted, Worms have been taken from them.

From a peccant Nouriſhment proceed thoſe Concretions about the Teeth and Gums, which are commonly call'd the Tartar of the Teeth. *Helmont* is of Opinion, that the Gums ſupply the Teeth with Nouriſhment; and that, when this nutritive Juice is become excrementitious, and diſcharged from the injured Gums, it indurates about the Teeth, and aſſumes a Degree of Hardneſs almoſt equal to their own. But, in my Opinion, the tartareous Matter, adhering to the Teeth, is produced partly from the Saliva impregnated with terreſtrial, tartareous, and viſcid Parts, and partly from the impure tartareous Lymph of the Gums, which, by continually moiſtening the Teeth, gradually adds viſcid and tartareous Particles to them. This Tartar, in conſequence of its Acrimony, gradually conſumes the Subſtance of the Teeth, induces a Blackneſs, and ſometimes a Caries. This tartareous Subſtance is inſtantaneouſly reſolv'd by being rubbed with Spirit of Salt, which is a Proof, that it conſiſts of an alcaline Earth. This Diſorder is generally moſt incident to Infants, and Children, who feed upon viſcid Preparations of Milk and Sweet-meats, as alſo to ſcorbutic, arthritic, nephritic, and hypochondriac Patients; becauſe their Serum abounds with impure, terreſtrial, and tartareous Parts. For this Reaſon, I think, Phyſicians ought carefully to inſpect the Teeth, becauſe, by their State, that of the Serum and Lymph are moſt ſatisfactorily diſcovered.

We now come to conſider thoſe Diſorders of the Teeth, which proceed from any Fault or Weakneſs of the Nerves: And the firſt of theſe we ſhall mention, is that ſevere Pain perceived not only in the Subſtance of the Teeth, but alſo in the Gums, and adjacent Parts, and ſometimes thro' the entire Jaw-bone; for 'tis ſufficiently known from phyſiological Obſervations, that a ſlender Membrane, furniſhed with an exquiſite Power of Senſation, is diſperſed through the Cavities of the Teeth; as alſo, that the Gums, the Sockets, and the Roots of the Teeth, are immediately ſurrounded by a nervous Coat. When therefore the Sanies of a carious Tooth preys upon the membranous Fibres contained in the medullary Subſtance of the Tooth, a moſt intenſe Pain is excited. Hence we find, from daily Experience, that a Tooth-ach is rarely excited, unleſs when the Teeth are carious; for the Humours conveyed to the Jaw-bones act principally upon thoſe Teeth, which are carious or corroded. Sometimes, whilſt the Teeth are ſound and entire, this Pain appears with a Redneſs and Swelling of the Parts, a Pulſation of the ſmall Arteries, a Redneſs of the Face, a continual Driveling of the Saliva, a preternatural Heat, a feveriſh Commotion of the Blood, and a continual Watching; all which Symptoms diſcover a ſort of arthritic Diſpoſition of the Teeth, and an Inflammation of the adjacent Parts. This Diſorder moſt frequently ſeizes plethoric and ſcorbutic Patients, Women whoſe Menſes are obſtructed, and Men whoſe accuſtomed Diſcharges of Blood from the hæmorrhoidal Veins are ſuppreſſed, as alſo thoſe who neglect Veneſection at the ſtated Time they have been uſed to it. Hence pregnant Women, on account of their plethoric State, with which a Cacochymia is often join'd, are highly obnoxious to this Diſorder; for it is produced by a Defluxion of acrid Humours ſtagnating about the Roots, the Gums, and Membranes of the Teeth. It is ſometimes accompanied with an Eryſipelas, which affects the external Integuments of the Face, the ſubjacent Muſcles, and the Parotid Glands, and is accompanied with a Pain of the Teeth; becauſe, by a ſpaſmodic Conſtruction of the Parts, it draws their Nerves into Conſent. Beſides, 'tis well known, that the Antients diſtinguiſhed Tooth-achs into ſuch as proceeded from a hot, and ſuch as aroſe from a cold Cauſe; which Diſtinction, when rightly explained, may be ſafely admitted. The Tooth-ach, ariſing from a hot Cauſe, is that, which is accompanied with intenſe and preternatural Heat in ſanguine, plethoric, and choleric Patients, or ſuch as are in the Vigour of Youth or Manhood, which ſeizes with a violent Fever, and other terrible Symptoms, ſuch as a Redneſs of the Face, and a turgid State of the Veſſels. A Tooth-ach, on the contrary, may be ſaid to proceed from a cold Cauſe, when it attacks Perſons of cachectic Habits, Patients abounding with Serum, old Men and Women, and is accompanied with a Paleneſs of the Countenance, a Weakneſs of the Pulſe, and œdematous Swelling of the Parts. And in general we are to obſerve, that, when a Tooth-ach proceeds from a hot Cauſe, the Pain is very intenſe, but not durable; whereas, when it proceeds from a cold Cauſe, the Pain is generally leſs intenſe, tho' more laſting. We muſt alſo obſerve, that a Tooth-ach, proceeding from a carious Tooth, is more conſtant than the other Kinds, tho' it may be aggravated by many Accidents both external and internal. But that Species of the Diſorder, which is of the inflammatory Kind, proceeds from a Defluxion of acrid and viſcid Humours, and generally ſeizes arthritic, rheumatic, hypochondriac, and plethoric Patients, and ſuch as have their accuſtomed Diſcharges of Blood from the Noſe obſtructed, accompanied with a feveriſh Horror, a heavy Pain of the Head, a Weakneſs of the Body, and a Diſtention of the Face, and that at certain Periods, and is terminated at ſtated Times. This Species of the Diſorder, with reſpect to its ſeizing the Patient, its Cauſes, its Symptoms, and its Method of Cure, has ſomething analogous to the Eryſipelas, the Gout, arthritic Diſorders, and the Rheumatiſm; for, in all theſe, there is an inflammatory Congeſtion of Serum or Blood, accompanied with ſpaſmodic Pains, Swelling, Redneſs, Heat, and Pulſation; and this Congeſtion requires a due Diſſipation and Reſolution.

Nor muſt we forget that Species of Tooth-ach ariſing from the Eruption of Teeth in Infants and Children, eſpecially when the *Dentes Canini*, which are harder and ſharper than the other Teeth, force their Paſſage through the Fleſh of the Gums; for theſe, in making their Appearance, more ſeverely afflict the tender Patients, becauſe they act with greater Sharpneſs upon the

Gums than the *Molares*, which are larger, and more obtuſe. The ſole Cauſe of the Pain is the Breaking, Tearing, and Irritation of the Fleſh of the Gums, which is compoſed of various Fibres, Nerves, and Membranes. From this Irritation the Pain proceeds; and from the Pain, which is always accompanied with Spaſms, and an impetuous Commotion of the animal Spirits through the whole nervous Syſtem, ariſe thoſe tormenting and ſevere Symptoms generally incident to Children during Dentition, and which are, by *Hippocrates*, enumerated in the twenty-fifth Aphoriſm of his third Section, in the following Words: "When Children begin to breed Teeth, they are "afflicted with Itchings and pricking Pains of the Gums, "Fevers, Convulſions, and Fluxes of the Belly, eſpecially "when they breed their Canine Teeth. But theſe Symptoms "moſt remarkably afflict Children, that are groſs, fat, and "coſtive." To theſe are alſo frequently added Watchings, Vomitings, frequent Diſcharges of the Saliva, Aſthmas, and Coughs; and generally theſe Symptoms, as alſo the Convulſions, are more violent, the greater the Diſpoſition is to them from the Birth. A ſickly or pregnant Nurſe, Milk coagulated in the Stomach, or tending to an acid and ſordid Putrefaction, hot Gruels, an Admiſſion of cold Air, the ſudden Diſappearance of Ulcers or exanthematous Efflorescences in the Head, or any other Parts, and the Preſence of Worms in the Inteſtines, give alſo frequent Occaſions to the Exaſperation of theſe Diſorders of the Teeth.

We now come to conſider thoſe Diſorders of the Teeth, which ariſe from any Fault or Reſolution of the Nerves, and a lax or flaccid State of the Ligaments. The firſt of theſe we ſhall mention, is what we commonly call Inſtability of the Teeth: Now, Teeth may be looſe, either in conſequence of ſome Fault of their own, or ſome Imperfection in the Gums. With reſpect to the former, the direct and immediate Cauſe of their Looſeneſs is the Laxity, the Flaccidity, the Corroſion, and Rupture, of their proper Ligaments. With reſpect to the latter, the Gums may be in the Fault, either when they are entirely relaxed, and eaten away, or only in part thus affected, attended with a Diſcharge either of pure, or, as it frequently happens, putrid and corrupted Blood.

The Ligaments of the Teeth are rendered lax and flaccid, firſt, by means of Narcotics, Opiates, Ointment of Henbane, and other Subſtances of the like Qualities; an Inſtance of which we have in *M. N. C. Dec.* 2. *an.* 2. Secondly, by external Violence, ſuch as Falls, Blows, the ſtrong Application of hard Bodies, and Filips; and this is ſo much the more dangerous in the Fore-teeth, becauſe, on account of their ſingle Root, they are eaſily looſened; and the *Inciſores*, in a particular manner, are not deep fixed in their Sockets. To this external Violence belongs the Biting of hard Subſtances, ſuch as the Cracking the Stones of Cherries and Prunes between the Teeth. Thirdly, the Ligaments of the Teeth may be rendered lax and flaccid by Convulſions; for Inſtance, in thoſe Shatterings and Colliſions of the Teeth, to which Children are ſubject. Fourthly, the Ligaments of the Teeth may be rendered lax and flaccid from a Defect of Nouriſhment in Perſons recovering from a Diſorder, and ſometimes in old People. Theſe Ligaments of the Teeth may be alſo corroded and mortified by any thing of an acrid and corroſive Nature, whether Tartar, a Caries, a Scurvy, or the Remains of Mercury. Thus *Euſtachius*, in his Treatiſe *de Dentibus*, informs us, that he often found, in the Sockets of the Teeth, ſuch a large Collection of tartareous Matter, ariſing from Defluxions to which they are ſubject, which *Ettmuller* takes for Tophs of the Teeth, that it rendered the Ligaments lax, and at laſt thruſt out the Teeth. In a legitimate Scurvy, a foreign and adventitious Acrimony, convey'd from the corroded Gums to the Roots and Ligaments, alſo induces this Corroſion. Mercury is highly prejudicial to a firm and fixed State of the Teeth; for this Subſtance, where-ever it finds Pores, which, on account of its Subtilty, it will do in very compact Bodies, inſinuates itſelf into them, and begins to act as a Corroſive; for which Reaſon it is principally injurious to the Nerves and Ligaments. This ſeems to be confirm'd by an Obſervation made by Mr. *Boyle*, in the ſixth Chapter of his Treatiſe *de Poris*; where we are told, that this Author, after a mercurial Unction, found a ſmall Drop of Mercury in the Socket of a Tooth, which was the Occaſion of its falling out. The ſame Effect is alſo produced by coſmetic Waters impregnated with Mercury; Inſtances of which occur in *Foreſtus* and *Ettmuller*. By external Violence, if not all, yet, at leaſt, ſo many of the Ligaments may be broken, that the Tooth may only remain ſlightly fixed in its Socket; and this Effect may be produced, either by Attempts to extract the Tooth, or by a Blow, or by a Fall. As for the Gums, their Tone is generally weakened, either when the Tooth-ach ceaſes, becauſe, being before inflam'd, they were, of courſe, turgid; for all inflam'd Fleſh afterwards becomes flaccid; or after a Salivation, the Gums not being previouſly ruptur'd, but only rendered lax. A Solution of the Unity of the Gums is produced in a ſimple Diſcharge of Blood, if the Saliva is impregnated with an acrid Taint, either of the ſimple or ſcorbutic Kind, which raiſes their Fleſh into a ſpongious Kind of Tumor. Hence the Gums, when gently touched, are broken, and diſcharge Blood. From what has been ſaid, we may eaſily account, both for the Falling out, and the Want or Defect, of the Teeth. They fall out, either in conſequence of their being exceſſively looſe, or by the violent Application of ſome external Cauſe. But a Defect of the Teeth is, when, in conſequence of Age, freſh ones do not ſucceed thoſe, which are fallen out.

We now come to conſider that Diſorder of the Teeth, commonly call'd a *Stupor*; which is a certain kind of Pain, in which the Membrane ſurrounding the Teeth is, in ſome meaſure, deprived of Senſation. This is principally produced, either by taking ſome acid and auſtere Subſtance, or by throwing up, by Vomit, a Subſtance of the like Nature. Hence this Diſorder is much incident to thoſe hypochondriac Patients, whoſe Diſorder draws its Origin from an acid and auſtere Principle. As for a Chattering or Colliſion of the Teeth, it is a peculiar kind of Convulſion, ariſing from a reciprocal ſpaſmodic Conſtriction of thoſe Muſcles, which are ſubſervient to the Opening and Shutting of the Jaws; for theſe Muſcles, when affected with ſuch a Convulſion, induce ſuch a Colliſion of the Teeth. The Cauſes of this Symptom are, whatever Things may contribute to produce Convulſions; intenſe Cold, for Inſtance, Pains produc'd by Worms, or a difficult Dentition, and a Suppreſſion of the Menſes.

Having now conſidered the various Diſorders of the Teeth, and inveſtigated their ſeveral Cauſes, it remains, that we point out the moſt proper Methods of curing each of them, and ſpecify the ſeveral Remedies beſt calculated for removing their Cauſes. The firſt then we ſhall take under our Conſideration, is a Caries of the Teeth, or a Deſtruction and Corruption of them by a ſanious Matter. In treating this Diſorder, we are to obſerve, that a Caries, a Corruption, or Mortification, of the Teeth can by no means be repaired; for what is corrupted and mortified, as we obſerve in a Sphacelus, can by no Art be reſtored to a ſound and live State; for what a ſphacelous Putrefaction and Corruption is in Fleſh, or the muſcular Parts of the Body, the ſame is a Caries or Rottenneſs in the Bones. We are, however, in the Beginning, to uſe our utmoſt Efforts to hinder this Diſorder, which is at firſt pretty gentle, and confined to a narrow Space, from ſpreading the Contagion through the Whole of the Tooth; for, when a Caries once begins in a Tooth, by means of the Putrefaction, which quickly ſpreads itſelf, eſpecially if a free Acceſs is given to the Air, that heavy and penetrating Body, which is continually in an inteſtine Motion, it does not ſtop, till it has conſumed the entire Tooth. 'Tis, beſides, obſerveable, that a Caries, after having conſum'd one Tooth, ſometimes attacks the next to it. To this ſpreading Corruption a Stop is, therefore, to be ſpeedily put. But all thoſe Subſtances generally uſed with Succeſs againſt a Caries of the other Bones, ſuch as Euphorbium, Camphire, Oil of Scurvy-graſs, and Cloves, are found ineffectual for this Purpoſe, partly becauſe they cannot be commodiouſly applied, and partly becauſe their Virtues are impaired by an Acceſſion of the Aliments, and a continual Admixture of the Saliva. The moſt effectual Remedy I have found for preſerving a Tooth, which is already excavated, and affected with a beginning Caries, is, to prepare ſmall Portions of Lead, which exactly fit the Cavity, and carefully to thruſt them into it. By this Method, I knew a Tooth preſerved entire and ſound for many Years; for, by the Lead, the Remains of the Aliment are hindered from entering the Cavity of the Tooth, where they degenerate into a fetid and putrid Subſtance, which not only farther preys upon the Subſtance of the Tooth, but alſo fills the whole Cavity of the Mouth with a noiſome Smell. Beſides, this Lead, by its alcaline Subſtance, temperates, corrects, and changes the cadaverous, acid, and acrid Sanies lodged in the Parts. In a Word, the Lead not only totally deſtroys the ulcerous Ferment, but, which is another conſiderable Advantage, prevents the free Acceſs of the Air.

It is well known to Phyſicians, that none are afflicted with more ſevere and terrible Diſorders of the Teeth, than thoſe, who have the Misfortune to have them corroded and excavated; for ſince, by this means, a free Paſſage into them is already open, the Defluxion of acrid Serum more readily enters them, and, by irritating the nervous Membrane, which lines their Cavity, excites the moſt cruel Pains. To prevent the Pain of ſuch a carious Tooth for the future, apply the actual Cautery, and, by its means, burn the internal nervous Membrane, which imparts Senſation to the Tooth. This Operation is performed without either Pain or Danger, with an Inſtrument made on purpoſe, as I myſelf, ſays *Hoffman*, and ſeveral others, on whom I have performed the Operation, can atteſt. After this, the Peace of Lead before-mentioned is to be thruſt into the Cavity. *Foreſtus*, in his fourteenth Book, orders the Application of the actual Cautery thro' a Cannula, and defends the adjacent Teeth with Wax, or ſome other ſuch Subſtance. *Scultetus*, in his *Armament. Chirurg.* deſcribes an Inſtrument adapted to this Uſe. We are to obſerve in general, that, in this Caſe, the actual Cautery is preferable to all thoſe of the potential Kind, ſuch as Oil of Vitriol, Aqua-fortis, and the Caput Mortuum

tuum of Vitriol; for these destroy the Texture of the Teeth, and injure the Fauces; whereas the actual Cautery, by drying up the superfluous Humidity of the Tooth, and at the same time extinguishing the Ferment, produces two happy Effects at once.

As for the Extraction of the Teeth, we affirm, that it is sometimes not beneficial or necessary, sometimes highly dangerous, and sometimes absolutely necessary. Extraction then is of no manner of Service, when an Inflammation and Exulceration possess not only the Tooth and Gum, but all the adjacent Parts, in consequence of a Congestion of impure Humours; for when no Fault is to be discovered in the Tooth itself, then the Pain is by no means to be removed by Extraction. Nor is Extraction necessary in a Tooth-ach arising from a carious Tooth; because, as we have already observed, the Tooth may be preserved, and the Spreading of the Caries, together with the Pain arising from it, prevented, by a due Application of the actual Cautery. The Extraction of the *Dentes Canini* is a dangerous Operation; because they have a pretty long and broad Root, in which there is a Portion of that Nerve, which arises from the Perforation of the Orbit. Hence acute or inflammatory Pains of the Eyes, together with Head-achs, may be produced. This is confirm'd by a memorable Observation of *Highmore's*, in his *Disquisitiones Anatomicæ*, *Cap.* 2. Besides, the Extraction of Teeth deep-seated in their Sockets, especially in plethoric and scorbutic Patients, in Women whose Menses are about to flow, or in Patients labouring under a burning Fever, may be attended with large Hæmorrhages, which sometimes terminate in Death. Instances of this occur in *Highmore*, *Hollerius*, *Platerus*, and *Rousſetier*. Neither is a Tooth to be extracted at the time a Patient labours under a violent Head-ach, or too large a Congestion of Blood to the Head; because then all the Parts being irritated, the Extraction of a Tooth must, of course, bring on the most formidable Symptoms. When a violent Hæmorrhage succeeds the Extraction of a Tooth, the *Caput Mortuum* of Vitriol must be applied. The Extraction also of the *Dentes Molares* is attended with considerable Danger, especially of the last but one, and third Tooth of the upper Jaw, not only because they are fix'd with three Fangs or Roots, and consequently capable of doing more Injury to the Flesh of the Gums, but also because, in extracting them, the Jaw-bone is easily shattered. For the Illustration and Confirmation of this, I shall present the Reader with the following Case: Some time ago, a Gentlewoman applying to me, says *Hoffman*, complained of a Fistula in that Part of her upper Jaw, in which the last Tooth but one had been fix'd, and which, on account of the Violence of the Pain with which she was afflicted, had been extracted about a Year before. From the very Time of the Extraction, the Patient told me, that she observed the Cavity, from which it was taken, was not consolidated; but that, from it, she had a perpetual Discharge of serous Matter into her Mouth. This Cavity received a Probe three Inches long; and when, for the sake of Consolidation, *Peruvian* Balsam, or any other Remedy of a penetrating Flavour, was applied to it, the Patient perceived it in her Nostrils, just as if it had been put into them externally. She also observed, that, when the Matter was not freely discharged from her Nose, the Effusion of serous Matter from this Cavity was increased; and, on the contrary, when the mucous Matter did not flow liberally from the Cavity, it was freely and copiously discharged from her Nostrils. She consulted the most celebrated Physicians and Surgeons of several Cities, who unanimously agreed, that the Disorder was a Fistula; and accordingly prescribed the Use of hot Baths, drying Decoctions prepared of proper Woods and Roots, as also Purgatives. Externally they also applied balsamic, vulnerary, and astringent Medicines, but without any happy Effect. The Surgeons were of Opinion, that an Incision should be made; but I cannot possibly comprehend which way they must have gone to Work. Whilst she was recounting these Circumstances, and imploring my Assistance for her Relief, I concluded, that it was not a Fistula; but that, by the violent Extraction of the Tooth, her upper Jaw-bone had been injur'd; and that the memorable Cavity, so accurately described by *Highmore*, which is furnished with a pretty strong pituitary Coat for the Secretion of the Mucus, and which communicates with the Nostrils, had been open'd. The Gentlewoman herself confirm'd me in my Opinion, when she told me, that there adher'd to the Root of the extracted Tooth a large Quantity of a solid Matter, resembling a Pumice-stone. I forthwith shew'd the Patient, in a Scull I had by me, how slender the Substance of the Bottom of the Socket, in which the last Tooth but one is fixed, was near that Sinus; in which manner, when this Substance was injured, the Probe might be introduc'd to the Orbit of the Eye; and how the Sinus itself terminated in the Nostrils. I therefore concluded, that a perfect Cure was impracticable, especially in a Woman pretty far advanced in Years; and that neither any Chirurgical Operation could be perform'd, nor any internal Medicine applied: For this Reason I only ordered, that the Cavity should be stopt with a Piece of Lead, lest the Air, having a free Access to the Sinus, should produce a greater Putrefaction and Corruption. Besides, I order'd her, at certain times, to draw up a proper Quantity of Balsamum Vitæ into her Nostrils; by following which Method she enjoys a good State of Health, and is free from all the Inconveniencies which before attended her Disorder.

But the Extraction of the Tooth is necessary in Fistulas, whether they draw their Origin from the Rupture of an inflammatory Tumor of the Gums and Jaw, producing a Caries of the Tooth, or from not extracting, in due time, a putrid and carious Tooth, since, by Extraction alone, a free Discharge is procured for the sanious Matter. 'Tis absolutely necessary the Matter should be discharged in this Manner, since, by stagnating, it acquires a higher Degree of Acrimony, and a more corrosive Quality. It sometimes happens, that the Callus is extracted along with the Tooth, and a Discharge of Blood from the Fistula ensues; in which Case the Cure succeeds happily, as we find in *Sennertus*, *Lib.* 2. *Prax. Part* 1. *Foreſtus* also furnishes us with the Histories of several Fistulas, which have been cured: Thus, for Instance, in *Lib.* 14. *Obſ.* 17. he describes two Fistulas of the Gums arising from carious Teeth. In the fifteenth Observation of the same Book he describes one arising from an Inflammation of the Gums, which render'd the Teeth carious; and, in the seventh Observation, he describes one of the external Parts, the virulent Matter of which was discharged on the Patient's Beard.

When carious and putrid Teeth afford a Lodging for Worms, an aking and corroding Pain is perceiv'd, and little or no Discharge of the Saliva is observ'd, as the learned *Foreſtus*, in the fourteenth Book of his *Observations*, takes notice. A Tooth-ach, arising from Worms, is with Difficulty cured and overcome; for it generally does not yield to the common Specifics used in other Tooth-achs. Such Medicines are, therefore, to be call'd in to our Assistance, as have the most immediate and direct Tendency to destroy Worms. For answering this Intention, *Foreſtus* highly extols a Decoction of Coloquintida, Pills prepared of Myrrh and Aloes, as also Worm-powders. Some, for driving out the Worms, recommend the Smoke of Henbane; but *Hagendornius*, in his *Hiſt. Medic.* sufficiently shews the Disadvantages attending such a Fumigation. The Smoak of Savin may be much more safely used for this Purpose. *Glauderus*, in *M. N. C. Dec.* 2. *an.* 5. orders the Extraction of the Tooth; but we are never to have recourse to this severe Remedy, except in Cases of absolute Necessity. But the tartareous and tophaceous Matter, produc'd by the Scurvy and an impure Lymph, and firmly adhering to the Teeth, is most commodiously removed by a Chirurgical Operation, performed by Instruments of Steel made for this very Purpose; for this tartareous Matter is to be abraded and removed, lest it should produce a Caries, a fetid Taste in the Mouth, an unseemly Blackness, or Worms. If it adheres only gently to the Teeth, Powders of the Bone of Cuttle-fish, of calcin'd Hartshorn, calcin'd Egg-shells, vitriolated Tartar, Florentine Orris, and Musk, may be recommended for whitening the Teeth, and cleansing them from the corrosive tartareous Matter. Spirit of Vitriol also, corrected by the Syrups of Scurvy-grass and Violets, is no contemptible Medicine for removing the Tartar adhering to the Teeth; but, at the same time, it must be cautiously and prudently used, lest the bony Substance of the Tooth should be corroded also by it.

We now come to consider that inflammatory Pain arising from a Defluxion either of Blood, or rather of an acrid Serum, with which the Teeth are often seized in a very severe and tormenting Manner. In Cases of this Nature we recommend all those Methods proper to be used in other Inflammations; but, above all, the Matter lodged in the affected Part is to be discussed by a gentle Diaphoresis; and the intense Pains, which sometimes produce Fevers, continual Watchings, intolerable Head-achs, and even Convulsions, are to be soothed and alleviated by Medicines of a gently anodyne and nervous Nature. When the Body is plethoric, or when any usual Evacuation of Blood is suppressed, Blood is to be taken either from the Veins of the Arm, or from the Venæ Raminæ under the Tongue. Thus *Thonerus*, in the eleventh Chapter of his *Observations*, informs us, that he freed a Woman of a plethoric Habit from a most severe Tooth-ach by a liberal Venesection at the Ancle. After these Measures are taken, 'tis expedient to use Diaphoretics mixed with Anodynes, such as the Diascordium, the Rob of Elder, Camphire, Nitre, the Theriaca Cœlestis, the Essence of Scordium, Elder-flower-water, the Bezoardic Tincture, the Mixtura Simplex, the Essence of Castor, Anodynes, and Cinnabar, which may be exhibited in various Forms, and their Use continued, till a gentle Diaphoresis and Discussion of the peccant Matter are produc'd, since these, at the same time, prevent the Increase of the Fever. But Patients of this Kind must carefully abstain from a violently sudorific Regimen, since, by throwing the Blood into strong Commotions, it not only increases the Thirst, the Pain, and other Symptoms, but also speedily destroys the Strength of the Patient. In order to dissipate the Tumor, and remove the Pain, Bags prepared of the discutient Species, Sal volatile oleosum, and mild Preparations of Sulphur,

ure to be apply'd warm externally. The Ingredients proper for this Purpoſe are, the Flowers of common and *Roman* Chamomile, thoſe of Elder, Melilot, and the wild Poppy; the Herbs Carduus Benedictus, Chervil, Hyſſop, and Clary; the Seeds of Aniſe, Caraway, and Dill; Juniper-berries, Camphire, Saffron, Amber, Bean-meal, common Salt, and Nitre; which are all poſſeſſed of a powerfully reſolvent and diſcutient Quality. Beſides, the Patient is carefully to abſtain from every cold Subſtance, whether fluid, or of a dry and more firm Conſiſtence. When the Pain is highly intenſe, we are to exhibit internally, eſpecially towards Night, the *Pilulæ Wildeganſii*, and the *Pilulæ Mutthæi*, which conſiſt of Opium for their Baſis, excellently corrected by other Ingredients of a diaphoretic and purgative Nature. During the Paroxyſm, and when the Pain is very intenſe, I have, ſays *F. Hoffman*, often obſerved a few Drops of camphorated Spirit of Wine, or of my Balſam of Life, drawn up the Noſe, to afford immediate Eaſe; which, however, does not laſt for any conſiderable Time. This Effect ſeems to be owing to this, that the Ramification of the Nerve diſtributed to the Membranes of the Noſe ariſes from the fifth Pair, as well as that diſtributed to the Teeth. Frankincenſe alſo, diſſolv'd in Balſam of Life, and applied to the Gums on Cotton, affords preſent Relief. Nothing alſo more ſpeedily mitigates the Pain, than the Injection of a proper Clyſter. If the Patient is of a cacochymic Habit of Body, Purgatives, and Specifics prepared of the Gums, Mercurius dulcis, Salt of Amber, Reſin of Guaiacum, Extract of Aloes, and exhibited in the Form of Pills, are of ſingular Service, by carrying off the peccant Matter by Stool.

We now come to conſider, whether Cauteries and Veſicatories produce any good Effects in a Tooth-ach: Moſt Practitioners highly extol their Efficacy in the moſt violent Tooth-achs. 'Tis a common Practice to apply actual Cauteries to the Anthelix of the Ear, or the Temporal Muſcles of the affected Side, for this Purpoſe. Others burn Cotton on the Temples; but, inſtead of Cotton, the celebrated *Frankius*, according to the Direction of the learned *Sereta*, uſes *Okim*, which is an inflammable Rope, totally untwiſted. In periodical Tooth-achs, *Spigelius* ſucceſsfully uſed the actual Cautery, with which he made a Wound in that Part of the Anthelix, which is contiguous to the ſuperior Part of the Tragus; and conſolidated the Wound in the ordinary Manner. As potential Cauſtics, intended for this Purpoſe, we may uſe wild Crow-foot, Horſe-radiſh, and ſome others. In *M. N. C. Dec.* 2. *an.* 9. we are informed, that Bliſters, excited on the Cubit by an Application of bruis'd Garlick, remove the Tooth-ach. *Jacobus Wolfius* alſo, in *M. N. C. Dec.* 2. *an.* 7. informs us, that about the Bulk of a Fig of wild Crow-foot, bruiſed with Spirit of Wine, and applied to the fleſhy Part of the Arm, on the affected Side, raiſes Bliſters, which remove the Tooth-ach. *Ettmuller* affirms for a Truth, that the Root of Leadwort bruiſed, and applied for a Night to the Wriſt, in the Morning leaves a Spot of a leaden Colour, and removes the Pain of the Teeth. In *M. N. C. Dec.* 2. we are told from *Bartholine*, that the ſame Effect is produced by Applications of Horſe-radiſh, and other Subſtances abounding with a volatile acrid Salt, to the Cubit. In the laſt-quoted Work, *Dec.* 2. 'tis ſaid, that the Tooth-ach is removed by a Liniment compoſed of eight Cantharides, three Heads of Garlick, and a proper Quantity of Theriaca, applied to the Bending of the Elbow in a Linen Cloth. In my Opinion, theſe Remedies may, with Succeſs, be uſed in violent Tooth-achs, eſpecially ſuch as ariſe from an acrid and corroſive Serum lodg'd about the Nerve, partly with an Intention to eliminate this peccant Matter, and partly with a View to derive the violent and impetuous Motion of the Spirits from the Membranes of the Tooth to other Parts. Veſicatories, as alſo nervous, antiſpaſmodic, and anodyne Medicines, are with great Succeſs applied, either behind or below the Ears; becauſe the Artery, together with the Nerve and Vein lying under the Ear, enters the inferior Jaw-bone, and is diſtributed to the Roots of all the Teeth fix'd in it. By this means, therefore, the acrid Serum, flowing down to the Teeth, is moſt commodiouſly diverted, and carry'd off in another Direction, or the impetuous Motion of the Spirits in that particular Nerve is ſooth'd and abated. For this very Reaſon, a ſtrong Compreſſion with the Fingers, behind the inferior Jaw-bone, during the Paroxyſm of a Tooth-ach, generally alleviates the Pain, ſo long as the Compreſſion is continu'd. Beſides, we obſerve in Practice, that, by applying to the Temples, as alſo below the Orbit, Plaiſters prepared of nervous and antiſpaſmodic Ingredients, eſpecially Maſtich, Peruvian Balſam, Extract of Caſtor, Camphire, Oil of Nutmegs, Saffron, and, in violent Pains, expreſſed Oil of Henbane, with an Addition of Opium, quickly afford Relief, becauſe the Ramifications of the Nerve diſtributed to the Temporal Muſcles, ariſe from the ſame common Origin with the Nerves convey'd to the Cavities of the Teeth; and the Nerve under the Orbit is immediately diſtributed to the anterior Teeth of the upper Jaw.

When the Teeth are looſe, either in conſequence of a Conſumption, a Corruption, a ſcorbutic and putrid Exulceration of the Gums, or an Imbecillity and Weakneſs of the Nerves, beſides internal Antiſcorbutics, and Decoctions of the Woods, for purifying the Blood and Lymph, and removing the immediate Cauſe of the Diſorder, we are alſo to uſe external Medicines for cleanſing and ſtrengthening the Gums. In a Corroſion, or fetid Smell, of the Gums, and a Looſeneſs of the Teeth produced thereby, I recommend, above all other Medicines, the following Liquor:

> Take of Maſtich, Myrrh, and Gum Elemi, each two Drams; of the Herbs Germander, Clary, Sage, and the Leaves of Myrtle, each two Pugils; of the Flowers of red Roſes, three Pugils; of Alum, one Dram and an half; of Clove-gilly-flowers, one Dram; of red *French* Wine, eight Ounces; of camphorated Spirit of Wine, one Ounce: Let an Extract be made in a due Degree of Heat; and to the filtrated Liquor may be added different Quantities of the Spirit of Scurvy-graſs, according to the Intention of the Phyſician.

This Liquor, when frequently held in the Mouth, and applied immediately to the Gums, powerfully preſerves them from farther Putrefaction, fixes the Teeth, and regenerates the conſum'd Fleſh. But, for the ſame Intention, and with equal Succeſs, we may uſe the Eſſence of Peruvian Balſam, mixed with the balſamic Liquor, and a proper Quantity of the Honey of Roſes; which Preparation is poſſeſſed of a very remarkable cleanſing and corroborating Quality. Sometimes ſo obſtinate an Ulceration of the Gums happens, as will not yield to the moſt efficacious and beſt-choſen Remedies, but leaves open and running Ulcers; in which Caſe we are carefully to examine, whether the Diſorder does not proceed from a Caries of the Tooth; and if it does, the Caries is either to be totally extirpated and removed, or the Tooth itſelf to be extracted. Beſides, in order to preſerve the Teeth from Blackneſs, Caries, and tartareous Concretions, as alſo with a View to ſtrengthen and corroborate the Gums, it is highly beneficial ſometimes, eſpecially in the Morning before Breakfaſt, to waſh the Mouth, and rub the Teeth, with Wine in which Sage has been infuſed. This Practice is alſo to be recommended to old Perſons, whoſe Teeth are looſe in conſequence of a Weakneſs of the Nerves; as alſo to thoſe who have the Misfortune of a fetid and diſagreeable Breath. When no new Teeth ſupply the Place of the old, 'tis beyond the Power of the Phyſician to force Nature; for which Reaſon a palliative Cure muſt be uſed, and the Art of the Surgeon muſt ſupply the Defect of Nature, by providing the Patient with artificial Teeth, made either of Ivory, or the Tooth of the Sea-horſe; which, however, are rather ſubſervient to the Purpoſes of Speech and Ornament, than thoſe of Maſtication, ſince they muſt be taken out when the Patient eats. Theſe artificial Teeth are not only mutually tied to each other, but alſo to the natural and ſound Teeth, either with a ſmall Wire of Silver or Gold, or with a Piece of Thread, an Inſtance of which *Paré*, in the third Chapter of his ſecond Book, gives from *Hippocrates*. *A. Benedictus*, in the 22d Chapter of his third Book, tells us of *Merulus Alexandrinus*, that, after his natural Teeth had fallen out, he, with a Piece of Gold Wire, fixed artificial ones in his Gums, in order to aſſiſt his Pronunciation. But the Hiſtories of Teeth quickly replaced, and becoming firm in their Sockets, after having been knock'd out, are, by judicious Authors, looked upon as fabulous; as alſo the Caſe of that Lady, who, wanting a Tooth, ordered one of her Footman's to be extracted from his, and inſerted into her own Gums; upon which it is ſaid to have taken Root, and remain'd fix'd in the Socket.

When there is a violent Hæmorrhage from exulcerated or ſcorbutic Gums, which is frequently obſerved by Practitioners, and is not altogether free from Danger, beſides internal Diaphoretics, together with ſuch Medicines as correct the Acrimony, and check the Efferveſcence, of the Blood, we are alſo to preſcribe the external Uſe of ſtrongly conglutinating Applications. In Caſes of this Nature I have found ſingular Succeſs from highly rectify'd Spirit of Wine, from well ſaturated Eſſence of Amber, or from a Liquor prepared of the Decoction of Pomegranate-bark and Balauſtine-flowers, and the Syrup of acid Pomegranates; for, by theſe Preparations, the Hæmorrhage is excellently ſtopt. But if it ſhould prove ſo violent as to reſiſt all the Methods uſed for checking it, we are then, as *Tulpius* juſtly adviſes, to have recourſe to that Species of Fungus call'd *Boviſt*.

Among the ſeveral things which prove injurious to the Subſtance of the Teeth, Cold deſerves our firſt Attention; for, according to *Hippocrates*, in the eighteenth *Aphor.* of his fifth *Sect.* "Cold is an Enemy to the Bones, Teeth, Nerves, "Brain, and ſpinal Marrow." As Cold is highly prejudicial to the exſanguious Parts, as alſo to thoſe furniſhed with an exquiſite Power of Senſation, ſo, in every violent Pain or Indiſpoſition of the Teeth, I adviſe the Patient carefully to guard againſt intenſe Cold. Hence the Face ought always, but more eſpecially during the Paroxyſm, to be kept warm; neither ought

the cold Air to have a free Acceſs to the Cheeks. This is the Reaſon why the Pain of an excavated Tooth is conſiderably abated, if the Cavity is exactly fill'd with Pieces of Lead or Nutmeg. *Foreſtus*, in the eleventh Obſervation of his fourteenth Book, in order to prevent a free Acceſs of the Air, orders a Patient, afflicted with the Tooth-ach, neither to ſleep with his Mouth open, nor to ſpeak much; for which Reaſon the Mouth is alſo to be always waſhed with warm, but never with cold, Water. But, at the ſame time, too intenſe a Heat is alſo prejudicial to the Teeth; for, according to the ſixteenth *Aphor.* of the fifth *Sect.* of *Hippocrates*'s *Aphoriſms*, "The too "frequent Uſe of hot things is attended with a Relaxation of "the Fleſh, and a Weakneſs of the Nerves; for, by too in-"tenſe Heat, the Spirits are diſſipated, and the Fibres, of "courſe, relaxed." This happens becauſe the Strength of the Nerves, which principally conſiſts in a due Degree of Dryneſs, is deſtroy'd. For this Reaſon ſcorbutic Patients, and ſuch as have looſe Teeth, or are ſubject to large Hæmorrhages from them, ought carefully to avoid every thing which is either too hot, or too moiſt. Accordingly the *Schola Salernitana* has juſtly eſtabliſhed this as a Maxim: *Pultes ferventes faciunt corrumpere Dentes:* Hot Subſtances produce a Corruption of the Teeth.

All Acids, and more eſpecially thoſe of the corroſive Kind, are highly prejudicial to the Texture of the Teeth; for, by means of theſe, a Stupor of the Teeth is not only brought on, but their Subſtance is alſo gradually diſſolv'd and deſtroy'd. Among all the Subſtances of this Kind, the Spirit of Nitre is the moſt prejudicial, ſince, in a ſhort time, it is ſaid to convert the moſt ſolid Tooth into a Fluid. Phyſicians, therefore, injudiciouſly order Patients, who are deſirous of white Teeth, to uſe theſe Spirits, becauſe they muſt neceſſarily prove noxious to the Teeth, by rendering them highly friable. Hence we are not to regard *Montanus*, who, in *Conſult. Medic.* 3. highly extols theſe acid and corroſive Liquors for cleanſing and whitening the Teeth. Large Quantities of Acids, taken internally, ſuch as aceſcent Wines and Ales, by generating a ſcorbutic Acrimony in the Blood and Lymph, contribute greatly to bring on a Corruption and Caries of the Teeth, together with a Corroſion of the Gums. Beſides, all viſcid Subſtances, Preparations of Milk, Cheeſe, Sweet-meats, and Things prepared with Sugar, are prejudicial to the Teeth; partly becauſe they ſupply the Principles of a ſcorbutic Blood, and partly becauſe, by the Groſſneſs of their Parts, they adhere to the Subſtance of the Gums, cover them with a fetid and viſcid Matter, and, by that means, obſtruct their Perſpiration: For there is no Part of the human Body, to which, on account of its Nutrition, Perſpiration is not neceſſary. Hence the tophaceous Matter, the Corruption, and the Blackneſs of the Teeth, are produced. Vegetables of the garlick Kind, as alſo all Subſtances which are too acrid, ſaline, aromatic, and ſpirituous, are injurious to the Teeth; as alſo all Subſtances which, by their ſaline and acrimonious Quality, either communicate a Taint to the Lymph, contribute to the Production of a Scurvy, or deprave and corrupt the Nouriſhment of the Teeth and Gums.

Preparations of Mercury, whether internally exhibited, or externally apply'd, are alſo highly prejudicial to the Subſtance of the Teeth; for, by mercurial Unctions, intended to raiſe a Salivation in obſtinate chronical Diſeaſes, we obſerve, that an Inſtability and Blackneſs of the Teeth, together with a fetid Corruption and Relaxation of the Gums, are produced, partly by the corroding and cauſtic Quality of the Mercury, occaſion'd by an Acceſſion of Salts, and partly becauſe, by relaxing the Fibres of the glandulous and nervous Parts, it fills them with a large Quantity of Moiſture. We muſt alſo obſerve, that Opiates never fail to prove highly injurious to the Teeth, as we may ſee in *M. N. C. Dec.* 2. *An.* 2. *Obſ.* 163. for, by preventing the Influx of the Spirit, they diſpoſe the Teeth, not only to become looſe, but alſo to fall out. In conſiderable Inflammations, the Uſe of Opium may eaſily bring on a Gangrene and Sphacelus, or even Death; an Inſtance of which occurs in *Foreſt. Obſervat. Lib.* 14. *Obſ.* 6. *in Scholiis.* But Opiates are principally injurious to old Perſons, and Patients of phlegmatic Habits; becauſe they induce Stupors, Vertigos, and Obſtructions of the Head, according to the Obſervation of *Salmuth. in Cant.* 3. *Obſ.* 32. 'Tis reported, that Tooth-drawers facilitate the Extraction of Teeth by Applications of the Seeds of Henbane and Opium; for which Reaſon, theſe Subſtances are never to be uſed, except in Caſes where the Pain is highly intenſe; and 'tis always more expedient to preſcribe them mix'd with Purgatives, Diaphoretics, and Alexipharmics, than alone. The ſmoking Tobacco, in conſequence of its anodyne and diſſipating Qualities, is not in violent Tooth-achs to be condemned, ſince we find, from Experience, that it produces happy Effects. But, at the ſame time, I will not deny, that the immoderate Uſe of it may produce an Inſtability and falling out of the Teeth, in conſequence of its narcotic Quality. With reſpect to Dentifrices, or Powders for cleanſing the Teeth, we muſt obſerve, that 'tis an idle and pernicious Practice to uſe ſharp Powders; ſuch as thoſe prepar'd of calcin'd Flint, Pumice-ſtone, and Coral, becauſe, by theſe, the Subſtance of the Teeth is conſumed and abraded. 'Tis therefore expedient, entirely to abſtain from them, and only to uſe Crabs-eyes, calcin'd Shells, and the Bone of the Cuttle-fiſh, reduced to a fine Powder; with which may be mix'd the Powders of Nutmeg, Orris, Maſtich, Alum, and a little Muſk. This is an excellent Powder, not only for cleanſing and fixing the Teeth, but alſo for rendering the Breath grateful and agreeable. With this, or ſome other ſuch Powder, the Teeth, if poſſible, are to be rub'd after every Meal, but not roughly. For this Purpoſe, we may take the large Roots of Mallows, or Marſhmallows, well clean'd, and immerſed in Vinegar of Roſes. With the Extremities of theſe Roots, bruiſed and ſprinkled with the above-mentioned Powder, we are gently to abrade and wipe away the Sordes adhering to the Teeth. *Frederic Hoffman, de Dentibus, eorum Morbis, & Cura.*

Farther OBSERVATIONS *of the* TOOTH-ACH.

The Tooth-ach ſeems to be a particular Species of Rheumatiſm; for, in Practice, we often obſerve Pains of the Joints, Scapulæ, and Shoulders, tranſlated to one Side of the Head, the Teeth of which they attack in a moſt violent manner. On the contrary, Pains of the Head and Teeth are frequently obſerved to change their Seat, and fall down upon the Shoulders, the Arms, and the Scapulæ. As a Rheumatiſm is generally produced by any Intemperature or ſudden Change of Air, ſo alſo a Tooth-ach is generally excited in ſuch as are previouſly diſpoſed to it, eſpecially if they happen to be of a cacochymic Habit, by their ſuddenly removing from a warm to a cold Air, or by the ſudden Viciſſitudes of Heat and Cold, in the Spring and Autumn. As Rheumatiſms are more incident to Women than to Men, ſo alſo are Tooth-achs, and that for the ſame Reaſons. Beſides, though theſe two Diſorders are leſs frequently incident to Men than to Women, yet they generally prove far more ſevere in the former, than in the latter. There is a certain Analogy, not only between a Rheumatiſm and a Tooth-ach, but alſo between a Tooth-ach and a Gout; for as arthritic Diſorders are accompanied with Pain, Redneſs, Swelling, and a ſlight Fever, ſo the ſame Symptoms are obſerved to attend a Tooth-ach. Beſides, 'tis confirm'd by Experience, that ſuch as are ſubject to rheumatic or arthritic Diſorders, are rarely afflicted with Tooth-achs, but, for the moſt part, have their Teeth ſound and entire; whereas thoſe who are free from thoſe Diſorders of the Muſcles and Joints, are generally, for that Reaſon, more ſubject to Tooth-achs. As in Rheumatiſms and Gouts, ſo alſo in Tooth-achs, thoſe who have been once afflicted, are eaſily, and, by every ſlight Cauſe, ſubjected to freſh Attacks of the Diſorder, on account of the Weakneſs which theſe Diſeaſes generally leave in the Parts; ſo that a Gout, a Rheumatiſm, and a Tooth-ach, ſeem to be but one and the ſame Diſeaſe, appearing with different Degrees of Strength, attacking different Parts, and therefore accompany'd with Symptoms ſeemingly different, though produc'd by one common Cauſe. Hence it follows, that the Regimen and Method of living, proper in one of theſe Diſorders, muſt of courſe be ſo in the other alſo: But theſe Things are ſo obvious to every Perſon who will only allow himſelf to think, that there is no Neceſſity for a longer or more explicit Illuſtration of them. When Tooth achs are ſo intenſely violent, as to reſiſt the Force, and elude the Efficacy, of all other Medicines, *Hoffman* tells us, that he has obſerv'd a very ſingular and unexpected Relief, afforded by the following Pills, invented by himſelf:

Take of the Pilulæ Aloephanginæ, one Dram; of the Pilulæ de Styrace, half a Dram; and of the Extract of Saffron, ſix Grains: Mix up into a Maſs, of which form ſixty Pills; ſix or eight of which are to be exhibited for a Doſe.

Obſervations on the DENTITION *of* CHILDREN.

Nature has not thought fit, that Men ſhould be born with Teeth; but hath more wiſely provided for ſucking Infants, by making their Teeth grow by degrees. The firſt Principles of which, yet in the Womb, are merely membranous Filaments, fill'd with a nutritive Juice, which are firſt inſpiſſated into a Mucus, then harden'd to a Cartilage, and, laſtly, contract a bony Firmneſs. Though the Time of Dentition varies as much as the Conſtitution of Infants, ſome having Teeth in ſeven or nine Months, others ſcarcely in the Space of a Year, yet generally this Order is obſerved in the Eruption: The *Inciſores* are ripen'd by the Attrition of the Nipples in ſucking, and make an Eruption firſt in the lower Jaw-bone; the *Canini* ſucceed theſe; and, laſt of all, the *Molares* break out.

Though the Eruption of the Teeth be a thing evidently natural, and to ſome Infants produces no great Trouble; yet, becauſe of the various Symptoms attending it, in many Infants, it creates great Uneaſineſs; and hence ariſes a difficult Den-

tition, which is generally nothing but a more ſlow and painful Eruption of the Teeth through the Gums, and may be known by the following Signs: They firſt burn with a preternatural Heat, and are ſeiz'd, as it were, with ſudden Frights; you may obſerve them ſtart in their Sleep, which is very much diſturb'd, and cry more frequently; they ſuck the Milk more greedily from the Breaſt, and more frequently put their Hands to their Mouths. All this time the Jaws, in the fore Part of the Mouth, begin to ſwell, and, when ſwell'd, become white or red; a greater Quantity of Saliva is frequently diſcharged into the Fauces; a tenacious Lymph frequently hangs out at their Mouths, and the Belly is either coſtive, or the Fæces are evacuated by a Diarrhœa. Theſe Symptoms are accompanied with others much more dangerous, ſuch as convulſive and epileptic Motions, acute Fevers, violent Contorſions of the Jaw-bones, and other Symptoms of a like Nature, which have different Effects, according to the different Degrees of the Difficulty of Dentition, and the Senſibility of the tender Patients.

The Cauſe of difficult Dentition proceeds ſometimes from the Teeth, and ſometimes from the Gums: From the former, when the Teeth, endeavouring to force their Paſſage, are either too big, or too ſharp, as the *Canini*, or *Oculares*; or when, by growing too ſlowly, they corrode, pinch, and perforate the Gums, for too long a time; or when many grow out at the ſame time too haſtily: From the latter, if their Texture be ſo groſs and ſtrong, as to prevent the Teeth, which are conceal'd in the Sockets of the Jaw-bones, from making their way freely.

As the Fleſh of the Gums, which is very ſenſible, being made up of various membranous and nervous Fibres, muſt, in a great meaſure, be hurt, prick'd, and inflam'd, by ſuch a violent Protruſion of the Teeth, we are not to wonder, that an Itching, Heat, and Pain of the Gums, accompanies a ſlow Dentition; or, becauſe of the vehement Irritation, and the conſequent Commotion of the nervous Syſtem, that ſudden Frights, Startings, want of Reſt, Vomitings, Aſthmas, Coughs, and even convulſive and epileptic Fits, ſhould enſue; eſpecially if the Infants have previouſly labour'd under either a natural or adventitious Weakneſs of the Brain, or nervous Syſtem, and a Diſpoſition to ſpaſmodic Contractions; which afterwards palpably diſcovers itſelf, and is increaſed, when they are ſeiz'd with acute Pains, or the Attacks of a Fever.

Neither will it be difficult to find out the Reaſon, why the Belly, under a Difficulty of Dentition, ſhould be either preternaturally coſtive, or too ſoluble; for ſince ſuch is the Nature of any vehement Pain, and of this alſo which ariſes from the Teeth, that it excites Spaſms through the whole Body, and at the ſame time injures alſo the *Primæ Viæ*, this corrupts and ſours the Milk; and the free Diſcharge of the Belly, depending thereon, is either accelerated or retarded.

As to the Prognoſtics, we often find Dentition dangerous and fatal to Children; for thoſe violent and ſevere Diſtempers, which, as I have ſaid, either attend or follow it, frequently bring on ſuch a Weakneſs of the Parts, that the Infant has not Strength to go through the Dentition; and then the other Symptoms increaſe the more. Dentition is the moſt dangerous to Infants who are plethoric, and to thoſe alſo who become, in a manner, languid and heavy by too much Sleep; which is a Sign of a ſubſequent Convulſion, according to *Hippocrates*; who alſo aſſerts, that Infants are more ſlow in breeding their Teeth, if they have a Cough, and that their tender Bodies are more extenuated on this Occaſion; which muſt certainly be the Caſe, becauſe the Cough diminiſhes the Strength neceſſary for the Protruſion of the Teeth, and ſhews that there is a great deal of viſcid and acrid Juices in the Body; which, as they vehemently irritate the Gums, muſt undoubtedly be very troubleſome to Infants, whilſt they breed their Teeth. In like manner, thoſe are in a more dangerous Condition who are coſtive, than thoſe who are ſoluble, in their Bodies; though we know by Experience, that both the one and the other have died of Convulſions, excited by the Pain, during the Paroxyſm of the Fever. It is alſo of Uſe in this Caſe to know, whether the Infants be very delicate, or are begot by paſſionate Parents; for, if ſo, Convulſions will more certainly happen, and be of more dangerous Conſequence; though all that are ſeiz'd with Convulſions do not die. Finally, by how much greater the Difficulty, and the longer the Time, of the Eruption of the Teeth is, ſo much greater is the Danger, leſt Nature ſhould be too much weaken'd, and at laſt ſink under the Diſorder. But as to what *Hippocrates* farther advances in the above quoted Place, about Infants eſcaping Convulſions, provided they have an acute Fever, and their recovering more eaſily in Winter, than in Summer, I ſhall leave to the Experience of others.

The CURE.

He that would effectually cure thoſe Diſtempers that threaten Infants, ought, in the firſt Place, carefully to advert to the Time aſſign'd by Nature for Dentition, which is commonly about the ſeventh Month; and ſhould, before the Difficulty of Dentition begins, take care that he eats nothing which is ſolid or hot, but the moſt thin Aliments, and the thinneſt Sorbitions. And, as the Temperature of the Nurſe, and a proper Regulation of Diet, is of ſingular Uſe to the ſucking Infant, Care ought to be taken, that ſhe abſtains from all heating Subſtances, ſuch as Wine, Aromatics, and ſuch-like; and rather make uſe of alterative and moiſtening Things, and accuſtom herſelf to the Drinking of Water. Theſe Things may and ought to be attended to at the time of the Eruption, as well as before it becomes troubleſome.

In the Method of Cure, the principal Thing to be adverted to is, to alleviate the Pain and Inflammation, which are commonly attended with ſlight Fevers, Convulſions, and Diarrhœas; as alſo to relax and ſoften the Gums, which will forward the Eruption. For anſwering this Intention, Medicines poſſeſs'd of a precipitating Quality are, of all others, the moſt effectual: Of this Kind, the principal are Jellies of Hartſhorn, diſſolv'd in ſome proper Liquor, with Eſſence of wild Poppies, and a few Drops of the anodyne mineral Liquor, exhibited at proper Intervals. A proper Doſe of the following Mixture may be alſo frequently exhibited with ſingular Succeſs:

> Take of the Waters of Lilies of the Valley, of Lime-flowers, and Cowſlips, each one Ounce; of the *Pulvis Marchionis*, and diaphoretic Antimony, each one Scruple; of Saffron, a few Grains; of the Syrups of Garden Piony, and wild Poppies, each one Dram; adding a few Drops of the Spirit of Sal Ammoniac.

As, in all violent Diſtempers incident to Infants, it is often of more Uſe to give Medicines to the Nurſe, than to the Infant; ſo in all vehement Symptoms of a ſlow Dentition, we ought to obſerve the ſame Rule. This Intention I have often ſeen excellently anſwered by exhibiting antiſpaſmodic Medicines to the Nurſe; ſuch as Powders compoſed of Piony-root, uncalcin'd Hartſhorn, the foſſile Unicorn, Amber, Caſtor, and other Ingredients of a like Nature.

Nothing tends more to increaſe and augment the Impetus of the Humours to the upper Parts, than a long-protracted Coſtiveneſs, and the Flatulencies and Spaſms thereby produced in the Inteſtines, which are lin'd with a nervous Coat. Wherefore, what a Phyſician ought principally to regard, is to render the Body of the Infant ſufficiently ſoluble by emollient and oleous Clyſters, and that of the Nurſe by proper Purgatives, leſt the Cure ſhould be either retarded, or totally prevented, by ſuch a noxious Cauſe.

But we may alſo make uſe of external Remedies, applied to the Gums; for the ſoftening and relaxing of which, Cream, ſweet Butter alone, or mix'd with Honey, conduces very much; nor is it of leſs Uſe to apply a Fig, divided in the Middle, to the Part where the Tooth is endeavouring to force its Way, and begets a Swelling, Pain, and Heat; or to apply the Marrow of Calves Legs, Mucilage of Quince-ſeed, with a ſmall Quantity of the Yolk of an Egg, diſſolv'd in Roſe-water, and the Syrup of Violets, or Hares Brains, which is reckon'd an excellent Specific in this Caſe: And what we find to be of ſingular Efficacy here is, a Liniment prepared of Sperma Ceti, the Syrup of white Poppies, Oil of ſweet Almonds, Saffron, and Nitre, and applied as an Ointment to the Fleſh of the Gum that is affected. A Cruſt of white Bread, boil'd in Milk, and mix'd with a little Oil of Roſes and Saffron, is mightily recommended by ſome, as an Anodyne for Pain and Inflammations.

But, if the Teeth ſhould not make any Eruption, we muſt make an Inciſion on the Gums, and, with a Knife, cut the Membranes next to the Extremities of the Teeth; and this Experiment I have frequently found ſucceſsful.

In difficult Dentition, all Things of a heating purgative Nature, ſpirituous Things held to the Noſtrils, and Aſtringents applied to the Gums by way of Ointment, are pernicious; becauſe, while the Motions are accelerated through the whole Body, the Symptoms are heighten'd, and the Fever, which is a more frequent, and, for the moſt part, an individual Concomitant of Pain, is thereby increaſed. And, for this Reaſon, Mothers are much to blame, who keep their Children under too hot a Regimen, or keep them in too warm Beds and Rooms, while they are ſeiz'd with thoſe Diſtempers which are attended with Pain, a Fever, and Inflammation. Since we may conceive greater Hopes of a Recovery from a free Diſcharge of the Belly, Corroboratives or Aſtringents ought not, by any means, to be uſed; for I have always obſerved them to be of dangerous Conſequence, and have ſeen Convulſions, with other Symptoms, much ſooner, and more certainly, follow thereupon. *Frederic. Hoffman.*

Chirurgical Operations relative to the TEETH.

Some Perſons have their Teeth and Jaws ſo cloſely and violently preſſed together, that they cannot be ſeparated for the Admiſſion of Food, or the clear Utterance of Speech: This

Diſorder ſeems to be owing to a Rigidity or Spaſm in the Muſcles of the lower Jaw; whence it is denominated a *Rigor* or *Spaſm* of the Jaw. This Sort of Spaſm or Convulſion proceeds not always from the ſame Cauſe; for ſometimes it is excited by a Wound in the Nerves or Tendons in ſome Part of the Body, or after the Amputation of an Arm or Leg; as I have frequently obſerved in Camps; and ſometimes it is cauſed by an Inflammation of the Jaw itſelf, or the Muſcles of the Fauces.

When the Diſorder proceeds from a Wound, you are firſt of all to examine, whether any extraneous Matter be retained in the Wound, and ſo occaſions theſe Spaſms; for when this is found and extracted, the ſpaſmodic Motions immediately ceaſe, though they obſtinately reſiſted all nervous Medicines. If no foreign Body lies concealed in the Wound, you may reaſonably conclude, that the Spaſms proceed from an Injury of the Nerves or Tendons; and muſt therefore have recourſe to the Remedies provided in theſe Caſes, ſuch as Balſam of *Peru*, Balſam of *Capaiva*, Oil of Turpentine, or a Mixture of this Oil, and Hungary-water, moderately heated, and now-and-then infuſed into the Wound; after which muſt be applied ſome digeſtive Cataplaſm, compoſed of Scordium, Wormwood, Southernwood, with Flowers of Elder, Flowers of Chamomile, and ſuch others, boil'd in Wine. If theſe, and other proper Remedies, fail of Succeſs, you are obliged totally to divide the wounded Nerve, unleſs it cannot be done without Danger of preſent Death; after which, theſe Spaſms and Convulſions will ceaſe in leſs Time than you could imagine. Sometimes the injured Nerve is ſo profoundly ſeated as to be inacceſſible, or not to be divided without imminent Danger of Death. This, indeed, is a miſerable Caſe; but yet there is one only Remedy, which is, ſpeedily to cut off the Arm or Leg, in which the injur'd Nerve is ſeated, if the Patient has Strength enough to bear it. If the Diſorder happens after the Amputation of a Limb, the Cure is much eaſier to be perform'd; for, in this Caſe, it often ceaſes of itſelf, as ſoon as the Ligature on the Veſſels, or the Ribs of Vitriol, applied to reſtrain the Hæmorrhage, are removed. In the mean time, 'tis no unuſual thing for the moſt efficacious Medicines, and the moſt proper Methods for Relief, to prove ineffectual in this Diſorder; ſo that I have frequently ſeen Patients, labouring under it, periſh in the moſt lamentable and calamitous Condition. When an Inflammation of the Tonſils, or of the Muſcles, by which the Jaw-bone is ſupported, hinders the Teeth from receding from each other, the beſt Method is to remove this Inflammation, by the ſame Meaſures uſed for the Cure of other Inflammations; for when it is removed, the Rigidity and Stiffneſs of the Jaw-bones and Mouth will, of courſe, gradually ceaſe. But leſt, during this State, the Patient ſhould be too much waſted with Hunger, 'tis abſolutely neceſſary to exhibit Broths, warm Ale, prepared with the Yolks of Eggs, Emulſions of ſweet Almonds, Jellies of Hartſhorn, and other highly nutritive Preparations, which may be ſup'd even with the Teeth cloſe. Beſides, if Neceſſity ſhould require it, nutritive Clyſters, compounded of the like Ingredients, are to be injected.

Some Phyſicians have invented Inſtruments of different Kinds for ſeparating the Jaws, commonly call'd *Specula Oris*, or *Specilla Oricularia*. By the Aſſiſtance of theſe, one of which is exhibited in *Tab.* 41. *Fig.* 12. and another *Fig.* 13. both Aliments and Medicines may, indeed, be more commodiouſly exhibited; but, at the ſame time, I am ſo far from recommending their Uſe as ſalutary and beneficial in all Caſes, that I am perſuaded every judicious Surgeon muſt look upon it as hurtful and pernicious, in ſome. Nor, indeed, can it well be otherwiſe, ſince by the violent and forcible Separation of the Teeth, the Inflammation of the Muſcles, and, conſequently, the Spaſms and Pain, muſt neceſſarily be increaſed; whereas the Patient might be much more mildly treated, and the Danger of increaſing the Inflammation ſhun'd, by the Patient's ſupping ſorbile and nutritive Preparations, in the manner beforementioned. So that the Uſe of theſe Inſtruments may juſtly be rejected and condemned, not only as trifling and unneceſſary, but alſo as cruel, and productive of the worſt of Conſequences. Nor does the Practice of *Dionis*, a celebrated *French* Surgeon, ſeem to deſerve a more favourable Cenſure; for in Caſes where by theſe Inſtruments the Teeth cannot be ſeparated for the Exhibition of Aliments or Medicines, he forthwith orders a Tooth to be taken out, for that Purpoſe. But in Caſes where there is a Neceſſity for opening the Teeth pretty wide, either in order to diſcover ſome Diſorder of the Mouth, or to perform ſome Operation on the Palate, Tonſils, or Teeth, I am ſo far from condemning theſe Inſtruments, that, for this Purpoſe, I recommend the *Speculum Oris*, repreſented in *Tab.* 41. *Fig.* 13. or ſome other Inſtrument capable of anſwering the ſame End.

The Methods of cleanſing foul and black TEETH.

Since by means of thoſe yellow, blackiſh, and unſeemly Scales, which ſometimes cover the Teeth, the Mouth is not only conſiderably deform'd, and the Breath made diſagreeable, but alſo the Teeth themſelves render'd looſe; it ſeems highly neceſſary to cleanſe and deterge theſe rough and foul Teeth with all Expedition. For this Purpoſe, there are various Inſtruments us'd, ſuch as theſe repreſented in *Tab.* 41. by *Figures* 14. 15. 16. and 17. Some of theſe, according to their ſeveral Intentions, are narrow at the Apex, or Point A; ſome of them broad, ſome of them ſharp, and others of them arch'd, in the Form of a Scythe, as in *Fig.* 17. But all of them may be either fix'd in one common Handle, repreſented by the Letter B, in *Fig.* 14. or they may alſo be fix'd in Handles peculiar to themſelves, as in *Figures* 16. and 17. taken from *Fouchard*. Applying theſe near the Gums, and holding the Extremities of the Teeth firm with the other Hand, theſe Scales are to be render'd looſe, and gradually abraded. But this is to be done cautiouſly, leſt the Gums ſhould be dilacerated, or the Tooth itſelf raſhly pull'd out. After this, the moſt proper Method to be taken is, for ſome Days ſufficiently to rub the Teeth and Gums with *Mynſicht*'s Tincture of Lac; or with Honey of Roſes, mix'd with a few Drops of the Spirit of Salt or Vitriol; for, by this means, the Teeth are not only render'd incomparably white, but the Gums are alſo corroborated and ſtrengthen'd. Not long ago I ſaw a Tooth-cleaner in *Saxony*, who, tho' he was provided with all theſe Inſtruments, yet, by means of that ſingle one repreſented by *Fig.* 17. quickly abraded the Scales from the Teeth of ſeveral Perſons in my Preſence.

But, leſt freſh Scales and Blackneſs ſhould again deform and diſorder the Teeth, 'tis neceſſary always to have a good Dentifrice in Readineſs; by which the Teeth may be cleans'd, and render'd white and firm, every ſixth or ſeventh Day; for rubbing the Teeth too often, or with ſuch Subſtances as are too acrid, crude, and draſtic, proves almoſt as prejudicial, as a total Neglect of them. Thus, the ſharp Powder prepar'd of Pumice-ſtone, Bricks, Coral, the Aſhes of Tobacco, and other Subſtances of a like Nature, too powerfully wears away and abrades the Teeth; And Spirits, alſo, and more eſpecially thoſe of Vitriol and Salt, gradually corrode and conſume them. The ſafeſt and moſt innocent Dentifrices are prepar'd of milder Subſtances; ſuch as Crabs-eyes, Mother of Pearl, calcin'd Shells, calcin'd Hartſhorn, Chalk, Root of Florentine Orris, Myrrh, and other Subſtances of a like Nature, reduc'd to Powder, and mix'd together. When the Gums are leſs firm, we may commodiouſly add a few Drops of the Spirit of Salt, or that of Vitriol. The Compoſition for this Purpoſe may be prepar'd in the following Manner:

Take of calcin'd Chalk, of red Myrrh, of the Roots of Florentine Orris, and of calcin'd Hartſhorn, each one or two Drams; and of the Spirit of Salt, between three and ſix Drops: Mix, and reduce to a fine Powder to be kept for Uſe. Or,

Take of calcin'd Shells, and calcin'd Mother of Pearl, each two Drams; of Dragon's-blood, one Dram; and of *Japan* Earth, one Scruple: Mix, and reduce to a fine Powder.

In order to give theſe Powders a grateful Flavour, we may pour upon them a few Drops either of the Oil of Cinnamon, Cloves, or Rhodium. Aſhes of Tobacco, provided they are rarely us'd, are an excellent Remedy for Blackneſs of the Teeth; as is alſo the following Preparation:

Take of Plantain-water, one Ounce; of the Honey of Roſes, two Drams; and of the Spirit of Salt, ten Drops. Mix all together.

In this Preparation, dip a ſmall Portion of a Napkin, or Linen Cloth, with which rub the Teeth daily, till they become whiter, uſing at the ſame time ſome proper Dentifrice, every ſixth or ſeventh Day. The Cuſtom of thoſe Quacks, who, for removing Blackneſs of the Teeth, recommend the frequent and liberal Uſe of the Spirit of Salt, or Vitriol, is to be condemn'd, ſince acid Spirits of this Kind more effectually corrode and deſtroy the Teeth, than any other Subſtances whatever. But if People are reſolv'd to uſe either theſe, or any other acrid Spirits, I would adviſe them immediately after, to waſh their Mouths with pure Water, leſt ſome of the Acrimony of theſe Liquors ſhould remain about the Teeth. For what I can perceive, the moſt effectual Means of preſerving the Teeth ſound and entire, is, not only in the Morning, but after every Meal, to waſh the Teeth with pure Water, and cleanſe them with the Finger. Some good Dentifrice muſt, at the ſame time, be us'd once a Week, either by itſelf, or in Conjunction with common Salt, which I have found highly efficacious for this Purpoſe. By this means, the Teeth may not only be kept free from thoſe

tenacious

tenacious Humours, or Remains of the Aliments, which produce Scales on the Teeth, but, which is ſtill more, this is the moſt effectual Method of preſerving them from Corruption, Pains, and Diſorders of every kind.

Of corroded and carious TEETH.

When Teeth are corroded, or, what we commonly call carious, it muſt, in the very Nature of the Thing, frequently happen, that ſome Particles of the Aliments muſt inſinuate themſelves into the ſmall Cavities or Perforations of theſe Teeth; and, whilſt theſe Particles gradually become putrid and acrid, they more and more corrode the Teeth, together with their Nerves and Membranes; by which means, they not only deform, but alſo torment the Patient. Leſt Surgeons ſhould ſeem to have forgot or overlook'd theſe Diſorders, Medicines have been long ago invented, if not for removing, yet, at leaſt, for alleviating and abating them. The firſt thing therefore, to be done, in Caſes of this Nature, is by a ſmall Needle, a Tooth-picker, or any other proper Inſtrument, ſuch as thoſe repreſented in *Tab.* 41. by *Figures* 19. 20. or 21. dextrouſly to remove the Sordes from the Cavities or Perforations, which are forthwith to be fill'd either with Maſtich, or white Wax; and, if theſe Portions of Maſtich or Wax ſhould happen to fall out, new ones are forthwith to be put in their Places: By this means, the Teeth are often preſerv'd for a long time, not only from the Sordes of the Aliments, and the Effects of the Air, but alſo from farther Corruption. When the Caries is not very deep, it may often be commodiouſly remov'd, by means of a proper File: But when the *Dentes Molares* are ſeiz'd with a Diſorder of this Nature, eſpecially in the Middle, the moſt efficacious Method of Relief ſeems to conſiſt, in filling the Cavities with Shreds of Gold or Lead, by means of the Inſtruments exhibited in *Tab.* 41. by *Fig.* 20. and 21. or in inſerting a Piece of ſolid Lead into the Sinus. When the Cavities or the Caries of the *Dentes Molares* reach pretty deep, ſo that they cannot be commodiouſly cleans'd in the Manner now directed, and muſt conſequently be rack'd with violent Pains, it is expedient to drop into theſe Cavities either Oil of Cloves, Oil of Cinnamon, Oil of Guaiacum, or Spirit of Vitriol; by which means, the latent Sordes are not only conſum'd and deſtroy'd, but ſometimes alſo the Pain inſtantaneouſly alleviated and abated. If theſe Medicines ſhould prove too weak to produce the deſign'd Effect; an actual Cautery, accommodated to this Purpoſe, and exhibited in *Tab.* 24. *Fig.* 14. and 16. or in *Tab.* 41. *Fig.* 20. or 21. is to be introduc'd into the Cavity of the Tooth; for, as this Operation quickly removes the Sordes and the Pain, ſo it creates no great Uneaſineſs to the Patient, provided it is perform'd with ſufficient Caution, and without injuring the adjacent Parts. When the Cavities of the Teeth are thus cauteriz'd, they are carefully to be fill'd with ſome proper Subſtance, leſt the former Pains ſhould recur: But if all theſe Meaſures ſhould prove ineffectual, or if the Cavity of the Tooth can neither be fill'd with Gold, Lead, nor Wax, the only Method of Relief remaining, is to extract the Tooth, if no Circumſtance contraindicates.

The Method of affording Relief in TOOTH-ACHS, *by manual Operation.*

Sometimes Tooth-achs are ſo violent and intolerable, that they obſtinately reſiſt the beſt choſen and moſt efficacious Medicines; in which Caſe, the Means of Relief are only to be obtain'd from manual Operation: For, firſt, the Pains are either to be alleviated by ſcarifying the Gums, as *Pliny*, in the ſeventh Chapter of his thirty-ſecond Book, has long ago obſerv'd; and this Method is frequently practis'd: Or, ſecondly, an actual Cautery, adapted to this End, is to be plung'd into the Cavities of the carious Teeth, in the Manner already directed: Or, thirdly, the Part behind the Ear, by Anatomiſts call'd Antitragus, is to be cauteriz'd, or have an Inciſion made in it; or, according to *Schelhammer*, it is to be ſtrongly compreſs'd with the Fingers: Or, in the fourth and laſt place, the corrupted and carious Tooth is to be extracted.

The Method of correcting uneven TEETH, *and ſuch as prick the Tongue and Lips.*

Sometimes the Teeth grow in ſuch a preternatural and diſagreeable Manner, as to incline too much either to the internal or the external Parts. But it much more frequently happens, that the ſharp and pointed Parts of fractur'd Teeth protuberate in an unequal manner. In both theſe Caſes it generally happens, that the Speech and Maſtication are not only in ſome meaſure hinder'd, but alſo the Tongue or Lips are prick'd and dilacerated; in conſequence of which, Inflammations, Tumors, Ulcers, and, very frequently, Cancers, are brought on. A ſpeedy Stop muſt neceſſarily be put to the Cauſe of theſe formidable Diſorders, either by abrading theſe troubleſome and noxious Teeth, by ſuch a File as is repreſented in *Tab.* 41. *Fig.* 22. or, if the Caſe requires it, by cutting off the prominent Parts with a very ſharp Forceps. But, if neither of theſe Methods ſhould prove effectual, the Tooth which creates the Uneaſineſs is to be totally extracted.

The Methods of extracting TEETH; *and the ſeveral Cautions to be obſerv'd in performing that Operation.*

Thoſe little conſult the Intereſt of Health and Eaſe, who raſhly, and without urgent Neceſſity, ſubmit to the Extraction of Teeth, as yet firm and ſound: For, ſo long as Teeth remain firm, the Extraction is not only highly painful, but alſo frequently endangers Life; ſince they are fix'd in their Sockets, like ſo many Nails in a Piece of Wood. Beſides, Maſtication and Speech are conſiderably injur'd by extracting Teeth, eſpecially in the anterior Part of the Mouth. This Misfortune is irreparable in Adults; ſince there are little or no Hopes left, that new Teeth will ſucceed thoſe which are extracted. There are, however, a great many Caſes, in which this Operation is abſolutely neceſſary; for, firſt, in Infants, it is more expedient cautiouſly to extract the *Dentes Inciſores* when looſe and diſengag'd, than to wait till they drop out ſpontaneouſly. When, therefore, theſe Teeth firſt become looſe, they are to be mov'd backwards and forwards with the Fingers, till they are ſo effectually diſengag'd, that they may be ſpeedily extracted, either by the Attempts of the Fingers, or by a Thread twiſted about them; or, which ſeems to be ſtill more commodious, by a proper Forceps, ſuch as that commonly call'd by Surgeons the Crow's-bill; for, when theſe Teeth are allow'd to remain too long in the Gums, there is ſome Danger, leſt new Teeth, ſpringing up near them, ſhould create freſh Pain, and bring on Deformity. Secondly, it ſometimes happens, that, in Infants, Teeth ariſe in the Palate, or in ſome other preternatural and improper Place. As theſe prove a Hindrance to Suction and Speech, or bring on ſome other Inconvenience, they are, with the greateſt Caution, to be extracted, as ſoon as they appear. Thirdly, it ſometimes happens, that Teeth, eſpecially when corroded, are afflicted with ſuch violent and intenſe Pains, as will yield to no Medicines, however efficacious; in which Caſe, manual Operation becomes neceſſary. Fourthly, when Teeth are of a Bulk and Figure ſo preternatural and uncommon, as either to deform the Mouth, injure the Tongue and Lips, or prevent the Conglutination of any Wound, that may poſſibly be made in them, ſuch Teeth are, with all Expedition, to be extracted. Fifthly, ſuch Teeth as are become fiſtulous are alſo to be extracted; becauſe, for the moſt part, this Species of Diſorder cannot be remov'd without the Extraction of the Tooth affected. Teeth of this kind, are to be extracted in the following manner: If the Tooth to be extracted is lodg'd in the inferior Jaw-bone, the Patient is either to be plac'd on a low Seat, or on the Ground; but when a Tooth is to be extracted from the ſuperior Jaw-bone, the Patient is to be plac'd on a Seat ſomewhat higher, or on a Bed: Then the Surgeon is, with ſome proper Inſtrument, to pull the offending Tooth in a ſtraight Direction, from its Socket, in the ſame manner as a Perſon draws a Nail out of a Piece of Wood. In extracting the Teeth of the inferior Jaw, the Inſtrument is to be pull'd ſtraight upwards; and, in extirpating thoſe of the ſuperior Jaw, ſtraight downwards. But a great deal of Art and Dexterity is neceſſary in this Operation, leſt we ſhould either break the Teeth, or attempt their Extraction without Succeſs. As for the Inſtruments calculated for the Extraction of Teeth, they are ſo numerous and various, that every Surgeon cannot fail to be acquainted with them. Thoſe beſt known, and moſt commonly us'd, are the Pelican and Crow's-bill. Some other Inſtruments, leſs commonly us'd, we have delineated in *Tab.* 41. *Fig.* 23. 24. and 25. But the peculiar Advantages attending them, are better repreſented by Practice, and the real Application of them, than by Words. When none of the Species of Forceps prove ſufficient for extracting the Fragments or Roots of fractur'd Teeth, there are other Inſtruments, contriv'd for that Purpoſe; the moſt common and beſt known of which is, that call'd the *Pes Capræ*, or Goat's Foot; and another, deſign'd for the ſame Purpoſe, we have repreſented at *Fig.* 26. *Tab.* 41. The Inſtrument repreſented at the Letter A, *Fig.* 23. is generally us'd for the ſame Purpoſe; and the other Part of it, exhibited at the Letter B, is intended for the Extraction of the Tooth. More Inſtruments for theſe Purpoſes are deſcrib'd and delineated by *Garengeot*, in his *Traité des Inſtruments de la Chirurg.* and by *Fauchard*, who was well acquainted with the Diſorders of the Teeth, and the moſt effectual Methods of relieving them. But it is to be obſerv'd, that Teeth, tho' in ſome reſpects there ſhould be a kind of Neceſſity for extracting them, are, nevertheleſs, to have no Attempt of this Nature made upon them, when the Gums, or any of the adjacent Parts, are affected with a violent Inflammation; otherwiſe there is a Danger, leſt, by the Violence of the Pain excited, the Operation ſhould be ſucceeded

ceeded by a higher Degree of Inflammation, and other troublesome Symptoms.

The Method of fixing artificial TEETH.

The Want or Defect of the anterior Teeth is not only a considerable Deformity, but also a great Hindrance to distinct and articulate Pronunciation, as we have already observ'd, and as daily Experience confirms. That these Defects and Misfortunes may be properly supply'd, Surgeons have fallen on an Expedient to make artificial Teeth, either of Ivory, the Teeth of the Sea-horse, or the Bones of an Ox; which are to be carefully fix'd to the remaining sound and natural Teeth. When there are several Teeth, adjacent to each other, lost, there must be a proportionable Number of artificial ones, made of the same Bone, fix'd in their room; and these, either by means of their Figure, or, by the Assistance of a Piece of Gold-wire, or Silk-thread, are to be properly united to each other, and to the adjacent sound Teeth. But that these artificial Teeth may be the more effectually preserv'd from Corruption, it is expedient to take them always out before going to Sleep, carefully to cleanse them, and refix them upon getting out of Bed. If any Root or Splinter of the natural Teeth should prevent the commodious Insertion of the artificial ones; such an offending Body is either to be abraded by a File, or extracted with some of the Instruments recommended above.

Explication of the Figures in Tab. 41. *relative to Operations on the* TEETH.

Fig. 12. represents an Instrument, commonly call'd a *Speculum Oris*, furnish'd with a Screw for separating the Teeth, when any chirurgical Operation is to be perform'd in the Mouth. The Letters AA denote the Parts to be introduc'd between the *Dentes Incisores*, which may be separated at Pleasure by the Screw B.

Fig. 13. represents another Species of *Speculum Oris*, made in the Form of a Forceps; the Part A of which is apply'd to the Tongue, for suppressing and rendering it firm. The Part BB is apply'd under the *Dentes Incisores* of the superior Jaw; and by the Handles or Extremities CC the Mouth is kept open, and the Tongue depress'd at the same time.

Fig. 14. 15. 16. and 17. represent Instruments adapted for cleaning foul Teeth, and such as are cover'd with Scales. Their Points are of various Forms, according as the anterior or posterior Teeth, or those of the superior or inferior Jaw, are to be clean'd. The common Handle B, exhibited by *Fig.* 14. is so contriv'd, that all these Instruments may, in their turns, be fix'd in it, by means of the Screw CCC.

Fig. 18. and 19. are two Instruments, destin'd for the same Purposes, but somewhat larger, and such as *Fauchard* thinks best suited to the Design.

Fig. 20. and 21. exhibit two Instruments, not only for cleansing the Cavities of the Teeth, but also for cauterising them, or filling them with Shreds of Gold or Lead.

Fig. 22. represents a File for filing such Teeth as are either carious, or prick the Tongue and Lips. A exhibits the File itself; and B its Handle.

Fig. 23. represents a new Species of Tooth-drawer. The Part A may commodiously be us'd instead of the *Pes Capræ*, or Goat's-foot, for extracting the Roots of Teeth. The Part B, with the Addition of the Hook C, is accommodated to the Extraction of entire or whole Teeth; for it may not only be drawn out, by means of the Screw D, according to the Bulk of the Tooth to be extracted, but it may also be conceal'd in the Covering E, when bent back, if Convenience should require it.

Fig. 24. represents another Tooth-drawer, which, by means of the Screw A, may be render'd fit either for extracting small or large Teeth, by twisting about the Ball or Handle B.

Fig. 25. exhibits another Instrument for the same Purpose, furnish'd with three Hooks; one straight, represented by A; and two incurvated, exhibited by BC. The straight Hook is intended for the Extraction of the anterior *Dentes Molares*; and the more bended Hooks serve to extract those, which lie more remote, either on the Right or Left Side: And every one of these Hooks may be fix'd to the Body of the Machine, by means of the Screw D, according to the Position of the Tooth to be extracted. The principal Part of this Machine, F, may be set longer or shorter, as Necessity requires, by means of the Handle E, and the Screw G.

Fig. 26. represents a Hook proper for extracting some Teeth, and their Roots. *Heister. Institut. Chirurg.*

DENSITAS, πυκνότης. Denseness is sometimes oppos'd to *Raritas*, Thinness; and then signifies Closeness, or Compactness; and sometimes means the same as *Crebritas*, Frequency. The Adjective *densus* is express'd by δασὺς, (see DASYS) and also by πυκνὸς, which in *Hippocrates*, 5 *Aph.* 62. signifies Denseness of Contexture; but, apply'd to the Pulse, or Respiration, imports Frequency, as in 6 *Epid. Sect.* 4. *T.* 4.

DENTAGRA, ὀδοντάγρα, from ὀδοὺς, a Tooth, and ἄγρα, a Capture, a Surgeon's Instrument, or Forceps, for extracting of Teeth. It is also call'd ψαλὶς, and its other *Latin* Names are *Dentiducum*, *Dentarpago*, *Odontagogum*. See various Forms of these Instruments in *Paræ*, *Lib.* 16. *Cap.* 27. And in *Tab.* 41. *Dentagrâ* signifies also the Gout in the Teeth, for which see ARTHRITIS.

DENTALIS *Lapis* is the tartareous and tophaceous Matter, which, being formed of a Coagulation of vitious Particles, adheres to the Teeth, and is consolidated into almost a stony Hardness. *Helmont*, *Alimenta Tartari insontia*, *Numb.* 23.

DENTALIUM, Offic. Schrod. 5. 328. Charlt. Exer. 63. Mont. Exot. 6. *Dentales*, Scyll. p. 136. Tab. 18. n. 7. 8. *Dentalium Conchæ Species*, Ind. Med. 45. *Dentale lævе, album, altera extremitate rufescens*, List. Hist. Conch. 14. Sect. 11. n. 2. *Dentales*, Gesn. de Aquat. 345. *Tubulus Dentalis lævis*, Lang. Meth. Testat. 5. Rondel. de Pisc. 2. 110. *Autales dicuntur alij ejusdem formæ, sed minores*, Bonan. 91. THE DOG-LIKE TOOTH-SHELL.

This is a small Shell, or oblong conical Tube, of a white Colour, which incloses a Sea-worm. It is found on the Coasts of *England*, and is alcaline, absorbent, cordial, and astringent. There is another kind of *Dentale* found on the Coast of *Normandy*; which is no more than a small Heap of Sand, in which a Worm hides itself. *Geoffroy.*

It is not very much us'd in Medicine; but what Virtues it possesses, seem to be much the same as other testaceous Substances.

DENTARIA.

The Characters are,

It has a long Pod full of Seeds, which are, for the most part, round. When this Pod is ripe, its Valves are twisted into a spiral Form, and discharge the Seeds with Violence; the Root is squamous, fleshy, and denticulated, or cut in, as it were, with Teeth. *Boerhaave*, *Index alter*, *Pars* 2. *p.* 21.

Boerhaave mentions but one Species of this Plant, which is Dentaria; heptaphyllos; baccifera. *C. B. Pin.* 322. *Raii Hist.* 1. 784. *Hist. Oxon.* 2. 254. *Tourn. Inst.* 225. *Elem. Bot.* 192. *Park. Theat.* 619. *Boerh. Ind. A.* 2. 21. *Dentaria*, Offic. Ind. Med. 65. *Dentaria*, *Viola Dentaria*, Mont. 42. *Dentaria heptaphyllos Clusii*, Ger. 834. Emac. 985. *Coralloides altera sive septifolia*, J. B. 3. 899. *Coralloides septifolia*, *Dentaria heptaphyllos*, Chab. TOOTHWORT.

It is frequently to be met with in the Botanic Gardens, and flowers in *April*. The Root is in Use, which is of a drying and astringent Quality. *Dale.*

DENTARIUS, ὀδοντικὸς, is a Physician or Surgeon, who professes the Art of drawing and curing of Teeth. *Gal. ad Thrasybul. C.* 24. where you meet too with OCULARIUS and AURICULARIUS, ὀφθαλμικὸς καὶ ὠτικὸς, an Eye-Doctor, and an Ear-Doctor.

DENTARPAGA, See DENTAGRA.

DENTES COLUMELLARES, in *Varro* and *Pliny*, are the same as *Varro* in another Place calls DENTES CANINI. *Castellus.*

DENTICULATA, *Boerhaave*, *Index alter*, is a Name for the *Moschatellina*, *Foliis Fumariæ bulbosæ*. See MOSCHATELLINA.

DENTIDUCUM. See DENTAGRA.

DENTIFRICIUM, ὀδοντότριμμα. A Medicine for rubbing the Teeth, and purging them from *Sordes*, and for cleaning and absterging the Gums when replete with Humours.

DENTILLARIA. A Name for the *Plumbago quorundam*. Leadwort.

DENTISCALPIUM, ὀδοντόγλυφον. A Surgeon's Instrument for cleansing the Teeth from Filth; and in *Scultetus* it signifies an Instrument for separating the Gums from the Teeth, in order to their more convenient Extraction.

DENTITIO, ὀδοντοφυία, *Æginet.* ὀδοντίασις, Dentition; the breeding the Teeth in Children; it differs from the ὀδαξισμὸς (Odaxismus) of *Galen*, and the οὔλων ὀδαξισμὸς of *Hippocrates*, which is the Itching of the Gums felt by Children in breeding their Teeth. *Blancard.*

DENTO. One whose Teeth are raised and prominent to an extraordinary Degree, or who is full-mouthed. *Blancard.*

DENUDATIO, γύμνωσις, Denudation; is spoken of Bones, which appear uncover'd in a Fracture, or on any other Occasion.

DEOBSTRUENS, ἀναστομωτικὸς, ἐμφρακτικὸς, deobstruent. A Quality of some Medicines, the same as *aperiens*, aperient. See ANASTOMOSIS.

DEON, δέον, from δεῖ, it ought, is what is fit, proper, becoming, *Gal. C. de Artic. T.* 50. *Hippocrates* 1. *Aph.* 1. makes the τὰ δέοντα, "Duties becoming the Station," incumbent as well upon the Patient and Attendants, as upon the Physician.

DEOPPILANTIA, DEOPPILATIVA *Medicamenta*, are aperitive or deobstruent Medicines. *Helmont*, *Aditus præcluſ. ad Cond. Visc. Numb.* 3.

DEPASCENS, νομώδης, is an Epithet of a putrid Ulcer, corroding and ſpreading itſelf over the adjacent Parts. It is more properly call'd *Phagedæna*, φαγέδαινα, and *Herpes exedens*, *Gal. 6. Aph.* 45. Theſe Sorts of Ulcers are, by *Hippocrates*, call'd *Nomæ*, νομαὶ.

DEPERDITIO, ἀποβολή. The ſame as ABORTUS, which ſee.

DEPHLEGMATIO. The ſame as *Rectificatio*, and is a Term uſed by the Chymiſts, and apply'd to Liquids, particularly Spirits, when, by Diſtillation, or ſome other means, they are ſeparated from their Phlegm.

DEPILATIO, μάδιοσις, μάδωσις, ψίλωσις. A Falling-off or Defluxof the Hair. *Hippocrates*, *Lib.* 1. 3. 6. *Epidem.*

DEPILATORIUM, ψιλωθρον, is a Medicine which deſtroys the Hair, and of which there are three Kinds: The firſt are call'd *Pſilothra*, or DEPILATORIA, by way of Eminence; others attenuate the groſſer Hairs, and others wholly extirpate the Hair; which laſt are dangerous, becauſe of their corroſive Quality. *Galen. de C. M. S. L. Lib.* 1. *Cap.* 4.

DEPILIS, ἄθριξ. See ATHRIX.

DEPLUMATIO, πτίλωσις. An Affection of the Eyelids with a callous Tumor, which cauſes the Hairs to fall off. According to *Aetius*, *Tetrab.* 2. *Serm.* 3. *Cap.* 78. it is a Diſeaſe of the Eye, compounded of a *Madaroſis* and a *Sclerophthalmia*.

DEPREHENSIO. The ſame as CATALEPSIS, which ſee. It has alſo the Signification of Diagnoſis. *Scribonius Largus*, *No.* 183, 184.

DEPRESSIO, ὕφλασις, Depreſſion. The Word is often apply'd, as upon other Occaſions, ſo particularly to an Injury of the Cranium, when the Bone is broken, and forced inwards upon the Meninges. It may be alſo expreſs'd by *Impreſſio*, or *Introceſſio*, Impreſſion, or Introceſſion, according to *Hildanus* and *Scultetus*.

DEPRESSOR. A Name given to ſeveral Muſcles. Thus there are the *Depreſſor Labii ſuperioris*, deſcrib'd under the Article CAPUT. The *Depreſſor Labii inferioris*. See CAPUT. The *Depreſſor Labiorum*. See CAPUT. The *Depreſſor Maxillæ inferioris*, which is the ſame as the *Digaſtricus*. See CAPUT. And the *Depreſſor Oculi*. See OCULUS.

DEPRESSORIUM. The Name of an Inſtrument, which is repreſented *Tab.* 36. *Fig.* 7. uſed for depreſſing the *Dura Mater*, after the Operation for the Trepan. See CAPUT.

DEPRIMENS *Auriculam*. The Name of a Muſcle which depreſſes the external Ear. See AURIS.

DEPURATIO, Depuration, the ſame as Clarification, or Purification, is the Purging a Body of all the Lees, Fæces, and other groſs, coarſe, and excrementitious Parts. The Chymiſts by this Word mean an Exaltation.

DEPURATORIA FEBRIS. A Fever thus call'd by the illuſtrious *Sydenham*, which prevail'd much in the Years 1661, 1662, 1663, and 1664. This, ſays he, ſeems to be the only one, as far as I could hitherto obſerve, in which Nature regulated all the Symptoms in ſuch a manner as to fit the febrile Matter, prepared by proper Concoction, for Expulſion, in a certain time, either by a copious Sweat, or a freer Perſpiration; and, upon this account, I call it the *Depuratory Fever*. And, in reality, I am inclined to believe, that this is the capital and primary Fever of Nature, as well with reſpect to the regular Method which Nature uſes in promoting and accompliſhing the Digeſtion of the morbific Matter at the appointed Time, as alſo becauſe it occurs more frequently than other Fevers; and it ſeems reaſonable to think, that the neceſſary and excellent Rules left us by *Hippocrates*, and other antient Phyſicians, are adapted to this primary Fever; by means of which it is to be regulated in ſuch a manner, that the febrile Matter may be prepared to make a proper Criſis by Sweat.

Beſides the Symptoms which accompanied other Fevers, the preſent Fever had theſe in particular: A great Anxiety and Faintneſs, Vomiting, a dry and black Tongue, great and ſudden Loſs of Strength, a Dryneſs of the external Parts, the Urine conſtantly either turbid or thin, both of them here equally Signs of Crudity; a Looſeneſs in the Decline, (unleſs the Phyſician happen'd to prevent it, by taking proper Meaſures in the Beginning) whereby the Diſeaſe was prolonged, and render'd more obſtinate; but, in its own natural Courſe, it ſeldom laſted above fourteen or one-and-twenty Days, when it went off with Sweat, or rather a gentle Moiſture; nor did any proper Signs of Concoction appear before in the Urine, but at this time they generally did.

Other Symptoms alſo aroſe, when this Diſtemper was unſkilfully treated: However, not only theſe, but the Nature of the Diſtemper itſelf, will more clearly appear from the particular Method which I formerly adapted to this Fever, and which I ſhall here ſpecify; tho', at that time, I was not aware of there being any other Species of Fever in Nature.

My firſt Obſervation is, That the irregular Commotion rais'd by Nature in the Blood, either as a Cauſe or Concomitant of this Fever, is excited, in order to ſeparate from it a certain heterogeneous Matter contain'd therein, and prejudicial thereto; or elſe to change the Blood itſelf into a new State.

And here I rather chuſe to make uſe of the general Word *Commotion*, than Fermentation or Ebullition, in order to prevent all fruitleſs Diſputes about Words, which might ariſe from the Uſe of thoſe, which, tho' they may ſeem harſh and metaphorical to ſome, are capable of a commodious Interpretation. For tho' the Commotion of the Blood in Fevers, at different times, reſembles the Fermentations and Ebullitions of vegetable Liquors; yet there are thoſe, who think this Commotion very different from both, in more reſpects than one: For Example, they ſay, fermenting Liquors acquire a vinous Nature, ſo as to afford an inflammable Spirit by Diſtillation, and to be eaſily convertible into Vinegar, which yields an acid Spirit by the ſame Treatment; yet neither of theſe Changes have been hitherto obſerved in the Blood. Again, Fermentation and Depuration are both carried on, at one and the ſame time, in vinous Liquors; whereas the Depuration of the Blood in Fevers does not accompany, but follow the Exeſtuation; as appears, even to the Eye, by the Solution of a Fever-fit by Sweat.

As to Ebullition, this Analogy, they ſay, is ſtill more foreign, and, in many Caſes, contrary to Experience, where the Commotion of the Blood is too gentle to deſerve the Title of Ebullition. But, not to engage in theſe Controverſies, ſince the Terms *Fermentation* and *Ebullition* have prevail'd among modern Phyſicians, I likewiſe have not ſcrupled to uſe them occaſionally, meaning only to convey my Thoughts more eaſily thereby. Moreover, that this febrile Commotion of the Blood is raiſed by Nature, in order to ſeparate an heterogeneous and noxious Matter, appears from eruptive Fevers, in which an excrementitious Matter of a vitiated Quality, that lay conceal'd in the Blood, is, by means of the Ebullition, thrown out upon the Skin.

Nor is it leſs clear to me, that a febrile Commotion of the Blood often tends only to introduce a new State of that Fluid; and that a Man, whoſe Blood is pure and untainted, may be ſeiz'd with a Fever; for Fevers frequently appear in healthy Bodies, where there was before no previous Indiſpoſition, either from a Plethora, Cacochymia, or tainted Air, that could give Riſe thereto. Yet, even in theſe Caſes, upon ſome remarkable preceding Change of the Air, Diet, and others of the Non-naturals, a Fever preſently ariſes, upon account of the Blood's affecting a new State, or Diſpoſition, ſuch as this Air and Diet require; and not becauſe the Irritation of vitiated Particles, latent in the Blood, brings on the Fever: Tho' I make no Queſtion, but the Matter regularly diſcharged in the Deſpumation of the Blood, after the febrile Commotion, may prove vitiated, tho' the Blood before was in a good State; which is not more ſtrange, perhaps, than that ſome Parts of our Food ſhould corrupt, and become fetid, after having undergone a remarkable Alteration in the Body, and been ſeparated from the reſt.

With reſpect to this Diſeaſe, I judge, that the genuine Indications are, to keep the Commotion of the Blood within ſuch Bounds as ſuit the Deſign of Nature, ſo as to prevent its riſing too high, on the one hand, whence dangerous Symptoms might follow; or ſinking too low, on the other, whereby either the Excluſion of the morbific Matter might be hinder'd, or the Endeavour of the Blood, affecting a new State, be fruſtrated. And hence, whether the Fever be owing to the Irritation of any heterogeneous Matter, or to the Blood's attempting a new Change, the Indication of the Diſtemper will, in either Caſe, be the ſame; and, upon this Foundation, I proceed to the Cure in the following Manner.

When the Blood is weak, as it generally is in Children, or wants its due Proportion of Spirits, as in declining Age, or even in young Perſons worn out by a lingering Illneſs, I refrain from Bleeding: Otherwiſe the Blood, being already too weak, even without taking any of it away, might prove abſolutely unequal to the Buſineſs of Deſpumation; whence the whole Maſs becoming corrupted, Death might eaſily enſue. Thus a haſty Check can ſcarce be put to the Fermentation of Wine, without injuring the Liquor; for Nature cannot bear the corrupted Particles ſhe once began to throw off, which, tho' they were pure, whilſt equally mix'd with the Blood, now ſtrongly tend to taint the reſt of the Juices. I am well aware, however, that, where Bleeding has been imprudently put in Practice, the Patient may be ſometimes ſaved by means of proper Cordials, and the Blood reduced to a proper Temper for performing the neceſſary Deſpumation; but Prevention is preferable to a Cure.

When the Blood happens to be of a contrary Diſpoſition, as it uſually is in young Perſons of a ſtrong and ſanguine Habit, I eſteem Bleeding the firſt Step to the Cure; and that it is not to be omitted without Danger, except in the Caſes hereafter mention'd; for, without it, not only Delirium, Phrenſies, and the like Diſorders, from Inflammation, might ariſe from too great an Effervеſcence of the Blood; but alſo the Circulation might be obſtructed, or the whole Maſs, in a manner, ſtagnate from its Exceſs in Quantity.

As to the Proportion, I uſually take away no more than I conceive may prevent thoſe Inconveniences, which might proceed from an immoderate Commotion of the Blood; afterwards regulating the Degree of Heat, by repeating or omitting Bleeding

ng occaſionally, together with the free or ſparing Uſe of warming Cordials; and, laſtly, by promoting or checking the Stools, as I obſerve the Commotion to prevail or languiſh.

After Bleeding, where it was neceſſary, I carefully inquire, whether the Patient has had any Vomiting or Retching at the Beginning of the Fever; and, if he has, I order an Emetic; unleſs the tender Age, or ſome remarkable Weakneſs, of the Patient ſhould contraindicate. Where a Retching has precedod, a Vomit is ſo neceſſary, that, unleſs the Humour be expel'd, it produces ſeveral other different Symptoms, not eaſy to be removed in the Courſe of the Cure, and highly dangerous to the Patient. The principal and moſt common of theſe is a Looſeneſs, which generally happens in the Decline of the Fever, if Emetics were omitted, when they were indicated; for, in the Progreſs of the Diſtemper, when Nature has, in ſome degree, ſubdued the malignant Humour in the Stomach, and thrown it lower, it, by its Acrimony, and the conſtant Supply derived from above, ſo corrodes the Inteſtines, that a Looſeneſs muſt neceſſarily follow. I have, however, obſerved, in ſuch inflammatory Fevers as are commonly call'd malignant, that, tho' a Vomit has been omitted, when Retchings at firſt appear'd, yet a Diarrhœa does not neceſſarily follow, as it did in the preſent.

Now the Danger of this Diarrhœa lies here, that it farther debilitates the Patient, already ſufficiently weaken'd by the Diſeaſe; and, what is ſtill worſe, happens in the Decline of the Fever, when the Blood ought to collect itſelf, and exert its Force to finiſh the Buſineſs of Deſpumation, but is hinder'd by this Evacuation.

What makes it ſtill plainer, that this Humour lodged in the Stomach, if not diſcharged by a Vomit, may bring on a Looſeneſs afterwards, is, that, upon Examination, we ſcarcely find any Inſtance of a Looſeneſs attending this Fever, but where the Patient was inclined to vomit at the Beginning, and an Emetic was not given; as, on the other hand, tho' this Inclination to vomit be over, yet the Looſeneſs generally ſtops, upon giving a Vomit, provided the Patient be ſtrong enough to bear it: And I have frequently obſerved, that, upon the coming on of a Looſeneſs in this Caſe, Aſtringents, either internally or externally given, have very little, if any, Effect in ſtopping it.

The Emetics I generally uſed were of this Kind:

> Take of the Infuſion of Crocus Metallorum, otherwiſe call'd Vinum Benedictum, ſix Drams; Oxymel of Squills, and compound Syrup of Scabious, each half an Ounce: Mix them for a Vomit.

I directed it to be given in the Afternoon, two Hours after a light Dinner; and, to make it work the ſafer and better, I order'd three Quarts or a Gallon of Poſſet-drink to be in Readineſs, becauſe this kind of Emetic is dangerous, unleſs plentifully diluted; and, therefore, as often as the Patient vomited or purged, he was directly to take a Draught of the Poſſet-drink; by which means Griping was prevented, and the Vomiting render'd more eaſy.

When I have ſometimes happen'd carefully to examine the Matter here thrown up by Vomit, and found it neither conſiderable in Bulk, nor of any remarkable bad Quality, I have been ſurpris'd how it ſhould happen, that the Patient has been ſo much relieved thereby; for, as ſoon as the Operation was over, the ſevere Symptoms, ſuch as the Nauſea, Anxiety, Reſtleſſneſs, deep Sighing, Blackneſs of the Tongue, and the like, uſually abated, and went off, ſo as to leave the Remainder of the Diſeaſe more tolerable.

I muſt here remark, that, in Fevers and the Small-pox, there is much Reaſon to believe, that the more modern Practice has very injudiciouſly ſubſtituted Ipecacuanha in the room of antimonial Vomits. Theſe laſt operate more roughly than the former; but at the ſame time, as I have frequently obſerved, afford more Relief.

We ſhould not omit, that, if the State of the Patient requires both Bleeding and Vomiting, it is ſafeſt to bleed firſt, and give the Vomit afterwards; otherwiſe there would be Danger, that, whilſt the Blood-veſſels are greatly diſtended, the violent Motion in Vomiting might burſt the Veſſels of the Lungs, or hurt the Brain, and occaſion a Vomiting of Blood, or a mortal Apoplexy: Of which I could give ſome Inſtances, if it were proper; but my Deſign is only to give Caution.

As to the Time of giving a Vomit, I would have it done at the Beginning of the Fever, if poſſible, in order to prevent thoſe terrible Symptoms ariſing from a Collection of Humours in the Stomach, and Parts adjacent: And thus, perhaps, the Diſtemper may be cruſh'd in its Infancy, which might otherwiſe increaſe, and prove both obſtinate and dangerous, whilſt ſupplied by theſe Humours, which, entering into the Receſſes of the Body, may mix with the Maſs of Blood; or, growing more corrupted by longer Continuance, communicate a malignant Quality thereto. We have an Inſtance of this in the *Cholera*; where, if we unſeaſonably endeavour to ſtop the Vomiting, whether by Laudanum or Aſtringents, and the Attempt ſucceeds, we ſometimes bring on a no leſs dangerous Train of Symptoms: For the acrimonious and corrupted Humours, which ought in ſome meaſure to be diſcharged, being by this means detain'd, exert their Force upon the Blood, and raiſe a Fever, which uſually proves of a bad Kind, and is accompanied with dangerous Symptoms, ſo as ſcarcely to be removed, without giving a Vomit; even tho' the Patient has then no Tendency to ſuch an Evacuation.

But if, as it frequently happens, the Phyſician is call'd ſo late, that a Vomit cannot be given at the Beginning of the Fever; yet I ſhould judge it proper to give one at any time of the Diſtemper, provided the Patient is not too weak to bear it. I have ſucceſsfully order'd an Emetic on the twelfth Day of the Diſtemper, even tho' the ſpontaneous Retchings were over; and by this means have ſtopt the Looſeneſs, which hinder'd the Blood from finiſhing its Depuration; and I ſhould not ſcruple attempting the ſame later, if the Strength of the Patient permitted.

In the Evening, after the Operation, I always endeavour to quiet the Diſturbance raiſed in the Juices by the Emetic, and to procure Sleep; and therefore direct a paregoric Draught to be taken, at Bed-time, after the following manner:

> Take of the diſtil'd Water of red Poppies, two Ounces; Aqua-mirabilis, two Drams; Syrup of white and red Poppies, each half an Ounce: Mix the Whole for a Draught.

But if there be no Danger of raiſing too great an Effervеſcence, either on account of plentiful Bleeding, in the Courſe of the Cure, frequent Vomiting or Purging, from the Uſe of an Emetic, the preſent Diſappearance of the Fever, its Mildneſs, or its natural Decline; then, inſtead of the Draught above ſet down, I give, without Apprehenſion of Danger, a ſufficiently large Doſe of Dioſcordium, either alone, or mix'd with ſome Cordial-water: And this is an excellent Medicine, provided it be given in a due Quantity.

Under the Article of Vomits, we ſhould not omit to obſerve, that it is by no means ſafe, at leaſt in this Fever, to give ſuch as are made with the Infuſion of Crocus Metallorum, even in the ſmalleſt Quantity, to Children under the Age of Fourteen. It were, indeed, to be wiſh'd, that, inſtead of this Emetic, we had others of a ſafer Kind, yet ſo ſufficiently efficacious, as thoroughly to diſcharge the Humour, which, in the Decline of this Fever, generally brings on a Looſeneſs; or, at leaſt, that we were poſſeſs'd of ſome proper Remedy for changing or diſſolving this corroſive Matter, and blunting its Force, ſo as to hinder it from producing a Diarrhœa. It has often been a Difficulty with me, when call'd to Infants and Children in a Fever, and obſerving an Emetic indicated, whereby they might have been preſerved from Danger, that I durſt not give this Infuſion, for fear of bad Conſequences; but, in grown Perſons, I have hitherto found no ill Effect from it, provided it were given with the Cautions above-mention'd.

When the Affair of Vomiting is over, I next conſider,

1. Whether, notwithſtanding the preceding Evacuations, the Blood may not ſtill hurry on ſo faſt, as to require a Check. Or,

2. On the other hand, whether it may not languiſh ſo much as to require quickening. Or, laſtly,

3. Whether the Fermentation is now brought to ſuch a proper State or Degree, as that it may be ſafely left to itſelf.

Something muſt be ſaid to each of theſe Caſes.

1. If the Blood hurries on ſo faſt, as to give a juſt Suſpicion of a Delirium, or other bad Symptom, coming on, the Day after the Emetic I generally preſcribe a Clyſter:

> Take of the common Decoction for Clyſters, one Pint; Syrup of Violets, and brown Sugar, each two Ounces: Mix them for a Clyſter.

This Clyſter I order to be repeated occaſionally; by which means the Blood is often ſo refreſh'd and cool'd, as ſufficiently to check its Effervеſcence. It ſometimes, likewiſe, becomes neceſſary to repeat Bleeding once or twice, as particularly in Perſons of a very ſanguine Conſtitution, and in the Vigour of Life, or ſuch as have inflamed their Blood by uſing Wine too freely; tho' there is ſeldom Occaſion for ſo capital a Remedy as repeated Bleeding; and, therefore, Clyſters may ſuffice to check the Effervеſcence, except in the Caſe juſt now mention'd. If, therefore, the Effervеſcence of the Blood be too high, I order a Clyſter to be injected, either every Day, or every other Day, as the Caſe requires; and this I continue to do, till about the tenth Day of the Diſtemper.

But, when a large Quantity of Blood has been taken away, or the Patient is in Years, I, at this time, order no Clyſter, tho' the Effervеſcence of the Blood ſhould be conſiderable; for, in theſe Caſes, as we need not fear its riſing ſo high, without the

the Uſe of Clyſters, as to bring on any great and dangerous Symptoms; ſo, on the other hand, it is certain, that the Strength and Texture of the Blood may be ſo impair'd and relax'd by the Uſe of them, as to diſturb and hinder the Procedure of Nature, eſpecially if the Patient be in Years; for Clyſters do not ſucceed ſo well in the Old, as in the Young. But if only a little Blood has been taken away, then, as was ſaid before, I continue the Uſe of Clyſters to about the tenth, and ſometimes to the twelfth Day, as, particularly, when I durſt not bleed at all: For ſome Perſons are ſeiz'd with a continual Fever, after an autumnal Intermittent, whether tertian or quartan, from a Want of Purging at the Cloſe of the preceding Diſtemper; and, if Blood ſhould be taken away in this Caſe, there is Danger of the Sediment, depoſited in the former Fermentation, being reabſorb'd into the Maſs of Blood, and occaſioning freſh Diſorders. Inſtead of Bleeding, therefore, in ſuch Caſes, I continue to uſe Clyſters to the twelfth Day, if the Patient be young, and the Fermentation too violent.

2. On the other hand, whether Bleeding has been uſed or not, if the Efferveſcence of the Blood ſinks too low, and requires raiſing, in order to aſſiſt Nature in her Work, in this Caſe I judge, that no Clyſter ſhould be injected, even before the tenth Day, and much leſs afterwards; otherwiſe we might thus farther check the Fermentation, now already too languid of itſelf. But to uſe Clyſters after this time, that is, in the Decline of the Diſtemper, would be as abſurd as to ſtop the Fermentation of Wine, before the Deſpumation was perform'd, by opening a large Vent-hole; for a Clyſter here would hinder Nature in her vigorous Endeavour to throw off the morbific Matter.

But, when once the Patient is out of Danger from thoſe Symptoms ariſing from too great an Ebullition, either by means of proper and ſeaſonable Evacuations; or becauſe the Diſeaſe begins to decline ſpontaneouſly, the more coſtive he is kept, the more ſecure I judge him, the febrile Matter then proceeding more kindly and gently to Concoction. And, therefore, if the preceding Evacuations ſhould either actually diſſolve, or tend to diſſolve, the Maſs of Blood, or the Fever go off before its due Time, or ſhould have arrived at its full Period, I not only refrain from the Uſe of Clyſters, but alſo call in the Aſſiſtance of Cordials, and directly endeavour to prevent a Purging.

Cordials, as I have experienced, when given too ſoon, do Miſchief; and, unleſs Bleeding has preceded, may drive the crude Matter of the Diſtemper upon the Membranes of the Brain, or the Pleura; and, therefore, I never give them, when either no Blood, or very little, has been taken away; or when no other conſiderable Evacuation has been made; or the Patient has not paſs'd the Meridian of Life: For, whilſt the Blood remains rich enough of itſelf, it ſhould not be more enrich'd to the endangering the Patient; nor does it require to be raiſed, ſo long as no remarkable Evacuations have diminiſh'd its natural Heat. Such kind of Patients have Cordials within them, which render external ones either ſuperfluous, or prejudicial; and, therefore, I here either uſe none at all, or thoſe of the weakeſt Sort.

But, if the Patient ſhould be greatly weaken'd and diſpirited by copious Evacuations, or be in the Decline of Life, I uſually allow of Cordials, even in the Beginning of the Fever; and on the twelfth Day, when the Buſineſs of Separation is at hand, I judge a freer Uſe of the hotter Remedies allowable; and they might be given earlier, if there is no Danger of the febrile Matter's falling upon the principal Parts; for, at this time, the more the Blood is heated, the more the Buſineſs of Concoction is promoted.

I cannot imagine what Phyſicians mean by their frequent Precepts for giving Remedies to promote the Concoction of the febrile Matter, which they often talk of, in the Beginning of the Diſtemper; tho', at the ſame time, they order only ſuch Medicines as may moderate the Fever: For the Fever itſelf is no other than the Inſtrument of Nature, by means whereof ſhe ſeparates the vitiated Parts of the Blood from the ſound; tho' ſhe does this in a manner perfectly imperceptible at the Beginning, and even at the State, of the Diſtemper; but more manifeſtly in the Decline thereof, as appears from the Sediment in the Urine. The Concoction of the febrile Matter, here, means no more than a Separation of the morbific Particles from the healthy; whence the Way to haſten this Concoction is not by moderating the Fever, but the Efferveſcence muſt be kept up ſo long as the Safety of the Patient will give Leave: But, when the Diſeaſe is in the Decline, and the Separation becomes manifeſt, warmer Medicines ſhould be immediately given, in order to finiſh the Operation with greater Certainty and Expedition: And this is properly promoting the Concoction of the febrile Matter; whereas I have frequently found, that Evacuations and Coolers hinder the Cure, and retard the Recovery, which was now approaching. But, if the Fermentation advances ſufficiently, Deſpumation will be perform'd about the fourteenth Day; whereas if Coolers are given too late, ſo as to check the Efferveſcence, 'tis no Wonder if the Fever runs on to the twenty-firſt Day, or even much longer, in Perſons extremely weaken'd with improper Treatment.

It is remarkable here, that, tho' the Patient may ſometimes ſeem to be a little relieved by the Uſe of Clyſters, or other Purgatives, unſeaſonably directed, about the Decline of the Diſtemper, and even, perhaps, to be totally freed from the Fever; yet, a Day or two after, it happens, that the former Fever does not ſo much appear to return, as a new one to ariſe; for Chilneſs and Shivering preſently come on, and are ſoon follow'd by Heat, and a Fever; which, unleſs it happens to degenerate into an Intermittent, runs its Courſe as already deſcrib'd. In this Caſe, the Patient is to be treated in the ſame manner as if he had not had the Fever before; for, tho' it be an afflicting Conſideration to the weaken'd Patient, the Depuration, conſequent upon this new Efferveſcence, will not be perform'd in leſs than fourteen Days.

I ſhall next ſet down the Cordials which I generally uſe in this Diſtemper, the milder of which I employ at the Beginning, when the Ebullition is violent; and gradually proceed to the hotter, according as the Fever, or the Degree of Ebullition, requires; always obſerving, where Bleeding was freely uſed, or the Patient was in Years, to adminiſter thoſe of a ſtronger Kind, than when no Blood had been taken away, or the Patient was in the Vigour of Life.

The milder Cordials I mean, are ſuch, for Example, as are made of the diſtil'd Waters of Borrage, Citrons, Strawberries, the compound Scordium-water, with a Mixture of the Syrup of Baum, Cloves, or of the Juice of Citrons, and the like. But the ſtronger are *Gaſcoign*'s Powder, Bezoar, Confection of Hyacinth, *Venice* Treacle, with others of the ſame Kind. The following Preſcriptions were frequently uſed:

Take of the diſtil'd Waters of Borrage, Citron, black Cherries, and compound Scordium-water, each two Ounces; Barley Cinnamon-water, one Ounce; prepared Pearls, two Drams; fine Sugar, two Ounces, or a ſufficient Quantity: Mix them together. Take four Spoonfuls of this Mixture often in a Day, eſpecially when faint.

Take of the diſtil'd Waters of the whole Citron, and Strawberries, each three Ounces; *Aqua Cordialis frigida Saxonix*, one Ounce; Treacle-water, Syrup of Baum of *Fernelius*, and of the Juice of Citron, each half an Ounce: Mix them for a Julap, ſome of which is to be taken frequently.

Take of *Gaſcoign*'s Powder, Oriental and Occidental Bezoar, and *Lapis Contrayerva*, each a Scruple; a ſingle Leaf of Gold: Reduce the Whole to a fine Powder, of which take twelve Grains, as often as there ſhall be Occaſion, in Syrup of the Juice of Citron, and Cloves, each two Drams; drinking after it a few Spoonfuls of the Julap above directed.

Take of Treacle-water, four Ounces; the Seeds of Citron, two Drams: Beat them together, and make an Emulſion. To the ſtrain'd Liquor add Sugar, enough to ſweeten it to the Taſte. Take two Spoonfuls of it thrice a Day.

It would be ſuperfluous to add any more Forms of Medicines, becauſe a larger Number are, or may be, of Uſe in the Courſe of the Diſtemper, and require to be varied according to its different Stages, and the different Symptoms ariſing therein.

But when the Fermentation neither riſes too high, nor ſinks too low, I leave it in that State, without preſcribing any Medicines, unleſs thro' the Importunity of the Patient, or his Friends; and then I direct ſuch only as may ſatisfy, without doing any Injury.

I ſhould not omit, that frequently, when I was call'd to Perſons of low Circumſtances, I order'd them to do nothing elſe, after Bleeding and Vomiting, when required, but to keep in Bed, during the whole Courſe of the Diſtemper, and to ſup only Water-gruel, Barley-gruel, and the like; to drink moderately warm ſmall Beer, to quench their Thirſt; and to take a Clyſter of Milk and Sugar every Day, or every other Day, till the tenth or twelfth Day of the Diſtemper; but towards the End of the Fever, when the Separation was begun, and proceeded ſlowly, to promote it, I allow'd them, now-and-then, a little ſtronger Malt-liquor, inſtead of Cordials. And thus, without any thing farther, except a gentle Purge at the End of the Diſtemper, they generally recover'd.

If the Method above deliver'd was carefully obſerved, I commonly, about the fifteenth Day, found it proper, from the laudable Separation in the Urine, and a manifeſt Abatement of all the Symptoms, to order a purging Potion to drain off the Sediment depoſited upon particular Parts by the preceding Fermentation; and, unleſs this was ſeaſonably done, that Sediment might return into the Maſs of Blood, and occaſion a Return of the Fever; or, by its Continuance in the Parts where it

lodged,

lodged, produce obſtinate Diſorders in the Body: For, the Separation being over, the groſs and vitiated Humours, tranſmitted from the Arteries to the Veins, eaſily prevent the Return of the Blood; whence various Kinds of Obſtructions, and, at length, new Ferments, ariſe.

But it may be here obſerved, that Purging is not ſo neceſſary after vernal as after autumnal Fevers, becauſe the Sediment depoſited by the former is neither ſo copious, nor of ſuch an earthy malignant Nature, as in the latter; which holds alſo in the Small-pox, and many other Diſtempers, which rage in the Spring; ſo that here, as far as I have obſerved, it is not ſo dangerous to omit Purging, as in the Caſes before-mention'd. And it ſeems to me, that more Diſtempers ariſe from an Omiſſion of Purging after autumnal Diſorders, than from any other ſingle Source.

If the Patient happens to be very weak, or the Depuration not perfectly perform'd, ſo as to render it unſafe to give a Purge on the fifteenth Day, I defer it to the ſeventeenth; and then preſcribe the following, or a ſimilar purging Potion, in proportion to the Strength of the Perſon:

Take of Tamarinds, half an Ounce; the Leaves of Sena, two Drams; Rhubarb, one Dram and a half: Boil them together in a ſufficient Quantity of Water, ſo as to leave three Ounces, when ſtrain'd off; in which diſſolve Manna, and ſolutive Syrup of Roſes, of each an Ounce: Mix the Whole for a purging Potion, to be taken in the Morning faſting.

I always order the Patient to keep his Bed, till he is purged; then permit him to riſe, and, by degrees, return to his ordinary Manner of Living. The Diet I order, to this Time, is nearly the ſame with that above-mention'd, as Water-gruel; Barley-gruel; Panada made of Bread, the Yolk of an Egg, Water, and Sugar; thin Chicken-broth; ſmall Beer; to which, when the Fever is high, a little freſh Juice of Oranges may be added, it being firſt juſt boil'd over the Fire, to take off the Crudity, with the like; tho' Water-gruel is the beſt of all. But to forbid the drinking of ſmall Beer, in ſmall Quantities, is an unneceſſary Severity, and often pernicious.

It ſometimes happens, eſpecially in the Aged, that tho' the Fever is cured, and the Body, perhaps, rather too much purged, that the Patient ſtill remains very weak; and, with coughing or ſpitting, expectorates a large Quantity of viſcid Phlegm: A Symptom terrifying not only to the Patient, but alſo to the Phyſician, if not appris'd of it, who might otherwiſe miſtake it for a beginning Conſumption; tho' I have found it no ways dangerous. In this Caſe, I order a Glaſs of old Malmſey or Muſcadel Wine, with a Toaſt; which, by ſtrengthening the Texture of the Blood, (weaken'd by the preceding Fever, and therefore render'd unfit to aſſimilate the Juices of the Aliment lately taken in) removes this Symptom in a very few Days, as I have found by repeated Experience.

By the Method here laid down, many Symptoms and Diſorders will be prevented, uſually attributed to Malignity; nothing being more common with Phyſicians, unſkil'd in their Profeſſion, than to cry out upon Malignity, when, by too cooling Remedies, or the unſeaſonable Uſe of Clyſters, they have weaken'd the Texture of the Blood, and reduced Nature ſo low, whilſt ſhe was performing the Office of Separation, as to bring on Faintings, and other bad Symptoms, which are the genuine Effects of ſuch perverted Rules of Art: But if the long Continuance of the Diſeaſe ſhould wipe off this Aſperſion of Malignity, whatever afterwards obſtructs them in the Cure, they impute to the Scurvy; tho', in reality, the Symptoms, which happen'd in the Height of the Diſeaſe, were neither owing to Malignity, nor thoſe, which appear'd in the Decline, to the Scurvy; but both of them to wrong Management, as I have frequently obſerved. Not that I, or any other Phyſician, who is acquainted with the Hiſtory of Diſeaſes, will ſay, that there are no Fevers of a malignant Nature; for there are manifeſt Signs of ſuch; nor will I deny, that a Fever may be ſometimes complicated with a Scurvy, and other Diſorders; but what I aſſert is, that both Malignity and the Scurvy are here frequently accuſed, without any Reaſon.

When the Fermentation of the Blood proceeds in a proper Manner, the Deſpumation of the morbific Matter will be finiſh'd in the Time above-mention'd; but if cooling Remedies, or Clyſters, are given too late, the Fever will run to a much greater Length, eſpecially in aged Perſons, who have been improperly treated. When I have ſometimes been call'd to ſuch, after they had ſtruggled with the Fever above forty Days, I have uſed my utmoſt Endeavours to procure the Deſpumation of the Blood, which was now ſo far weaken'd, partly by Age, and partly by Clyſters, and cooling Medicines, that I could not obtain the End propoſed, either by Cordials, or any other ſtrengthening Remedies; but either the Fever maintain'd its Ground, or, if the Patient ſeem'd free from a Fever, his Strength was almoſt quite exhauſted.

But when other Means fail'd me, I have made uſe of a ſingular Expedient with great Succeſs, that is, the Application of the Heat of ſtrong and healthy Men; nor will it be found ſurpriſing, that, by this uncommon Means, the Patient ſhould be conſiderably ſtrengthen'd, and debilitated Nature aſſiſted, ſo as to diſburden herſelf, and throw off the Remains of the morbific Matter; for it is eaſy to apprehend, that a conſiderable Quantity of ſound wholſome Effluvia will thus paſs from a robuſt, healthy Body into the exhauſted Body of the Patient; and I have never found the repeated Applications of warm Napkins to prove near ſo ſerviceable as this Method, where the Heat applied is not only more natural to the human Body, but alſo more mild, moiſt, equable, and conſtant. And this Way of tranſmitting, perhaps, balſamic Spirits and Exhalations into the Body of the Patient, has alſo ſince been ſucceſsfully us'd by others. Nor do I think it below me to mention this Expedient, whatever Cenſure may be paſſed upon me for it by ſuch as deſpiſe whatever is vulgar, becauſe, I think, the Health and Benefit of Mankind ought to be prefer'd to their falſe Opinion of things.

By carefully purſuing the Method hitherto deliver'd, the greater Part of the bad Symptoms, which either accompany or follow upon this Fever, will be prevented; which otherwiſe, in the Courſe of the Cure, frequently perplex the Phyſician, and prove fatal to the Patient, tho' the Diſeaſe itſelf ſhould have no ſuch deſtructive Tendency. But, as ſuch Accidents are common, if the Phyſician comes too late, be negligent, or unſkilful, I will here briefly treat of the Cure of thoſe Symptoms, which, when they happen, require a peculiar Treatment, tho' they might generally have been prevented, by keeping cloſe to the above-mentioned Method.

And, firſt, if a Delirium be occaſion'd, either by the early and unſeaſonable Uſe of heating Medicines, or the Patient's being naturally of a hot Conſtitution; or, which is nearly the ſame, if he has conſtant Watchings, ſpeaks haſtily, looks wild, drinks his Medicines or other Liquors eagerly, or has a Suppreſſion of Urine; in this Caſe, I bleed more freely, order Glyſters, and cooling Medicines, particularly in the Spring; at which time, ſuch as are young and florid, tho' free from this Symptom, may be treated in the ſame manner, without much Danger.

By theſe Means I endeavour to ſupport the Patient, till the Diſeaſe has run to a certain Length; when I find it eaſy to take off both that and the Delirium by a large Doſe of ſome Opiate: For Anodynes, properly given in the Decline, are very beneficial; whereas they prove of no Service whilſt the Fever is high, tho' given in the largeſt Doſe, as being unable to ſtop the violent Courſe of the Fermentation; but principally becauſe the peccant Matter, then equally mix'd with the Blood, and not ripe for Separation, is confin'd; whence the expected Depuration is hinder'd. Whether this be the Reaſon of the thing, or it proceeds from ſome more latent Cauſe, I leave to the Determination of others.

This, however, I can affirm from numerous Obſervations, that Laudanum, or any other Narcotic, us'd to take off this Symptom, whether in the Beginning, Increaſe, or Height of this Fever, was either ineffectual, or prejudicial; whereas a moderate Doſe in the Decline proved ſucceſsful. I once order'd a Narcotic upon the twelfth Day of the Diſeaſe with Succeſs; but never knew it given ſooner to Advantage; and, if it be defer'd to the fourteenth Day, when the Separation is more perfect, it will prove ſtill more beneficial; for I have frequently obſerv'd, that the Delirium may be diſregarded, till it is proper to give an Opiate, provided the Diſorder be not increas'd by the Uſe of Cordials, and heating Medicines, which may here prove mortal. The Opiates I uſually preſcribe, are either *London* Laudanum to a Grain and a half, or the following:

Take of Cowſlip-flowers, one Handful; boil them in a ſufficient Quantity of black Cherry-water to leave three Ounces, when ſtrain'doff; to which add Syrup of white Poppies, half an Ounce; Juice of Lemons, half a Spoonful: Mix the Whole together. Or,

Take of black Cherry-water, one Ounce and a half; Plague-water, two Drams; liquid Laudanum, ſixteen Drops: Mix them together.

It may be proper to add, that if this Symptom be not very urgent, and the Fever be prolong'd, ſo as that the Patient may be ſafely purg'd before an Opiate is given, it will then be attended with greater Succeſs; and therefore I uſually direct two Scruples of the Pil. Cochiæ, diſſolv'd in Betony-water, to be taken ten or twelve Hours before the Opiate; and thus the Diſturbance this warm Purgative might otherwiſe occaſion, will be prevented by the Opiate, and an agreeable Sleep procur'd. But, if the Watching continues, after the Fever, and the other Symptoms, are gone off, I have known a Piece of Linen dipt in Roſe-water, and applied cold to the Temples and Forehead, prove of greater Service, than any kind of Opiate.

'Tis uſual for the Patient to be afflicted with a bad Cough during

during the whole Courſe of the Diſeaſe, ariſing from the violent Commotion of the Blood; whereby the Juices, being broke, are ſeparated from the Maſs, in its Circulation thro' the pulmonary Veſſels, and thrown upon the internal Membrane of the Trachea, which is of a fine Texture, and extremely ſenſible. The Cough is firſt dry, the Matter being then too thin to be expectorated; but the febrile Heat gradually thickens it, and ſoon renders it more tenacious; whence it is, with Difficulty, expectorated, and becomes ſubject to cauſe a Suffocation, for want of ſufficient Strength in the Patient to diſcharge it. In this Caſe, I ſeldom uſe any other Medicine, than freſh-drawn Oil of ſweet Almonds, unleſs, as it ſometimes happens, the Patient has an Averſion to Oil; and, if ſo, I endeavour to relieve him by the common Pectorals. Otherwiſe, I prefer the Oil of Almonds to all other pectoral Medicines, principally becauſe that, to anſwer any Intention, theſe muſt be given freely, and in large Quantities; whereby the Stomach, already too weak, and ſubject to Retchings, is overcharged; and, beſides, we are ſometimes, by this means, prevented from giving what is proper upon other Accounts.

Again, neither Reaſon nor Experience have yet convinced me, that the Uſe of this Oil is not to be allowed in Fevers, becauſe it is of an inflammable Nature, and conſequently may tend to increaſe the Diſtemper; for, granting it to be naturally hot, 'tis however certainly not ſo hot, but that the Advantages ariſing from its Uſe are greater than the Inconveniencies; for it is an excellent Pectoral, opens and lubricates the Paſſages, thereby promoting Expectoration, which, when copious, frees the Blood from the noxious Humour, now ſeaſonably ſeparated, and at the ſame time tends to cool; ſo that this Symptom thus proves of conſiderable Service; for which Reaſon I am not anxious about it. Let it, however, be obſerved, that 'tis unſafe to give ſeveral Spoonfuls of Oil of Almonds at once, as Retchings, and a Looſeneſs, may thereby be occaſioned; but the frequent Uſe of it in ſmall Quantities, throughout the Day and Night, not only eaſes the Cough, by promoting Expectoration, but, which is very material, the Patient, now almoſt worn out, is, in ſome meaſure, recruited by this kindly Nouriſhment.

Sometimes a Bleeding at the Noſe happens, either from giving too warm Medicines in the Beginning of the Fever, or from not ſufficiently depreſſing the Ebullition of the Blood, the Patient either being in the Prime of Life, or the Seaſon of the Year conſpiring with the Fever. Here the Means commonly made uſe of to check the Motion of the Blood will be of little Service; ſuch as Bleeding, Ligatures, aſtringent, agglutinant, and balſamic Remedies, tho' Recourſe may be had to theſe and the like Helps, according as they ſhall be judged proper; but the principal thing is, to ſtop the violent Ebullition of the Blood by a proper Medicine, tho' in reality, if this Symptom be conſidered apart, the Remedies above-mentioned, and particularly Bleeding, ſhould ſeem to be ſerviceable therein; nor have I ſcrupled to uſe them: Yet, as they do not (Bleeding excepted) ſtrike ſufficiently at the Cauſe of this Symptom, that is, the Ebullition of the Blood, 'tis imprudent to depend upon them. Therefore, in this Caſe, when all other Means had proved ineffectual, I uſually gave the following Draught:

Take of the diſtil'd Waters of Plantain, and wild Poppies, each an Ounce and a half; Syrup of white Poppies, ſix Drams; Syrup of Cowſlips, half an Ounce: Mix them together for a Draught.

But I judge it improper to put an immediate Stop to every Hæmorrhage after this manner; for it is frequently rather to be permitted; and may prove of great Service, ſometimes by abating the too violent Ebullition of the Blood, and at others, by proving critical, put an End to the Diſeaſe. And, in reality, no conſiderable Effect is to be expected from the above-mentioned Medicine, unleſs the Symptom has continued ſome little time, and Bleeding in the Arm preceded its Uſe. Again, it muſt be carefully remark'd, that this, and all other moderate Hæmorrhages, are peculiarly apt to return ſoon after a Stop has been put to them, unleſs a gentle Purge be given; which therefore muſt not be omitted, even tho' it ſhould ſeem too early to purge with reſpect to the Stage of the Fever, if this Symptom had not happened.

The Hiccup generally happens to the Aged, after an immoderate Looſeneſs, but principally after exceſſive Vomiting, and frequently prognoſticates imminent Death. I ingenuouſly own, that I have not been able to ſatisfy myſelf in my Inquiry into the Cauſe of this Symptom; but I have frequently obſerved it to ariſe from ſome Diſturbance raiſed in the Stomach, and adjacent Parts, by violent Medicines, not without great Danger to the Patient; becauſe Nature is unable to check and quiet this Commotion: And on this account I judged it proper to aſſiſt her by Art, by giving a large Doſe of Diaſcordium; for Inſtance, two Drams; which ſeldom fail'd to remove this Symptom, when the Seeds of Dill, and other celebrated Specifics, had proved ineffectual.

If, as above intimated, a Looſeneſs ſhould happen in the Courſe of the Diſeaſe, for want of giving a Vomit at the Beginning, when it was indicated by the Retchings, one ſhould be given at any time of the Diſeaſe, provided the Patient be ſtrong enough to bear it, even tho' the Tendency to that Evacuation has, for ſome time, ceaſed. But, as this has been largely treated of before, I ſhall only mention what is proper to be done, if a Looſeneſs ſhould happen, notwithſtanding an Emetic has been given; which is very ſeldom the Caſe, except in an inflammatory Fever, where this Symptom, ſo far from being prevented, is ſometimes occaſioned by a Vomit; which is an Obſervation of Conſequence. And here I have found the following Glyſter more efficacious, than any other Aſtringents:

Take of the Bark of Pomegranates, half an Ounce; red Roſes, two Pugils: Boil them in a ſufficient Quantity of Milk, ſo as to leave half a Pint of ſtrain'd Liquor, in which diſſolve half an Ounce of Diaſcordium: Mix the Whole for a Glyſter.

'Tis improper to inject a larger Quantity of this Glyſter than is here directed, tho' it be naturally aſtringent; becauſe the Inteſtines may be oppreſſed by its Bulk, whence the Looſeneſs will rather be promoted than checked.

But it may be ſaid, that, if a Diarrhœa ſhould appear, eſpecially in the Decline of the Diſeaſe, it is better to encourage than ſtop it, as it is ſometimes a critical Diſcharge, and terminates the Diſtemper. This undoubtedly may ſometimes be the Caſe; but it happens ſo rarely, as not to encourage one to attempt it: Beſides, the Reaſon before alledged, in treating of the Cure of Fevers in general, which tends to ſhew the Neceſſity there is of ſtopping the Flux, holds here alſo. And to this may be added, that, in order to the genuine Depuration of the Blood, it is not only neceſſary there ſhould be a Secretion of ſome feculent Parts, but there is further required a Separation of others by way of Efflorescence, as we daily ſee in other rich and heterogeneous Liquors. Conſequently, if the Looſeneſs be too much promoted, the Depuration will not be wholly completed, and perhaps the Matter, which ought to have been laſt expel'd, will paſs off firſt. I own indeed, that after the Separation by way of Efflorescence is finiſhed, which is uſually performed gradually and inſenſibly, and by means of a freer Perſpiration, rather than of a manifeſt Sweat, if then a Looſeneſs ſhould happen, it would be attended with little Danger: For it muſt be obſerved, that now it is only owing to a Neglect of purging in time; whence the Excrements, for want of being evacuated, contracting a kind of malignant Ferment, irritate the Inteſtines to diſcharge their Contents: Beſides, the very liquid Conſiſtence of the Excrements is a Proof, that the Looſeneſs ought not to be accounted a critical Solution of the Diſeaſe.

Poſſibly the Iliac Paſſion deſerves to be enumerated among the Symptoms conſequent upon Fevers, ſince it is ſometimes occaſioned by immoderate Vomiting in the Beginning of the Diſeaſe. This terrible Diſorder proceeds only from the inverted periſtaltic Motion of the Bowels, whoſe natural Formation is ſuch, as, by their many Folds, to promote the Deſcent of the Fæces in the propereſt Manner; and therefore, whenever they are forced to yield to a Motion oppoſite to that of their Fibres, a pungent Pain is occaſioned, which remains fix'd upon a particular Part, when either the Valve placed at the Beginning of the Colon, to prevent the Return of the Excrement into the Ileum, or any other Membrane belonging to the Cavity, ſingly ſuſtains the Force of this preternatural Motion. This inverted Motion, productive of the Pain, may proceed either from Obſtruction or Irritation.

It is manifeſt, that whatever blocks up the Paſſage of the Inteſtines, muſt occaſion this contrary Motion in them; and this may happen, according to Authors, from harden'd Excrements; from Flatulencies collected in the Bowels, and, as it were, purſing them up; from Strangulation on account of a Rupture; from Inflammation; and laſtly, from large Swellings filling up their Cavity. However, 'tis plain, that the inverted Motion, proceeding from theſe Cauſes, is rather to be accounted the Motion of the Aliment taken in, than of the Inteſtines themſelves; nor is it an Inverſion of the Motion of the whole Duct, but of thoſe Parts only, which are ſituated above the Seat of the Obſtruction; for which Reaſon I call it the ſpurious Iliac Paſſion.

I conceive the Inverſion of the periſtaltic Motion generally proceeds from acrid and peccant Humours being depoſited in the Stomach and adjacent Inteſtines, from the violent Fermentation of the Blood in the Beginning of the Fever, whereby the Motion of the Stomach is firſt inverted, and its Contents thrown up with Violence; and then the ſmall Guts, which are contiguous to it, being weaken'd, yield to the violent Motion of the Stomach; and at laſt the large Guts are alſo made to ſympathize with them. This is the true Iliac Paſſion, and the Diſorder under Conſideration. The Method of curing it has hitherto remain'd a Secret, notwithſtanding the Pretenſions of ſuch as have had recourſe to Quickſilver, and leaden Bullets, which do little Service, and are frequently very dangerous.

As

As ſoon as it appears, from Glyſters being vomited up, and other Signs, that the Diſeaſe is a true Iliac Paſſion, I endeavour to anſwer theſe three Intentions:

1. To put a Stop to the inverted Motion of the Stomach; which produces the ſame in the Inteſtines.

2. To ſtrengthen the Inteſtines, weaken'd by the ſharp Humours. And,

3. To free the Stomach and Bowels from theſe ſharp Humours.

I. I direct a Scruple of Salt of Wormwood, with a Spoonful of Lemon-juice, to be taken Morning and Night; and, in the Intervals, give ſome Spoonfuls of Mint-water by itſelf twice every Hour; by the repeated Uſe of which the Vomiting and Pain may be ſoon remov'd.

II. At the ſame time I order a live Puppy to be applied to the Belly, till the following Purgative is given.

III. Two or three Days after the Pain and Vomiting are gone off, I give a Dram of the greater Pil. Cochiæ diſſolved in Mint-water, and direct Draughts of Mint-water to be frequently taken during the Operation of the Purge, in order to prevent the Return of the Vomiting.

I have obſerv'd, that 'tis in vain to give this, or any other the ſtrongeſt Kind of Purge, before the Stomach be ſtrengthened, and reduced, together with the Inteſtines, to its natural Motion; for otherwiſe all Cathartics will prove emetic, and conſequently be more prejudicial than ſerviceable: And this Reaſon induced me to forbear Purgatives, till I had firſt uſed Stomachics a while.

The Diet I direct is very ſparing; for I allow the Patient only to ſup ſome Spoonfuls of Chicken-broth twice or thrice a Day, and confine him to his Bed during his Illneſs, and till the Signs of Recovery appear, directing him to continue the Uſe of the Mint-water for a conſiderable time after the Cure, and to keep the Belly warm, by wearing a double Flannel; whereby a Relapſe may be prevented, which happens more frequently in this than any other Diſeaſe.

In theſe few Particulars conſiſts my whole Method of curing this Diſeaſe; which, 'tis hoped, no one will deliberately contemn on account of its Simplicity, and the Want of Elegance of Language, and the Pomp of Medicine, to recommend it.

Thus I have enumerated the Symptoms that uſually happen in this Fever; but there are others I ſhall not now mention, as they are of leſs Moment, and require no particular Treatment, but go off ſpontaneouſly, if the Fever be ſkilfully treated. And let this ſuffice for the continued Fever of this Conſtitution, with its Symptoms. *Sydenham.*

DERAS, δέρας, a Sheep-ſkin, is the Title of a Book in Chymiſtry, treating of the Art of making Gold of baſer Metals, *Langius, Lib.* 1. *Ep.* 53. *Theat. Chym. Vol.* 1. *p.* 19. *Libavius, T.* 3. *p.* 211, 234. The Reaſon of the Name is, becauſe δέρας χρυσόμαλλον is the Sheep-ſkin which bore the golden Fleece, which, *Suidas* ſays, was a Book written on Parchment, or Sheep-ſkins, teaching the Art of making Gold.

DERBIA. A Name given by ſome Surgeons to the *Impetigo. Caſtellus.*

DERIS, δέρις, in *Hippocrates, Lib. de Artic.* is the ſame as δέρμα, Leather.

DERIVATIO, παροχέλευσις, ἀποχέλευσις, a Derivation, in Medicine, is when a Humour, which cannot be conveniently evacuated at the Part affected, is attracted thence, and diſcharg'd at ſome more proper Place in its Vicinity; or is drawn from a noble to a more ignoble Part, where it is leſs capable of doing Injury. See PHLEBOTOMIA.

DERMA, δέρμα, from δέρω, to excoriate, is the ſame as DERIS, which ſee.

DERMATODES, δερματώδης, from the preceding Word, Leather-like, is an Epithet of the *Dura Mater.*

DERQUET. Verniſh. *Rulandus.*

DERSES. An occult Fume or Vapour of the Earth, from whence all ligneous Subſtances have their Riſe and Growth. *Rulandus* and *Johnſon* from *Paracelſus, Lib.* 3. *Philoſ. ad Athenienſ. Text.* 4.

DERTRON, δέρτρον, *in Lib.* 5. *Epid.* is taken by *Foeſius* for the Omentum or Abdomen; but *Linden* renders it, according to the Interpretation of *Cornarius*, the ſmall Inteſtine.

DESCENSIO, DESCENSUS, καθόδους, is properly ſpoken of the moderate or gentle Motion of the Body or Humour downwards, and is oppoſed to *Anabaſis, Aſcenſio.* The Chymiſts alſo have a Way of Diſtillation, which they call *Diſtillatio per Deſcenſum*, Diſtillation by Deſcent, which is when the Fire is applied to the Top, and all around the Veſſel, whoſe Orifice is at the Bottom; and conſequently the Vapour, being incapable of riſing upwards, is precipitated to the Bottom. There is a ſecond kind of Diſtillation by Deſcent, called *per Deliquium*, which is a natural liquefying or reſolving Salts into a Liquor, by means of Moiſture. *Deſcenſio* has alſo another Meaning among the Chymiſts; where it ſometimes ſignifies an Alteration or Deſcent from a higher to a lower Degree of Goodneſs and Purity, as of Gold to Quickſilver.

DESCENSORIUM. The Furnace in which the *Diſtillatio per Deſcenſum* is performed.

DESESSIO, from the Verb *deſidere*, uſed by *Celſus, Lib.* 4. *Cap.* 16. is a Sitting on the Cloſe-ſtool; which, in all Fluxes of the Belly, but eſpecially a Lientery, muſt not, he ſays, be indulged ſo often as Nature prompts, but only when Neceſſity requires it, that, by this very Delay, the Inteſtines may be reduced to a Cuſtom of bearing their Burden.

DESICCATIO, ξήρανσις, from ξηρὸς, dry. A Deſiccation, or Drying. Deſiccation is alſo by the Chymiſts, though improperly, refer'd to Calcination. *Caſtellus.*

DESICCATIVUM, from *deſicco*, to dry, is an Epithet of an Ointment or Plaiſter for drying up thin Humours flowing to an Ulcer. *Blancard.*

DESIDIA, ἀργία. See ARGOS.

DESIPIENTIA, παραφροσύνη. The ſame as DELIRIUM, which ſee.

DESME, δέσμη, from δέω, to bind, is the ſame as *Faſciculus*, or *Manipulus*, a Handful. The Word occurs in *Moſchion, de Morb. Mul. Cap.* 155.

DESMIDION, δεσμίδιον, is a Diminutive of δεσμὸς, (from δέω, to bind) a ſmall Handful or Parcel.

DESMOS, δεσμὸς, in *Hippocrates, Lib. de Fracturis*, is an Affection of the Joints after Luxation, in manner of a Tye or Ligature; whereby they are rendered incapable of Extenſion or Inflexion. It proceeds from an Inflammation drying and hardening the Tendons and Ligaments. The Paſſage in which the Word occurs, is as follows: φλεγμονὴ δὲ ὐ μεγάλη παρεγίνεται, ὐδὲ δεσμὸς τῦ ἄρθρε, "but no conſiderable Inflam-"mation happens, nor Ligature of the Joint;" that is, after a Luxation of the Bones of the Knee.

DESPERATIO, ἀπελπισία. Deſpair. *Paracelſus* treats of Diſeaſes proceeding from Deſpair, with their Cure, *in Fragment. medicis ad Tom.* 1. *referendis, Cap. de Deſperatione*, and *Vol.* 1. *Theat. Chym. in Tract. Penoti de Medicam. Chym.*

DESPERATUS, DEPLORATUS, ἀπήλπισ@, deſperate, is an Epithet applied to incurable Diſeaſes, and to Patients labouring under them; as, for Inſtance, to a Perſon under a Dropſy, attended with a Cough. *Hippocrates, Lib.* περὶ τέχνης, calls ſuch as are affected with deſperate Diſeaſes κεκρατημένυς ὑπὸ νοσημάτων, "ſubdu'd by Diſeaſes;" and forbids attempting their Cure.

DESPUMATIO, Deſpumation, is the Clarification of a Liquor by elevating its Impurities in a Spume or Froth, and then taking it off.

DESQUAMATIO, Deſquamation, generally means the ſame as ABRASIO, which ſee. It is alſo a Word to expreſs the Exfoliation of carious Bones.

DESQUAMATORIUM. An Epithet of a Trepan, call'd alſo *Exfoliativum*, for abrading a Part of the Cranium to what Thickneſs it ſhall be thought convenient.

DESTILLATIO, *ſive* DISTILLATIO, ςάλαξις καταςαλαγμὸς, Diſtillation, is an equivocal Word, ſometimes ſignifying a Defluxion or Catarrh (ſee CATARRHUS); and, in Pharmacy and Chymiſtry, is an artificial Separation of the ſpirituous, aqueous, oily, or ſaline Parts of a mix'd Body from the groſſer and more terreſtrial Parts, by means of Fire. See AQUA.

DESTRUCTIO, φθορὰ, διαφθορὰ, is the ſame as CORRUPTIO; and is defin'd, in general, an Alteration of any thing from its natural State to one contrary to Nature. A Chymical Deſtruction, or Corruption, is nothing but a Reſolution of the whole naturally mixed Body into its Parts.

DESUDATIO, ἐφίδρωσις. A profuſe and inordinate Sweat, ſucceeded by an Eruption of Puſtules call'd *Sudamina*, or *Hidroa. Avicenna.*

DESURRECTIO, ἐξανάςασις. The ſame as DESESSIO, which ſee.

DETENTIO. The ſame as CATALEPSIS, or CATOCHE, which ſee.

DETERGENS, ῥύπτων, deterging. The ſame as *Abſtergens*, abſterging, See ABSTERGENTIA.

DETERSORIUM. An Apartment at the Baths, where the Sweat was deterg'd, and the Body anointed.

DETERSORIUS, ῥυπτικὸς, deterſive. The ſame as *Abſterſorius*, abſterſive, and a common Epithet of Medicines endu'd with a cleanſing Quality, whether inward or outward.

DETONATIO. Detonation. The Noiſe and Exploſion which any Subſtance makes upon the Application of Fire to it. It is alſo call'd Fulmination.

DETRACTIO, καθαίρεσις. See CATHÆRESIS.

DETRITIO, ῥάκωσις. See RHACOSIS. *Detritio* is alſo taken, in a general Senſe, for Trituration, in *Scribonius Largus, Numb.* 130.

DETRUSOR *Urinæ*. The Name of a Muſcle belonging to the Bladder. See VESICA.

DEVALGATUS, βιβλαυώμενο. The ſame as BLÆSUS, which ſee.

DEVEN-

DEVENTRIS, ἀκόιλιος. See ACOELIOS.

DEUNX. The Weight of eleven Ounces, or eleven Twelfths of a Pound, or of any entire Quantity.

DEVOTATUS is the ſame as DEFIXUS, and ſignifies a Man render'd impotent by the Power of Witchcraft. *Apuleius, de Medic. Herb. Cap.* 7.

DEURENS (*Febris*). The ſame as CAUSOS, which ſee.

DEUSTIO, ἔγκαυσις. See ENCAUSIS.

DEUTERIA, δευτεία, δευτερία, *Deuterias*, δευτείας, *Deuterinas*, δευτείνας. All theſe Terms are uſed for a ſecondary low-priz'd Sort of Wine, made of the Huſks of Grapes, after Preſſing, macerated in Water. It is call'd, by the *Latins*, LORA, which ſee.

DEUTERION, τὸ δευτέιον, τὰ δεύτερα. The Secundines. See SECUNDINÆ and PARTUS.

DEUTEROPATHIA, δευτεροπάθεια, from δεύτερος, the ſecond, and πάθος, an Affection, Senſe, or Feeling, is as much as to ſay a Fellow-feeling. It imports the ſame as συμπάθεια, *Conſenſus*. See CONSENSUS.

DEXAMENE, δεξαμένη, from δέχομαι, to receive, ſignifies any Receptacle in general, but, in a reſtrain'd Senſe, the *Labrum* or *Solium*, that is, a ſort of deep Baſon, in which thoſe who bathed might ſwim. It was alſo call'd *Colymbethra*, and *Embaſis*.

DEXIOS, δέξιος, the Right. It is a received Opinion among the Antients, that the Parts on the Right Side, being that in which the Liver has its Situation, are hotter and more robuſt than thoſe in the Left; that Males are generally conceived and generated on the Right Side of the Uterus, *Hippoc.* 5. *Aph.* 48. that the Arteries of the Right Side are larger than thoſe of the Left; and that Diſeaſes are more dangerous on the Right Side, than on the Left. *Caſtellus.*

DEXIS, δῆξις. A Bite.

DEXTANS. The Weight of ten Ounces *Troy*, or ten Twelfths of an Integer.

DEXTER. See DEXIOS.

DIA, διά. A *Greek* Preposition, ſignifying of, by, thro', with, and uſually governing a Genitive Caſe, as διὰ φοινίκων, of, or made of Dates, διὰ ῥόδων, of Roſes, διὰ χυλῶν, of Liquors or Juices; where, in theſe and other like Inſtances, the Preposition διὰ, by frequent Uſe, and for the ſake of Smoothneſs or Brevity, came at length, eſpecially when *Latiniz'd*, to be incorporated with its caſual Word, and to make with it one compound Term, as *Diarrhodon*, *Diachylum*; and hence *Dia*, when it makes the three firſt Letters of a Medicinal Term, ſignifies ſomething compounded principally of the Thing meant by the Word with which it is incorporated.

DIABACANU, διὰ βακάνε. An hepatic Remedy in *Trallian*, *Lib.* 8. *Cap.* 2. taking its Name from the *Bacanon*, a principal Ingredient. See BACANON.

DIABEBOS, διαβιβώς. In *Hippocrates*, *Lib. de Art.* μὴ διαβιβῶτα σφυρὰ are the Malleoli, or Ancle-bones, not kept aſunder, but cloſed together, ſpeaking of a mechanical Operation for reducing a Gibboſity.

DIABESASA, from διὰ and βησασὰ, wild Rue. See the Preparation of this compound Medicine under the Article ANGINA.

DIABETES, from διαβαίνω, to paſs off.

That Diſcharge of Urine, which the *Greeks* call διαβήτης, is when any Liquor, ſoon after it is drank, is immoderately, and without undergoing almoſt any Change, evacuated crude, and under the Appearance of Water.

In this Diſorder the Patient is continually afflicted with an inſatiable Thirſt, incapable of being removed by drinking the moſt liberal Draughts. The Liquor drank is often diſcharg'd by Urine, in larger Quantities than it was taken into the Stomach. Thus the whole Body is, by this means, conſumed, and, as it were, diſſolved; tho', in ſome Patients, the Loins, the Thighs, the Teſtes, and eſpecially the Feet, become a little turgid. In this Diſorder alſo a certain Heat is perceiv'd in the Inteſtines. A *Diabetes* is a Diſeaſe of the Chronical Kind, and depends upon the State of the Kidneys. When recent, it ſometimes admits of a Cure; but, when inveterate, and of long Standing, it becomes incurable; diſſolves, and gradually conſumes, the Body. Phyſicians maintain, that this Diſorder rarely occurs. *Lommius, Obſ. Med.*

OBSERVATION I.

A certain Girl, of eighteen Years of Age, a few Years before her Death, laboured under a *Diabetes*, and was racked with ſuch inſatiable Thirſt, that, in one Day, ſhe would ſometimes drink eight or twelve Gallons, and diſcharge as much by Urine.

Upon laying open her Body, her Kidneys were not found to be conſumed, tho' they were more flaccid than in a natural State they ought to have been; they were alſo of a cineritious, and not a bright-red Colour. *Petrus Pawius Obſervat. Anatom.* 2.

OBSERVATION II.

A certain Woman, much ſubject to nephritic Diſorders, and who had once a Stone cut from her Bladder, was at laſt ſeized with a Pain in her Left Groin, and became feveriſh. Upon this ſhe was afflicted with an intolerable Pain in her lower Belly, Reſtleſſneſs, continual Vomitings, a Pain at her Breaſt, and various other Species of Pains. In her Left Hypochondrium a large hard Tumor appeared, which induced ſome to aſſert, that the Spleen, and others, that the Kidney, was ſwell'd. She labour'd under a hectic Fever, gentle Convulſions, frequent Faintings, and a Species of Diabetes; for her Urine, which was thin, and ſometimes bloody, was diſcharg'd involuntarily. Theſe Symptoms at laſt put an End to her Life.

Upon laying open her Body, a ſmall Stone was found in her Left Kidney, which had on all Sides grown out ſo far, as in Bulk to equal that of an Ox. There was a ſmall Quantity of Sanies alſo found in it. But the Right Kidney was waſted ſo much, and become ſo little, that it was ſcarcely to be found. *Ballonius, Ephem.* 8. & *Epid. Lib.* 2.

OBSERVATION III.

A certain Gentleman of Diſtinction diſcharged large Quantities of Urine like Water, and was afflicted with an inſatiable Thirſt, which could not be removed by the moſt copious Draughts; but, at laſt, dying of a burning Fever, his Body was laid open; upon which his Lungs were found black, and highly tumid, and two large Stones in each Kidney.

OBSERVATION IV.

Tho' the Cauſe of a *Diabetes* is aſcribed to a Diſorder of the Kidneys, yet, upon opening the Bodies of ſome, who have dy'd of that Diſeaſe, their Bladders have been found plainly contracted, and Gangrenes and ſphacelous Tumors have been diſcovered in their Cavities. This Circumſtance ought to be adverted to, leſt any one ſhould be deceived. *Ballonius, Epid. Lib.* 2.

Rabbi *Moſes* affirms, the *Diabetes* is very ſeldom ſeen in the Weſtern Parts of the World, but more frequently in the hot and Eaſtern Countries; inſomuch that in *Egypt*, in ten Years Practice, he ſaw more than twenty Patients of this Kind: But we ſee a great Number, almoſt every Year, in our Weſtern World.

The Account *Aretæus* gives of the *Diabetes* is as follows:

The *Diabetes* is a ſtrange, and not very common Diſtemper, conſiſting in a Colliquation of the Fleſh and Members into Urine, and proceeding, like the Dropſy, from a cold and humid Cauſe. The Diſcharge is by the uſual Paſſages, the Kidneys and the Bladder; and the Flux of Urine is perpetual, as from an open Sluice. The Diſeaſe is of a chronical Nature, and a long time contracting; but, when arrived at its Height, the Patient continues but a ſhort time; for the Colliquation is violent, and Death approaches with Speed, and ſoon puts an End to a loathſome and painful Life. The Symptoms of this Diſorder are, an inſatiable Thirſt, and immoderate Drinking, which, however, bears no Proportion to the exceſſive Quantity of Urine; and it is as impoſſible to reſtrain the Sick from drinking, as from making of Water; for, if they refrain from all potable Liquors for the leaſt Space of Time, their Mouth is parched for want of Moiſture, their Body dry'd up, and their Viſcera ſeem to burn within them; they are moleſted with great Reſtleſſneſs and Anxiety, and die in a ſhort time, exhauſted with Heat and Thirſt, as with a Fire. No Reaſon can induce, nor Shame prevail upon, them to retain their Water; for both ſubmit to the Senſe of Pain: And, upon the leaſt Suppreſſion, they are afflicted with a Tumor of the Loins, Teſtes, and Hips; which ſubſides after a free and plentiful Diſcharge of the Urine, the redundant Humour having its Courſe diverted to the Bladder.

When the Diſeaſe is perfected, its Characters are evident; but, when it is in its Growth, the Symptoms are, a Dryneſs of the Mouth, white frothy Spittle, like that of a thirſty Perſon, but, as yet, without Thirſt, together with a Senſe of Weight on the Hypochondria. In the Progreſs of the Diſorder the Patient is affected with a Senſe of Heat or Coldneſs, which reaches from the Belly to the Bladder; and his Diſcharges by Urine are a little more in Quantity than uſual; and he grows thirſty, but not as yet to any vehement Degree.

As the Diſeaſe increaſes, it is attended with a ſmall, but biting, Senſation of Heat in the Viſcera; the Abdomen becomes wrinkled, the Veins appear prominent, and the whole Body is emaciated; the Flux of Urine, and the Thirſt, are more and more augmented; and whenever the Diſorder, by Conſent of Parts, affects the Extremity of the Penis, the Patient immediately makes Water. And hence the Diſeaſe ſeems to me to be call'd *Diabetes*, that is to ſay, a *Pipe*, becauſe, in Perſons affected with it, nothing liquid remains in their Body, but all runs thro' it, as if it ran thro' a Pipe. The Patient ſtruggles with the Diſeaſe for ſome time, but not long; for he diſcharges

his Urine with Pain, and the Colliquation is dreadful beyond meaſure, ſince nothing conſiderable of what he drinks is diſtributed over the Body, and the Fleſh is continually diſſolv'd, and paſſes away in great Quantities in the Urine.

The Cauſes of this Diſorder may be ſome occult and malignant Reliques of an acute Diſtemper remaining after the Criſis. It is not improbable alſo, that ſomething of a deleterious Quality, particularly injurious to the Kidneys and Bladder, may occaſion ſuch an Affection; for it may proceed from the Bite of the venomous Serpent the *Dipſas*, which kindles an unquenchable Thirſt. The Patient drinks immeaſurably, not to the Satisfaction of his Thirſt, but the Repletion of his Belly. If he be in Pain from the Diſtention of his Belly, and abſtains a ſhort time from Liquor, his ardent Thirſt compels him to fall afreſh to drinking; and thus he labours under a Viciſſitude of Evils, and Thirſt and Drinking help one another to haſten his Deſtruction. Some neither evacuate by Urine, nor have any Way to diſcharge what they drink, but by Perſpiration: Whence it comes to paſs, that, thro' a Redundance of Liquor, ſtill augmented by an inſatiable Drinking, the Belly becomes more and more diſtended, and at laſt ſuddenly burſts. *Aretæus, de Cauſ. et Sig. Morb. chron. Lib.* 2. *Cap.* 2.

As nothing has a more direct and immediate Tendency both to diſcover and illuſtrate Truth, than a joint View of what the greateſt Authors have wrote upon any Subject; and as even Errors themſelves ſometimes luckily point out the Way to Truth; we ſhall therefore enumerate the Sentiments of ſome of the moſt celebrated modern Authors, with reſpect to the Symptoms, the Cauſe, and the Cure, of a Diabetes. The learned and ingenious Dr. *Liſter* informs us, that this Diſorder does not ſeize the Patient ſuddenly, but, from an imperceptible Beginning, gradually acquires freſh Degrees of Strength, till at laſt it terminates in a formidable Diſeaſe. Upon the firſt Approach of this Diſtemper, the Patient's Mouth becomes dry and parched, his Saliva white and frothy, and his Urine more in Quantity than it was in a ſound and healthy State. He is ſeized with a Thirſt, which at firſt is pretty moderate, but gradually calls for larger Supplies, in proportion as the Diſeaſe advances: He begins to perceive a preternatural Heat, and gently-biting Pain, in his Bowels; his Body becomes ghaſtly and meagre, and his Mind reſtleſs and inconſtant. When the Veſſels are much relaxed, his Urine is diſcharg'd continually, and without Intermiſſion, a Circumſtance by which his Solids are ſurpriſingly waſted, and, as it were, melted away. During this deplorable State of Things, his Thirſt becomes inſatiable; and, which is ſurpriſing, the Quantity of the Urine he diſcharges, ſurpaſſes that of the Liquor he drinks. If he retains his Urine for a very inconſiderable time, he is ſeized with a Swelling of the Loins, the Teſtes, and the Ilia; and the Diſcharge of it is attended with Pain. Theſe Symptoms are ſpeedily ſucceeded by Death. The Urine of a Patient in this Condition is of a ſoft and mild Taſte; but Dr. *Liſter* affirms, that he never met with any of it ſweet; tho', at the ſame time, he owns the Probability of its becoming gradually ſweetiſh, ſince, in the Beginning of the Diſorder, it is mixed with the aqueous, and afterwards with the chylous, Parts of the Serum. This Opinion, he thinks, is confirm'd by the Sweetneſs of the Matter expectorated by phthiſical Patients a little before they die.

The learned and judicious *Willis* informs us, that this Diſtemper was little known among the Antients, but is become more common among the Moderns; that it is accompanied with a continual Thirſt, and a Species of ſlow hectic Fever; and that he himſelf knew a Man, who, by uſing *Rheniſh* Wine for twenty Days as his common Drink, contracted an incurable *Diabetes*.

According to *Ettmuller*, this Diſeaſe is diſtinguiſhed into three Kinds, a *true*, and a *ſpurious Diabetes*, and that Species which is call'd a *Cœliaca by Urine*.

The true and legitimate *Diabetes* bears a certain Reſemblance to a Cœliac Paſſion and Lientery; for, as in theſe the Aliments are evacuated by Stool crude and unooncocted, ſo, in this, the Liquor drank is diſcharged by Urine, without undergoing any conſiderable Change with reſpect to Colour, Taſte, and Smell, as may be obſerved upon the Patient's drinking red Wine: But this Species of *Diabetes* rarely occurs.

In a ſpurious *Diabetes*, the Urine is diſcharged in preternaturally large Quantities, and the Patient is afflicted with an inſatiable Thirſt, Loſs of Strength, Leanneſs, a burning Heat about the Region of the Loins, a ſlow continual Fever, and even the Symptoms of a confirm'd Hectic. In this Species of the Diſorder a pinguious Matter is ſometimes diſcharged with the Urine; but theſe Symptoms prognoſticate the ſpeedy Death of the Patient.

The third and laſt Species of a *Diabetes*, commonly call'd a *Cœliaca by Urine*, is when the Chyle is diſcharged along with, or inſtead of, the Urine.

According to this Author, a *Diabetes* is always dangerous, and often incurable, eſpecially if contracted by immoderate Labour, exceſſive Venery, and chronical Fevers, as alſo by a long Habit of drinking ſpirituous Liquors. The Urine of thoſe afflicted with a *Diabetes* is generally ſweet.

According to the incomparable *Sydenham*, the Juices, convey'd into the Blood in a *Diabetes* are diſcharg'd by Urine, crude and unconcocted; by which means the Strength of the Patient is gradually impair'd, his Body waſted, and its Subſtance, as it were, colliquated and carry'd off by the urinary Paſſages. The Patient, under this Diſorder, is rack'd with Thirſt, afflicted with a Heat of the Bowels, ſeized with a Swelling about the Loins and Hips, and often expectorates a frothy Matter.

Various Authors inform us, that this Diſtemper is ſeldom mention'd among antient Writers, and that it was little known among the *Greeks*, ſince *Galen* himſelf, in the third Chapter of his ſixth Book, *de Locis Affectis*, confeſſes that he himſelf had only ſeen it twice.

The Method of CURE.

According to *Aretæus*, the Diabetes, if Regard be had to the Cauſe, as well as Form and Manner, of the Diſtemper, is a kind of Dropſy; and differs from it only in the Place by which the Liquid is diſcharged. For, in the Aſcites, the Peritonæum is the Receptacle for the Waters, which, finding no Vent, are there collected and abound; whereas in the Diabetes, the Patient is affected with the ſame Colliquation and Flux of the Liquids; but then they take their Courſe to the Kidneys and Bladder, by which they are evacuated: Now, this is the way by which hydropical Perſons find moſt Relief, when the Diſeaſe takes a favourable Turn; though the eaſing them from the preſent be not ſufficient for removing the Cauſe: But in the Diabetes the Thirſt is the greater, becauſe the continual Diſcharge of the Liquids dries the Body.

The Remedies for putting a Stop to the Colliquation are the ſame as thoſe which are proper for Dropſies; but the Thirſt is to be the principal Object of our Care; for this is the moſt tormenting Symptom belonging to this Diſorder; and, if the Patient attempts to appeaſe it by Drinking, he immediately provokes a Flux of Urine, which carries off with it much of the colliquated Subſtance of the Body. Proper Medicines then are ſuch as quench Thirſt, which no drinking, how plentiful ſoever, can aſſwage. The Stomach, therefore, whence proceed the Incentives to Thirſt, is by all means to be relieved; firſt, by purging with Hiera, and then by Applications of Epithems of Spikenard, Maſtich, Dates, and raw Quinces; the Juice of which, with Spikenard, and Oil of Roſes, makes an excellent Embrocation for this Purpoſe; and of this Pulp, together with Maſtich and Dates, may be made a Cataplaſm, for the ſame Uſe; and with theſe may conveniently be mix'd Wax and Ointment of Spikenard, or the Juice of Acacia and Hypocyſtis, as well for Embrocations as Cataplaſms.

For Drink, let the Patient uſe Water boil'd with autumnal Fruits [ὀπώρησι]; and let his Food be Milk, mix'd with frumentaceous Aliments, as Amylum, Alica, and ſorbile Liquors. His Wine muſt be aſtringent, for reſtoring the Tone of the Stomach; and but little diluted, for the better Evaporation and Diſſipation of the other Humours. For ſalt Things excite Thirſt, but Wine that is both aſtringent and cooling, changes the Body to a good Temperament; and ſweet Wine, [οἶνος γλυκὺς, *Wine made of Grapes left to dry in the Sun, Lat. Paſſum*, which ſee] moreover, reſtores Strength, by generating Blood. Various are the compound Medicines for theſe Purpoſes, ſuch as Theriaca, Mithridate, and what is prepared of autumnal Fruits, with other Medicines proper for a Dropſy, and a Regimen of Diet, and Way of Living, in all Things anſwerable to what is preſcribed for the Cure of that Diſtemper. *Aretæus de Curat. Morb. Chron. Lib.* 2. *Cap.* 2.

According to *Liſter*, nothing more effectually contributes to the Cure of this Diſorder, than all Preparations of Almonds, and a Milk-diet; and he himſelf gives us an Inſtance of one cured of it by drinking as much Wine, boil'd with Ginger, as his Strength and Condition would admit of, allowing him, at proper Intervals, Draughts of Milk and Water, to allay his Thirſt.

According to *Willis*, few or none at all have been obſerved to be cured of a Diabetes by Aſtringents; and this Practitioner, as he himſelf informs us, often preſcrib'd, with Succeſs, the Tincture of Antimony, and a Solution of Quick-lime in Water, together with Saſſafras, Aniſe-ſeeds, Raiſins, and Liquorice. He, in Conjunction with ſome other Phyſicians, preſcribed in the following manner for a certain Perſon of Diſtinction:

Take of the Tops of Cypreſs-tree, eight Handfuls; of the Whites of Eggs, two Pounds; of Cinnamon, half an Ounce; and of recent Milk, eight Pints: Mix all together, and ſubject them to Diſtillation. Six Ounces are to be taken for a Doſe, three times a Day.

Take of Gum Arabic, and Gum Tragacanth, each ſix Drams; and of the Saccharum Penidium, one Ounce.

Reduce them into a Powder, of which one Dram, or one Dram and an half, are to be taken twice a Day in the above-mentioned diſtil'd Water, exhibiting a paregoric Draught every Night.

This Patient's Diet conſiſted almoſt entirely of Milk; and, by the Uſe of theſe, he recovered ſo faſt, that in a Month's time he was reſtored to a perfect State of Health.

The ſame Author gives us the Hiſtory of a Woman, of about fifty Years of Age, and of a full Habit of Body, who ſo long labour'd under a Diabetes, and a Salivation, ſucceeding each other alternately, that her Strength was highly exhauſted: For this Patient he preſcribed an Infuſion of Rhubarb, in *Canary* Wine, every Day. A few Days after, he order'd her to drink *Fuller's Decoctum Catechu Compoſitum* every Night; and, for her common Drink, *Florence* Wine diluted with *Briſtol* Waters; by which means both Diſorders were effectually removed in two or three Weeks, and the Patient enjoy'd perfect Health for ſeveral Years after.

According to *Ettmuller*, the principal Intention of Cure, in a Diabetes of every Kind, is to diminiſh the Acrimony of the Blood; and, in moſt Circumſtances, the Cure both of a ſpurious Diabetes, and that call'd a Cœliaca by Urine, is to be carried on in the ſame manner with that of hectic Fevers. He therefore orders the Cure to be begun with an Emetic, and then recommends the *Antihecticum Poterii*, Blood-ſtone, Sugar of Lead, *Crocus Martis Aluminata*, the *Trochiſci de Carabe*, the *Terra Sigillata*, and Opiates at Night; but eſpecially Quick-lime-water, chalybeated Milk, and Emulſions.

In a true and legitimate Diabetes, he recommends the Uſe of Aſtringents and Chalybeates; but, in particular, of a Decoction of Orange-peel.

The Cure of a Diabetes, according to *Sydenham*, is the ſame with that of the Fluor Albus, omitting the Circumſtances of Bleeding and Purging; ſince, notwithſtanding the apparent Differences between theſe Diſeaſes, the curative Indications are the ſame in both.

Harris ingeniouſly, and, perhaps, juſtly enough, imagined, that a Diarrhœa was a kind of Diabetes of the Belly; and a Diabetes, a Diarrhœa of the Kidnies: For which Reaſon he, with Succeſs, preſcrib'd in the following manner for a Patient labouring under a Diabetes:

Take of the beſt Rhubarb, half an Ounce; of white and yellow Sanders, each one Dram; of the ſmaller Cardamom-ſeeds, half a Dram: Mix all together, infuſe them in a Pint of *Canary*, plac'd over a gentle Heat, in a cloſe Veſſel.

This Patient took ſix Spoonfuls of this Wine, when ſtrain'd, at Six in the Morning, and ſix more at Ten; by which means the Diabetes, and all its concomitant Symptoms, were remov'd before Ten o'Clock at Night. But this celebrated Author has only one Inſtance of a Diabetes cured in this Manner.

Beſides theſe Medicines and Forms already mentioned, the *Decoctum Catechu Compoſitum*, the *Decoctum Incraſſans*, Iſinglaſs, Jellies of Hartſhorn, Rice, Tincture of Coral, and the *Trochiſci Gordonii*, are of ſingular Service. But, in the modern Practice, nothing is look'd upon as a Remedy ſo effectual for the Cure of a Diabetes, as the hot Well-waters at *Briſtol*. The following Decoction may be uſed with ſingular Succeſs:

Take of *Peruvian* Bark, reduc'd to a groſs Powder, one Ounce; and of the Tincture of Roſes, one Pound and an half: Boil it to one Pint, over a ſlow Fire; then ſtrain off the Liquor, and add half a Pint of White-wine, and two Ounces of the Syrup of Quinces: Mix all together, for a Decoction, three Ounces of which are to be taken two or three times a Day, at proper Intervals.

With reſpect to this Diſtemper, Dr. *Wynter* ſtarts a Queſtion, Whether *Briſtol* Water be ſpecific in a Diabetes? A ſpecific Remedy, ſays he, for each Diſeaſe, would prove, in Phyſic, what finding the Longitude muſt, in Navigation: We ſhould go directly to the Cure, without the Circle of the alterative Courſe: But, at preſent, there is as little Probability of diſcovering the one, as the other. We know but one Specific, and but one Diſeaſe cur'd by it, unleſs I can prove this to be ſuch in the Diabetes.

The Diabetes then is defin'd to be a too quick and large Excretion of crude, unalter'd, and ſweet-taſting Water, exceeding the Proportion of Fluids taken into the Body, accompanied with intolerable Thirſt: And a ſpecific Medicine is that which cures a Diſeaſe, without promoting any ſenſible Evacuation.

Suppoſe then a Perſon, labouring under a Diabetes, void a given Quantity of ſuch Urine, for Inſtance, four or five Quarts in twenty-four Hours; let him drink as many of this Water, and he ſhall excrete leſs daily. From whence it is manifeſt, that it proves no Evacuant. Another Argument to prove its ſpecific Quality is, that it may be uſed in as large Quantities as the Stomach will bear; and this is a very grateful Circumſtance to Perſons labouring under an infatiable Thirſt. In all other Diſorders, where it acts by its contemperating, alterative, and heating Qualities, it alſo proves ſpecific. A third is, that we ſee, by daily Experiment, its Effect in a Diabetes more quick and ſudden, than in any other Diſtemper, the Patient being certain of a Cure in a very ſhort time. *Wynter's Cyclus Metaſyncriticus.*

A Conſumption *from a* Diabetes.

A Diabetes is commonly call'd a Dropſy of the Chamber-pot, and is a continual Flux of the nutritious Juice running down through the Kidnies; which, for the moſt part, happens to thoſe that are very thoughtful, and to ſuch as are Drinkers of *French* Wines, and diuretic Liquors: Whereupon the Urine (by reaſon of the great Quantity of new Chyle, which flows to it, and mixes itſelf with it) being deprived of its Saltneſs, become ſweet, even like Honey. By the continual Efflux of the Chyle the Blood is impoveriſh'd; and thereupon the Strength of the Patient grows extremely languid. A preternatural Heat is kindled in the ſolid Parts, by which the Nerves are weaken'd; and, upon that, Convulſions, a Giddineſs, and other Affections of the Nerves, enſue; and, at length, the muſcular Parts, being deprived of their nutritious Juices, fall into an Atrophy, or Conſumption. The Way of curing this Conſumption is by a long Uſe of a Milk-diet, Conſerve of red Roſes, Bole Armoniac, Gum Arabic, and Gum Tragacanth; by drinking the *Bath* or *Iſlington* Waters, or any other mineral Water that is chalybeate, for a long time. But the Patient muſt abſtain from Wine, eſpecially *French* Wine: He muſt not bleed, nor uſe any purging Medicines, except Rhubarb, Myrobalans, and other ſuch-like gentle Things, which have alſo ſome ſtyptic and binding Particles; of the Virtue of which, in curing this Diſtemper, I ſhall preſently give a very remarkable Caſe.

CASE I.

Mr. *Petit's* Son, upon a Diabetes, which they had a long time neglected the Cure of, was not only frequently troubled with Fits of the Falling-ſickneſs, and a Swimming in his Head, but alſo, in the Progreſs of the Diſtemper, became very conſumptive. But with the Uſe of *Tunbridge* Waters, a Milk-diet, and aſtringent Electuaries, he was perfectly recover'd, and is now, after ten Years, in perfect Health.

CASE II.

Mr. *Petit* himſelf, the Father of the Patient I juſt now mentioned, being about ſeventy Years of Age, who was brought by a Diabetes into a high hectic Fever, and to the utmoſt Degree of a Maraſmus, and kept his Bed for three Weeks, got well of his Diabetes and Fever, and at length his Conſumption too, by the Uſe of a Milk-diet, which he very ſtrictly obſerved, and of aſtringent Julaps and Electuaries; and is now, as far as I know, after five Years, ſtill living.

CASE III.

Mr. *Wheeler*, living in *Prince's-ſtreet*, though he has now three Girls living, and well, yet he loſt all his Sons, who were taken off, in their firſt Infancy, (that is, as ſoon as they began to breed their Teeth) with a Conſumption from a Diabetes. As for the Name of the Diſtemper, that he was ignorant of; but when he obſerv'd, that he loſt all his Sons in the ſame manner, and that they were extremely emaciated with a continual and unquenchable Thirſt, and a ſtrange Flooding of Urine, he at length aſk'd my Advice for his fourth, who at that time was breeding of his Teeth. And he began, juſt like the three former, that were dead, to be very thirſty, and to make Water at the ſame immoderate Rate that they had done; whereby his Fleſh was become very lank, and a hectical Heat began to ariſe. So being confirm'd in my Opinion, by ſo demonſtrative an Argument as the Sweetneſs of his Urine, being like Honey, I pronounced it a Conſumption from a Diabetes, cauſed by the Breeding of his Teeth; which could not poſſibly admit of a perfect Cure, till the Child had bred all his Teeth. Within the Space of a Month or two, the poor Infant ſeem'd to have a *Hippocratical* Face, and to be reduced to that Degree of a Conſumption, as to be arrived at the laſt Scene of his Tragedy; for he labour'd under a Colliquation, as well by a Looſeneſs, as a Diabetes, though he had no Cough, nor any other Affection of his Lungs. However, for the preſent Relief of the Symptoms, I order'd a Milk-diet to be ſtrictly obſerved, and an aſtringent Electuary; and gave Orders, that for his Thirſt, he ſhould drink nothing but Milk, mix'd with *Iſlington* Waters, all the Summer: By which means his Thirſt, and the Flux of his Urine, ſeem'd to be ſomewhat abated, and his Fleſh to be recover'd. But the Diſtemper returning by uncertain Intervals, with a remarkable Colliquation, and Expence of the Humours, as well by Stool, as by the urinary Parts, *that is*, as often as he bred any new

new Teeth, according to the Prognoſtics which I at firſt made; at length I order'd him ſix, ſeven, or eight Grains of Rhubarb to be taken every Morning, and a little Diaſcordium at Night, when he went to ſleep. To the conſtant Uſe of which Remedies I left the Child, and he perſiſted in the Uſe of them for two Years at leaſt, that was, till all his Teeth were cut; by which means he continually gather'd Strength and Fleſh, and grew better every Day, though he was in ſome meaſure troubled with a Thirſt, and too great a Flux of Urine, till the time that he had got all his Teeth. But now, being four Years old, he enjoys his perfect Health, and is a luſty Boy, as if he had never been troubled with any Diſtemper. *Morton's Phthiſiologia.*

DIABIN, διάβιν, a barbarous and corrupt Word in *Myrepſus*, *Antidot.* 37. and *Paſtil.* 48. which *Fuchſius*, by the Help of *Actuarius*, amends, by reading διὰ ἰων, "of Violets." The *Latin* Copies of *Myrepſus*, he obſerves, render it *Diauf.*

DIABOLUS *Metallorum* is a Title beſtow'd by the Chymiſts on *Jupiter*, or Tin; becauſe, when incorporated with other Metals, it renders them incapable of Reduction, or at leaſt very difficult to undergo that Operation. *Caſtellus.*

DIABOLI INTESTINA. A Name for the *Cuſcuta. Dodder.*

DIABOTANUM, διὰ βοτανῶν, from βοτάνη, an Herb, is a Plaiſter prepared of Herbs, deſcrib'd by *Galen*, *de C. M. P. G. Lib.* 6. *Cap.* 2.

DIABROSIS, διάβρωσις. The ſame as ANABROSIS, which ſee.

DIACADMIAS, διὰ καδμίας. The Name of a Plaiſter, whoſe Baſis is *Cadmia*, in *Scribonius Largus. Numb.* 242. One like this is deſcrib'd by *Galen*, *de C. M. P. G. Lib.* 2. *Cap.* 14. which was uſed by *Lucius*, and reckon'd among the Epulotics.

DIACALAMINTHES, διὰ καλαμίνθης. The Name of an Antidote, whoſe Baſis is Calamint, in *Myrepſus*, *Antid.* 105.

DIACARCINON, διὰ καρκίνων, from καρκίνος, κάρκινος, a Crab, or Cray-fiſh. The Name of an Antidote prepar'd of thoſe Fiſh againſt the Bite of a mad Dog; which, as *Galen* ſays, *Lib.* 11. *de Simp. Facult. T. de Cancris uſtis*, was uſed by *Æſchrion*, with very good Succeſs.

DIACARYON, διὰ καρύων, from κάρυον, a Walnut, Rob of Walnuts. *Galen*, *de C. M. S. L. Lib.* 6. *Cap.* 2. See the Preparation of the Diacaryon for the Quinſey, under the Article ANGINA.

DACASSIA. See CASSIA.

DIACASTORIU, διὰ καστορίε, from καστόριον, Caſtor, is the Name of two Antidotes, in which Caſtor is a principal Ingredient. *Nicol. Myrepſ. Sect.* 6. 27. and 102.

DIACATHOLICON, otherwiſe call'd CATHOLICON, from διὰ, of, and καθολικὸς, univerſal, the univerſal Purge.

Take of the Pulps of Caſſia and Tamarinds, and of Sena-leaves, of each two Ounces; of Polypody-root, of Violet-flowers, and of Rhubarb, of each one Ounce; of Aniſeeds, white Sugar, and Liquorice, of each two Drams. Powder thoſe Ingredients together that require it: And then take of freſh Polypody-root bruiſed, three Ounces; of ſweet Fennel-ſeed, ſix Drams; and boil them in two Quarts of Spring-water, to the Conſumption of a third Part: Strain out the Liquor, and, with two Pound of the fineſt Sugar, boil it up to the Conſiſtence of a Syrup; then by degrees pour it upon the Pulps, as they ſtand over the Fire; and afterwards ſtir in the Powders, ſo as to make the Whole into an Electuary.

This is originally a Preſcription of *Nicolaus*, and the College receiv'd it into their firſt Diſpenſatory, under the Title of *Diacatholicon*; but the preceding to this varied conſiderably from that, both in the Materials, and Order of Preparation; though here, the cold Seeds, and ſome other Ingredients, of no great Conſequence to the main Intention of the Whole, are quite rejected, although, at beſt, it is but an indifferent Compoſition; and, notwithſtanding its oſtentatious Title, hardly ever preſcrib'd or made.

DIACELTATESSON. A Term in *Paracelſus*, relating to the Cure of Fevers, *Lib.* 2. *de Vita longa*, *Cap.* 5. He ſeems to mean by it a Vomit excited by Mercury. *Rulandus* and *Johnſon* read *Diateſſadelton*, that is, *precipitate Mercury*. Others will have the *Diaceltateſſon* to be crude Quickſilver diſſolved by the Liquor Alcaheſt.

DIACENES, διὰ κενῆς, διὰ κενῆς, from κενὸς, empty, vain, in *Hippocrates*, ſignify vain, fruitleſs. Thus διὰ κενῆς ἐξανιεσθαι, *Lib.* 7. *Epid.* import the Patient's often endeavouring to go to Stool without Effect; and διακενῆς θορυβεῖν, is ſpoken of a Perſon in a Phrenſy, who vainly employs his Hands in ſearching about, and catching at he knows not what.

DIACENOS, διάκενος, from κενὸς, empty, void, is an Epithet of porous Bodies, ſuch as a Sponge, and a Pumice-ſtone, *Gal. Lib.* 4. *de Diff. Pulſ. Cap.* 6. *Caſtellus.*

DIACENTETON. The Name of a Collyrium in *Aetius*, *Tetr.* 2. *Serm.* 4. *Cap.* 110.

DIACERATON, διὰ κέρατος, the Name of a Collyrium in *Celſus*, *Lib.* 6. *Cap.* 6. ſo call'd, he ſays, from κέρας, a Horn, becauſe burnt Hartſhorn is a principal Ingredient in it.

DIACHALASIS, διαχάλασις, from διαχαλάω, to be relaxed or opened, in *Hippocrates*, *Lib. de Vulneribus Capitis*, is a Solution of Continuity in the Sutures of the Cranium; that is, when the Bones recede from their mutual Indentations, an Accident which frequently happens in Wounds of the Head.

DIACHEIRISMOS, διαχείρισμὸς, from χεὶρ, a Hand, is any manual Operation. Διαχειρισμοὶ φαρμάκων, *Lib.* 2. *Epidem.* import Preparations, Adminiſtrations, and Diſpenſations, of Medicines.

DIACHELIDONIUM, διαχελιδόνιον, from χελιδὼν, a Swallow, is a Preparation of Swallows; which ſee under ANGINA.

DIACHOREMA, DIACHORESIS, διαχώρημα, διαχώρησις, in *Hippocrates*, ſignify, according to *Galen*, *Com. ad Aph.* 18. *Lib.* 2. all manner of Excretions or Evacuations from the Body, but more properly and frequently Excretions of the Belly by Stool; for *Hypocheresis*, (ὑποχώρησις) and *Diacheresis*, he ſays, differ in this; that the former ſignifies only Diſcharges by Stool, but the other may be underſtood of Evacuations of all Sorts. Again, *Com. ad Aph.* 68, 69. *Lib.* 7. he tells us, that *Hippocrates* calls the Stools indifferently *Hypocheremata*, and *Diacheremata*, and ſometimes applies them to Excretions by Urine.

DIACHORISIS, διαχώρισις, from χωρὶς, apart, ſignifies Separation. The Word occurs in *Moſchion*, *de Morb. Cap.* 129.

DIACHRISTA, διάχρισα, from χρίω, to anoint, in *P. Ægineta*, *Lib.* 1. *Cap.* 46. are Medicines applied to the Fauces, Uvula, Palate, and Tongue, for the Abſterſion of Phlegm.

DIACHRYSU, διαχρυσῦ, from χρυσὸς, Gold, is the Name of a Plaiſter for Fractures in *Gal. ſpurio Libro alt. de Dynamidiis*, § *ad Oſſa fracta.*

DIACHYLON, διὰ χυλῶν, from χυλὸς, a Juice, is an emollient, digeſtive Plaiſter, compoſed of Juices. *Gal. Lib.* 7. *de C. M. P. G. Cap.* 9.

There are ſeveral Plaiſters deſcrib'd by Diſpenſatory-writers, under the Name of *Diachylon*. The College order the *Diachylon Simplex*, the *Diachylon Magnum*, the *Diachylon Magnum cum Gummi*, and the *Diachylon Compoſitum*, otherwiſe call'd *Emplaſtrum è Mucilaginibus.*

DIACHYLON SIMPLEX: *Simple Diachylon.*

Take of Mucilage of Fenugreek, and Linſeeds, and of Marſhmallow-root, of each one Pound; of old Oil, that is fine, three Pound; of Litharge of Gold, one Pound and a half. To make the aforeſaid Mucilage, take of Fenugreek, and Linſeed, and of Marſhmallow-root, of each three Ounces; of common Water, three Quarts: Let the Litharge be finely powder'd, and mix'd with the Oil; then boil it over a gentle Fire, ſtirring it all the while with a Spatula, until it grows as thick as the Conſiſtence of Honey. Take it from the Fire, and let it leiſurely cool, and then mix it with the Mucilage, and gently boil it again to the Conſumption of all the aqueous Humidity, ſo as to make it into a Plaiſter. *S. A.*

This is originally preſcrib'd by *Meſue*, and is not only the moſt common Plaiſter of the Shops, as it is much us'd alone; but alſo, as it is the Baſis of many others. What is given in the *Auguſtan* Diſpenſatory under the Title of *Diachylon ſimplex, ſive album*, is exactly the ſame as this; and the *Diachylon parvum*, aſcrib'd to the ſame Author, in the ſame Collection, differs only in adding Henbane and Fleawort-ſeeds to the Mucilage. But the Simplicity of this Compoſition is ſuch, as to have admitted of very little Variation in any Hands it hath paſſed thro': However, we have ſome Dealers in Medicine amongſt us, who have have had Diſingenuity and Diſhoneſty enough to debaſe it, by the Uſe of Hog's Lard inſtead of Oil, and adding Ceruſs to it, to make it heavier; with an Omiſſion alſo of the Mucilage, only for the ſake of a greater Profit in its Sale.

DIACHYLON MAGNUM: *The greater Diachylon.*

Take of the Mucilages of Raiſins, Figs, Marſhmallow-roots, Fenugreek, and Linſeed, Bird-lime, of the Juices of Orrice and Squills, of Œſypus, or Sheeps-foot Oil, of each one Ounce and a half; of the Oils of Orrice, Chamomile, and Dill, of each eight Ounces; of Litharge of Gold, finely powder'd, one Pound; of Turpentine, three Ounces; of Reſin of the Pine-tree, and yellow Wax,

of

of each two Ounces. Let the Oil and Litharge be well ſtirred together, and then boiled over a gentle Fire, all the while ſtirring it, till they incorporate into a Body: then removing it off the Fire, till it is cold, add the Mucilages, and boil again to the Conſumption of all the ſuperfluous Humidity. Afterwards put in the Bird-lime, the Œſypus, with the Juices of Orrice and Squills, and boil again to the Conſumption of theſe Juices; and, while the Mixture is yet hot, melt in the Wax and Reſin: After it is taken off the Fire, mix in the Turpentine by briſk ſtirring; ſo that the Whole may obtain a ſuitable Conſiſtence for an Emplaſter.

This is alſo aſcribed to *Meſue*, and hath kept its Place in almoſt all the Officinal Diſpenſatories, as well as thoſe of our College, and without much Alteration. Indeed *Zwelfer* takes the Liberty to ſay, that this, and all Compoſitions of like kind, deſerve rather to be quite expung'd than mended; altho', in the ſame Place, he is at a good deal of Pains to direct the particular Manner of its Compoſition: That is, however, ſo fully done here, as not to want any of his Help. The Œſypus was frequently directed in the antient Pharmacy, particularly by *Matthiolus* and *Dioſcorides*; from whom *Schroder* teaches us, that it was made by boiling that Wool of a Sheep, which grows chiefly upon the Neck and Flanks, in Water, till the Oil was got out of it, and could be ſeparated from the Water: But the Joint-oil of the Feet, which is here ſubſtituted to ſave that Trouble, is every whit as good for the ſame Intention; it partaking as much of that ſoft mucilaginous Nature, as the other was ſuppoſed to do.

Diachylon magnum cum Gummi:

The great DIACHYLON *with Gums.*

Take of ſtrained Galbanum, three Ounces; of Bdellium, Sagapenum, and Ammoniacum, of each two Ounces. Let them be added to the preceding *great Diachylon*, after Solution in Wine, ſtraining and boiling up to the Conſiſtence of Honey; and, by this means, it becomes a *Diachylon* with Gums.

This Addition to the former was, originally, the Contrivance of *Renodæus*, except the Galbanum; but the *Pharmacopœia Regia* adds the Gums to the *Diachylon ſimplex*, which is a much leſs troubleſome way, leaving out the Bdellium, and putting in both Galbanum and Opopanax. The *Auguſtan* Diſpenſatory gives a Preſcription from another Author; but that is ſo extremely perplex'd, as to have been followed by none ſince.

Diachylon compoſitum, ſive Emplaſtrum e Mucilaginibus:

Compound DIACHYLON, *or the Mucilage-plaiſter.*

Take of the Mucilage of the middle Bark of Elm, of Marſhmallow-root, Fenugreek, and Linſeed, of each four Ounces and an half; of the Oils of Chamomile, Lilies, and Dill, of each one Ounce and an half; of Ammoniacum, Galbanum, Sagapenum, and Opopanax, of each half an Ounce; of yellow Wax, twenty Ounces; of Turpentine, two Ounces; of Saffron, two Drams. Let the Mucilages, extracted with Water, be boiled over a gentle Heat with the Oils, to a Conſumption of their aqueous Humidities; and the Wax, cut into ſmall Pieces, be melted in them, and ſtirred in with a Spatula: When they are taken from the Fire, and while hot, add, by degrees, the Gums diſſolv'd in Turpentine, and ſtir them well about: Laſtly, put in the Saffron, finely powdered, ſo that the Whole may be made into a Maſs, of a Conſiſtence fit for a Plaiſter.

This a Compoſition of *Meſue*, and hath been in all the Officinal Diſpenſatories, with little or no Alteration. It is much in Eſteem now amongſt our Surgeons, who uſe it principally as a Suppurative.

DIACHYSIS, διάχυσις, from χύω, to fuſe, or melt, is Liquefaction, or Fuſion. *Diachytica*, (διαχυτικὰ) in *Dioſcorides*, are Medicines of a diſcutient and diſſolving Quality, ſuch as he aſcribes to Aniſe and Turpentine.

DIACHYTOS, HYPOCHYTOS, διάχυτος, ὑπόχυλος, are Epithets of Wine, prepared of Grapes dry'd ſeven Days in the Sun, in an incloſed Place, on Hurdles raiſed ſeven Feet from the Ground; by which means they are defended from the Dews and Moiſture of the Night, and fit to be preſſed the eighth Day. By this Method, as *Pliny* relates, *Lib.* 14. *Cap.* 9. they make a Wine of an excellent Taſte and Flavour.

DIACINEMA, διακίνημα, from διακινέω, to move or agitate in a ſlight Manner, (ſo *Galen*, *Com.* 4. *in Lib. de Art.* explains the Verb) is a ſlight Diſlocation. Thus διακινήματα τῶν ὀστέων, *Lib. de Fract.* are ſmall and inconſiderable Diſjunctions or Removals of the Bones from their juſt Situation, as ἐξιοθήματα are perfect Luxations, when the Bone is entirely remov'd out of its Place. The *Diacinemata*, in the Language of *Celſus*, *Lib.* 8. *Cap.* 14. are *quæ paulum exceſſerunt*; and the Holiſthemata, *quæ toto loco mota ſunt.*

DIACINAMOMUM, διὰ κινναμώμου, is the Name of an Antidote in *Myrepſus*, *Antid.* 11.

DIACISSU, διὰ κίσσου. An Acopon in *Marcellus Empiricus*, *Cap.* 36. near the End; which takes its Name from κίσσος, Ivy.

DIACLYSMA, διάκλυσμα, from κλύζω, to waſh out, or rinſe, ſignifies in particular a Collution of the Mouth by Liquors held therein for a while, and then diſcharged, comprehending under it *Gargariſm* and *Apophlegmatiſm*. *Schroder.*

DIACOCCYMELON, διακοκκυμήλων, from κοκκύμηλον, a Plum. The ſame as DIAPRUNUM, which ſee.

DIACOCHLACON, διακοχλάκων, from κόχλακες, Flints, an Epithet of Milk, in which red-hot Flints have been extinguiſhed. *Hippocrates*, *Lib.* 7. *Epid.* calls it διαπεπυρωμένων.

It is remarkable, that Milk, wherein red-hot Flints have been extinguiſh'd, is a moſt powerful Sudorific.

DIACODIUM. From διὰ, and κώδεια, a Poppy-head. It is thus prepar'd:

Take of white Poppy-heads, well dried, fourteen Ounces; and, after twenty-four Hours Infuſion in four Quarts of Spring-water, boil them well; and, to the expreſſed Liquor, put twenty-four Ounces of Sugar, to be boiled into a Syrup.

The new Diſpenſatory of the College makes this differ from the former, both in rejecting the black Poppies, and in the Proportions; the white here anſwering to the Quantities of both before. This Syrup will not bear the uſual way of Clarification, without loſing much of its Strength as an Opiate. And ſuch Difference will happen on one account or other, tho' made with the utmoſt Care, as renders it difficult to be found always of the ſame Strength.

This Preparation is alſo called by the Name of *Syrupus de Meconio*.

DIACOLOCYNTHIS, διὰ κολοκυνθίδων, from κολοκυνθὶς, Colocynth; a Remedy of which Colocynth is a principal Ingredient.

The *Pilulæ Diacolocynthidos* are thus prepar'd:

Take Aloes, Colocynth, Scammony, Bdellium, black Hellebore, Gum Arabic, of each two Drams; Euphorbium and Nitre, of each one Dram: Make them into Pills with ſolutive Syrup of Roſes.

Theſe are in the *Auguſtan* Diſpenſatory by the Name of *Pil. de Nitro*; but the Compoſition has *Alexander Trallianus* for its Author, who gives it under the Title it bears here, *de Hemicrania*, *Lib.* 1. *Cap.* 12. where he pronounces it effectual in purging off viſcid, cold, pituitous Humours from the extreme Parts, and to be good to reſtore the Vigour of the Nerves, as well as to remove their Impediments. *Monardus*, *Lib.* 13. *Epid.* 6. prodigiouſly commends them in the Epilepſy; and affirms that they excel the *Hieræ*, in fortifying the Stomach, and removing Iſchiadic Pains. The Gum Arabic ſeems intended as a Corrector of the Euphorbium, as it may entangle its violent active Parts, and make its Operation more tolerable; but it is to be fear'd, that Ingredient is here in too large a Proportion, notwithſtanding ſuch Precaution. The Doſe of this is from fifteen Grains to half a Dram: And in robuſt Conſtitutions there is hardly any Cathartic of equal Efficacy to cleanſe away the moſt obſtinate Humours.

DIACOMERON. The Name of an Antidote in *Myrepſus*, *Antid. Cap.* 39.

DIACONES, δι' ἀκόνης, from ἀκόνη, a Whetſtone. The Name of a Plaiſter invented by *Crito*, and prepared of a Whetſtone. *Galen Lib.* 6. *de C. M. P. G. Cap.* 2.

DIACOPE, διακοπὴ, from κόπτω, to cut, in *Hippocrates*, 7 *Aph.* 24. and, *Lib. de Capitis Vuln.* ſignifies a deep Cut or Wound; and the Verb διακόπτω is often uſed by him to the ſame Purpoſe.

DIACOPRÆGIA, διακοπραγία, from διὰ, of κόπρος, Dung, and αἴξ, a Goat; is a Remedy prepared of Goats Dung againſt Diſorders of the Spleen, and the Parotides. *Blancard.*

DIACORALLIUM *Alexandri*, a Medicine ſo call'd, not from *Coral*, but *Corallia*, a Name of the *Anagallis*, or Male *Pimpernel*, being not of an aſtringent, but penetrating Quality.

But the *Diacorallium*, in the *London* Diſpenſatory, is call'd thus, becauſe Coral is a principal Ingredient therein. See CORALLIUM.

DIACORONOPODIUM, διὰ κορωνοπόδιον. The Name of an Antidote in *Trallian*, *Lib.* 11. prepared of the Herb *Coronopodium*, or *Coronopus*, with other Things.

DIA-

DIACORUM, Διὰ ἀκόρου, a cephalic Medicine prepared of the *Acorus*, or *Calamus aromaticus*; it was invented by *Meſue*, and is deſcrib'd in the *Auſburg* Diſpenſatory.

DIACRISIS, Διάκρισις, from Διακρίνω, to judge, diſtinguiſh, occurs in *Hippocr. Lib.* περὶ γονῆς, where we read, ἢ ἀπὸ τούτων αἱ νοῦσοι γίνονται, ἢ αἱ ἐν τούτοις διακρίσιες, "from theſe [four Humours] proceed Diſeaſes, with their "diſtinguiſhing Characters." *Diacriſis* is alſo a Name in *Oribaſius Med. Coll.* for the *Delphinium*.

DIACROCIUM. A Name for the *Electuarium de Ovo*, in *Platerus*, *de Curat. Febrium peſtilentialium*, *Tom.* 2. *Cap.* 2.

DIACROCU, Διὰ κρόκου, Διάκροκον, from κρόκος, Saffron; the Name of a dry Collyrium in *Ægineta*, *Lib.* 7. *Cap.* 16. whoſe Baſis is Saffron.

DIACURCUMA, from *Curcuma*, a Word which *Fuchſius* thinks *Meſue* uſed for Saffron; the Name of ſeveral Antidotes in *Myrepſus*, of which Saffron is a principal Ingredient.

DIACYDONIUM, Διὰ κυδωνίων (μήλων,) from κυδώνιον (μῆλον,) a Quince; a Remedy prepared of the Juice of Quinces, for which ſee CYDONIA.

DIADAPHNIDON, Διὰ δαφνίδων, from Δαφνὶς, the Bay-tree, or Bay-berry; the Name of a drawing Plaiſter, prepared of Bay-berries and other Ingredients, and deſcribed by *Celſus*, *Lib.* 5. *Cap.* 19.

DIADEMA, Διάδημα, from Δέω, to bind, in a ſtrict Signification means a Bandage for the Head, under Pains of that Part, and a Danger of Relaxation of the Sutures. *Caſtellus*.

DIADEXIS, or DIADOCHE, Διάδεξις, or Διαδοχὴ, from Διαδέχομαι, to ſucceed. A Succeſſion of Humours; or, to ſpeak more intelligibly, a Tranſmigration of Humours from one Part to another, which more generally is call'd a Metaſtaſis of the Humours, when one Diſtemper ſucceeds, or is converted into another. It is alſo call'd *Diadoche*.

DIADOSIS, Διάδοσις, from Διαδίδωμι, to diſtribute, diſſipate, or, in Medicinal Authors, to remit. The Diſtribution of the Aliment over all the Body; and in this Senſe it is the ſame as ANADOSIS. But this Word more frequently implies, a Remiſſion or Relaxation of a Diſeaſe, and its Symptoms.

DIÆRESIS, Διαίρεσις, from Διαιρέω, to divide, or ſeparate. A Diviſion or Separation of the Veſſels. *Galen* underſtands by it, any Solution of Continuity, whether brought about by a Wound, Contuſion, Eroſion, or Rupture. Hence

DIÆRETICA. Corroſive Medicines.

DIÆTA, Δίαιτα, Δίαιτη, is a Way and Method of living, comprehending what we call *Diet*, and whatever elſe concerns the Management of human Life; for we muſt not imagine that by *Diæta* we are to underſtand only Meat and Drink; for every thing which may be ſerviceable to the Body will fall within its Limits. "I call *Diæta*, ſays *Galen*, *Com.* 3. *in Lib.* 3. *Epid.* "not only what conſiſt in Eating and Drinking, "but in all other Things, as Reſt, Exerciſe, Bathing, Ve"nery, Sleep, Waking, and whatever elſe, in any reſpect, "concerns the State of the human Body." In the ſame Senſe are Δίαιτησις and Δίαιται to be taken, in *Lib.* 6. *Epid. Sect.* 8. *Aph.* 43. 48. And Διαιτήματα, in *Aph.* 46. of the ſame Section, and in *Lib. de Natura Hominis*, are of the ſame extenſive Signification. In the ſame Latitude are uſed the Verbs Διαιᾶσθαι, and Διαιᾶν, Διαιτᾶσθαι, and Διαιτᾶσθαι. Thus, (*Lib.* 1. περὶ γυναικ.) Διαιτᾶν λυτρῆσι, "Let there be a "proper *Diæta* with reſpect to Bathing." And in the ſame Book, Διαιτωμένη δὲ ἡ γυνὴ περιγίνεται, "The Woman, "if kept to a proper Regimen, will ſurvive, and do well." See ALIMENTA.

Tho' *Pliny* the younger uſes this Word for any Place where Aliments are eaten, or what we commonly call a Dining-room; and tho' ſome of the later and leſs pure Authors mean no more by it than a public Convention of Men for regulating Matters, or tranſacting Buſineſs of any kind; yet the *Diæta* of the *Latins*, and the Διαῖτα of the *Greeks*, in their moſt common and genuine Signification, import no more than what we call *Diet*, or Manner of Living.

Every one who allows himſelf to think, muſt undoubtedly be convinced, that the Dietetic Part of Medicine is of the laſt Importance to Mankind, not only in preventing, but alſo in curing Numbers of thoſe Diſorders to which the State and Condition of human Nature ſubjects us; and as the celebrated *Frederic Hoffman* has not only ſhewn, that this, as well as the other Parts of Medicine, is founded upon ſcientific Principles, but has alſo given full, tho' ſhort and ſuccinct Directions, with reſpect to the Diet and Manner of Life, proper for the robuſt and vigorous, the weak and tender Perſons of different Ages, diſtinct Sexes, and oppoſite Conſtitutions, as alſo in the various Seaſons of the Year, and during the different States of the Weather; we ſhall therefore preſent the Reader with that excellent Author's Thoughts upon this Subject:

As no Subſtance is abſolutely, and of its own Nature, either ſalutary or noxious; but derives either the one or the other Quality from its particular Relation to the human Body; ſo 'tis certain, that the Effects of the Non-naturals muſt bear a direct Proportion to the different Conſtitutions of thoſe who uſe them, ſince, in theſe, their Conſequences muſt vary, and prove either of the ſalutary or the noxious Kind, according to the different Cauſes which concur to produce them.

Hence 'tis obvious, that the Phyſician acts a prepoſterous and unaccountable Part, who to every one preſcribes one and the ſame Method of living; or thinks that what contributes to the Health of one, will prove ſalutary and beneficial to all, without Diſtinction or Reſerve: For we are ſufficiently taught, by daily Experience, that all Subſtances are not equally adapted to all Patients; and that what one may bear without being ſenſible of any bad Effects, may to another not only prove prejudicial, but alſo fatal. Time itſelf has a conſiderable Influence in determining the ſalutary or noxious Effects of Aliments, ſince ſome Subſtances may ſafely, and without any bad Conſequences, be us'd at one Seaſon, which at another will contribute not a little to the Deſtruction of Health.

The ſalutary and noxious Effects of Aliments are, for the moſt part, to be accounted for from the Diverſity of Habits; for, as the divine *Hippocrates* obſerves, the Nature and Conſtitution of one Man differ from thoſe of another. This Diverſity of Natures may proceed either from a Difference with reſpect to Age, Temperament, Habit of Body, Cuſtom, and natural Diſpoſition; but moſt remarkably from a Difference with reſpect to Strength and Weakneſs.

As, in general, there is a vaſt Diſparity among Mankind, with reſpect to Strength and Weakneſs; ſo the State and Condition of vigorous and robuſt Bodies muſt be widely different from thoſe which are weak and infirm. For this Reaſon we are always to have a ſacred Regard to the Diverſity of Conſtitutions; ſince this is a Circumſtance of the higheſt Importance, in the Dietetic as well as the Therapeutic Part of Medicine.

That Man is ſaid to be ſtrong, who is furniſh'd with a remarkable Strength and Power, not only in exerting the voluntary Motions; but alſo in whom the vital and animal Actions are perform'd with Vigour and Energy; or, to render the thing ſtill more clear, who can liſt heavy Burdens, undergo great Fatigue, both of Body and Mind; who eats plentifully, and regularly diſcharges the excrementitious Parts of his Aliments by Stool; who ſuſtains no conſiderable Injury by Watching, and the Uſe of various improper and leſs ſalutary Aliments.

The Man who has a robuſt and athletic Body, has alſo generally a courageous Soul, and a chearful Temper, is not readily ſubject to Diſeaſes and Diſorders of the Mind, nor eaſily hurt by external Objects.

As every moving Force depends partly upon the Inſtrument by which the Motion is immediately perform'd, and partly on the Activity and Energy of the moving Cauſe; ſo it follows of courſe, that the Strength of the human Body proceeds partly from the Hardneſs and Bulk of the Muſcles, and partly from the free and copious Influx of a laudable Blood, and nervous Fluid, into theſe Parts.

The Strength, therefore, of the Body is diſcover'd by the Largeneſs and Capacity of the Veſſels, the Thickneſs of the Nerves, and the Solidity of the Muſcles; for the Strength of the Body, with reſpect to the ſolid Parts, is deriv'd from the Diſpoſition of Parents, but, with reſpect to the Fluids, from a due and proper Regimen in the Uſe of the Non-naturals. Among robuſt and vigorous Men, we reckon ſuch common People as are accuſtomed to hard Labour, and live upon ſimple and coarſe Aliments; ſuch as are in the Flower of their Youth, and advanc'd to the State and Condition of Men; ſuch as are of a ſanguine and choleric Habit; ſuch as are not too fat, and of a ſpongious Texture, but have ſolid Bones, tenſe Nerves, firm Tendons, and capacious Veſſels. With reſpect to Nations and Climates, the *Weſtphalians*, the *Pomeranians*, and the Inhabitants of *Brunſwick* in general, belong to the Claſs of hardy and robuſt Men. But thoſe are of a more weak and feeble Nature, whoſe Fibres are either tender, and endued with an exquiſite Power of Senſation, or ſubject to undergo heterogeneous and preternatural Motions; who are eaſily diſorder'd by the Operations of their Paſſions, and whoſe narrow Veſſels are not furniſh'd with a ſufficient Quantity of laudable and ſpirituous Blood; whoſe Tendons and Nerves are ſmall and lax; whoſe Teeth are fewer than the natural Number, and who are eaſily fatigued both in Body and Mind.

Perſons of weak Habits are not only eaſily injur'd by external Cauſes, and fall into Diſeaſes on the ſlighteſt Occaſion; but alſo, when actually ſeiz'd with a Diſorder, their Condition is worſe than that of the Robuſt and Hardy, ſince their Minds are fickle and inconſtant, and their frail Bodies incapable of ſupporting the Shock of the Diſeaſe for any conſiderable Time. Among the Number of the Weakly and Tender, we may juſtly reckon Infants and old Perſons; ſuch as are addicted to an

idle Town-life, conſtant Study, and cloſe Meditation. The Generality of Women alſo belong to this Number; and the *Swabians*, and Inhabitants of *Meiſſen*, are, if we may be allow'd the Expreſſion, nationally weak. Thoſe are alſo to be accounted among the Number of the Weak and Infirm, whoſe Strength is conſiderably impair'd by the Shock of ſome violent Diſeaſe, by long Watching, protracted Hunger, long-continu'd Grief, too liberal Veneſection, violent Hæmorrhages, or the too frequent Uſe of Purgatives. To this Claſs, in a particular manner, belong Women in Child-bed, and thoſe whoſe Menſes are immoderately diſcharg'd. Perſons of a weakly and tender Habit are diſcompos'd and diſorder'd by the Smell only of ſweet-ſcented Subſtances, have copious Evacuations from a ſmall Doſe of any emetic or purgative Medicine, and are put out of Order by Aliments either of the flatulent or acid Kind, as alſo by the moſt gentle Blaſt of cold Air.

Since the Weakneſs of the Body, and its preternatural Diſpoſition to receive the Impreſſions of morbid Motions, generally proceed from a Penury of laudable Juices, it ought therefore to be the principal Care of the Phyſician, who intends to ſtrengthen the Body, and fortify it againſt external Injuries, to fill the Veſſels and Nerves with laudable Juices, whilſt he evacuates the ſuperfluous Humours, and removes them from the Body. Hence it is obvious, that weak Perſons, who, in conſequence of their Conſtitutions, are ſubject to a Train of Diſorders, and are incapable of bearing any Exceſs, are much more ſafely and eaſily reſtored to Health, by a moderate and well-ordered Regimen, than by the draſtic and more operative Medicines of the Shops.

None certainly ought to be more careful in living up to the ſtricteſt and moſt rigid Rules of Health, than the Weak and Tender, becauſe, by the ſlighteſt Error in Diet, they are ſignally injured, and, by their Sufferings, ſufficiently prove, how great Power and Influence the Uſe or Abuſe of natural Things have on the human Body.

The Weak and Tender ought to be, in a particular manner, careful to preſerve, as much as poſſible, their Perſpiration and Concoction entire and uninterrupted. In order to aſſiſt Concoction, they muſt indulge themſelves ſomewhat freely in Sleep, before Meals ventilate their Bodies, not by vehement, but moderate Exerciſe, and eat but ſparingly. Subſtances which are acid, hard, flatulent, ſaltiſh, or ſweet, are to be carefully abſtain'd from, ſince, in Perſons of weak Habits, they are eaſily converted into a Subſtance of a ſouriſh Quality, which proves injurious to the Conſtitution. 'Tis alſo expedient they ſhould ſhun northerly Winds, preſerve a ſerene Tranquillity of Mind, and guard againſt every thing, which borders upon Exceſs or Intemperance.

Since the Man, who is robuſt, and, in every reſpect, ſound and vigorous, is not eaſily injur'd by Exceſs, for that Reaſon he ought not, according to *Celſus*, *in Lib.* I. *Cap.* I. "to "confine himſelf rigidly to the ſtricteſt Rules of Health, but "to vary his Method of Living, and accuſtom himſelf to every "thing." But the ſame Author, in the End of the Chapter now quoted, beautifully and juſtly obſerves, that the Vigorous and Robuſt ought to take care, "leſt, in a perfect State of "Health, thoſe Things ſhould be conſumed, which, in Sick-"neſs, are of the greateſt Benefit and Advantage;" that is, leſt the Strength, which is the moſt efficacious Medicine for ſubduing Diſeaſes, ſhould be impair'd.

The Weak and Tender, among whom *Celſus* reckons the *Literati*, who, by the conſtant Labours of their Minds, impair their Strength, and diſſipate their Spirits, ought, by all means, to uſe ſuch a Regimen and Method of Life, as may aſſiſt Concoction, promote Perſpiration, and recruit their Strength. Men addicted to Study ought, therefore, when at Meals, to be entirely free from uneaſy Cares, or deep Meditations. But the moſt favourable Time of applying to Studies is in the Morning, and when the Concoctions are finiſh'd. Studious Men ought alſo to uſe tender and light Aliments, which generate ſubtle and ſufficiently fluid Juices in the Body; but they muſt abſtain from flatulent and leguminous Aliments, Peaſe, Beans, thick Ales, and bad Wines, which oppreſs the Head, blunt the Senſes, and cloud the Genius; for Ales and Wines, the finer they are, the more they contribute to the Health of the Studious. And becauſe a due Concoction of the Aliments is highly beneficial to the Brain and Nerves, and generates a large Quantity of Animal Spirits, hence ſufficient Sleep ought warmly to be recommended to the Studious; for as much of the Sleep as is taken away, ſo much of the Strength neceſſary to go through the Studies of the Day is loſt. Men of a ſtudious Turn ought alſo to take care, leſt, by too cloſe Application, they enervate their Bodies, and render them ſubject to the Attacks of various Diſeaſes. 'Tis far more expedient and eligible to unbend the wearied Mind at proper Intervals, that thus it may return to the Exerciſe of its Functions with freſh Vigour, and a new Degree of Alacrity. Nothing alſo is more prejudicial to Health, than conſtant Sitting, a Practice too common among the Studious, and by which they bring upon themſelves thoſe hypochondriac Diſorders, and coſtive State of the Belly, uſual among the Men of this Claſs.

In the dietetic Part of Medicine, great Regard is to be had, not only to thoſe, whoſe Bodies are corpulent, and filled with a large Quantity of Humours, but alſo to thoſe, who are of a thin and ſlender Habit.

Thoſe who are corpulent, and abound either with Serum or Blood, are greatly diſpoſed to Diſeaſes, ſuffer very conſiderably, as well from Commotions of the Mind, as Things external, ſuch as Cold and Heat; and, when ſeized with any Diſeaſe, recover with Difficulty.

Thoſe, who are corpulent, and full of Humours, ought, above all things, to take ſuch Meaſures, and uſe ſuch Aliments, as extenuate the Body, and evacuate its ſuperfluous Humours. Theſe Intentions are anſwer'd by warm Water, mineral Waters, hot Baths, Watchings, violent Exerciſe of every kind, acid and ſaltiſh Subſtances, eating once a Day, gentle Vomitings and Purgings, which muſt not be excited by too ſtrong and draſtic Medicines, which generally prove more hurtful than beneficial in Caſes of this Nature.

For ſuch as are of a thin and ſlender Habit, thoſe Subſtances are moſt proper, which preſerve the Strength, and nutritious Juices, and hinder their Diſſipation: For this Reaſon, moderate Exerciſe, frequent Reſt, a ſoft Bed, Serenity of Mind, as much Aliments as the Stomach can with Eaſe digeſt, ſufficient Sleep, the Uſe of Baths after Dinner, ſweet Subſtances uſed with their Aliments, cold, and whatever generates laudable Juices, and retains them in the Body, are highly proper for Perſons of lean and ſlender Habits. But Vomiting and Purging of every kind are highly detrimental to Patients of this Claſs.

As ſome Perſons are, at certain Seaſons, coſtive, and, at others, have their Bodies preternaturally ſoluble, theſe muſt alſo uſe a particular Diet, and obſerve a peculiar Regimen.

Thoſe, who are coſtive, muſt uſe ſuch Aliments as have a Tendency to render the Body ſoluble, and Wines, eſpecially of the ſweet Kind, together with ſaline and oleous Subſtances. If theſe ſhould prove ineffectual, *Celſus* adviſes the Uſe of Aloes; but, at the ſame time, they muſt abſtain from the frequent Uſe of Purgatives. Thoſe, on the contrary, whoſe Bodies are preternaturally ſoluble, ought to reſtrain this Diſpoſition by violent Exerciſe. For Perſons in this State, Hunger is alſo proper, as alſo a ſmall Quantity of Drink, which is to be us'd rather cold than hot, if no other Circumſtance forbids it. Having thus conſider'd the Diet and Regimen proper for the Robuſt and Vigorous, and that adapted to the State of the Weak and Tender, we ſhall now take a View of thoſe ſuited to Perſons of different Temperaments, different Ages, and the various Seaſons of the Year, or States of the Weather.

A Temperament, then, is nothing but a certain Habitude and Diſpoſition, both of the ſolid and fluid Parts, to perform the Circulation of the Blood, the ſeveral Motions neceſſary in the animal Oeconomy, and the various Functions, whether natural, vital, or animal. 'Tis ſufficiently confirm'd by Experience, that the Strength of the Body bears a Proportion to the Circulation of the Blood, and its Influence on the ſolid Parts; and that, by this very means, the Digeſtion, the Secretions and Excretions, and, which is more, the Inclinations of the Mind, the Morals, and the Turn of Genius, are conſiderably vary'd; ſo that 'tis certain all theſe Changes draw their Origins from the different Manners, in which the Circulation of the Blood is carry'd on.

In what we call a choleric Temperament, the Fibres are very tender, and highly tenſe. The Veſſels alſo are narrow, and the vital Juices driven thro' them by a ſtrong moving Force. Hence it is, that, in Perſons of this Temperament, we obſerve a certain Precipitancy of Mind, and a certain Velocity or Quickneſs in the other Functions of the Body: And becauſe, in Perſons of this Temperament, the Blood is quickly forc'd through the Veſſels, it is, by this very Means, render'd hoter, and its ſulphureous Parts are exalted.

People of this Temperament ought carefully to abſtain from every thing, which can either increaſe the Heat of the Body, or accelerate the Motion of the Blood, but ought rather to uſe ſuch Subſtances, as, in ſome meaſure, check this rapid Motion, and procure to it a certain Temperature or juſt Medium, which is the beſt and moſt efficacious Preſerver of Health. For this Reaſon, choleric Perſons are conſiderably injur'd by long and violent Exerciſe; by laborious Motion; by aromatic, hot, and pinguious Aliments; by ſpirituous Liquors, eſpecially generous Wine, Brandy, and ſtrong Ale; by the ſcorching Heat of the Sun, immoderate Commotions of Mind, draſtic Medicines, Purgatives, Sudorifics, Volatiles, too long protracted Watchings; and, in general, every thing which has a Tendency, either to accelerate the ſulphureous Intemperature of the Humours, or increaſe their Heat. Choleric Patients are alſo endanger'd by all things which are exceſſively cold, whether the cold Air, or Draughts of cold Liquor, ſince theſe are of ſuch a Nature, as to reduce the Blood, already too thick, and deſtitute of its due Humidity, into a viſcid and tenacious Kind of Glew.

Hence generally ariſe the violent Inflammations and Fevers of choleric Patients. But the Health of choleric Perſons is moſt effectually provided for by warm Infuſions, liberal Draughts of ſome proper Liquor diluted with Water, boil'd Water, Water mix'd with Wine, all moiſtening Aliments, temperate Stoves, warm Beds, and ſpacious Rooms. In a Word, Perſons of this Temperament ought to obſerve a due Medium in every thing; and, if they find themſelves coſtive, their Bodies are to be render'd ſoluble, not by the more draſtic Purgatives, but by the mild and gentle Laxatives, ſuch as Raiſins, Manna, Rhubarb, Tamarinds, and Aloes.

In Perſons of melancholic Temperaments, the Blood, in conſequence of the Hardneſs and Denſity of the Fibres, is carry'd thro' the Veſſels with a ſlow and languid Motion. Hence the Humours become thick, and all the Actions, whether of the Body or the Mind, are perform'd with a certain kind of Difficulty. To Patients, therefore, of this kind, all thoſe things prove injurious, which thicken and inſpiſſate the Juices, and ſtill more retard and check their ſlow and languid Circulation. Melancholic Patients, as their Veins contain a Blood which is thick, and leſs ſuſceptible of a briſk and lively Motion, ought, for that very Reaſon, to abſtain from thick and acid Foods; from Fleſh and Fiſh of a firm and compact Texture; from Puls; from thick and ſtrong Ales, which throw the Fluids into too violent Commotions: Nor is an Air, which is either too hot or too cold, ſo proper for their Condition; becauſe the Atmoſphere, in both theſe States, diminiſhes the Fluidity neceſſary to the human Juices. All immoderate and exorbitant Paſſions ought alſo to be baniſhed from their Minds, ſuch as Anger and Dread, ſince theſe, by more forcibly impelling the inſpiſſated Blood into the Cavities of the capillary Veſſels, generally prove highly injurious to their Health. On the contrary, the Health of melancholic Perſons is provided for by proper Motion and Exerciſe, not perform'd ſuddenly, but gradually augmented; by liberal Draughts of moiſtening Liquor; by generous Wine moderately drank; by Veneſection; and by Aliments moderately ſeaſon'd with Aromatics. It is alſo expedient for Perſons of a melancholic Temperament to eat moderately, to labour, to walk abroad in a ſerene and moderately warm Air, and to uſe a Variety of innocent Diverſions and Recreations.

In Perſons of a phlegmatic Temperament, Serum abounds; the Circulation of the Humours is highly ſlow and languid; and all the Actions, whether of the Body or the Mind, are perform'd with a certain Lazineſs and Torpor. It is therefore expedient to add a *Stimulus* or Spur to the ſlowly moving Blood, to reſtore the Strength and Vigour of the Parts, and to reduce the cold and moiſt Intemperature of the Humours to a drier State.

As the Blood, in Perſons of this Temperament, performs its Circulation ſlowly, hence the Health of the Phlegmatic is excellently conſulted by roaſted Fleſhes ſeaſon'd with Salt and Aromatics, by Ale which is moderately ſtrong, and by rich Wines. Perſons of this Temperature muſt be very careful to uſe due Exerciſe, which excellently diſcuſſes and throws off the ſuperfluous Humidity and Moiſture of the Body. But 'tis abſolutely neceſſary they ſhould abſtain from autumnal Fruits, and crude Vegetables; and that they guard againſt a moiſt and rapid Atmoſphere; ſuch as that generally obſerv'd in narrow and low Places in the Autumn. They muſt alſo baniſh all ſad and melancholy Thoughts, and carefully purſue ſuch things as procure Vigour, Alacrity, and Chearfulneſs, to the Mind.

Thoſe are ſaid to be of a ſanguine Conſtitution, whoſe Habit of Body is ſpongious and lax, whoſe Veins are numerous, but ſmall, narrow, and through which the Blood flows gently and eaſily. Since, therefore, this Temperament is greatly diſpos'd to generate a large Quantity of Blood, Perſons of a ſanguine Habit ought, for this very Reaſon, to abſtain from ſuch things as generate a ſuperfluous Quantity of this Fluid.

The Health of the Sanguine is moſt effectually preſerv'd by Sobriety, Temperance, and what we call a hard Method of Living. Perſons of this Claſs ought carefully to abſtain from ſweet Subſtances; from ſpirituous Liquors, ſuch as Wine and Brandy; from eating too large Quantities of Fleſh; from nouriſhing Ales; from Pork; and from too much Sleep. Moderate Exerciſe is alſo highly beneficial to them, and they ought, if poſſible, to live in a temperate Air; ſince the Atmoſphere, when either immoderately hot, or exceſſively cold, generally proves prejudicial to their Health. Draughts of thin diluting Liquors, Infuſions of Herbs, warm Water, and Veneſections, contribute not a little to their Preſervation: And ſince the Sanguine are naturally diſpoſed and inclined to critical Evacuations of Blood, we are to be particularly careful not to ſuppreſs theſe.

As the State and Condition of the human Body, both with reſpect to its fluid and ſolid Parts, is not the ſame at all Periods of Life, ſo neither is the ſame Regimen and Method of Living ſuited and adapted to Perſons of different Ages. At certain Seaſons of Life, the human Body grows, arrives gradually at its full Vigour, and at laſt, loſing its Strength, decreaſes by degrees. In every Period of Life, the State of the Body is found to vary, becauſe not only the Fluids undergo a Change, with reſpect to their Temperature and Quantity; but alſo the Solids, with reſpect to their Fitneſs and Diſpoſition to perform their proper and reſpective Motions. Different Regimens and Methods of Life are, therefore, neceſſary for different States of the Body, and conſequently for Perſons of different Ages.

As in framing dietetic Laws, and laying down the Rules of Regimen, we ought, above all things, to have a due Regard to the Strength or Weakneſs of the Patient; ſo, in like manner, ſince the Strength of every one differs in different Periods of Life, we cannot lay down accurate and judicious Rules of Regimen, without a previous Inveſtigation of the Nature and Degree of Strength peculiar to each different Age.

Infants, Children, and old Perſons, are to be reckon'd among the Weak and Tender; whereas young Perſons, and thoſe arriv'd to the State of Manhood, are to be conſider'd as robuſt and vigorous. Different Regimens muſt, therefore, neceſſarily be preſcrib'd for Perſons in theſe ſo oppoſite States.

Infants, on account of the Tenderneſs and Senſibility of their Fibres, are eaſily injur'd, and become ſubject to Diſeaſes, by any thing of a noxious Nature; for which Reaſon the Phyſician ought to be very cautious and circumſpect in preſcribing a Regimen for them.

Human Creatures, before they arrive at the Uſe of Speech, are call'd Infants; and, from that Period, till they arrive at Puberty, they are ſaid to be Children. Infants are much ſubject to violent Diſorders of the nervous Syſtem, as is obvious from the Spaſms, Convulſions, Gripes, Epilepſies, Startings, Fevers, and Pains, with which they are afflicted. This is alſo certain from their being ſubject to the moſt terrible Diſorders, and ſometimes to Epilepſies, by ſucking the Milk of a Nurſe, whoſe Mind is diſturbed and ruffled by the Fury of tempeſtuous Paſſions. Their tender and delicate State is ſufficiently prov'd by their being frequently purg'd by the Milk of the Mother or Nurſe, who has, the Day before, taken a purgative Medicine; and by their being indiſpos'd by every conſiderable Error in Diet committed by the Woman, who gives them Suck; if, for Inſtance, ſhe has drank Brandy, admitted of the Embraces of a Man, us'd acid or flatulent Aliments, or if the cold Air has had Acceſs to her Breaſts.

As Infants, with reſpect to Strength and Weakneſs, differ very much from each other, ſo a different Diet and Regimen are to be preſcrib'd for them: Nor is one and the ſame Milk ſuited and adapted to all Children without Diſtinction; for we obſerve, that the Bodies of Infants, with reſpect to the Strength and Texture of their Parts, differ very widely from each other: For thoſe who are propagated from ſound and vigorous Parents, ſuch as the Country-people and Labourers, are neither eaſily injur'd by any thing, nor generally ſubject to Diſeaſes. On the contrary, Infants ſprung from weak Parents; from ſuch as are either too young, or too old; from ſuch as are valetudinary, or addicted to Intemperance and Drunkenneſs; are eaſily injur'd, and highly ſubject to the Attacks of Diſeaſes. Infants alſo differ with reſpect to their peculiar Habits of Body; for thoſe whoſe Fleſh is ſpongy, and riſes too ſpeedily in Fat, and ſuch as have tender Nerves and Tendons, are much obnoxious to Diſorders; nor are they ſo ſprightly and lively as thoſe of the oppoſite State. Thoſe, on the contrary, have their Health eſtabliſh'd on a ſurer and leſs precarious Foundation, whoſe Fleſh is compact and firm, whoſe Nerves are ſolid, and whoſe Tendons and Membranes are ſufficiently tenſe. We muſt alſo obſerve, that one Infant is more ſubject to ſpaſmodic Diſorders and Convulſions than another. Neither ought we to forget, that Infants ſprung from Parents who give a Looſe to their Paſſions, and indulge themſelves in delicate and high Living, which is generally the Cuſtom of the Grand and the Opulent, do not live ſo long as the Children of other People, and are principally ſubject to thoſe Diſorders, which draw their Origin from a Weakneſs of the Nerves. For Infants of this Claſs, a mild Diet, and a ſtrict Regimen, ought to be preſcrib'd.

Nothing is more deſtructive of the Health of a ſucking Child, than too liberal a Repletion with Milk; for as every kind of Repletion is hurtful to Nature, and injurious to the Digeſtion, it is, of courſe, to be ſo much the more apprehended in ſo weak and tender a Patient; for this Reaſon the univerſal Practice of Nurſes is to be condemn'd, who, when Children are indiſpos'd, or cry, force the Breaſt upon them, often againſt their Inclinations; by which means they clog the Stomach with Milk, increaſe its Crudities, and add new Vigour to the Diſorder: For all Subſtances, not duly digeſted by the Stomach, ſtagnate in the Primæ Viæ, become aceſcent, and are corrupted. Hence *Hippocrates* juſtly affirm'd, that Nurſes, by their prepoſterous Method of ſuckling Children, often put an End to their Lives.

A ſufficiently thin and fluid Milk is to be us'd by Children; for ſuch as is thick, and impregnated with too large a Quantity of buttery or cheeſy Parts, is productive of the worſt of Conſequences, becauſe it cannot be ſufficiently digeſted and diſtributed by the Stomach. 'Tis, therefore, a Circumſtance of the higheſt Importance carefully to examine the Milk of Nurſes, with a

View

View to diſcover its Conſiſtence, and in what Proportion it contains the ſerous, the cheeſy, and the buttery Parts. This Intention is moſt commodiouſly and accurately anſwer'd by Evaporation, by any ſtatical Inſtrument, with which the ſpecific Gravities of Ales and Waters are determin'd; as alſo by an Affuſion of highly rectified Spirit of Wine, by which the Proportion of the ſolid to the fluid Parts may be diſcover'd. The buttery Part alſo of Milk may be inveſtigated by ſuffering it to ſtand twenty-four Hours in a moderately warm Place.

Milk which is thick and pinguious, is of the worſt Kind; and that is beſt, which is neither too thick, nor too thin and ſaline, and which is yielded by a ſound and healthy Nurſe. A preternatural Thickneſs of the Milk may be corrected by moderate Exerciſe before Meals, by Infuſions of the Seeds of Fennel, Aniſe, and Cumin, prepared with warm Water, and drank in the Morning upon an empty Stomach; as alſo by abſtaining from too large a Quantity of Aliments.

During the firſt Months 'tis expedient the Infant ſhould be ſuckled with thin Milk; but in Proceſs of Time, or at a Year's End, Milk which is pretty thick, produces no bad Conſequences, tho' new-born Infants cannot well bear it; for thick Milk obſtructs the Veſſels, whoſe Diameters are as yet narrow, and ſtuffs the meſeraic Glands, and the Villi and Mouths of the lacteal Veſſels, with thick and tenacious Sordes. Beſides, a large Quantity of thick Milk is, with Difficulty, carried thro' the Meanders of the Inteſtines by the periſtaltic Motion; in conſequence of which, it becomes tartiſh, and degenerates into a colliquated and corrupted Maſs: Hence ariſe the uneaſy Inflations, the Gripes, the Spaſms, the painful Fluxes, the Watchings, the Epilepſies, and the Startings during Sleep, with which Infants are afflicted.

Infants are to be indulg'd in the Uſe of Milk for a longer time than a Year, ſince, by this means, they acquire a Degree of Strength, and a certain Firmneſs of the Parts, of which they would otherwiſe be deſtitute; but, if the Work of Ablactation is limited to ſix or eight Months, then the Infant is gradually to be habituated to Aliments which are thin, and eaſily concocted. Moſt Mothers are to be blamed, becauſe, at the very time they are ſuckling their Children, they ſtuff them with Gruels prepared of Meal, Eggs, and Milk; a Species of Aliment, which, in conſequence of its viſcid and tenacious Nature, cannot fail to prove injurious. For this Reaſon, Aliments prepared of the Crumbs of Wheaten Bread, Water, and Butter, are far better ſuited to Children. The Health of Infants is alſo preſerved by Infuſions of Liquorice-root, and of the Herbs Paul's Betony and Germander; to which may be added, a Decoction of Barley, with Lemon-peel infuſed in it. The Uſe of this may alſo be preſcribed to Nurſes, for purifying their Milk.

We ought, above all things, to take care, that Infants labouring under a painful and difficult Dentition, or any other Diſeaſe, ſhould not have too large a Quantity of Milk, becauſe, in conſequence of its Stagnation, it eaſily becomes corrupted, and exaſperates the Diſorder; for, under every violent Pain, the whole nervous Syſtem is affected, by reaſon of the ſurpriſing Conſent of the Parts; for Pain produces a ſpaſmodic Conſtriction of the nervous Parts, by which means the Tone and periſtaltic Motion of the Stomach and Inteſtines, together with the Digeſtion, and ſeveral Excretions, are greatly diſturbed, and the Evacuation of the Fæces by Stool prevented.

The younger the Infant is, the more proper it is to indulge it in long Sleep; but it is gradually to be wean'd from this Habit, in proportion as it advances in Age.

We muſt take care, that the Bodies of Infants be kept always ſoluble, and that they go frequently to Stool; for, as ſoon as they become coſtive, we may infallibly conclude, that ſome Diſeaſe or other will ſoon attack them; for, as at all Periods of Life, ſo in Infancy, the regular and orderly Evacuation of the Fæces by Stool is an excellent Sign of Health, ſince it is a Proof of the Soundneſs of the nervous Syſtem, on which the Vigour of the periſtaltic Motion of the Inteſtines depends. But a coſtive State is always to be dreaded, becauſe it denotes, that the Strength of the nervous Parts is impair'd; and, conſequently, that the Body is diſpoſed to the Attacks of Diſeaſes. *Hippocrates*, in his Treatiſe *de Dentibus*, tells us, "That thoſe Infants are ſound and healthy, whoſe Bodies are "pretty ſoluble, and whoſe Concoction is good; but that thoſe "are ſickly and indiſpoſed, who have ſcanty Diſcharges by "Stool, and who, tho' furniſhed with a voracious Appetite, "are not ſufficiently nouriſhed."

Nothing has a more direct and immediate Tendency to deſtroy the Tone of the Stomach and Inteſtines in Infants, than Purgatives of a ſtrong and draſtic Nature. Of this Kind are all Compoſitions of Jalap and Scammony; as alſo metalline Preparations, ſuch as Aurum Fulminans, and Mercurius Dulcis, which, by remaining long in the Foldings of the Inteſtines, corrode their Membranes, after having brought on an Acceſſion of acrid Humours to the Parts: For Infants, gentle Laxatives are far more proper; ſuch as Preparations of Rhubarb, joined with Abſorbents; or Preparations of Manna, mixed with Extract of Rhubarb; for tho' we are perpetually to endeavour daily to eliminate the thick and viſcid Recrements of the Milk by Stool, yet we are to be no leſs careful, that the Tone of the Stomach and Inteſtines ſhould be preſerv'd ſound and entire; for, when this is either impair'd, or totally deſtroy'd, the Inteſtines never perform their Office in a due and regular Manner. Hence the moſt general and frequent Cauſe of the Diſeaſes of Infants is to be deduc'd; for draſtic Purgatives have this Unhappineſs peculiar to them, that tho' they render the Body ſoluble for once, yet, by injuring, and perhaps deſtroying, the Tone of the Inteſtines, they afterwards produce Obſtructions, and cauſe Retentions of the Fæces; a fruitful Source of various Diſeaſes incident to Children. I have often, with Grief, obſerv'd and foretold this in Patients of Diſtinction, tho' this Truth has been the common Butt of the Ignorance and Malice of ſome Phyſicians. But this Opinion is ſupported by the Judgment of the celebrated *Ferrarius*, who, in his Treatiſe *de Art. Medend. Infant.* affirms, "That Infants, in conſequence of their ſmall "Degree of Strength, are not able to bear highly alterative "Medicines. Opiates produce the ſame Effects, prove highly "injurious to the Habits of Children, and expoſe their Bodies "to the Attacks of Diſeaſes."

Infants and Children ought to eat little, but often; becauſe the ſmaller the Quantity is, the better it is adapted for nouriſhing the Parts. This Rule of Regimen is ſupported by the Authority of *Hippocrates*, who uſes the following Words: "Thoſe "who are in a growing State have a great deal of radical or "innate Heat, and therefore require a great deal of Nouriſh-"ment, otherwiſe the Body is conſum'd:" For, that the Bodies of Infants and Children may gradually become larger, they require a large Quantity of nutritious Juice, which ought to be gradually added to their Parts; but, ſince their tender Stomachs are not able to concoct a large Quantity of Aliments, 'tis therefore expedient, that they ſhould be exhibited frequently, but in ſmall Quantities; and the better the Foods are, with reſpect to their Qualities, the more effectually they are alſo calculated for nouriſhing the Parts.

In the Uſe of all the Non-naturals, whatever exceeds a due Temperature muſt be carefully kept from Infants and Children, to whom Wine, Brandy, and all Acids, are as prejudicial as ſo many Poiſons, becauſe they not only prevent the Nutrition and Augmentation of the Parts, but alſo prove injurious to the Brain and Nerves, the former of whoſe Functions they often diſturb.

A moderate and equal Perſpiration contributes not a little to preſerve the Health of Infants and Children. For this Reaſon their Regimen is to be of the temperate Kind, and both their Beds and Chambers are to be warm, that they may be ſufficiently defended againſt intenſe Cold. If they are otherwiſe manag'd, they are generally ſeized with Gripes and Hiccoughs. *Hippocrates*, in the ſixth Section of his Book *de Alimentis*, informs us, "That thoſe who perſpire freely are weak, but healthy; "and, if ſeiz'd with a Diſeaſe, eaſily recover: Whereas thoſe "whoſe Perſpiration is obſtructed before they are afflicted with "a Diſorder, are ſtronger, but then they recover with greater "Difficulty." But a free Perſpiration is highly neceſſary to Children, becauſe they require a large Quantity of Nouriſhment, the greateſt Part of which is again to be thrown out of the Body: The more effectually, therefore, this cutaneous Excretion is carry'd on, the more genuine and ſalutary the Nouriſhment of courſe becomes.

The Health of ſucking Children principally depends on the Nature of the Milk, and the ſound or weakly Conſtitution of the Nurſe; for, ſince the Infant receives its Nouriſhment from the Woman who gives it Suck, it muſt neceſſarily ſuſtain an incredible Injury by Milk, which is either of a bad Kind, or entirely depraved. Hence it happens, that Infants are generally ſeized with violent epileptic Diſorders, by ſucking the Milk of a Nurſe whoſe Mind is diſturb'd by the Sallies of Paſſion, or diſcompoſed by the fatal Influences of Dread and Terror. When a Misfortune of this Nature happens, it is expedient to milk the Breaſts frequently, taking care, at the ſame time, that none of the Milk be exhibited to the Child for twenty-four Hours after. For this Reaſon Nurſes of good Morals, and ſweet natural Diſpoſitions, are to be choſen, if they can poſſibly be had; and we muſt always take care, that Milk of one and the ſame Nature be uſed by Children. But the Health of Infants is moſt effectually preſerved by Nurſes who are neither too old nor too young; who have only given Suck once before; and who have never ſuffer'd Abortion. A Woman is alſo better qualify'd for the Purpoſes of a Nurſe, if ſhe feeds upon laudable Aliments, drinks large Quantities of very thin Liquors, abſtains from all Acids, from ſpirituous Liquors, from Subſtances tending to Putrefaction, from acrid Purgatives, from ſleeping in the Day-time after Meals, and from Venery. It is alſo expedient ſhe ſhould, twice a Day, exerciſe the inferior Parts of her Body, and that her Breaſts ſhould not contain a thick and ſuperfluous Milk.

We are, above all things, to take care, not to throw the Bodies of Infants into too violent Commotions, either by too great a Variety of Medicines, or ſuch as are poſſeſſed of too draſtic a Quality; but we are rather to uſe ſuch as are of a mild and gentle Nature, ſuch as do no Injury to the Tone of the Inteſtines, whilſt, at the ſame time, they preſerve the Perſpiration free, entire, and uninterrupted. Draſtic Preparations are never to be exhibited to Infants; and if at any time the State of their Health ſhould ſeem to require any ſuch thing, the Medicine is much more ſafely exhibited to the Nurſe than to the Child, ſince it is confirm'd, by repeated and well-vouch'd Obſervations, that a Purgative or Laxative, taken by the Nurſe, renders the Body of the Infant ſoluble.

Children, to whom Nutrition and Growth is neceſſary, muſt have Aliments frequently exhibited, but in ſmall Quantities, and ſuch as, by their Qualities, are adapted to nouriſh the Parts. 'Tis alſo highly neceſſary they ſhould uſe moderate Exerciſe, and keep up a free and uninterrupted Perſpiration, becauſe, by theſe means, their Health is excellently preſerv'd, and their Growth promoted. Children are by no means to be indulged in the Uſe of ſweet Subſtances, Milk, and Cheeſe, becauſe theſe contribute to the Generation of Worms, and bring on a Corruption of the Humours. They muſt alſo abſtain from Wine, ſpirituous Liquors, and too violent Exerciſe, leſt the Humours ſhould be over-heated, and the Body, in conſequence of the unſeaſonable Diſſipation of its Fluids, deprived of the proper Materials neceſſary for its Growth and Nouriſhment. Children, who apply themſelves to their Studies, muſt alſo abſtain from Aliments of a groſs and coarſe Texture, or of a flatulent Quality, ſuch as Beans, Peas, Millet, farinaceous Subſtances, and intoxicating Ales; for theſe not only weaken and impair the Strength of the Body, but alſo clog the native Force of the Genius, and impair the Underſtanding.

Celſus judiciouſly affirms, "That 'tis a Matter of leſs Moment what Aliments young Men uſe, or what Regimen they obſerve;" for Perſons in a youthful State are poſſeſſed of great Vigour, and an uncommon Strength of the ſolid Parts. For this Reaſon young Men are not eaſily injur'd, nor ought they to be rigidly ty'd down to the Laws of a ſtrict and ſevere Regimen.

In a State of Youth, however, as well as that of Manhood, a proper Medium is to be obſerved, and Perſons, in both Conditions, are to eat and drink in ſuch a manner, as to recruit and ſupport, but not to oppreſs and deſtroy, the Strength of the Body, and the Powers of the Mind.

Men, at this Period of Life, ought to take particular Care, that neither cold Liquor, nor a chilly Atmoſphere, get the leaſt Acceſs to their Blood, when overheated by hot and ſpirituous Liquors, or Motion; ſince, in conſequence of this, a great Number of young Men are, by fatal Inflammations, prematurely deprived of Life.

Young Men, and ſuch as are arrived at a State of perfect Maturity, ought carefully to abſtain from hot Subſtances, and ſuch as throw the Blood into preternatural Commotions. They muſt alſo avoid the more draſtic Purgatives, and carefully guard againſt indulging themſelves in the immoderate Tranſports of exorbitant Paſſions. But Veneſection, if Neceſſity requires it, is not, at this Period of Life, to be condemn'd. *Baglivi*, when delivering his Sentiments on this Subject, uſes the following memorable Words: "In young Men the Humours are generally convey'd to the ſuperior Parts; but, in old Perſons, they flow to ſuch as are inferior: This, if Conjecture is allowable, depends on the preternatural Laxity of the Solids and Fluids in old People; and the too great Strength, Tenſion, and Elaſticity of the ſame, in ſuch as are young." For this Reaſon, ſays *Duretus*, in his *Comment. in Coac. Prænot.* "Burning Fevers, in young Men, have a Solution by an Hæmorrhage from the Noſe; and, in old Men, by a Dyſentery. But that theſe may happen, as, according to the Dictates of Nature, they ought, the Mind muſt neceſſarily be free from every Care, that by this means the Spirits may, without Interruption, flow to all Quarters, and perform their Office in every Part, according to the fix'd and ſtated Laws of Nature; for, when the Mind is rack'd with Care, wrapt up in Study, or diſturb'd and tormented with the intricate and perplexing Affairs of Civil Life, the Circulation of all the Fluids is variouſly diſturb'd; and they are, in a tempeſtuous Manner, convey'd here-and-there, to Parts where they ought not naturally to be."

It contributes not a little to the Preſervation of Health, to enure and habituate the Body, from the very Dawn of Youth, to hard Labour, ſpare Living, and rather to a cold than too hot an Air.

The Regimen and Diet of old Perſons require the ſtricteſt Care and Attention, ſince they may be juſtly reckon'd among the Number of the Weak and Tender; for the more their Strength is impair'd, the more readily and effectually their Bodies are diſpoſed to be injured by external Objects.

For Perſons at this Period of Life, Moderation, Temperance with reſpect to Meat and Drink, and Tranquillity of Mind, cannot be too warmly recommended; for every Exceſs is injurious to the Nature and Conſtitution of old People: For this Reaſon, ſuch as are pretty far advanced in Years are carefully to abſtain from too liberal a Repletion with Aliments, from the frequent Uſe of Wine, eſpecially of the acid and tartareous Kind, from Food of bad Qualities, from ſuch Subſtances as are ſaline, acid, hard, and with Difficulty digeſted by the Stomach.

Nothing is ſo prejudicial to the Health of old Perſons, as violent Cold, and the frequent Uſe of Acids; for, in the Decline of Life, the Blood moves ſlowly thro' the Veſſels; and all the Excretions, which contribute to the Preſervation of Health, become languid: Hence the Humours are inſpiſſated, and acquire a Tendency to Stagnation. Since, therefore, Cold and Acids diveſt the Humours of their due Fluidity, and impair the natural Heat, the Reaſon is obvious, why they ſhould be deſtructive of the Health of old Perſons, and contribute greatly to the Production of thoſe Diſorders, with which they are generally afflicted. Some Sorts of Aliments ſoon become acid in the Stomachs of old Perſons; for which Reaſon, Preparations of Milk prove highly prejudicial to them.

The Health of old Perſons is beſt preſerved by ſuch Subſtances as are quickly digeſted, eſpecially for Supper; ſince, by this means they enjoy ſounder Sleep, which never fails to afford ſingular Relief to Perſons advanced in Years.

The more nearly the Aliments of old Perſons approach to Simplicity, and a due Temperature, the better they are adapted to the Preſervation of their Health.

Perſons advanced in Years are not, without the moſt urgent Reaſons, to change the Method of Life, to which they have been long accuſtom'd, whether with reſpect to Exerciſe or Aliments.

As a moderate Tranſpiration is highly conducive to the Health of old Perſons, this Evacuation is, therefore, to be carefully preſerved, and duly carried on. Now 'tis certain, that Tranſpiration is excellently aſſiſted and promoted by due Motion and Exerciſe in a temperate Air; as alſo by ſtrong and generous Wine, which not only forwards this Evacuation, but alſo procures Strength and Vigour to the whole Body; for which Reaſon it is by ſome call'd the Milk of old Men. This Intention is alſo anſwer'd by Infuſions of Aromatics, ſuch as Sage and Baum, together with Lemon-peel and Cinnamon: But intoxicating and ſulphureous Wines, or ſuch as are poſſeſs'd of an acid and aſtringent Principle, are highly injurious to old Perſons, becauſe they render them coſtive, and prevent the due Diſcharge of the Urine.

Veneſection is of ſingular Service to old Perſons; but is principally to be uſed when they have ſufficient Remains of Strength, when their Appetites are entire, and when the whole Body is ſtill poſſeſs'd of a due Degree of Energy and Vigour. Moſt old Perſons might protract Life longer than they really do, if they did not wilfully and obſtinately deſpiſe Veneſection; for a Redundance of Blood, to which old Perſons, in conſequence of their ſedentary Lives, and free Living, are inclined, puts an End to the Lives of many; for it brings on Scurvies, Infarctions of the Viſcera, Conſumptions, lethargic Diſorders, and Apoplexies.

Such old Perſons, as by any means are deſtitute of a Power of exerciſing their Bodies, ought, by Frictions, to promote the due Circulation of their Blood.

Perſons advanced in Years ought carefully to abſtain from the too liberal Uſe of Fleſh; and boil'd Vegetables, ſuch as Raiſins, Prunes, and Apples, are far better ſuited and adapted to the Preſervation of their Healths. Fleſh generates too large a Quantity of Blood in the Body, which, ſince old Perſons are averſe to Exerciſe, not only proves highly injurious to them, but is the principal Cauſe of the Diſorders with which they are generally afflicted. The Health of old Perſons is far better conſulted by ſoft Pulſes, Pot-herbs, and Fiſh; ſince theſe contain but a ſmall Quantity of nutritious Juice. *Baglivi* has a memorable Obſervation to this Purpoſe: "In the Courſe of Practice, ſays he, a Phyſician may obſerve, that ſome Patients, ſubject to Defluxions, and chronical Diſorders, recover in *Lent*; but begin again to languiſh in *Eaſter*, by their eating Fleſh. He may alſo obſerve, that ſome Diſorders are removed by eating Roots, Pulſes, Pot-herbs, Fiſh, and other Aliments of a like Nature; whereas the ſame Diſorders are augmented by Fleſh, and other Aliments of rich Juices."

Old Perſons are highly injured by Purgatives, and all violent Commotions of Mind; for the more weak and tender the Body is, the more Injury it ſuſtains by any Intemperature or Exceſs.

At different Seaſons of the Year, different Regimens are alſo to be uſed, becauſe a Change in the State of the Atmoſphere induces a proportionable Alteration in animal Bodies.

In the Winter the Fibres, in conſequence of the increaſed Elaſticity of the Air, are more ſtrong, better qualified for performing the ſeveral Motions, and aſſiſting the Concoction of

the Aliments; for which Reaſon we can far better bear Aliments of difficult Digeſtion in that Seaſon, than in any other.

As, during the Winter, Tranſpiration is in ſome meaſure obſtructed, becauſe the cutaneous Ducts are braced up by the cold Air; hence the Uſe of rich Wines, and ſtrong Ales, becomes highly proper. It is alſo expedient to make frequent Uſe of warm Broths, and Infuſions; and Care is always to be taken, that the Perſpiration beat a Proportion to the Quantity of Aliment uſed.

It is a highly culpable Cuſtom which prevails, eſpecially among the *Germans*, of heating their Rooms, in cold Weather, ſo intenſely hot, that Perſons are, in a manner, ſcorch'd during their Stay in them; for when, a little after, they expoſe their Bodies to the cold Air, for the ſake of Relief, they procure to themſelves catarrhous Defluxions, Coryzas, and Weakneſs of the Head, which, in Proceſs of Time, generally bring on dangerous nervous Indiſpoſitions.

In the Spring ſomething is to be retrench'd from the Quantity of our Aliments, and the Liquor we uſually drink is ſomewhat to be enlarged. During this Seaſon, alſo, Venery is moſt ſafe, and is leſs likely to be injurious to the Health of the Body.

Thoſe but ill conſult their Health, who, in the very Begining of the Spring, lay aſide their Winter Clothes, and uſe ſuch ſlender Garments as are only proper for the intenſe Heats of the Summer. During the Spring the State of the Atmoſphere undergoes a great Variety of Changes, and there is almoſt a perpetual Viciſſitude of Heat and Cold. If, therefore, a hot Conſtitution of the Air is ſuddenly changed into a cold State of Weather, the Cold inſinuates itſelf into the open Pores of the Skin, and contracts them: Hence the cutaneous Exhalations, the Emiſſion of which is ſo ſalutary in the Spring, are, to the great Prejudice of Health, retain'd within the Body.

An obſtructed Perſpiration is at no time to be more dreaded than in the Spring, becauſe it prepares and diſpoſes the Body for the Attacks of the moſt terrible Diſorders. This is ſufficiently proved by the various Diſeaſes and Fevers, eſpecially of the exanthematous Kind, which generally rage in the Spring, and which draw their Origin from nothing more than an obſtructed Perſpiration; for, during the Winter, the ſuperfluous Juices of the Aliments are too largely accumulated in the Body; and, in the Spring, Nature endeavours to throw them off by a greater Expanſion, both of the ſolid and the fluid Parts: For this Reaſon the taking Meaſures, in order to preſerve Health, is at no Seaſon more neceſſary than in this: Hence it is become cuſtomary to uſe Veneſection, and purify the Blood by gentle Laxatives and Infuſions, in the Spring; for, at this time, the State of the Air is highly favourable to ſuch preſervative Methods. We are, therefore, to be very careful, that, during this Seaſon, that ſalutary Perſpiration, which eliminates the Sordes of the whole Body, be not obſtructed.

No Seaſons of the Year are productive of more Diſorders than the Spring and Autumn. Now, ſince the greateſt and moſt effectual Preſervative of Health is a free Tranſpiration, our principal Care ought to be employ'd in preſerving this Evacuation entire and uninterrupted, during theſe Seaſons; for this Reaſon we are to guard ourſelves ſufficiently againſt the Inclemency of the Weather: And becauſe the Atmoſphere is, at theſe times, impregnated with many Exhalations injurious and prejudicial to Nature, we are to be highly careful not to expoſe ourſelves to the inclement Air about the Beginning of the Spring, and the End of the Autumn, that is, in the Months of *March* and *November*, as alſo in Mornings and Evenings.

In the Autumn the ſame Phænomena are to be obſerved as in the Spring, becauſe the Inclemency of the Air is the ſame, and the Changes of Weather are equally ſudden and frequent, by which means Perſpiration, which is abſolutely neceſſary to Health, is eaſily obſtructed; and becauſe, at this Seaſon, the Equinoctial happens, Diſeaſes are to be prevented by what we call preſervative Cures.

During the Summer, Health is moſt effectually preſerved by Vegetables, and Draughts of diluting Liquors; but we are to abſtain from ſuch Aliments as are heavy, and of difficult Digeſtion, from Wine and Brandy, and from the unſeaſonable and exceſſive Uſe of Tobacco; which, however, may be permitted in the Spring and Autumn. But, according to *Celſus*, Venery is to be entirely abſtain'd from during the Summer.

Different Sexes alſo require a different Diet and Regimen.

Women are weaker than Men, and, for that Reaſon, require a Diet and Regimen peculiar to themſelves: They are of a ſpongy and lax Habit, for the moſt part, addicted to Indolence and Pleaſure, drink little, have Bodies of a highly delicate and ſenſible Nature, much inclin'd to Spaſms, and convulſive Motions, and diſpoſed to generate a Redundance of Blood. Beſides, at certain fix'd and ſtated Times, they have a regular Evacuation from the Veins of the Uterus; and, in conſequence of theſe Circumſtances, 'tis neceſſary, that Women, rather than Men, ſhould have a Regimen, and Method of Living, peculiarly and accurately adapted to their Habit and Conſtitution.

The Female Sex, as we are taught by Experience, are generally in the worſt and moſt uncomfortable State of Health, when this Evacuation is diſorder'd, and irregularly carried on; on the contrary, they are in a ſound and flouriſhing State, when this Diſcharge is duly and regularly made: For this Reaſon, it ought to be the principal Care of the Phyſician always to preſerve this Evacuation in a due and natural Condition, both with reſpect to Quantity, Time, and Order; and never to ſuffer it either to be diſturb'd, or totally ſuppreſs'd, by an improper Diet, or the Neglect of a due Regimen. But nothing ſo effectually diſturbs this Evacuation, as a free Admiſſion of the Cold to the Belly, and inferior Parts, when the Menſes are juſt about to flow. This ſalutary Excretion is alſo palpably injur'd by violent Commotions of Mind, eſpecially by the Influences of Dread and Terror, the Force of which is ſo great, that it frequently puts a Stop to the Diſcharge, after it is begun. Nor, in a Caſe of this Nature, is it expedient to uſe the harſher Methods of Cure, or to excite impure and filthy Ideas in the Patient; but Tranquillity of Mind is rather to be preſcrib'd by the Phyſician, and, if poſſible, preſerved by the Patient. At the time the Menſes flow, they are to abſtain from all Acids, flatulent Subſtances, Aliments that are heavy, of difficult Digeſtion, and a refrigerating Quality; as alſo from Preparations of Milk, and Things of a viſcid Nature. They ought, alſo, carefully to avoid toaſted Bread ſoak'd with Butter, Draughts of cold Liquors, feculent Ale, and, in a Word, every thing of an aſtringent Quality.

When the Menſes are juſt about to be diſcharged, 'tis highly expedient and neceſſary to uſe all Meaſures in order to promote the free and briſk Circulation of the Blood. The liberal and copious Diſcharge of this recrementitious Fluid is excellently obtain'd by Infuſions of Herbs moderately balſamic, ſuch as Baum, Paul's Betony, Wall-flowers, and thoſe of Marigold, Cinnamon, and freſh Lemon-peel, drank every Morning inſtead of Tea. It is alſo expedient to keep the Body always pretty ſoluble; for which Reaſon, if the Patient has been coſtive for any conſiderable time, an emollient Clyſter is to be injected, or a Doſe of the balſamic Pills exhibited. Moderate Exerciſe, and a temperate warm Air, are alſo of ſingular Service; and we are always to take care, that the Feet, and inferior Parts, be ſufficiently defended from the Cold.

Pregnant Women are alſo to have a Regimen peculiar to themſelves directed for them, leſt the Mother herſelf, or the Fœtus, ſhould ſuſtain any Injury; for the Infant, included in the Uterus, is, as it were, a Part of the Mother's Body.

Such as is the Health of the Mother, the State of her Mind, and the Condition of her Humours, and their ſeveral Motions, ſuch alſo the State of the Infant is: The more ſound and robuſt, therefore, the Mother is, the more briſk and vigorous the Fœtus is obſerved to be; and whatever injures the Mother, is ſtill more prejudicial to the Health of the tender Fœtus. For this Reaſon Women, in a State of Pregnancy, ought to take particular care of their Health, and, as much as poſſible, conform themſelves to the Rules of a proper Regimen.

Women ought principally to uſe ſuch Aliments as generate a laudable and balſamic Blood in the Body, procure a due Degree of Fluidity to the Humours, and eliminate the ſuperfluous and recrementitious Parts from the vital Juices: But they ought to abſtain from all Subſtances which are not of a due Temperature, which either throw the Humours into too violent Commotions, render them impure, or generate too large a Quantity of Blood: For, ſince every Degree of Intemperature or Exceſs is prejudicial to the Health and Conſtitution of the Body, it muſt prove much more ſo to pregnant Women: For this Reaſon they ought to guard againſt the violent Sallies of Paſſion, immoderate Cold, intenſe Heat, too liberal a Repletion with Aliments, violent Exerciſe, long Sleep, Foods of difficult Digeſtion, and depraved Juices, all draſtic Emetics and Purgatives, and, in a Word, whatever, in conſequence of its Energy and Activity, throws the Humours into too violent Commotions. But the Health of pregnant Women is much more effectually preſerved by ſuch Subſtances as are of a mild and temperate Nature, generate balſamic and laudable Juices in the Body, are eaſily digeſted, and ſoon paſs thro' the Emunctories.

Since, in pregnant Women, a Ceſſation of the menſtrual Diſcharge neceſſarily throws them into a plethoric State, nothing more effectually contributes to the Preſervation of the Health, both of the Mother and Fœtus, than ſeaſonable Veneſection, which in ſome becomes neceſſary in the ſecond, but in moſt in the third Month; and this Operation is to be repeated in the ſeventh or eighth, as the Neceſſity and Condition of the Patient require it. The ſuperfluous Blood, in the Bodies of pregnant Women, is to be taken away by Veneſection; becauſe, when it is left in the Habit, it throws both Mother and Fœtus into violent Diſorders. But, becauſe ſome Women have a far larger Quantity of Blood than others, for this Rea-

ſon one Veneſection is by no means ſufficient to make a due Evacuation; but the Operation is, in theſe Patients, to be three or four times repeated; for by this means Abortion, and the other Misfortunes incident to pregnant Women, are excellently prevented.

The Plethora, generally incident to pregnant Women, for the moſt part, produces a Cacochymia. The Phyſician, therefore, to whom the Health of the Mother and Fœtus is entruſted, ought, above all things, to attempt the Prevention of this Depravity and Degeneracy of the Humours, by proper Remedies. This Intention is excellently anſwer'd by ſuch mild Evacuants, as gently eliminate the impure and peccant Humours collected in the *Primæ Viæ*. Thus *Hippocrates*, in the twenty-ninth Aphoriſm of his fifth Section, tells us, "That pregnant Wo-"men, when abounding with ſuperfluous Humours, are to be "purged, from the fourth to the ſeventh Month, tho', about "the ſeventh, not ſo much." This Intention is anſwer'd by balſamic Medicines, which, whilſt they gently evacuate, at the ſame time corroborate and ſtrengthen the Stomach, Inteſtines, and whole nervous Syſtem. Of this Kind are the *Pilulæ Becheri*, and the *Pilulæ Rhabarbarinæ*; as alſo Raiſins, impregnated with Rhubarb, with the Addition of a little Cinnamon.

Draſtic Purgatives are highly prejudicial to pregnant Women, becauſe, by affecting the Membranes of the Inteſtines, and the nervous Parts of the Body, with violent Spaſms, they ſtimulate the Uterus to the Expulſion of the Fœtus, or even deſtroy the Tone and Strength of the Stomach.

Such Subſtances as render Perſpiration free and eaſy, contribute greatly to remove the Impurity of the Juices; for which Reaſon pregnant Women ought frequently to uſe the fix'd Bezoardic Powders, the Elixir Stomachale, warm Infuſions of Herbs, moderate Exerciſe, and generous Wines; but theſe are to be uſed ſparingly, and at proper Seaſons.

During the firſt Months of Pregnancy, Women ſhould not eat very liberally; and, through the whole Courſe of Geſtation, Temperance is highly commendable; for the ſmalleſt Degree of Repletion produces Crudities, which prevent the Generation of laudable Juices. Hence 'tis confirm'd by Experience, that too liberal an Indulgence in the Uſe of Aliments, prevents or retards the Nouriſhment of the Fœtus; and we find, that fat Women frequently bring into the World weakly and extenuated Children; whereas the Infants of lean Mothers are often fat, robuſt, and vigorous.

Pregnant Women ought, above all Things, to guard againſt Commotions of Mind, eſpecially Dread, and groundleſs Fancies; which are highly injurious to the Health of the Fœtus, and diſturb or hinder the due Conformation of its Parts. 'Tis ſufficiently confirm'd, by Experience, that the deprav'd and groundleſs Imaginations of Mothers frequently imprint laſting Deformities on the Bodies of Children; and this Misfortune principally happens during the laſt Months of Geſtation. *Frederic Hoffman, Medicin. Rational. Syſtemat.*

DIÆTEMA, *διαίτημα*, the ſame as DIÆTA, tho' *Galen, ad Thraſyb.* calls the reſt of the Non-naturals, beſides Meat and Drink, by that Name. *Caſtellus.*

DIÆTETICA, from *Diæta*, is that Part of Medicine which preſcribes a due Regimen with regard to the Uſe of the Non-naturals. *Blancard.*

DIAGLAUCIUM, *Diaglaucii*, *διὰ γλαυκίε*, is the Name of a Collyrium, recommended by *Scribonius Largus, Numb.* 22. for beginning Lippitudes and Ophthalmies. It takes its Name from *Glaucium*, which, according to *Dioſcorides, Lib.* 3. *Cap.* 100. is the Juice of an Herb growing about *Hierapolis*, a City of *Syria*. *Dale* takes this Herb for the *purging Thiſtle*. See the Compoſition of this Remedy in *Scribonius Largus*, Numb. before quoted.

DIAGNOSIS, *διάγνωσις*, from *διαγινώσκω*, to diſcern, or diſtinguiſh, is defin'd by *Galen, Com.* 1. *in Progn.* *ἡ τῶν ἐνεστώτων γνῶσις*, "a Knowledge of Things, as they are in the preſent "State." This Knowledge is acquir'd by the Obſervation of certain Signs or Characters, which are therefore call'd *Signa Diagnoſtica*, the diagnoſtic Signs.

DIAGRYDIUM. See SCAMMONIUM.

DIAHERMODACTYLU, *διὰ ἑρμοδακτύλε*, a purging Remedy in *Trallian, Lib.* 11. in which the Hermodactyl is a principal Ingredient.

DIAION. The Name of a Paſtil or Troche in *Myrepſus, Sect.* 41. *Cap.* 48. It ought to be *διὰ ἰων*, of Violets, a principal Ingredient in the Compoſition.

DIAIREOS. The Name of an Antidote in *Myrepſus, Sect.* 1. *C.* 103. in which the *Iris*, Orris, is a principal Ingredient.

DIAITHROS, *Διαθρος*. This is explain'd by *Galen*, *διαφανὴς*, pellucid, tranſparent.

DIALACCA. The Name of an Antidote in *Myrepſus, Sect.* 1. *C.* 123. in which Lacca is a principal Ingredient.

DIALAGOOU, *διὰ λαγῶ*. The Name of a Medicine in *Alexander Trallianus, L.* 8. *C.* 2. in which the Dung of a Hare is an Ingredient. According to this Author, it is an approv'd Remedy againſt Indurations and Obſtructions of the Liver and Spleen.

DIALEIMMA, *διάλειμμα*, from *διαλείπω*, to intermit. An Intermiſſion; that is, the Interval betwixt the End of one Paroxyſm, and the Beginning of another.

DIALEPSIS, *διάλημψις*, from *διαλαμβάνω*, to interpoſe, or intermit. It imports much the ſame as Apolepſis, which ſee. *Hippocrates* uſes it, *Lib. de Arte*, to expreſs the Interſtices, or Spaces left betwixt the Revolutions of Bandages.

DIALIBANON. The Name of ſeveral Medicines in *Myrepſus, Trallian*, and *Marcellus Empiricus*, in which Frankincenſe is a principal Ingredient.

DIALOES, *δι' ἀλόης*. The Name of ſeveral Medicines whoſe Baſis is Aloes.

DIALTHÆA, *διαλθαία*. The Name of an Ointment in *Myrepſus, Sect.* 3. *Cap.* 49. from which the Unguentum Dialthææ of the Diſpenſatories ſeems to have been taken. See ALTHÆA.

DIALYSIS, *διάλυσις*, from *διαλύω*, to diſſolve, *(the Strength)* or render languid. A Diſſolution of the Strength, or Weakneſs of the Limbs.

DIAMARENATUM. From *Amarenæ*, red ſubacid Cherries. There are two Medicines call'd by this Name in *Schroder*, the Simple, and the Compound. The Simple is made of the Pulp of Cherries, *(Amarenæ)* paſſed through a Sierce, three Pounds; and Sugar, two Pounds. The Compound is made in the ſame manner, with an Addition of Aromatics. The Virtues of theſe may be known by thoſe of Cherries. See CERASA.

DIAMARGARITON, *διὰ μαργαριτῶν*. The Name of an Antidote in *Myrepſus, Sect.* 1. *C.* 37. in which Pearls are a principal Ingredient.

DIAMASCIEN, or DYAMASSIEN. The ſame as *Flos Æris. Rulandus.* See Æs.

DIAMASSEMA, *διαμάσημα*, from *διαμασάομαι*, to chew. A Maſticatory. See MASTICATORIUM.

DIAMBRÆ SPECIES. The Name of two Medicines in the *London Diſpenſatory*, one call'd *Species Diambræ ſine Odoratis*, the other *Species Diambræ cum Odoratis*.

The *Species Diambræ ſine Odoratis*, Species Diambræ, without Perfumes, is thus prepared:

> Take Cinnamon, Angelica-roots, Cloves, Mace, Nutmegs, the *Indian* Leaf or Malabathrum, and Galangal, of each three Drams; Spikenard, and the greater and leſſer Cardamoms, of each one Dram; of Ginger, a Dram and a half; of Aloes-wood, yellow Sanders, and long Pepper, each two Drams: Make them into a Powder.

This is originally a Preſcription of *Meſue*, and exactly tranſcribed from him by the College into their firſt Diſpenſatory: Afterwards, indeed, they rejected the Doronicum, or Wolf's-bane; but now not only that, but the Perfumes, are quite expung'd, as being wholly remote from the main Intentions of the Medicine, and prejudicial to many Conſtitutions: Altho' as ſome particular Caſes may require theſe very Ingredients, the College have allowed of them in the following. This is eſteem'd a great Cephalic and Cordial, and is frequently preſcribed in nervous Decays, from Apoplexies, Epilepſies, Palſies, and old Age. It ſtrengthens the Stomach in particular, raiſes the Spirits, and warms the Blood to a very great Degree; whereby it is a Provoker to Venery, but more as a Stimulus, than by ſupplying any freſh Recruits to thoſe Parts, or augmenting the Ability of Performance. Its Doſe is from ten Grains to half a Dram.

The *Species Diambræ cum Odoratis*, Species Diambræ, with Perfumes, is thus directed:

> This is made by an Addition to the foregoing Species, of Ambergriſe, one Dram and a half; and of Muſk, half a Dram.

DIAMELON. The Name of two Compoſitions in *Trallian, L.* 7. *C.* 7. in which Quinces are a principal Ingredient.

DIAMISYOS *Collyrium*. The Name of a Collyrium in *Marcellus Empiricus, C.* 8. in which *Miſy* is a principal Ingredient.

DIAMNES. An involuntary Diſcharge of Urine; that is, when the Urine is diſcharged without the Conſciouſneſs of the Patient. It is a barbarous Word, made uſe of by *Johannes Anglicus*.

DIAMORON, *διὰ μόρων*. The Name of a Preparation of Mulberries and Honey. See MORUS.

DIAMOSCHU. The Name of an Antidote in *Nicolaus Myrepſus, Sect.* 1. *C.* 223. ſo call'd from Muſk, the principal Ingredient. There is alſo a Species, directed in the old *College Diſpenſatory*, under the Title of *Species Diamoſchu dulcis*, which is left out in the laſt.

DIA-

DIAMOTOSIS, διαμότωσις, from μοτὸς, Lint. The Introduction of Lint into a Wound or Ulcer.

DIANA, in Chymiſtry, is the Silver of the Philoſophers.

DIANÆ ARBOR, the Tree of *Diana*. It is prepared of a due Mixture of Silver, Mercury, and Spirit of Nitre, cryſtalliz'd together in the Form of a ſmall Tree. Thus, for Inſtance:

Take an Ounce of Silver; diſſolve it in two or three Ounces of Spirit of Nitre; evaporate your Solution in a Sand-heat, to about the Conſumption of half the Liquor: Pour what remains into a Matraſs, in which there are twenty Ounces of pure Spring-water; add two Ounces of Quick-ſilver; place your Matraſs on a ſmall Bundle of Straw, and ſuffer it to remain in a State of Reſt for forty Days; during which time, there will be a ſmall Tree produc'd with Branches; at whoſe Poins are ſmall Globules, reſembling Fruit.

Though this Proceſs is not of any formal and direct Uſe in Medicine, yet, as it is highly curious, and ſuggeſts ſome Phenomena, the Explication of which may poſſibly enlarge the Mind of the inquiſitive Chymiſt, we ſhall make ſome Remarks upon it.

Theſe Branches, then, are produc'd by the Spirit of Nitre, which, being incorporated with the Silver and the Mercury, aſſumes different Figures, according to the Quantity of Liquor in which it ſpreads and diffuſes itſelf; for if ten or twelve Ounces of Water were only uſed in this Operation, a Species of contus'd Cryſtals would only be produc'd: On the contrary, if too large a Quantity was employ'd, nothing would appear but a ſmall Quantity of a precipitated Powder. 'Tis neceſſary the Mixture ſhould remain in a State of Reſt for forty Days; becauſe the Spirit of Nitre, being pretty much weaken'd by the common Water, muſt of courſe operate very ſlowly. If we remove the Matraſs, we of courſe break and diſcompoſe the beginning Figure, which, however, will form itſelf afreſh, if the Veſſel is ſuffer'd to continue in a State of Reſt. This Proceſs is more commodiouſly carried on in a cool, than in any other Place, becauſe it is properly a Species of Cryſtallization.

This Operation has ſome Analogy with that perform'd in the Earth, in order to the Generation and Growth of Plants; for, if the Seed has too large a Quantity of Moiſture, the Spirits ſubſervient to the Dilatation of its Parts will be ſo weak, as to become incapable of acting any longer: Hence nothing at all will be produc'd. If, on the contrary, the Seed has too ſmall a Quantity of Moiſture, the Spirits, not finding a ſufficient Space to extend and diffuſe themſelves in, will either remain pent up within their former Boundaries, or evaporate themſelves in the Air. But when there is a due Proportion of Water in the Earth, then theſe Spirits, being in a proper Degree of Motion, and extending themſelves inſenſibly, rarefy and extend the Subſtance of the Seed; a Circumſtance on which the Vegetation of Plants depends. But to return to our Proceſs.

When we have a mind to ſeparate the Silver from the Mercury, the Whole muſt be ſtirr'd about, pour'd into an earthen Diſh, boil'd for half a Quarter of an Hour, taken off the Fire, and ſuffer'd to cool, till it is little more than tepid. Whilſt it is in this State, pour into it gradually a Pint of Water, in which two Ounces of Sea-ſalt have been previouſly diſſolv'd; by which means a white Precipitate will be form'd. Pour off the Water by Inclination, and dry the Precipitate; then put it into a Retort, placed in a Sand-heat; and, adapting to it a Receiver full of Water, apply a ſmall Degree of Fire at firſt, but augment it gradually, till the Retort becomes red; by which means your Quickſilver will be diſtil'd, Drop by Drop, into the Water in the Receiver. Continue the Fire, till no more is yielded in Diſtillation. Suffer the Veſſels to cool; pour the Water from the Receiver, and after having waſh'd the Mercury in it, dry it with a linen Cloth, or with the Crumbs of Bread, and preſerve it for future Uſe.

In the Retort you will find your Silver, which you may reduce to an Ingot or Wedge, by fuſing it over a briſk Fire in a Crucible, with a ſmall Quantity of Saltpetre.

I once, ſays *Lemery*, calcin'd the Precipitate in a Crucible, inſtead of ſubjecting it to Diſtillation, thinking, that, by this means, the Mercury would be evaporated, whilſt the Silver remain'd. But the Whole was diſſipated in the Air, with a certain Degree of Noiſe, and nothing remain'd in the Crucible; becauſe the Silver, in conſequence of its Conjunction with the Mercury, had been render'd volatile.

Another Species of the *Arbor Dianæ* may be produc'd in the following Manner:

Diſſolve an Ounce of pure Silver in three Ounces of Aqua-fortis, either in a Phial or ſmall Matraſs; place your Veſſel in Sand, and, by a moderate Heat, evaporate half of the Aqua-fortis. Then add three Ounces of the beſt diſtil'd Vinegar, ſomewhat warm'd. Stir the Mixture; and then diſpoſe of your Matraſs in ſome Place where it may remain in a State of Reſt for about a Month; during which time, there will be produc'd a ſmall Tree, reſembling a Fir, and whoſe Top will reach to the very Surface of the Liquor.

This Species of philoſophical Tree is alſo a kind of Cryſtallization, produc'd by the Silver, penetrated by the Acids of the Aqua-fortis, and the Vinegar. It may be again reduc'd into Silver, by pouring Water upon it, in order to make it precipitate into a white Powder, which is to be fus'd over a briſk Fire in a Crucible, with a ſmall Quantity of Borax, or Saltpetre. *Lemery, Cours de Chym.*

DIANANCASMUS, διαναγκασμὸς, from ἀνάγκη, Neceſſity, Force. The forcible Reſtitution of a diſlocated Part into its proper Place. *Hippocrates* calls an Inſtrument by this Name, which is intended for reſtoring a diſtorted Spine, in his Treatiſe *de Articulis*.

DIANISTESMOS, διανίστημος. The ſame as *Acratiſma*, which ſee.

DIANŒA, διάνοια. The Mind. See *Animus*.

DIANTHON, δι' ἀνθῶν. The Name of an Antidote in *Nicolaus Myrepſus, Sect.* 1. *C.* 454. from *Galen*. From this, probably, the Hint of the *Species Dianthus* was taken, which is thus directed by the College:

Take of Roſemary-flowers, one Ounce; of red Roſes and Liquorice, of each ſix Drams; of Cloves, Spikenard, Nutmegs, Galangal, Cinnamon, Ginger, Zedoary, Mace, Aloes-wood, the leſſer Cardamoms, the Seeds of Dill, and Aniſe, of each four Scruples; and make them into a Powder together.

Zwelfer gives it an uncommon Recommendation for a Cardiac; and praiſes it alſo in Defluxions, and many Weakneſſes of the Conſtitution from Indigeſtion. It is certainly a very good Compoſition for all nervous Intentions, and does not give ſuch Diſorders as ſometimes thoſe with the Sweets do; it is a great Strengthener of the Brain, and a good Preſervative againſt thoſe Diſtempers which Age is ſubject to bring upon it, as Apoplexies, Epilepſies, Palſies, Loſs of Memory, and the like. It greatly warms the Stomach and Bowels, and invigorates the whole Maſs of Humours. Medicines of this Kind are of great Service in cold cachectic Habits, where the Load of Humours has been forced away by ſtrong Detergents and Cathartics, and the Fibres are left weak, ſo as to be continually liable to relapſe; becauſe they ſtrengthen the Solids, fill them with due Spirits, and procure ſuch a vigorous Vibration and Circulation, that afterwards a proper Digeſtion and Separation is made, and all Supply cut off, which might occaſion a Return. Things of this Nature are therefore indiſpenſably neceſſary after Purging in Dropſies, or to be given in their Intervals; and, for want of this Knowledge, many, whoſe utmoſt Acquaintance in Phyſic goes no farther than a few violent Purges, undertake ſuch Cures; and make ſhort ones, by carrying off the preſent Load, but cannot prevent a Return of the Diſeaſe.

DIAOPORON, διὰ ὀπωρῶν. The Name of a Compoſition deſcrib'd by *Trallian, L.* 7. *C.* 7. It is thus call'd from ὀπώρα, autumnal Fruit; becauſe Quinces, Services, and Medlars, enter its Compoſition.

DIAPASMA. The ſame as CATAPASMA, which ſee.

DIAPEDESIS, διαπήδησις, from διαπηδάω, to leap thro'. A Tranſudation of the Fluids through the Sides of their containing Veſſels.

DIAPENCIA is, according to *Rulandus*, the *Alchimilla*.

DIAPENSIA. A Name for the *Sanicula Officinarum*.

DIAPEPEREON. The Name of an Antidote deſcrib'd by *Nicolaus Myrepſus, Sect.* 1. *C.* 184. from *Galen*.

DIAPHANES, διαφανὴς. Tranſparent, or red-hot.

DIAPHILEDONU, διὰ φιληδόνι. The Name of an Antidote in *Myrepſus, Cap.* 124.

DIAPHLYXIS, διάφλυξις, from διαφλύζω, to irrigate, or moiſten, is expounded in *Galen's Exegeſis* on *Hippocrates*, by ὑπερχύσεις, Effuſions, Ebullitions.

DIAPHŒNICON, διὰ φοινίκων, from φοῖνιξ, a Date, is a Medicine made of Dates.

DIAPHORA, διαφορὰ, of διαφέρω, to differ; Difference. In Medicine it comprehends the characteriſtical Marks, or Signs which diſtinguiſh one Diſeaſe from another.

DIAPHORESIS, διαφόρησις, from διαφορέω, of διὰ, through, and φέρω, to carry; is an Elimination of the Humours in any Part of the Body through the Pores of the Skin.

DIAPHORETICA. Diaphoretics, or Medicines which promote Perſpiration. See ALEXIPHARMICA.

Hippocrates relates the Caſes of ſome Patients, whoſe Fevers were terminated after the Eruption of Sweat, whether that Sweat really put a Period to the Diſeaſe, or only appear'd at its End; as it happen'd in the Inſtances recorded *Lib.* 1. Patient 6. 7. *Lib.* 2. *Sect.* 2. Patient 7. 11. 12. in which Patients

the

the Fever ſeems rather to be terminated by an Eruption of Blood than of Sweat; for Sweat, ſo far as I can perceive, is not, by *Hippocrates*, always propos'd as an Inſtrument by which the Diſeaſe is cur'd, but only as a Mark, or Sign, from which its Event or Termination may, with the greater Certainty, be prognoſticated. For this Reaſon, in thoſe Books of his, which are accounted genuine, he no-where mentions ſudorific Medicines; and even in thoſe Works, which are falſly aſcrib'd to *Hippocrates*, there is only once Mention made of a Sweat procur'd or forc'd by Medicines; for the Author of the ſecond Book of the *Epidemics* orders a Sweat to be procur'd by carefully covering the Patient with the Bed-clothes, and exhibiting Meal boil'd in rich and generous Wine. Nor does he even preſcribe theſe Meaſures as proper to be taken, except in thoſe Fevers, which ariſe from Laſſitude, or ſome other ſimilar Cauſe, ſuch as thoſe commonly call'd Diary Fevers.

Internal Medicines for producing Sweats were ſo little in Uſe among the Antients, that *Celſus* has not a ſingle Word upon this Subject. If, therefore, Sweats are of any Advantage, in Fevers of this kind, they ſeem to derive their Efficacy from Nature alone: During theſe Sweats, perhaps, the peccant Matter might be eaſily diſſipated, and carried thro' the Skin; either on account of the Temperance of the Climate, or by the good Conſtitutions of the Patients, which were not yet corrupted by Sloth and Luxury: But in the preſent Condition of Mankind we in vain expect the Solution of a Diſeaſe by Sweat, whether ſpontaneous and natural, or procur'd by Art; and I believe I may juſtly venture to affirm, that in violent Fevers the Patients are rarely reſtor'd by Sweats alone.

But from the Times of the *Arabian* Phyſicians there has appear'd ſuch a Multitude of ſudorific Medicines, that there is ſcarce any Species of Fever, againſt which ſome of the Chymiſts, or ſome curious old Woman, has not found out an Antidote, without having any manner of Regard to the Nature of the Diſeaſe. Hence that Cuſtom has been handed down to our Days, of treating feveriſh Patients with Cordials, as promiſing the moſt grateful and agreeable Cure. Thus, for the ſake of the Agreeable, we fall into an Error, which is in no Caſe more dangerous, than when the Intereſts of Health happen to be concern'd.

This Method, as conſiſting too much in hot Medicines, is juſtly rejected by *Sydenham*, tho' it does not, as yet, ſeem to be ſufficiently baniſh'd from the modern Practice; for, according to the Confeſſion of Phyſicians themſelves, the Exhibition of hot Subſtances, and ſuch as excite profuſe Sweats, accelerate the Circulation of the Blood: Hence the Fever gradually increaſing, and ſeizing the Brain, we obſerve that the Deliriums and Diſtentions of the Nerves are ſo far from being remov'd, that they are rather augmented. This is an Effect, which may be conſtantly obſerv'd by thoſe, who in the Treatment of acute Fevers, are ſo exceſſively fond of Snake-root, Salt of Hartſhorn, and other hot Subſtances. The ſame Effect is generally produc'd, when, in Fevers already remitting, the *Peruvian* Bark happens to be imprudently exhibited, by the Uſe of which Phyſicians generally find, that the Fever, which was upon the Decline, is forthwith heighten'd, and render'd more violent. When Things are brought to this deplorable State, then a Principle of Terror and Uncertainty begins to influence their Minds; they have recourſe to Vomits, Veneſection, and Veſicatories, as the laſt and moſt important Remedies. This prepoſterous Method of Cure is, therefore, attended with this ſignal Diſadvantage, that it reduces the Practitioner to a Neceſſity of taking thoſe Meaſures at the Decline of the Diſeaſe, which he ought to have taken at its Beginning. Thus thoſe Means of Relief are often tried at an unſeaſonable Time, which, when ſkilfully preſcrib'd in the Beginning of the Diſorder, generally prove highly beneficial to the Patient.

Others run into a different, tho' not a leſs fatal and pernicious Error, who, placing all their Hopes of a Cure in Acids, forthwith have recourſe to Vinegar or Verjuice; as if it was expedient to kill a Patient with Cold, becauſe it was not proper he ſhould be parch'd with Heat.

I would not, by what has been ſaid, be thought abſolutely to diſſuade the Uſe of ſuch Medicines as provoke Sweat in the Cure of Fevers; for I cannot deny, but as Sudorifics of a mild and temperate Nature are productive of happy Effects, ſo they not only may, but alſo ought to be us'd, when Circumſtances indicate their Propriety. But, ſince the reſpective Natures of the hot and cold Subſtances already mention'd recede too palpably from the due Medium, they are, therefore, to be abſolutely rejected by the Phyſician, as hurtful and injurious. Neither is it ſafe to truſt to the milder Sudorifics alone; for, by the previous Uſe of Evacuants, they not only relieve the Fever more effectually, but alſo provoke Sweat more expeditiouſly. This Circumſtance holds remarkably true, with reſpect to Opium, than which no Medicine is more effectual for opening the Pores of the Skin. *Freind. Comment. 3. in Hipp. Epidem.*

DIAPHOROS, διάφορος, in *Hippocrates*, *Lib. de Articulis*, ſignifies pertinent, or to the Purpoſe.

DIAPHRADES, διαφραδὴς, διαφραδέως, in *Hippocrates*, *de Locis in Homine*, is expounded by *Erotian*, σαφὴς, manifeſt, evident.

DIAPHRAGMA, διάφραγμα· from διαφράσσω, to make a Partition, or Intercloſure; of διὰ, through, and φράσσω, to cloſe; the Diaphragm; called alſo the Midriff. It ſeparates the Thorax, and Organs of Reſpiration, from the Belly: It is frequently called by *Cœlius Aurelianus*, the *Diſcrimen Thoracis & Ventris*; and, *Cap. 12. Lib. 1. Tard. Paſſ. Diſcretorium.* *Pliny* calls it the *Præcordia, quod Cordi prætendatur*, "becauſe it ſtands like a Wall or Fence before the Heart." The Antients called it φρένες, as in ſeveral Places of *Hippocrates*; who alſo gave the Name of διάφραγμα to the ſtrait Place of the Fauces, between the Mouth and the Œſophagus, terming it, by way of Diſtinction, τὸ κατὰ γαργαρεῶνα διάφραγμα, "the Diaphragm by the Œſophagus." *Lib. 2. Epid. Galen* alſo, and *Rufus Epheſius*, call the cartilaginous Partition between the Noſtrils, τὸ τῆς ῥινὸς διάφραγμα, "the Diaphragm, or Partition of the Noſe."

But the only Part, which is now call'd *Diaphragma*, is that which ſeparates the Thorax from the Abdomen.

This is a very broad and thin Muſcle, ſituated at the Baſis of the Thorax, and ſerving as a tranſverſe Partition to ſeparate that Cavity from the Abdomen: For this Reaſon, the *Greeks* termed it *Diaphragma*; and the *Latins*, *Septum Tranſverſum*. It forms an oblique inclined Arch, the fore Part of which is higheſt, and the poſterior Part loweſt, making a very acute Angle with the Back.

It is looked upon as a double and digaſtric Muſcle, made up of two different Portions; one large and ſuperior, called the great Muſcle of the Diaphragm; the other ſmall and inferior, appearing like an Appendix to the other, called the ſmall or inferior Muſcle of the Diaphragm.

The great or principal Muſcle is fleſhy in its Circumference, and tendinous and aponeurotic in the Middle; which, for that Reaſon, is commonly call'd *Centrum nervoſum*, *ſive tendinoſum*. It muſt not, however, be imagined, that this middle Part is of ſmall Extent; or that it is round, becauſe Anatomiſts have named it the Centre; for, in ſo doing, they had regard only to its Situation, not to its Form, or the Space it takes up. It is of a conſiderable Breadth, and repreſents, in ſome meaſure, a Trefoil-leaf, ſuppoſing the Part to which the Foot-ſtalk is fixed, to be ſloped, and that this Slope is turned backward, and the middle convex Part, forward; and therefore I choſe to call it ſimply, the middle Aponeuroſis, or aponeurotic Plane, of the Diaphragm.

The fleſhy Circumference is radiated; the Fibres, of which it is made up, being fixed, by one Extremity, to the Edge of the middle Aponeuroſis; and, by the other, to all the Baſis of the Cavity of the Thorax; being inſerted, by Digitations, in the lower Parts of the Appendix of the Sternum, of the loweſt true Ribs, of all the falſe Ribs, and in the neighbouring Vertebræ.

We have, therefore, three kinds of Inſertions; one ſternal, twelve coſtal, ſix on each Side, and two vertebral, one on each Side: Theſe laſt are very ſmall, and, ſometimes, ſcarcely perceivable. The coſtal Inſertions join thoſe of the Tranſverſalis Abdominis, but do not mix with them, as they ſeem to do, before the Membrane, which covers them, is removed. I need not mention here ſome communicating Fibres of the ſame Nature with thoſe found in other Muſcles; as for Inſtance, between the Obliquus Externus and Pectoralis Major.

The Fibres inſerted in the Appendix Enſiformis run from behind directly forward, and form a ſmall parallel Plane. I have ſometimes obſerved a Faſciculus of Fibres detached from the under Side of this Plane, to run down on the Inſide of the Linea Alba, in which it is inſerted near the Navel.

The firſt coſtal Inſertion runs a little obliquely towards the Cartilage of the ſeventh true Rib; a triangular Space being left between this and the ſternal Inſertion, at which the Pleura and Peritonæum meet. The Inſertion of theſe Fibres is very broad, taking up about Two-thirds of the Cartilage of the ſeventh Rib, and a ſmall Part of the Bone, from whence it reaches beyond the Angle of the Cartilage.

The ſecond Inſertion is into the whole Cartilage of the firſt falſe Rib; the third, partly in the Bone, and partly in the Cartilage of the ſecond falſe Rib; the fourth in the Bone, and ſometimes a little in the Cartilage, of the third falſe Rib; the fifth in the Bone, and a little in the Cartilage, of the fourth falſe Rib, being broader than the reſt.

The ſixth is in the Cartilage of the laſt falſe Rib, and almoſt through the whole Length of the Bone. At the Head of this Rib, it joins the vertebral Inſertion, which runs from the lateral Part of the laſt Vertebra of the Back, to the firſt Vertebra of the Loins.

Between this vertebral Inſertion, and the ſecond Muſcle of the Diaphragm, a ſmall triangular Interſtice is ſometimes left, like that which I mention'd, in ſpeaking of the firſt Inſertion. This Inſertion, and that in the laſt falſe Rib, join the upper Extremities of the Pſoas, and Triangularis or Quadratus Lumborum, and ſend off to them ſome communicating Fibres. The common Plane of theſe laſt Inſertions, by the Separation of their Fibres, forms a Hole, through which a Bundle of Nerves paſſes.

It is to be obſerved, that the lateral Inſertions of the great Muſcle of the Diaphragm, on the Right Side, appear to be lower than thoſe on the Left Side; and that the right lateral Portion appears to be larger than the Left, as being more arched.

The ſmall Muſcle of the Diaphragm is thicker than the other, but of much leſs Extent. It is ſituated along the fore Side of the Bodies of the laſt Vertebra of the Back, and ſeveral of thoſe of the Loins, being turned a little to the Left Hand. It is of an oblong Form, repreſenting, in ſome meaſure, a fleſhy Collar, the two lateral Portions of which croſs each other, and afterwards become tendinous toward the lower Part.

The upper Part of the Body of this Muſcle is fixed in the Slope of the middle Aponeuroſis of the great Muſcle. The outer Edges of the Alæ, or lateral Portions, join the poſterior Plane of the great Muſcle; and theſe Portions adhere to the Body of the laſt Vertebra of the Back. The Extremities, called likewiſe Pillars, or Crura, are inſerted by ſeveral tendinous Digitations in the Vertebræ of the Loins.

The upper Part of the fleſhy Body is formed by a particular Intertexture of Fibres, belonging to the two Alæ. Theſe two Alæ, whereof that toward the Right Hand is generally the moſt conſiderable, part from each other, and form an oval Hole, terminated on the lower Part by Fibres detached from the Inſide of each Ala, immediately above the laſt Vertebra of the Back. Theſe Fibres decuſſate and croſs each other; and afterwards thoſe that come from each Ala, join that on the other Side; ſo that each of the Crura is a Production of both Alæ.

The Fibres that come from the left Ala, croſs over thoſe from the Right Ala; and this again ſends a ſmall Faſciculus of Fibres over thoſe of the Left Ala: Afterwards the two Crura part from each other.

The Right Crus is larger and longer than the Left, and is always inſerted in the four upper Vertebræ of the Loins, and often in the fifth likewiſe, by the ſame Number of Digitations, which become more and more tendinous as they deſcend, and, at length, are expanded in form of an Aponeuroſis. This Crus lies more on the Middle of the Bodies of the Vertebræ, than on the right Side.

The Left Crus is ſmaller and ſhorter, and lies more on the Sides of the Vertebræ. It is fixed, by Digitations, to the three upper Vertebræ of the Loins, ſeldom reaching lower. The lower Part of it is expanded in the ſame manner as the other; and the two Expanſions ſometimes meet together.

The oval Opening of this inferior Muſcle of the Diaphragm gives Paſſage to the Extremity of the Œſophagus; and the Aorta lies in the Interſtice between the two Crura. Immediately above the Opening, or Hole, a thin Faſciculus of Fibres is ſent off to the Stomach; and, I have ſometimes obſerved a larger Faſciculus, at the lower Extremity of the Hole, ſent off, chiefly, from the Right Ala, and accompanied by ſome tendinous Fibres from the Left, which ſeemed to run to the Meſentery.

In the middle Aponeuroſis of the great Muſcle, a little to the Right of the anterior Part of the Slope, near the ſmall Muſcle, is a round Opening, which tranſmits the Trunk of the lower Vena Cava: The Border, or Circumference, of this Opening is very artfully formed by an oblique and ſucceſſive Intertexture of tendinous Fibres, almoſt like the Edge of a Wicker-baſket; and is, conſequently, incapable either of Dilatation or Contraction, by the Action of the Diaphragm.

We find, therefore, three conſiderable Openings in the Diaphragm; one round and tendinous, for the Paſſage of the Vena Cava; one oval and fleſhy, for the Extremity of the Œſophagus; and one fork'd, partly fleſhy, and partly tendinous, for the Aorta. The round Opening is to the Right Hand, cloſe to the upper Part of the Right Ala of the ſmall Muſcle: The oval Opening is a little to the Left; ſo that the Right Ala, which is between theſe two Holes, lies almoſt directly over-againſt the Middle of the Body of the eleventh Vertebra of the Back: The tendinous Fork is under the oval Opening, but a little more toward the Middle.

This Situation, well conſidered, will ſerve to juſtify, in ſome meaſure, the Deſcriptions and Figures of the antient Anatomiſts; eſpecially ſince the Right Ala of the ſmall Muſcle is larger than the Left; and ſince it was an eaſy Matter, in taking out the Diaphragm, and ſpreading it on a Board, to extend it too much toward both Sides. *Winſlow.*

The Veins of the Diaphragm are pretty large, and go directly to the Cava, between its Entrance into the Thorax and the Liver, where two pretty large Branches, from each Side of the Diaphragm, enter it.

It has Arteries immediately from the Aorta, and, ſometimes, from the Cœliac, and a few ſmall Twigs from the Lumbals and Adipoſe.

Verheyen mentions two Arteries and two Veins of his own Diſcovery; whereof the Right Artery, and the two Veins, are Branches of the Subclavians: The Left he dares not pretend to have ſufficiently trac'd, but ſays, that, in the Diaphragm, the Arteries and Veins inoſculate with the afore-mention'd of this kind; and that the Veins receive ſome Branches in their Return from the Diaphragm, from the Pericardium and Mediaſtinum.

It receives a pretty large Nerve from the Plexus Cervicalis on each Side, and from the ſecond Pair of the Vertebræ, which, from a triple Root, form a conſiderable Branch, which diſtributes itſelf on each Side, through the whole Body of the Diaphragm.

In Inſpiration, the Diaphragm deſcends towards the Abdomen, which is its proper Motion; which, as a Muſcle, is Contraction. In Inſpiration it is relax'd, and drawn upwards, and makes a concave-convex Figure; the concave Side toward the Abdomen. By this Alteration of Poſture, it enlarges the Cavity of the Thorax in Expiration; and, at the ſame time, leſſens the Cavity of the Abdomen, acting perpetually upon all the Contents thereof, and aſſiſting them in the Performance of their reſpective Functions, particularly the Stomach: It alſo draws the Cartilages of the ſpurious Ribs inwards, towards the Vertebræ, depreſſes the two inferior ſpurious Ribs, aſſiſts in the Expulſion of the Excrements, and of the Fœtus in Parturition.

DIAPHROS, διάφρος· from ἀφρός, Froth; in *Galen's Exegeſis*, is expounded by ἀφρίζων, frothy.

DIAPHTHORA, διαφθορά· from φθείρω, to corrupt; in *Hippocrates* ſignifies a Corruption of the Fœtus, an Abortion. The ſame is often expreſſed by φθορά, and, in the Beginning of the ſixth Epidemic, by ἀποφθορά, which *Galen* expounds by διαφθορὰ and ἄμβλωσις, "Abortion." The Verbs διαφθείρω; and φθείρω, are often us'd in the ſame Senſe.

DIAPHYLACTICOS, διαφυλακτικὸς· deriv'd from φυλάσσω, to keep; is of the ſame Import as *Prophylactico*, preſervative.

DIAPHYSIS, διάφυσις, is an Interſtice, Diviſion, Partition, whatever intervenes between things. Διάφυσις, in *Hippocrates*, *Lib. de Fract.* as *Galen* explains it, ſignifies a certain nervous and cartilaginous Protuberance in the Middle of the Joining the Os Tibiæ with the Os Femoris, which enters that large Sinus, and makes a Separation between the lower Heads and Proceſſes of the Os Femoris, which are inſerted into the Sinus of the Os Tibiæ. This Subſtance only appears in recent Carcaſes; for it withers after Death. In *Mochl.* where he writes, πλευραὶ δὲ καὶ ἀπὸ τὰς διαφύσιας τῶν σπονδύλων νευρίῳ περιπεφύκασιν, "the "Ribs at the *Diaphyſes* of the Vertebræ are connected by a "nervous Subſtance," by the Diaphyſis we are to underſtand the Interſtices, Intervals, Chinks, ſuperficiary Cavities, or Sinuſes, which are cut in the Bodies of the Vertebræ, at the Roots of the tranſverſe Apophyſes, for the Reception of the round Heads of the Ribs; and thoſe double Sinuſes, in which the Ribs make a double Dearticulation, are called by that Name. The tranſverſe Proceſſes, or Apophyſes themſelves, may alſo be called Diaphyſes, as growing in the Spaces between the Vertebræ, and join'd to the Ribs by a double Diarthroſis. In the ſame Book, τὸ στῆθος διαφύσιας ἔχον πλαγίας, "the Breaſt "having oblique *Diaphyſes*," where the Ribs are connected with it, imports, by *Diaphyſis*, what poſſeſſes the Partitions or Intervals, that is, the Cartilages at the Sides of the Bones of the Sternum, by which they are join'd by Synarthroſis with the Ribs; or elſe the Sinuſes, which are indented at the Sides and Joints of the Bones of the Breaſt, and into which the Ribs, by their cartilaginous Part, are inſerted. Again, in the ſame Book, ἐκ τῆς διαφύσιος τῶν τῆ πήχυος ὀστῶν, "from the Space between "the Bones of the Cubit," a torpid Nerve is ſaid to proceed. And (*Lib.* περὶ πήχεως) διαφύσιες are the Intervals, Diſtances, and Partitions, by and into which numerous and large Cavities of a Body are divided. The Word διάφυσις alſo, in *Hippocrates*, ſignifies the Pedicle of a Fruit. *Lib.* περὶ ἑλκέων.

DIAPISSELÆON. The Name of a Compoſition in *Marcellus Empiricus*, C. 35. in which liquid Pitch is a capital Ingredient.

DIAPLASIS, διάπλασις, from πλάσσω, to form. Conformation. It is uſed to expreſs the Replacing a fractur'd Bone, as near as is poſſible, in its natural Situation.

DIAPLASMA, διάπλασμα. An Unction or Fomentation, applied all over the Body. *Caſtellus.*

DIAPLOCE, διαπλοκὴ, from διαπλέκω, to complicate, to twiſt, or intermix. In *Hippocrates de Alimentis*, this implies a Mixture of the Aliments; or rather a Miſcibility.

DIAPNE. An involuntary Diſcharge of Urine. *Caſtellus.*

DIAPNOE, *Διαπνοὴ*, from *Διαπνέω*, to perſpire. Perſpiration. Tranſpiration.

DIAPOREMA, *Διαπόρημα*, from *Διαπορέω*, to be in Doubt. Anxiety in Diſtempers; the ſame as ALYSMUS, which ſee.

DIAPRASIUM, *Διαπράσιον*. The Name of a Compoſition in *Trallian*, *L.* 5. *C.* 4. ſo called from *πράσιον*, Horehound, one of the Ingredients.

DIAPRUNUM. The Name of two Compoſitions, directed thus in the *London* Diſpenſatory;

The DIAPRUNUM LENITIVUM.

Take of new and ripe Damaſk Prunes, one hundred; boil them in a ſufficient Quantity of Water till they are ſoft; then remove them from the Fire, and, when cold, drive the Pulp through a Sieve, and ſet by for Uſe. In the Liquor ſtrain'd from the Prunes before pulping, boil one Ounce of Violet-flowers; and, after ſtraining again, diſſolve in it two Pounds of Sugar, and boil into a Syrup; to which add of the before-mention'd Pulp half a Pound; of Caſſia and Tamarinds diſſolv'd in a little of the ſame Decoction, and pulp'd, of each one Ounce: Boil them again over a gentle Heat, and frequently ſtir the Mixture: After which ſift in the following Powders, of Coriander-ſeed, Rhubarb, Liquorice, and Marſhmallow-roots, of each a ſufficient Quantity, to make into a ſoft Electuary.

DIAPRUNUM SOLUTIVUM.

Take of the lenitive Compoſition of Prunes, four Pounds; of prepar'd Scammony, two Ounces five Drams; and mix them together into an Electuary. *S. A.*

Theſe were Preparations of *Nicolaus Myrepſus*, the firſt of which was receiv'd into the College Diſpenſatory, under the Title of *Diaprunum Simplex*, *rectius Lenitivum*; but the latter Part of it is here much abridg'd of many ſuperfluous Ingredients, as the Spodium, Barberries, and many other things of the like Nature. But neither of theſe are hardly ever preſcribed or made.

DIAPSORICUM. The Name of a Collyrium in *Marcellus Empiricus*, *Cap.* 8.

DIAPTERNES, from *πτέρνα*, the Heel. A Medicine made of the Heels of Animals, and Cheeſe. *Caſtellus* from *Guilielmus Budæus*.

DIAPTEROSIS, *Διαπτέρωσις*, from *πτερὸν*, a Feather. The cleaning the Ears with a Feather.

DIAPYEMA, from *πῦον*, Pus. An Abſceſs, or Suppuration. See ABSCESSUS.

DIAPYETICA. Suppurating Medicines.

DIARRHODOMELI. The Name of a Compoſition in *Trallian*, *L.* 7. *C.* 4. prepar'd of the Juice of Roſes, Scammony, Agaric, Pepper, and Honey.

DIARIA *Febris*. A Diary Fever; one which continues only one Day. It is the ſame as EPHEMEROS.

DIAROCHÆ, *Διαρχαὶ*. The Interſtices betwixt the Circumvolutions of Bandages. *Erotian*.

DIAROMATICUM. A Medicine compounded of Aromatics.

DIARRHAGE, *Διαῤῥαγὴ*. A Fracture; in particular, of the Temporal Bones.

DIARRHODON. A Name for a great many Compoſitions, in which Roſes are the principal Ingredient. In the old College Diſpenſatory, one of this ſort is directed under the Title of *Diarrhodon Abbatis*; but it is omitted in the laſt.

DIARRHŒA, *Διάῤῥοια*, from *Διαῤῥέω*, to flow thro'. It imports what in *Engliſh* we call a Looſeneſs. See ALVUS, DEJECTIO, and CHOLERA.

A Diarrhœa is defin'd to be a frequent and plentiful Diſcharge of thin, watery, mucous, ſlimy, frothy, greaſy, bilious, or blackiſh Matter from the Inteſtines, ſometimes with, and ſometimes without, a Mixture of Excrements. It is frequently attended with Gripings; but they are not eſſential to it. The Patient is weak, makes little Urine, has a depreſſed Pulſe, impair'd Appetite, and is ſometimes feveriſh.

OBSERVATION I.

A Child about a Year and a half old, who, for ſeveral Months, had laboured under a feveriſh Indiſpoſition, a preternatural Appetite, a Flux, the Subſtance of which was mix'd with a whitiſh Matter, and a ſubſequent Leanneſs and Extenuation, was at laſt reduc'd to ſuch a low State, as to fall a Sacrifice to theſe Symptoms.

Upon opening the Body, the Liver appear'd ſo preternaturally large, as almoſt to equal that of an Adult; for it poſſeſſed the whole Cavity of the Abdomen; and the Subſtance of it was found ſcirrhous. The Gall-bladder was alſo preternaturally large, and as long as one's fore Finger. The Condition of the Spleen was found to be the ſame with that of the Liver; for it was every-where full of very hard tartareous Spots. The Glands, diſperſed through the whole Meſentery, were found ſcirrhous; which Circumſtances ſufficiently accounted for the Death of the Patient. *G. Theophilus Bierlingius Miſcell. Cur. Anno* 1671. *Obſervat.* 157.

OBSERVATION II.

A certain Man, after labouring under a Flux for ſix Years, at laſt died; and, upon laying open his Body, his whole Liver was found full of Impoſtumations, and a Part of the Meſentery deſtroyed. *Hollerius*, *Cap. de Alvi Fluxibus.*

OBSERVATION III.

A certain Man, of thirty Years of Age, happening to die of a Diarrhœa, whilſt we were laying open his Body, and attempting a Separation of the Liver from the Diaphragm, to which it adher'd for a conſiderable Space, before we opened the Liver, there appear'd a large Tumor of that Species called Atheroma. This Tumor was ſituated in the convex Part of the Liver, near the poſterior Region of the Diaphragm, hard by the Vena Cava. It was of a round Figure, in Bulk almoſt equal to one's Fiſt, and free from the reſt of the Parenchyma of the Liver. It weigh'd five Ounces ſix Drams and thirteen Grains. Its Coat was as thick as the true Skin. It contain'd two Kinds of Matter, both of them thick, and very little fluid. The one reſembled a pellucid Jelly, and the other was like thick Cream, or a white Poultice. *Boneti Sepulcr. Anat.*

OBSERVATION IV.

A certain *German* Prince, of two Years of Age, happening to die of a Diarrhœa, accompanied with an Atrophy, and other Symptoms, upon laying open his Body, we found his Liver hard, whitiſh, of an uncommon Bulk, and weighing ſeventeen Ounces and a half. Between this Organ and the Duodenum, near the Meſentery, there was a Collection of blackiſh Blood. The Gall-bladder was preternaturally large, and ſo firmly adhering to the Subſtance of the Liver, that it could not be freed from it without injuring it. In the Gall-bladder itſelf there was not a yellow Humour, but a certain greeniſh black Matter, like that which, during his Life, he had copiouſly diſcharged by Stool. Beſides, his Liver was very little, and cloſely adherent to the ſpurious Ribs and Diaphragm. Hence we may eaſily underſtand, in what manner the Functions of the Liver might be diſordered. The Stomach and Inteſtines were in their natural State, but contained no Excrements, and were ſomewhat diſtended with Flatulencies.

OBSERVATION V.

A certain Lawyer, after labouring for a conſiderable while under a Diarrhœa, at laſt died conſumptive; and, upon laying open his Body, we found a large pendulous Tumor adhering to the lumbar Muſcles on the Right Side.

OBSERVATION VI.

A certain Gentlewoman, about Ten o'Clock in the Morning, complained of a troubleſome and uneaſy Flux. I perſuaded her to go to Bed, becauſe Motion had a Tendency to increaſe her Pain, and prevent the Diſcharge of the Excrements. Her Stools were chylous, white, liquid, diſcharged in ſuch large Quantities, that ſhe filled a large Baſon every time ſhe went to Stool. Terrified at this Symptom, I deſired a Conſultation of the moſt experienced Phyſicians: Upon which we preſcribed aſtringent Liniments, medicated Bags, Julaps, and next Day an Infuſion of Rhubarb. By her frequent and copious Stools, her Strength was gradually impaired, and, before Midnight, ſhe died, when ſhe little ſuſpected ſuch an Accident.

In order to inveſtigate the genuine Cauſe of ſo ſudden and unexpected a Misfortune, I beg'd the Body might be laid open; upon which we found the Bottom of the Stomach ulcerated. 1 *Riolanus Part. Meth. Med. Sect.* 3. *Tract.* 1.

OBSERVATION VII.

A certain Youth, about eighteen Years of Age, was ſeized with a deprav'd Appetite, eating Stones and Rubbiſh, and at laſt fell into a ſlow and gentle Fever. In Proceſs of Time his Stomach began to throw up its Contents, and he was ſeized with a Flux. This Complication of Diſorders in a few Days put a Period to his Life.

Upon laying open the Body, we found a Callus ſituated among the meſeraic Veſſels, by which, when they were ſo obſtructed, that the Blood could be conveyed no farther, the Patient muſt neceſſarily die. *Benivenius de Abditis*, *Cap.* 37.

OBSERVATION VIII.

A certain Gentleman of Diſtinction, about thirty Years of Age, of a melancholic Conſtitution, highly ſubject to Catarrhs, and addicted to the immoderate Uſe of Wine and Summer Fruits, was at laſt ſeized with a Vomiting and a Diarrhœa, which were now-and-then ſucceeded by a bloody Flux; by which means his Strength was gradually ſo exhauſted, that he died on the tenth Day.

Upon laying open the Body, I found ſeven or eight ſmall Stones

Stones as large as Chiches, in that Part of the pancreatic Duct, where it terminates in the Inteſtines. *Regnerus de Graaf Tract. de Succo Pancreatico, Cap.* 7.

Observation IX.

A certain Clergyman of Diſtinction, being, for three Weeks, afflicted with a highly bilious Diarrhœa, at laſt fell a Sacrifice to his Diſorder.

Upon laying open his Body, I found in his Gall-bladder, three ſmall hard Stones; tho' at the ſame time, during the whole Courſe of his Diſeaſe, he had frequently diſcharged highly bilious Stools, which certainly were ſupplied from the biliary Duct, which leads directly from the Liver to the Inteſtines. *Riolanus Anthrop. Lib.* 2. *Cap.* 20.

Observation X.

At *Montpelier* I had an Opportunity of ſeeing a Woman laid open, who, for fourteen Years, had been afflicted with a Diarrhœa, which, however, for ſeven Months before her Death, had been ſo violent, that ſhe was obliged to go to Stool ſeveral times in a Quarter of an Hour.

Mr. *Gintelius*, by whom the Body was laid open, could find no other Cauſe for her Death, than a Petrification of the Bile, which had formed itſelf into a hard and unequal Stone in the Gall-bladder, which it diſtended far beyond its preternatural Dimenſions. *D. Creterus, Zod. Med. Gal. an.* 3.

Observation XI.

I have ſeen the Bodies of ſeveral Patients, who died of Diarrhœas, laid open, whoſe Inteſtines were thick, tumid with Blood, and, as it were, formed into Holes like Honey-combs. Veneſection, and the due Uſe of Emetics, would, in all Probability, have contributed much to the Cure of theſe Patients. *Guarinonius, Conſultat.* 4.

A Flux of the Belly, where the Stools are liquid, and more frequent than uſual, in the Beginning, is not ſo much to be regarded; but this Diſorder is ſometimes attended with ſlight Pains, ſometimes with very ſevere ones. It is often moſt adviſable for Health to let it have its Courſe for one Day, or even more, provided there be no Fever, and the Flux ceaſes within ſeven Days; for by this means the Body is cleanſed, and the noxious Matter evacuated, to the great Benefit of the Patient. But to endure it too long is dangerous; for ſometimes it excites griping Pains, with feveriſh Diſorders, and exhauſts the Strength.

The firſt Day it is ſufficient to keep quiet, without attempting to repreſs the Efforts of the Belly. If the Flux ceaſes ſpontaneouſly, you may go into the Bath, and take a little Food; but, if it continues, it will be beſt to abſtain, not only from Eating, but alſo from Drinking. The next Day, if the Looſeneſs perſeveres, keep quiet as before, and take a little aſtringent Food. The third Day, go into the Bath, and uſe vehement Frictions of every Part, except the Belly; hold your Loins and Scapulæ to the Fire; take ſome Food of a binding Quality; and drink pure Wine, but moderately. If the Flux ſtill continues the next Day, eat more freely, and take a Vomit; and, in ſhort, reſiſt the Diſorder by Hunger, Thirſt, and Vomiting, till you have ſubdued it; for it is ſcarcely poſſible, after the joint Uſe of ſuch effectual Means, for the Belly not to be contracted and bound.

Another Way for ſuppreſſing a Looſeneſs, is to make a Supper, and afterwards to take a Vomit; to keep in Bed the next Day; in the Evening to be anointed, though but ſlightly; and then take about half a Pound of Bread ſop'd in pure *Aminæan* Wine. After this, eat ſomething roaſted, eſpecially a Bird; and, upon this, drink the Wine before-mentioned mixed with Rain-water. Continue this Courſe for five Days together, and then take another Vomit. *Aſclepiades*, contrary to former Authors, preſcribes cold Liquors, and even ſuch as are extremely cold, to be taken every Day. I believe, every Man ought to truſt his own Experience, whether it be fitteſt for him to drink cold or hot Liquors.

Sometimes it happens, that the Diſorder, being neglected for ſeveral Days together, becomes ſomewhat difficult to cure. In this Caſe, you muſt begin with a Vomit; the next Day in the Evening be anointed in a warm Place; take a moderate Quantity of Food; drink pure Wine of the rougheſt ſort; and apply Rue with Cerate to the Belly. In this Affection of the Body, neither Walking nor Friction are required; but Riding in a Chariot or Waggon, or, which, is better, on Horſeback, is of Service; for nothing more ſtrengthens the Inteſtines.

If it be neceſſary to have recourſe to Medicines, the moſt proper Remedy is what is prepared of Apples. In the time of Vintage, put into a large Veſſel wild Pears and Apples; if they are not to be had, take green *Tarentine* or *Signine* Pears, with *Scandian* or *Amerine* Apples, Myrrhapia, [*a ſort of Pears, ſo call'd from their Smell*, Plin. Lib. 15. Cap. 15. *Muſk-pears*] Quinces, Pomegranates with their Rinds, Services, and principally that Species which we call *Torminalia*: Let theſe Fruits take up a third Part of the Capacity of the Veſſel, and then fill up the ſame with Muſt: Boil the Contents all together, till they are diſſolved, and concur in forming, as it were, one Maſs. This Preparation is not ungrateful to the Taſte, and, taken upon Occaſion, gently binds the Belly, without injuring the Stomach: Two or three Spoonfuls are enough for a Doſe. Another more potent Remedy is to take Myrtle-berries, preſs out the Juice, and boil it to a tenth Part; of which take an Ounce [*Cyathum*] for a Doſe. A third Remedy, when it can be prepared, is as follows: Take a Pomegranate, and excavate it by taking out all the Inſide; then picking out all the Seeds, put the intermediate Membranes into the Shell again, and pour thereon raw Eggs, and ſtir them about with a Spattle: Then ſet it upon the Coals, and the Moiſture which is in it, while it continues, will keep it from burning: When it begins to be dry, remove it, and eat the Contents with a Spoon. This Remedy is made more effectual by ſome Additions, as when it is thrown into Diſhes highly ſeaſoned with Pepper, or mixed with Salt and Pepper, and ſo eaten. They prepare alſo a Gruel for this Purpoſe, in which they boil Part of an old Honey-comb. Alſo Lentils boil'd with Malicorium, and the Tops of Brambles boil'd in Water, and eaten with Oil and Vinegar, are effectual in this Caſe; and ſo are Decoctions of Dates or Quinces, or dry Services, or Bramble-tops; I mean on ſuch Occaſions as require an aſtringent Potion. Half a Pint of Wheat boiled in auſtere *Aminæan* Wine, and given to the Patient faſting and thirſty, and the Wine afterwards ſupped, may juſtly be accounted one of the moſt potent Remedies in this Diſorder. They preſcribe alſo *Signine* Wine, or auſtere refinated Wine, or any other auſtere ſort of Wine. They alſo bruiſe a Pomegranate with the Rinds and Seeds, and mix it with the Wine before-mentioned, which may be ſupped pure, or diluted. However, there will be no Neceſſity of uſing Medicines, unleſs the Diſtemper be violent. *Celſus, Lib.* 4. *Cap.* 19.

A Flux of the Belly, or a Diſcharge of pure and unmix'd Humours, without Inflammation, Exulceration, or conſiderable Senſe of Pain, is by the *Greeks* called *Διάῤῥοια*, "a Diar-"rhœa." In this Diſorder, there is an Evacuation of ſeveral ſorts of Humours, ſometimes of Phlegm, ſometimes of Bile, either yellow or black. The Origin, from whence this Flux proceeds, is ſeated in various Parts: If there be a Defluxion of Phlegm from the Brain upon the Belly, the Looſeneſs is moſt urgent by Night, and after Sleep; and the Diſcharges, according to *Hippocrates*, are thin and ſpumous. The Flux alſo has its Intervals, and is preceded by a Diſtillation and Pains of the Head, eſpecially after a ſudden Heat or Cold. The ſame Humour, if the Flux be owing to ſome Diſorder of the Inteſtines, Meſentery, or Stomach, is thick and mucous; and is diſcharg'd principally by Day, without any certain Intervals. When yellow or Lemon-coloured, an ardent, and often ſpumous Bile flows from the Liver into the Belly; it moleſts the Patient by Intervals in the Night, without any conſiderable Pains or Gripings of the Belly; but this Flux is uſually of a ſhorter Continuance than what is excited by a Diſorder of the Stomach. The ſame Conſequences uſually follow from a Flux of black Bile from the Spleen or Meſentery into the Belly; but this Caſe is far more difficult than the former, as proceeding from a worſe Humour. But here we ought to diſtinguiſh between this Humour, and Blood concreted for want of Motion, and by long Stagnation, highly torrefied, blackiſh, and very much reſembling Tar; for, if this vitiated Blood, and not a melancholy Humour, be the Cauſe, the Diſorder is attended or preceded by ſanguineous Vomitings, which ſtain Linen red; but nothing of this happens in a Flux of black Bile.

A Looſeneſs, for one Day, is often healthy, and even for ſeveral Days, provided it ſtops within the ſeventh Day, without returning upon the Patient, and is not attended with a Fever, or a vehement Thirſt: But the Danger proceeds from the Length of the Diſeaſe; for ſometimes it excites Gripings, and feveriſh Diſorders, and exhauſts the Strength. Now the Acceſſion of a Fever, and a Relapſe into the Diſeaſe, after its Ceſſation, with its growing more obſtinate, and likely to continue upon the Patient, muſt be dangerous, whether the Matter of the Flux be bilious, or crude and pituitous. There is as much Danger from an Inflammation of the Liver, Præcordia, or Belly, as from various or mix'd Stools of long Continuance, and attended with Pain.

A Flux cannot be ſuppreſſed, before its due Time, with Safety; for hence ariſe, Diſorders of the Stomach, Fevers, and Inflammations of the Viſcera; and, from a Diverſion of the morbific Matter to the ſuperior Parts, proceed Pains of the Head, Madneſs, or Lethargy, according to the Nature of the Humour. When the Stools are liquid, it is beſt when they are not diſcharg'd violently with Noiſe, but are evacuated in a gentle Manner, by degrees, nor are too frequent; for, by often going to Stool, the Patient is fatigu'd, and kept waking. If the Stools be copious, as well as frequent, there is Danger of Fainting. A Looſeneſs, after a long Duration, ſucceeded by ſpontaneous Vomiting, ceaſes; a Looſeneſs ceaſing in Seaſon is no way injurious; it is known to be ſtopped, when the

Belly

Belly being contracted, its Motion is no longer felt by the Hand laid thereon; and, beſides, the laſt Stool was ſucceeded by no Flatus. It is good to have an Alteration in the Stools, if it be not a Change for the worſe. Bilious Diſcharges ſtop upon the Acceſſion of Deafneſs; and, on the contrary, a Deafneſs has its Solution by Evacuations of Bile. Perſons who ſtammer, are ſubject to long Fluxes of the Belly, which give way to Vomiting. In any Flux, acid Eructations, not beginning with the Diſtemper, but acceding afterwards, are a good Sign. The Belly bound for ſeveral Days indicates either a ſudden Evacuation, or the Approach of a Fever. The Hiccoughs, or Loſs of Appetite, under a Looſeneſs, are bad. Perſons much extenuated by an acute or chronical Diſeaſe, or from Wounds, or ſome other Occaſion, and ſeized with a Flux of black Bile, reſembling black Blood, die the next Day; for Fæces of this kind, ſpontaneouſly diſcharged, are the worſt of Symptoms; and always ſo much the worſe, as their Variety of Colours, and theſe not good ones, is greater; but it is better to have them brought away by Medicines, particularly when they are of various Colours. A Diſcharge of aduſt Bile, in the Beginning of a Diſeaſe, is mortal; and the Danger is no leſs, if, during the Evacuation in a Looſeneſs, the Patient be ſeized with a Nauſea, Vomiting, and Delirium; or, if he be ſo far exhauſted as to have a conſtantly vermicular and formicating Pulſe, which cannot be raiſed even by generous Food. If a Looſeneſs come after a long Diſtemper, without at all mitigating the ſame, and the Patient be inſufficient to ſupport it, the Caſe is certainly dangerous. A Looſeneſs, or Diarrhœa, occaſion'd by a beginning Dropſy, or after an atrabilious Ulcer, or from an Exulceration of the ſuperior Inteſtines, eſpecially the Jejunum; or the Continuance of a Looſeneſs, after a ſudden Diſappearance of Puſtules; or its being grown to an Inveteracy in an old Perſon; or when a liquid Matter, like Water, is at firſt diſcharged, and, afterwards, a pinguious Humour, reſembling an Ointment; all theſe Caſes are to be dreaded equally with the preceding. A Diſcharge of Fæces, appearing as if they were cover'd with Oil or Fat, is familiar with thoſe who labour under peſtilential, burning, colliquative, and hectic Fevers, a Tabes, or Atrophy, and ſometimes attends an Inflammation of the Viſcera. Gripes are, very frequently, obſerved to proceed from a long-continued Diarrhœa, or one in which the Humours are evacuated pure and unmixed; and this Caſe often proves fatal to pregnant Women; or, if they eſcape, it is not without a Miſcarriage. It is uſual for ſuch Patients, after they have been long afflicted with this Diſtemper, to be affected with a Swelling of the Feet. *Lommii Medicin. Obſerv.*

Diarrhœas are frequently the direful Effects of Grief, and other exorbitant Paſſions of the Mind. They generally prove incurable, eſpecially if the Mind continues long under the Influence of that Grief or Paſſion which firſt produc'd them; becauſe, in this Caſe, they are, for the moſt part, ſucceeded by erratic Fevers, and Atrophies, which prove fatal to the Patient.

The Eruption of a Sweat, in Patients labouring under a Diarrhœa, gives a proportionable Check to the Diſeaſe.

In Diſeaſes of the Breaſt, in Women in Child-bed, and in Infants labouring under malignant Fevers, Diarhœas are highly bad and prejudicial.

The Cure of this Diſorder is not to be begun by Aſtringents; ſince by this means we induce Obſtructions of the Viſcera and Inteſtines, which are with Difficulty remov'd, and which are at laſt ſucceeded by obſtinate Dropſies.

As the eating of Fleſh increaſes a Diarrhœa, the Patient ought, for this Reaſon, to abſtain from it as much, and as careſully, as he poſſibly can.

Nothing has a more immediate Tendency to produce a coſtive State of the Belly, than the Uſe of Venery; as was long ago obſerv'd by *Hippocrates*, in the ſeventh Book of his *Epidemics*. *Aetius* alſo, in the eighth Chapter of his third Book, and *Paulus Ægineta*, in the thirteenth Chapter of his firſt Book, aſſert, that Fluxes are remov'd by the ſame Means. This was alſo obſerv'd by *Amatus Luſitanus*, in the forty-ſeventh Obſervation of his ſecond Century. See ACHROMOS.

Thoſe who are too much addicted to Study, or too keenly attach'd to the Affairs of the World, become coſtive; and this Misfortune is endemial, or peculiar to the *Roman* Climate.

The Inhabitants of this Country, by chewing Cinnamon throughout the whole Day, and ſwallowing the Saliva, in a ſhort time cure the Diarrhœas, the Languors of the Stomach, and the Dyſenteries, with which they happen to be afflicted.

Purgative Medicines generally produce a dangerous Hypercatharſis, or exceſſive Purging, which frequently brings on a ſudden Fainting. By the Preſcription of an old and experienc'd Phyſician, in one of our Hoſpitals, I was ſurpris'd to ſee a Diarrhœa both ſpeedily and ſafely ſtopt, by a Scruple, or a Dram, of the Theriaca, diſſolv'd in a ſufficient Quantity of Wine.

In an inveterate Diarrhœa, a Dyſentery, a Teneſmus, or a Relaxation of the Anus, the Fundament is to be expos'd to the Steam of Turpentine, thrown upon live Coals; by which means the Patient will be cur'd.

When in a Diarrhœa the Patients diſcharge, by Stool, a Saffron-colour'd Bile, reſembling the Ruſt of Iron diſſolv'd, or Brick-duſt; 'tis always a fatal Symptom, as I have obſerv'd in many Patients, who all died. *Cheſnau, Lib. 3. Cap. 6.*

A Diarrhœa, ſucceeding a violent Fit of Anger, is a lucky Circumſtance; becauſe, if this Effect is not produc'd, the Patient will, in all Probability, be ſeiz'd with a Fever.

I myſelf have often obſerv'd, and alſo been inform'd by others, that in ſome Diſeaſes, eſpecially of the chronical Kind, ſuch as a Phthiſis, and even in any other Diſorder, the Patients are frequently ſeiz'd with an irreſiſtible Stimulus to diſcharge their Fæces, and ſometimes die at the very time this Diſcharge happens. *Baglivi, de Praxi Medica, Lib. 1.*

From CAROLUS PISO.

Moſt People, who are a little too regardleſs of their Health, and who do not take care to defend their Bodies from the Injuries of the Air, at the End of Autumn, when the Leaves begin to fall, find their Bodies more ſoluble, and perceive that their Stools are not only more liquid and aqueous, but alſo bilious and ſlimy, and that, ſometimes, for ſeveral Days together. In the preſent and preceding Year, about the End of *Auguſt*, when Heat and Cold alternately ſucceeded each other, at different Hours of the Day, I obſerved many ſtudious Perſons, who liv'd temperately, and ſpent a great deal of Time on mental Speculations, to labour under Diarrhœas, and to diſcharge an aqueous Sort of Excrements, call'd by *Hippocrates* ὑδατόχλωα ὑποχωρήσια, with a Mixture of a little Blood in ſome. Tho' a Diarrhœa of the ſame Kind frequently ſeiz'd me about the Middle of Autumn, in all the former Part of my Life; yet, in the Beginning of the Autumn, and during all the other Changes of the Seaſons of the preceding Year, I only diſcharg'd liquid Excrements for one Day, and, ſoon after, nephritic Pains ſucceeded. But in the preſent Year, about the End of *September*, I was firſt ſeiz'd with very obſtinate nephritic Pains, which were ſucceeded by a profuſe Diarrhœa, which continued about a Fortnight; but, being commonly ſerous, I bore with it the more eaſily. In Bodies, which have a Redundance of Serum, in conſequence of a Life ſpent in Eaſe, the Cold of the Autumn, whether in the Morning or the Evening, acting upon the Pores which are opened, either by the Heat of the Sun in the Day-time, or by the Warmneſs of the Bed; and, for that Reaſon, penetrating more deeply into them, drives, with great Force, the Serum both inwards and downwards from the Veſſels on the Surface of the Body; for, becauſe the ſerous Humours cannot thoroughly incorporate with the Blood, tho' they are mix'd with it throughout the whole Body, they are, in conſequence thereof, more eaſily ſeparated; and, after a Separation, becauſe they are fluid and heavy, being reverberated by the Cold, they return into the larger Ramifications of the Veſſels, and are convey'd thence to the Inteſtines.

Stools of this Sort ought not to be eſteem'd preternatural, whether we conſider, either the Quality and Condition of the Matter, its Courſe, or moving Cauſe: For, after the Serum has perform'd its proper Functions, it can be of no farther Uſe; 'tis nothing but an Excrement, and, therefore, ought to be evacuated any way.

But, as the ſerous Humours cannot find a free Paſſage thro' the Pores of the Body, when they are clos'd up by the Inclemency of the Air, 'tis but natural, that the lower Belly, and eſpecially the large Inteſtines, ſhould ſerve as a Sink to carry them off; and, therefore, ſuch Diarrhœas are not to be conſider'd as preternatural; ſince there is no way left to get rid of the Redundance of Serum, but by being evacuated as other Excrements are; and 'tis well known, that a Redundancy of Serum creates no little Uneaſineſs in our Bodies.

Laſtly, if we conſider the Occaſion; which is only a cold State of the Air, a mere external Cauſe; upon this Account alſo, the Diarrhœas here deſcrib'd, ought not to be eſteem'd preternatural: And, ſince this is the Caſe, the Conſequences are not much to be apprehended.

But, on the other hand, ſince the Serum, by returning back through the Veſſels, cannot fail to interfere with the Circulation of the Blood, in ſome degree, and even diſturb the Diſtribution of the Chyle, and its complete Elaboration in the Inteſtines; and, therefore, muſt be inconvenient; it is proper, that the Patient ſhould, with all convenient Speed, be freed from it.

In the firſt place, Patients ought to preſerve themſelves from the Injury of the Air, and ſleep in a warm Place, whereby the Force of the moving Cauſe may be moderated; and, ſecondly, they ſhould carry off the Matter of the Flux, both by a dry Regimen, and a Derivation of the Serum thro' the Kidneys; and, laſtly, they ought to corroborate the Parts which receive the Serum: And theſe Deſigns will be anſwer'd,

partly by making uſe of ſome Wormwood-wine, diluted with a Decoction of Succory, or Chalybeate Waters, or old Conſerve of Roſes; and partly, by anointing the Abdomen with Oils of Chamomile, Roſes, Maſtich, or Wormwood.

'Tis very remarkable, what happened to my Brother, in the Month of *October* this preſent Year; for, tho' he had been rack'd with the Gout all the preceding Month of *September*, he fell into a very great and unuſual Difficulty of Breathing, attended with a violent Stertor; and, after four Days, was ſeiz'd with a violent Flux, by which he ſeem'd to receive ſome Relief; but in this we were miſtaken, for he died, the Week after, of a Suffocation.

'Tis to be obſerved, in the Beginning of continual Fevers, the principal Cauſe of which reſides in the Liver, eſpecially if there is any inflammatory Diſpoſition, the Symptom of which is a Tenſion and Hardneſs of the Viſcera, that Perſons generally diſcharge aqueous and bilious Excrements, not only for a Week or two, but ſometimes even for forty Days together.

And, to paſs by Inſtances of People, who have labour'd under a Flux for a Week or two, I remember, that the Cardinal *de Giury*, whoſe Liver was greatly inflam'd, and affected with a Tumor, which by the Continuance of the Diſtemper became ſcirrhous, diſcharged liquid Stools, which were evidently bilious, in great Quantities, for the Space of forty Days.

And, the preceding Year, Baron *Ferdinand ab Honauſem*, being ſeiz'd with an inflammatory Diſorder of the Liver, and a continual Fever, which recur'd three times in the Space of a Year, diſcharged aqueous and bilious Excrements, in large Quantities, thro' the whole Courſe of the Diſeaſe. When his Body was diſſected, among other Signs of a Corruption of the Viſcera, we obſerved in his Liver an extraordinary Tumor, the Surface of which, being about two Fingers Breadth, was altogether wrinkled and flaccid, and appear'd ſoft to the Touch; but the inner Part of it was hard and dry, like a Piece of Wood.

We need not wonder, that an Inflammation of the Liver ſhould produce ſuch large Quantities of Bile; for I remember that *Franciſcus Poirotius*, an eminent Phyſician, being, in the Space of ten Months, quite worn out by an erylipelatous Inflammation of the Liver; a little before he died, vomited up, not without great Torture, and an intolerable Heart-burn, three or four Pound-weight of green unmixed Bile. In his dead Body the Liver was found to be ſcirrhous, and of a blackiſh-green Colour.

In continual Fevers, and particularly ſuch as are conſequent to an inflammatory Diſpoſition of the arterial Blood, a Symptom of which is, a great Blackneſs and Dryneſs of the Tongue, eſpecially if the Body has any remarkable Denſity, either on account of Age, or the Conſtitution of the Seaſon; in all ſuch Fevers, we know by Experience, that Diſcharges of liquid Excrements are uſual, tho' not ſo bilious, as in ſome others. I remember the Caſe of a Patient, very much troubled with arthritic Pains, who, through the whole Courſe of a Fever, diſcharg'd by Stool a large Quantity of ſuch Serum, tho' the Fever recur'd ſeveral times in the Space of a Year, and continued forty Days. But, tho' ſuch Stools are truly ſymptomatical, as they come on with the Beginning of the Diſeaſe, and at the time of its Crudity, yet they are very ſerviceable, becauſe they leſſen the morbific Matter, which, at other times, is to be carried off either by Urine or Sweat; and therefore it ought not to be ſtopt, ſince they are not uſually exceſſive, but ſuch as Nature may eaſily bear; and I have found by Experience, that the Violence of Fevers was always conſiderably diminiſh'd by them; excepting only ſuch Fevers as are attended with an Inflammation of the Viſcera, which, being generally mortal in themſelves, render ſuch Fluxes of no Effect; and, in this Caſe, there is no room left for any other Remedies, but ſuch as we know by Experience to be not only aſtringent and corroborative, but, at the ſame time, to purge off the Serum, together with the Bile: Of this Sort, Rhubarb is the principal; therefore an Infuſion of it, with a Decoction of Myrobalans, and other ſuch Medicines, or a compound Syrup of Succory with Rhubarb, will be of conſiderable Uſe: Theſe Medicines may be repeated every fourth Day to Advantage; and, in the mean time, Alteratives, ſuch as Syrups of Poppies, the ſimple Syrup of Succory, or Conſerve of Roſes and Succory, may be alſo exhibited. But young Phyſicians ought not, after the Example of vulgar Practitioners, who mind only the Flux, Catarrh, or other Symptoms of little moment, to content themſelves with the above Medicines, but ſhould have recourſe to other Remedies, which more immediately reſolve a Fever or Inflammation, ſuch as Veneſection, and other ſuch important Remedies; which ſome People generally neglect, to the great Danger of their Patients.

Beſides the before-mentioned ſerous Stools, I have frequently obſerved, on the Decline either of intermitting or continual Fevers, Stools which were liquid, but, at the ſame time, of an aſh Colour, and as like a crude Lixivium, as Milk is to Milk.

When I attended the Medicinal Lectures at *Paris*, I obſerved, that upon the Decline of a Tertian Fever, I diſcharg'd ſuch Stools; and, ſince that time, I have obſerved the like in many others. Concerning theſe, my Opinion is, that they ought to be look'd upon as critical and ſalutary; ſince by them the febrile Heat is perfectly remov'd, ſo that there is no further Danger of a Relapſe; and ſuch a Solution of Fevers as is not attended with Excretions, is not to be depended on; and I know by Experience, that ſuch Evacuations will follow a conſiderable time after the Concoction of the morbific Humours, and not before. Mineral Springs have promoted this ſalutary Evacuation in many, who have got rid of long ſlow Fevers, conſequent upon an Infarction of the Viſcera, by drinking the Waters of *Berkenfield* near *Deux-ponts*, which brought on a cinericeous Flux. Laſtly, the great *Hippocrates* obſerves, that a ſpontaneous aqueous Diarrhœa is the moſt ſalutary Criſis of aqueous Tumors, whether of the whole Body, which is call'd *Leucophlegmatia*, (for this, ſays he, is remov'd by a Diarrhœa) or of the Abdomen in particular: An aqueous Flux, ſays he, without Crudity, cures a recent Dropſy; but if a Diarrhœa does not happen at the Beginning of the Dropſy, and before the retentive Faculties are much weakened, it proves mortal to the Patient: Beſides, Diarrhœas in this Caſe ought to be profuſe, and equal to the Diſeaſe; for no ſcanty Evacuation can poſſibly prove critical. Diſcharges of this kind muſt neceſſarily produce the Relief of the Patient; becauſe, by their means, only ſuch Humours as are peccant, are evacuated. I obſerved ſuch aqueous Stools, ſpontaneouſly recurring at different times, in a Jeſuit; by means of which, an inveterate Aſcites, of ſeveral Months Continuance, was kept down, and which, at laſt, by the Patient's obſerving an exact Regimen, decreas'd by degrees, and was entirely remov'd. *C. Piſo.*

Ettmuller informs us, that a Diarrhœa, the Matter of which is pinguious and oily, if not produc'd by the Aliments, ariſes from a Colliquation and Melting down of the Fat of the Body. See DEJECTIO.

In this Diſorder, ariſing from whatever Cauſe, the Stomach is to be ſtrengthen'd with burnt Wine, Aromatics, the Vinum Abſynthites, Preparations of Quinces, and corroborative Fomentations externally: Sudorifics, alſo, mix'd with ſuch Medicines as abſorb Acids, are to be exhibited. The Effervescence of the Humours is, by proper Medicines, to be check'd and abated; ſince, when this Effect is produc'd, the Diarrhœa of courſe ceaſes.

In all Diarrhœas and Dyſenteries, whether of the benign or malignant Kind, a Decoction of the Roots of Tormentil is a Medicine, according to this Author, of all others the moſt efficacious. Quinces, alſo, and Medlars, together with the Marmalades prepar'd of them, are by him highly recommended in this Diſorder. Jellies of Hartſhorn diſſolv'd in the Patient's ordinary Drink, and Gum Arabic diſſolv'd in the white Decoction, are by him accounted Specifics in epidemical Diarrhœas. When this Diſorder is attended with violent Gripes, and a Teneſmus, 'tis expedient to inject a Glyſter prepar'd of warm Milk, and the *Theriaca Andromachi*. In habitual Diarrhœas, protracted for a long time, Chalybeates, grateful Aromatics, and warm Baths, are, of all other Medicines, the moſt efficacious. Stubborn and long-continued Diarrhœas, may, he ſays, be cur'd in the ſame manner with a Dyſentery, by Doſes of Ipecacuanha, often repeated at proper Intervals, not neglecting the Uſe of other proper Remedies at the ſame time.

Opium, according to Dr. *Cockburn*, is of little or no Uſe in the Cure of ſerous Diarrhœas; ſince, generally ſpeaking, it only eaſes the Pain, and gives Reſt; by which means, the Stools diſcharg'd are fewer in Number, but larger, and equally thin and liquid as they were before, and, at the ſame time, more fetid.

Walker informs us, that during the Siege of *Londonderry* the Soldiers were ſo far reduc'd, that they were fond of eating a Mixture of Starch and Suet; by the former of which, they were furniſh'd with an excellent Cure for the Diarrhœa; and by the latter preſerv'd from Starving, and defended againſt the Tyranny of Hunger. *Wainwright*, in his mechanical Account of the Non-naturals, informs us, that a woolen Shirt contributes very much to the Cure of an habitual Diarrhœa: And *Fuller*, in his *Medicina Gymnaſtica*, for producing the ſame Effect, recommends Riding on Horſe-back, or in a Chaiſe; probably from *Celſus*.

There are ſeveral other Medicines, which are in a Diarrhœa ſometimes preſcrib'd with good Succeſs; ſuch as the *Laudanum liquidum cydoniatum*, the *Cataplaſma ſtomachicum*, the *Fotus aſtringens*, *Epithema ſtomachicum*, *Saccul. ſtomach.* the *Decoctum Catechu compoſitum*, the *Decoctum Fracaſtorii*, the *Decoctum ſiſtens*, the *Electuar. Corinth.* the *Enema de Malicorio*, the *Expreſſio Rofacea*, the *Miſtura Coral.* and the *Elect. ad Diarrhœam.*

The

The *Coneſſi* Bark is eſteem'd a Sort of Specific, adminiſter'd in the Manner directed under the Article CONESSI.

Clutton recommends the following Glyſter, in Diarrhœas either with or without a Fever, as preferable to Reſtringents of any Kind:

Take of the Confection of Starch, four Ounces: Let it be injected warm, once or twice a Day.

If the Flux is bloody, or the Bowels exceedingly relax'd, let the Confection be thicker, and an Ounce of *French* Brandy be added to it.

Calcin'd Cork is much recommended in a Diarrhœa, and ſeems to be a very likely Medicine. 'Tis known, that Cork will poiſon a Dog; and, upon Diſſections of Dogs thus poiſon'd, it appears that the Cork turns to a viſcid whitiſh Mucus, which contracts the Inteſtines, and, as it were, glues them together.

Wheat Flour ty'd up cloſe in a Linen Bag, and boil'd in Water for ſix Hours, is excellent in a Diarrhœa, eaten with Milk.

Solid Millet, (κέγχρος στερεὸς) boil'd in Oil, ſtops crude and liquid Stools. *Hippocrates.*

Kermes Mineral, exhibited in ſmall Doſes, gradually changes the ſerous and crude Fæces, and renders them of a more bilious and thick Conſiſtence, by attenuating the viſcid Bile, and ſo diſpoſing it to paſs off by Stool. *Geoffroy.*

A colliquative Diarrhœa, that is chronical, is to be cured by Riding: One proceeding from Acrimony, is better cur'd by Medicines. *Fuller's Medicina Gymnaſtica.*

Morton aſſerts, that nothing more effectually promotes a colliquative Diarrhœa in Fevers, when once begun, than Beer, Poſſet-drink, or any thing elſe which has Beer in it.

Hippocrates, Aph. 12. *Sect.* 5. pronounces, that in a Conſumption, when the Hairs of the Head fall off, a ſucceeding Diarrhœa carries off the Patient. And *Aretæus* affirms more generally, that a Diarrhœa, happening in a Phthiſis, is fatal.

Aretæus alſo obſerves, *de Cauſis & Signis Acut. L.* 2. *C.* 7. that a plentiful bilious Diarrhœa ſaves the Lives of thoſe, to whom it happens in an Inflammation of the Liver; but that, three Weeks after, the Liver has a Tendency to Suppuration.

The ſame Author remarks, *de Cauſis & Signis Acut. L.* 2. *C.* 1. that a bilious and frothy Diarrhœa reſolves a Peripneumony, provided it be conſiderable.

Again, *de Cauſis & Signis Acut. L.* 1. *C.* 10. he repreſents a bilious Diarrhœa on the ſeventh Day of a Pleuriſy, as a ſalutary Sign.

In *L.* 2. *C.* 12. *de Cauſis & Signis Acut.* he informs us, that a *Satyriaſis* is frequently reſolv'd by a pituitous and bilious Diarrhœa.

Chalybeate Waters, if taken in the Quantity of three or four Quarts, for one, two, or three Days, is of itſelf a moſt excellent Medicine in Diarrhœas, and a very good Preparative before Opiates. *Jones's Myſteries of Opium reveal'd.*

Sydenham, ſpeaking of the epidemical Fever, which reign'd in 1667. and 1668. has the following Remark: Neither, ſays he, did the Looſeneſs, which often accompanied this Fever, hinder my proceeding cloſely in the above-mentioned Method; having experienc'd, that nothing proved ſo effectual in ſtopping this Diſcharge, as Bleeding, and cooling the Blood by Barley-water, Whey, and other things above enumerated, inaſmuch as this Looſeneſs proceeded from inflammatory Vapours, ſeparated from the Blood thro' the meſenteric Arteries into the Inteſtines, and vellicating theſe Parts.

A little after, he ſays, that before this Fever went quite off, and particularly in the Year 1668. a Looſeneſs became epidemical, without any manifeſt Sign of a Fever; for the Conſtitution at this time inclin'd to the Dyſentery, which prevail'd in the following Year. Nevertheleſs, I judg'd this Looſeneſs to be the ſame Fever with the then reigning variolous Fever; and that it only differed in Form, and appeared under another Symptom: For, having obſerv'd, that a Chilneſs and Shivering likewiſe ordinarily preceded this Looſeneſs; and further, that it generally aroſe from the ſame evident Cauſe with the then reigning Fever; it ſeem'd probable to me, that this Fever, with the Looſeneſs, proceeded from an inflammatory Diſpoſition of the Blood, determin'd towards the Inteſtines, and irritating them to this Diſcharge; whilſt the Blood, in the mean time, by this Revulſion, was freed from the ill Effects its Diſpoſition would otherwiſe have occaſion'd, without any viſible external Sign of a Fever. To this we may add, that the Parts below the Pit of the Stomach were ſo tender, as not to abide the Touch; which Symptom happen'd in the Small-pox, and Fever of this Conſtitution; and the ſame Pain and Tenderneſs of the Fleſh often reach'd to the Epigaſtrium; and ſometimes there was an Inflammation, which ended in an Abſceſs, and deſtroy'd the Patient; all which apparently ſhew'd this Looſeneſs to be of the very ſame Nature and Eſſence with the then reigning Fever: And this Opinion of mine was further confirm'd, from the good Succeſs, which Bleeding, and the Uſe of a cooling Regimen, always had in ſtopping this Looſeneſs; for it readily yielded to this Method, which is the ſame we uſe in the Cure of the variolous Fever: But, when it was treated in a contrary Manner, either by giving Rhubarb, and other lenient Purgatives, to carry off the acrimonious Humours, ſuppos'd to irritate the Inteſtines to theſe Diſcharges, or by adminiſtring Aſtringents; this Diſeaſe, tho' naturally gentle, frequently prov'd mortal, as the Bills of Mortality of the current Year ſufficiently teſtified. *Sydenham.*

All Sorts of Fluxes are very endemic in the *Weſt-Indies*, but more eſpecially in the rainy Seaſons; and may be imputed chiefly to the Negligence of thoſe, who too unwarily expoſe themſelves to the Injuries of the wet Weather; by which means, Perſpiration being interrupted, the thin Part of the Blood, which ſhould have been exhal'd through the Pores of the Skin, is thrown upon the Bowels, and thence diſcharg'd in looſe Stools. This appears plainly, from the great Number of Negroes, and the poorer Sort of white People, who, in theſe Seaſons, are much more afflicted with this Diſtemper, than ſuch, whoſe Condition of Life does not ſubject them to the like Inconveniencies. Beſides catching Cold, there are other antecedent Cauſes of a Diarrhœa; the principal of which are, an immoderate Uſe of crude fugacious Fruits, unwholſome Food, and Meats of difficult Digeſtion; all which, by ſtimulating the Inteſtines, will likewiſe occaſion a Diarrhœa.

When theſe laſt-mentioned Cauſes concur with a damp, rainy Seaſon, the Bowels will not only be loaded with the thin Juices, which ought to paſs off by Perſpiration, but they will alſo, by reaſon of the Stimulus lodged in them, be continually ſolicited to expel their Contents more frequently, and of a thinner Conſiſtence, than uſual. A diminiſhed Perſpiration will likewiſe contribute towards enlarging the Orifices of the hepatic and pancreatic Ducts; and, on this account, the Secretion of their reſpective Juices will be more plentifully made into the Inteſtines; and hence we have an additional Cauſe of a Looſeneſs. Theſe Circumſtances, I think, are ſufficient to account for every Species of a Diarrhœa; and, when we are once fully aſcertain'd of the Cauſe, we need not be much at a Loſs what Method of Cure ought to be purſued in each Species.

Fluxes have, very often, been neglected in the Beginning, from an Opinion, that they are ſalubrious, and of Service to the Conſtitution, by affording an Outlet to ſome offending Matter, which, if retained, would have proved prejudicial. This Remark may, in ſome Caſes, be very true; but it is not to be confided in, without great Caution, in the *Weſt Indies*, where a ſimple Flux frequently riſes up into an obſtinate Dyſentery, in three or four Days; and, when the Diarrhœa is ſuffered to continue any time, it too commonly terminates in a Leucophlegmatia, or Dropſy, to which Diſeaſe People in theſe Parts of the World are exceedingly diſpoſed.

But as a Diarrhœa is ſometimes truly critical, and contributes a great deal towards the Cure of other Diſtempers, ſuch a Diarrhœa ought, by no means, to be ſuppreſs'd, ſo long as the Strength of the Patient can ſupport him under it. The moſt general Rule I know, in this Caſe, is to obſerve diligently, whether the original Diſeaſe receives any conſiderable Abatement from the ſupervening Looſeneſs; which if it does, we have then Reaſon to believe, that the original Diſeaſe was occaſioned by the Retention of the Matter which is evacuated by the Diarrhœa, and therefore the Diarrhœa ought not to be checked.

Dr. *Cockburn* has juſtly obſerved, that a Fever may be a Symptom of a Diarrhœa, as well as a Diarrhœa may be a Symptom of a Fever.

In a Diarrhœa ariſing from ſharp fermenting Juices in the Primæ Viæ, which accelerate the periſtaltic Motion of the Bowels, the firſt Indication is to make a Diſcharge of the ſtimulating Matter; which may be effected by a Doſe or two of Rhubarb, if timely adminiſter'd, in the following manner:

Take of the beſt Rhubarb, half a Dram; and of the Powder of Cinnamon, twelve Grains: Mix for a Doſe, to be taken in the Morning; uſing, at the ſame time, a proper Regimen. Or,

Take of the Tincture of Rhubarb, prepar'd with *Madera* Wine, four Spoonfuls; and of the ſolutive Syrup of Roſes, one Ounce: Mix for a Doſe. Upon going to Bed, the Patient may take fifteen Drops of liquid Laudanum, in two or three Spoonfuls of Barley Cinnamon-water; and the Rhubarb is to be repeated till the Looſeneſs abates, which frequently happens after the ſecond Doſe.

But, as the Stomach itſelf is often in Fault, by tranſmitting an ill-concocted Saburra to the Inteſtines; the Defects

fects of this Organ are to be conſidered and amended. For this Purpoſe, a Doſe of the Salt of Vitriol, or of Ipecacuanha-root, may be adminiſter'd; and when the Stomach has been cleanſed by this Operation, its Tone may be ſtrengthened, and its Fibres fortified, by ſome of the following Remedies:

Take of *Virginian* Snake-root, two Drams; of Gentian, half an Ounce; of Orange-peel, one Ounce; of Winter's Bark, and Galangals, each one Dram: Make into a Decoction with three Pints of *Madera* Wine, of which take five or ſix Spoonfuls twice or thrice a Day. Or,

Take of the Roots of Gentian and Sweet Flag, each two Drams; of the Tops of the leſſer Centaury, two Pugils; of Chamomile-flowers, one Pugil: Infuſe in two Pints of warm Spring-water; and with the Liquor, when ſtrained off, mix four Ounces of compound Gentian-water, and two Ounces of Chalybeate Wine. Of this Preparation, let the Patient drink four Spoonfuls, thrice a Day.

If the Diarrhœa continues to be violent, it will be proper to mix Aſtringents with the Rhubarb in a Bolus.

Take of the Powder of Rhubarb, half a Dram; and of Diaſcordium, a ſufficient Quantity for making a Bolus; to which add two Drops of the chymical Oil of Cinnamon.

When Cold is the productive Cauſe of a Diarrhœa, the Seat of this Diſeaſe is more remote than in the former Caſe; and the Stools are generally very thin, ſerous, and watery. This Matter is convey'd into the Bowels, by reaſon of the inſenſible Perſpiration being ſuppreſſed, ſome other of the Secretions interrupted, or the Blood having contracted an undue Craſis. If this be the Circumſtance of the Patient, we muſt endeavour, in the firſt Place, to unload the Stomach and Bowels, by evacuating the Flux of Humours forced upon them; which is to be performed by a Vomit with Ipecacuanha, and afterwards a Rhubarb-purge. But as this ſort of Diarrhœa is not uncommonly attended with a Fever, or at leaſt with feveriſh Symptoms, it is often found neceſſary to let Bleeding in the Arm precede the other two Operations, eſpecially if the Perſon be ſanguine and plethoric.

This being premiſed, we muſt have recourſe to Diaphoretics, Aſtringents, and Opiates.

Take of the compound Decoction of *Japan* Earth, one Pint; and of the *Species pro Confectione Hyacinthi*, half an Ounce: Mix theſe together, and give the Patient three Spoonfuls after every Stool. Or,

Take of the *Decoctum Fracaſtorii*, one Pint; Dragon's-blood, half an Ounce; and Gum Arabic, two Drams: Mix all together, and let the Patient drink three or four Spoonfuls, as his Condition requires. Or,

Take of the *Confectio Fracaſtorii*, two Scruples; of the Powder of Gum Arabic, one Scruple; and of the Syrup of Lemon-peel, a ſufficient Quantity for making a Bolus, to be taken every four Hours, drinking after it a few Spoonfuls of the following Julap:

Take of Barley Cinnamon-water, ſix Ounces; of Mint-water, two Ounces; and of the Syrup of Lemon-peel, two Ounces: Mix all together for a Julap.

The Patient may uſe, for his common Drink, the white Decoction, with a Diſſolution of Gum Arabic, Rice boil'd in Water with a little Cinnamon, or a Decoction of the Pomegranate-bark; and any of theſe may be made palatable with the Syrup of Citron-peel. Hartſhorn, and Calf's-foot-jelly, are of Service.

At Bed-time one of the following Boluſes may be adminiſtered:

Take of *Venice* Treacle, half a Dram; of *Japan* Earth, one Scruple; of *London* Laudanum, one Grain, or one Grain and a half; and of Diacodium, a ſufficient Quantity for forming into a Bolus. Or,

Take of Diaſcordium without Honey, one Dram; of Snake-root and Saffron, each ſix Grains; of *London* Laudanum, one Grain; and Syrup of Poppies a ſufficient Quantity for making a Bolus.

Theſe Medicines are given in order to promote Perſpiration, that the detained Matter may gain a Vent through the proper Emunctories, and not be forced inwards upon the Bowels for want of a natural and appropriated Evacuation. For this Reaſon, a Decoction of Saſſafras, Guaiacum, Juniper-berries, Chamomile-flowers, and ſuch-like, gratefully contrived, may contribute more towards the Cure of this Diarrhœa, if taken as common Drink, than any of the Preparations before-mention'd for that Purpoſe.

Sometimes the Looſeneſs is ſo obſtinate and untractable, as not to yield to theſe Endeavours; and the Patient, after ſome Continuance in this Courſe, begins to loath, and abſolutely renounce, his Medicines. We muſt therefore apply to Glyſters, as our laſt and only remaining Expedient. The following Forms may ſerve as Specimens of their Compoſition:

Take of the common Decoction for Glyſters, eight Ounces; of Juniper-berries, two Ounces; and of Turpentine diſſolved in the Yolks of Eggs, half an Ounce: Mix for a Glyſter. Or,

Take of Diaſcordium, half an Ounce; of *Venice* Treacle, two Drams: Boil in a ſufficient Quantity of Cows-milk. Let eight Ounces of this Liquor, when ſtrain'd, be injected as a Glyſter, to be repeated as often as the Condition of the Patient requires it.

It is to be obſerv'd, that theſe Glyſters muſt be injected in ſmall Quantities, and are to be retain'd as long as is poſſible by the Patient. I would not be underſtood to mean, that Glyſters are only to be uſed when the Sick rejects other Remedies; for they are of Service in every Stage of this Diſeaſe, but more immediately neceſſary in this.

There are ſeveral external Applications to the Region of the Belly, which are greatly applauded by Authors of good Credit; and, as I myſelf have found conſiderable Aſſiſtance from them, I ſhall ſubjoin three different Forms:

Take of camphorated Spirit of Wine, four Ounces; of *Venice* Treacle, two Drams; of the Oil of Cloves, twenty Drops; and of the Oil of Aniſe and Wormwood, each ſix Drops: Mix up for an Epithem.

Take of *Venice* Treacle, half an Ounce; of the Powders of Cinnamon and Cloves, each one Dram; of the Oils of Cinnamon and Mint, each eight Drops; and of the Vinegar of Roſes, a ſufficient Quantity for making a Cataplaſm.

Take of Mithridate, one Ounce; of Nutmegs and Cinnamon, each one Dram; and of the Powder of Maſtich, a ſufficient Quantity for making a Plaiſter to be ſpread upon Leather, with a little adhefive Plaiſter about the Edges, for its more commodious Retention on the Part to which it is applied.

Thoſe who are ſubject to an habitual Looſeneſs, may receive great Benefit by wearing Flannel, and by keeping their Bodies warm. *Towne's Treatiſe on the Diſeaſes of the Weſt Indies.*

A Consumption *from a* Diarrhoea.

Many times, in a ſcorbutical Diſpoſition of the Body, the Blood grows ſharp to that Degree, that, being diſturbed upon every little Occaſion, it cannot aſſimilate the new Chyle to itſelf; whereby it comes to paſs, that it is thrown out by the Glands of the Inteſtines in a continual Flux like a Stream; which Chyle, if it is benign, and more mild, forms a Diſtemper in the manner of a Looſeneſs; but, if it be ſharp, and of a malignant Nature, produces one in the Form of a bloody Flux. By this continual Efflux of the Chyle, the Blood is much impoveriſh'd, and grows hot; ſo that, although the bloody Flux or Looſeneſs be overcome by the Uſe of Opiates and binding Medicines, yet a hectical Heat ſtill remains in the Blood, together with an Atrophy, and Dryneſs of the Skin, ariſing from the impoveriſhed and diſpirited State of the Blood; as it happened to my own Son, and many others; which very often terminates in a Conſumption of the Lungs. But the Way to prevent it is (after the Looſeneſs and bloody Flux are cured by proper Medicines) by a long Uſe of a Milk-diet, the *Peruvian* Bark, the mineral Waters, which are chalybeate, and of the white Decoction for ordinary Drink. This Conſumption often happens to Children who breed their Teeth; but, by the long Uſe of the white Drink, of Pearl-julaps, and binding Medicines, mix'd with ſome little Opiate, it is eaſily cur'd.

A Case.

Mr. *Tindal*'s only Daughter, a very fine young Woman, but ſcorbutical, and ſomething melancholic, about eighteen Years of Age, upon the Suppreſſion of her *Menſes*, fell into a colliquative Looſeneſs, with Stools which came away like Water; which, by degrees, brought her into an univerſal Atrophy, even to the Degree of a Maraſmus; but without any ſenſible Fever, or Cough, or Shortneſs of Breath, or any other

Sign of any Diſtemper of the Lungs: So that ſhe was not at all taken for a conſumptive Perſon by the Phyſician, under whoſe Care ſhe was, before I was concerned. Being called to go to ſee her, as one that had only a Looſeneſs, when ſhe was now, by reaſon of her Weakneſs, almoſt always confin'd to her Bed, I found her worn away with a Conſumption even to a Maraſmus; and that I plainly told her Friends, as my Opinion, altho' her Lungs as yet ſeemed ſound; neither was there any Sign of a hectic Fever. But when this Looſeneſs, which the former Phyſician, for want either of Skill or Care, had ſuffered to run on ſo long, came once to be ſtopt by a due Government, and the Uſe of efficacious Medicines, preſently a hectic Flame began to be kindled in the Habit of her Body; and her Lungs alſo began to be affected with a Cough, that was almoſt perpetual, and a Shortneſs of Breath; which Symptoms being at length followed by colliquative Sweats, a Swelling of the Legs, and other Signs of a fatal Conſumption of the Lungs, ſoon brought her, amidſt the Lamentations of her Friends, to the laſt Period of her Life. Two things were here particularly worthy of a Remark: Firſt, that the more her Looſeneſs was ſtopt, ſo much the more always were her Lungs preſently affected. And, ſecondly, that altho' this Conſumption had prevailed upon her almoſt for the Space of a Year, even to a Maraſmus, before the Lungs ſeem'd to be in the leaſt touch'd, yet in the Body, when it came to be open'd after Death, the Lungs appeared full of little Tubercles, and that not only ſuch as were crude and hard, but alſo ſome which were ripen'd into Apoſtems. *Morton's Phthiſiologia, Chap.* 7.

For an Account of an arthritic Diarrhœa, ſee ARTHRITIS.

That what has been ſaid above, relative to Diarrhœas, may be the better underſtood, I muſt make the following Remarks:

All ſorts of Subſtances whatever, poſſeſſed of any conſiderable Degree of Acrimony, will ſtimulate the Inteſtines, accelerate their periſtaltic Motion, invite a larger Quantity of Fluids to their Glands, and cauſe a Diſcharge of their Contents by Stool. Thus all thoſe Medicines which are called Cathartics act, and produce an artificial Diarrhœa.

If alcaleſcent Aliments are taken into the Stomach in Quantities ſuperior to the Powers of Digeſtion, they putrefy, and, becoming acrimonious, by their Stimulus, provoke a Diarrhœa. Thus thoſe who eat ſtale Fiſh, fall frequently into violent Diarrhœas; and half a Grain of the putrefied Yolk of an Egg will produce a great Number of Stools.

If aceſcent Aliments are taken in too large Quantities, they putrefy, and contract an acid Acrimony. Thus Milk, if it turns acid on the Stomach, purges; as do Fruits, and other Vegetables, under the ſame Circumſtances. If the Stomach, Inteſtines, Liver, Pancreas, or any Part, which has an immediate Communication with the inteſtinal Tube, are affected with an Abſceſs, or Ulcer of any kind whatever, the acrimonious Matter diſcharged ſtimulates the Inteſtines, and produces a Diarrhœa.

In caſe of an Abſceſs in any Part at a Diſtance from the Inteſtinal Tube, ſuppoſe in the Lungs, and ſo ſituated, that it cannot be diſcharged externally; the patent Orifices of the Veins may abſorb a Part, or even all the Pus of the Abſceſs, and convey it to the Arteries. Now, as the Arteries of the Inteſtines are very conſiderable, it is eaſily conceivable, that they may depoſit this acrimonious Matter upon the Inteſtines, where it may ſtimulate them to a Diarrhœa, and make a Way for its own Diſcharge out of the Body. Or, if this ſhould not happen, the Matter may be conveyed by the Arteries to the Veins, which, by their Union, form the *Vena Portæ*; which does, in ſome meaſure, the Duty of an Artery with reſpect to the Liver: And here the Matter may be ſeparated from the Maſs of Blood, diſcharged by the biliary Ducts into the Inteſtines, and thus paſs off in copious Stools.

If any habitual Evacuation ſhould be obſtructed, Perſpiration, for inſtance, the Matter retained will acquire a Tendency to Acrimony, and be more likely to be depoſited upon the Inteſtines, than any-where elſe, as it may be ſecreted both from the inteſtinal Arteries, and the Vena Portæ.

When the obſtructing Matter, in a chronical Diſtemper, is reſolv'd, mov'd, and mix'd with the Maſs of Blood, this may, and frequently is, convey'd to the Inteſtines, and diſcharg'd by a Diarrhœa. This happens to ſurfeited Horſes, when turn'd to Graſs in the Spring, eſpecially in ſalt Marſhes; for, when the ſaponaceous Juice of Graſs has reſolv'd their Obſtructions, and the Matter thereof is mix'd with the Blood, a ſalutary Diarrhœa carries it off, and the Animal recovers his Health, and grows plump and ſleek.

Thus, alſo, People who eat large Quantities of the ſaponaceous Spring-herbs, or of ripe Fruits, fall into a plentiful Diarrhœa, attended with ſimilar good Effects.

Hence we may perceive, how careful Phyſicians ſhould be to inveſtigate the Cauſes of Diarrhœas, in order to preſcribe judiciouſly, and to avoid doing a great deal of Prejudice: For the Matter cauſing a Diarrhœa muſt be carried off, either ſpontaneouſly, or by Art, before there can be any good Reaſon for adminiſtering Aſtringents; which ſeem only to be indicated, when the Diſcharge is ſo exorbitant, as to endanger Life; or when the Emiſſaries of the Glands, which open into the Inteſtines, are too much relax'd, after the ſtimulating Cauſe is perfectly eliminated.

Deſtroying the peculiar Acrimony cauſing a Diarrhœa, when that can be done, will bid fair to cure, or, at leaſt, to alleviate, the Diſorder.

DIARTHROSIS. A Species of Articulation. See ARTICULATIO.

DIASAPONIUM. The Name of an Unguent in *Nicolaus Myrepſus, Sect.* 3. *C.* 88. in which Soap is the principal Ingredient.

DIASATYRION. The Name of an officinal Electuary, ſo call'd from Satyrion, the principal Ingredient. Its Uſe is to excite Venereal Inclinations. It is directed in the former Diſpenſatories of the College, but omitted in the laſt. It is deſcrib'd in *Nicolaus Myrepſus*.

DIASCILLION. The Vinegar and Oxymel of Squills are call'd by this Name in *Marcellus Empiricus*.

DIASCINCI *Antidotus*. A Name for Mithridate.

DIASCORDIUM, ſo call'd from Scordium, one of its Ingredients. A celebrated Compoſition, otherwiſe call'd *Confectio Fracaſtorii*, is thus directed by the College:

> Take of Cinnamon, and Caſſia-wood, of each half an Ounce; of true Scordium, one Ounce; of *Cretan* Dittany, Tormentil, Biſtort, Galbanum, and Gum *Arabic*, of each half an Ounce; of Storax, four Drams and a half; of Opium, and Seeds of Sorrel, of each one Dram and a half; of Gentian, half an Ounce; of *Armenian* Bole, one Ounce and a half; of *Lemnian* ſeal'd Earth, half an Ounce; of long Pepper, and Ginger, of each two Drams; of clarify'd Honey, two Pounds and a half; of Sugar of Roſes, one Pound; of generous *Canary*, eight Ounces: Make into an Electuary. *S. A.*

It may alſo be prepared with Diacodium inſtead of the Honey, and leaving out the Sugar of Roſes.

Quincy, a very good Judge of pharmaceutical Subjects, makes the following Remarks upon this Compoſition:

This, ſays he, is originally the Preſcription of *Hieronymus Fracaſtorius*, a moſt celebrated *Italian* Phyſician, given in his Book *de Contagio, & Morbis contagioſis, Lib.* 3. *Cap.* 7. and, for that Reaſon, is commonly, in extemporaneous Preſcriptions, call'd *Confectio Fracaſtorii*. The firſt of our College Diſpenſatories, and the *Auguſtan*, inſerted it alike; but, in ſubſequent Editions, it hath been alter'd, tho' chiefly in the Tranſpoſitions of the Ingredients. The preſent, however, is copy'd after the firſt Form exactly, unleſs in the Sugar of Roſes for Conſerve. The Emendation here, likewiſe, to be made at Diſcretion, of Diacodium for Honey, is, on many Accounts, greatly to be liked; and the Reaſons for ſuch an Alteration cannot but be obvious to every one acquainted with theſe Matters. The Scordium and Dittany are to be finely pick'd from their Stalks; and all muſt be powder'd together, except the Galbanum and Opium, which muſt be ſtrain'd, and firſt mix'd with the Honey; and then the Species muſt be ſifted and ſtirr'd in; and, after all, the Wine is to be put to it, as *Zwelfer* hath directed in his Remark hereupon. Some alſo ſtrain the Styrax, but it will paſs with the others into a Powder; but, then, it muſt be better ſettled from the Droſs, otherwiſe the Quantity will be defective. For the Sugar of Roſes, one Ounce of the Flowers are powder'd with the dry Ingredients, and ſo much the more Honey put inſtead of the Sugar. If, for the Caſſia-wood, Cinnamon be uſed, it much improves the Medicines; both as the latter is a much more aſtringent Spice, and the other, in time, gives a ſlimy Quality to the Compoſition, and ſpoils it. This is valued for its Colour, which it receives only from the Bole, the moſt indifferent Ingredient in it; but, as it is a Sign of its Freſhneſs, it is of Uſe; for this Medicine is much the worſe for Age, and is known to be ſo by the red Colour wearing off: But that, likewiſe, may be diſcover'd by the Faintneſs of its Taſte; for the Aromatics by Time exhale, and the Roughneſs of the Ingredients, in which its Aſtringency conſiſts, by long Continuance in a moiſt Form, grows ſofter and ſmoother upon the Palate. The Colour is, indeed, renewable by a little freſh Bole, but the Deceit may be diſcover'd by the Taſte. Every one knows, how much this is in Uſe, and for what Purpoſes; and, indeed, if the ſeveral Ingredients be nicely ſelected, and the Medicine freſh-made, it is excellent in all Fluxes whatſoever, and a great Strengthener both of the Stomach and Bowels. In its Influence upon Fluxes, the Opium has no ſmall Share, as may be well conceived from the Virtues of that Drug. It is given to Children, from five Grains to one Scruple, and to grown Perſons from one Scruple to two Drams for a Doſe. There is but one Grain of Opium in five Drams twelve Grains. A very miſchievous Way ſome Nurſes have got, of giving their Children this Medicine to make them ſleep, more for their own Eaſe than any thing elſe; which is frequently the Foundation of many Diſorders, from its keeping them

them too coſtive, the worſt State Children can be in. Becauſe Honey, which is certainly an Opener, and a powerful Detergent, and therefore contrary to the main Deſign of this Compoſition, is here in ſo large a Quantity, the modern Practice has very prudently order'd this Medicine to be made without it, by uſing, in its ſtead, a ſufficient Quantity of Syrup of Meconium, boil'd up to a due Conſiſtence, which greatly improves the Medicine; but the Quantity for a Doſe muſt then be proportionably leſſen'd, as the Syrup adds to its narcotic Property. Many alſo, of late, have a Way of drying the Opium, ſo as to powder with the Species, and reſerving it by itſelf; and this is the beſt Way of all to preſerve the Virtues of the ſeveral Ingredients entire, which no moiſt Form can do thoſe of an aſtringent Nature. Of the Species may be given, for a Doſe, from five Grains to one Scruple.

With reſpect to the Change of *Syrupus e Meconio* for Honey, it may be much doubted, whether this is an Improvement or not. It is very certain, that Honey, by its Fermentation, induces a very great Alteration in all the Ingredients, unites their Virtues, and, perhaps, in this Compoſition, alters the Opium for the better. Thus far, however, may be affirm'd, that Diaſcordium, without Honey, is a very different Medicine from that prepared with Honey. It may be added, that the Medicine ſeems to be intended for a ſtomachic Reſtorative, and Strengthener of the Organs of Digeſtion, and not particularly for an Aſtringent. And Honey is known to deterge and attenuate; and therefore the viſcid Humours, adhering to the Coats of the Stomach and Inteſtines, are removed, and prevented from interfering with the Functions of the Organs abovemention'd.

DIASENA. The Name of an Antidote in *Nicolaus Myrepſus*, *Sect.* 1. *C.* 112. ſo call'd from Sena, a principal Ingredient in the Compoſition. The *Pulvis Diaſenæ*, in the *London Diſpenſatory*, is very different from this. See SENNA.

DIASERICOS, *διὰ σήρικος*. The Name of a Compoſition deſcrib'd by *Trallian*, *L.* 3. *C.* 7. in which Silk is an Ingredient.

DIASMYRNON, or DIASMYRNES, *διάσμυρνον*, *διασμύρνης*. The Names of ſeveral Collyria, deſcrib'd by *Galen*, *Aetius*, and *Scribonius Largus*, in which Myrrh (*σμύρνη*) is an Ingredient.

DIASOSTICA, from *σώζω*, to preſerve. That Part of Medicine, which relates to the Preſervation of Health.

DIASPERMATON, *διὰ σπερμάτων*. The Name of a Malagma in *Galen*, *L.* 7. *de Comp. per Gen.* and of another in *Paulus Ægineta*, *L.* 7. *C.* 18. both compounded of Seeds.

DIASPHAGE, *διασφαγή*. An Interſtice betwixt two Rocks, or any Interſtice. *Hippocrates* uſes it to expreſs the Interval or Diſtance betwixt two Branches of a Vein.

DIASPHYXIS, *διάσφυξις*, from *σφύζω*, to ſtrike. The Pulſation of an Artery.

DIASTASIS, *διάστασις*, from *διΐστημι*, to ſeparate. A Separation, frequently uſed with reſpect to Bones, which recede from each other. It imports alſo an Interval or Interſtice, as that betwixt the Ulna and Radius, or that betwixt the Tibia and Fibula. This Word, alſo, ſometimes ſignifies ſuch a Diſtention of the Muſcles as happens in Convulſions; and, when apply'd to the Stomach, an Effort to vomit. It farther implies the ſame as *Diaſtole*, when uſed relative to the Pulſe.

DIASTEATON, from *στέαρ*, Fat. The Name of an Ointment in *Marcellus Empiricus*, in which the Fats of the Stag, Swine, Gooſe, and Hen, are directed.

DIASTEMA, *διάστημα*, of the ſame Derivation as *Diaſtaſis*, and of much the ſame Import. *Galen* ſays, it ſignifies a Conformation of Bodies reſembling Wool. And *Hippocrates*, *L. de decenti Habitu*, uſes it to expreſs the Interval of Time betwixt one Viſit, which a Phyſician makes his Patient, and the next.

DIASTOLE, *διαστολή*, from *διαστέλλω*, to ſtretch. In Anatomy it imports the Dilatation of the Heart, Auricles, and Arteries.

DIASTOMOTRIS, *διαστομωτρὶς*. This is uſually joined with *μήλη*, a Probe, and implies any dilating Inſtrument, as a *Speculum Oris*, *Speculum Ani*, or *Speculum Uteri*.

DIASTREMMA, *διάστρεμμα*, from *διαστρέφω*, to diſtort. A Diſtortion of the Limbs. *Diaſtrophe*, *διαστροφὴ*, is of the ſame Import.

DIASULPHURIS EMPLASTRUM.

Take of the Flowers of Sulphur, and *Venice* Turpentine, of each half an Ounce: Stir them over a gentle Heat, that they may incorporate together, and be in perfect Fuſion. After Removal from the Fire, put in one Ounce more of Turpentine, and ſtir them about till they are cold. Of this Mixture take one Ounce; of Wax, two Drams: Melt theſe together, and remove them off the Fire, to ſtir in of Myrrh, in fine Powder, one Ounce; of Camphire, one Dram: Mix them exactly ſo as to make into a Plaiſter. *S. A.*

This is originally aſcrib'd to *Rulandus*; and *Sennertus*, in his *Inſtitutions*, gives it a great Recommendation for the Cure of all ſorts of Ulcers. *Schroder*, and our Countryman *Bates*, have given Preſcriptions of it alike; but this differs from them both very conſiderably, in omitting the Reſin, adding Camphire, and changing, indeed, the Manner of Compoſition in moſt Parts of the Proceſs.

There are many other Preparations of Sulphur, which have the Appellation of *Diaſulphuris*.

DIATAMARON. The Name of an Antidote in *Nicolaus Myrepſus*, *Sect.* 1. *C.* 25. *Fuchſius* thinks the Reading is wrong, and that it ſhould be *Diatamoron*, or rather *Antimoron*, that is, againſt Death.

DIATASIS, *διάτασις*, from *διατείνω*, to diſtend. The Extenſion of a fractured Limb, in order to its Reduction.

Διάτασις πνίυμονος is the lower and internal Part of the Thorax, in which the Lungs are diſtended during Inſpiration.

DIATECOLITHU, *διὰ τηκολίθου*. The Name of an Antidote deſcrib'd in *Paulus Ægineta*, *L.* 7. *C.* 11. ſo call'd from the *Lapis Judaicus*, (*τηκόλιθος*) one of its Ingredients.

DIATESSADELTON. The ſame as DIACELTATESSON, which ſee.

DIATESSARON, *διατεσσάρων*. The Name of a Compoſition, ſo call'd from the four Ingredients it comprehends.

Take of Gentian-root, Bay-berries, Myrrh, and round Birthwort, of each two Ounces; of Honey, two Pounds: Mix them into an Electuary. This, with the Addition of the Shavings of Ivory, two Ounces, is intituled *Diapente*, or a Compoſition of five Ingredients.

This hath paſs'd, without Alteration, thro' all the Emendations of the College Diſpenſatories, where, at firſt, it enter'd under the Title of a Theriaca. It comes originally from *Meſue*. *Avicenna* alſo preſcribes it; but it is hardly ever order'd in the Form of an Electuary, and therefore not kept ſo in the Shops: But in its Species, with the Addition of Ivory, it is much call'd for, by the Name of *Diapente*, principally for ſome Diſtempers among Cattle.

Quincy miſtakes in ſaying, that this came originally from *Meſue*; for *Vegetius*, in his *Mulomedicina*, *L.* 1. *C.* 64. deſcribes the *Diapente* exactly as here directed; and, in *L.* 1. *C.* 16. he ſpeaks of it as a Medicine of great Importance in the Diſeaſes of Cattle.

DIATETTIGON, *διὰ τεττίγων*. The Name of an Antidote in *Paulus Ægineta*, *L.* 7. *C.* 11. in which Graſshoppers are an Ingredient.

DIATHESIS, *διάθεσις*, from *διατίθημι*, to diſpoſe; an Affection or Diſpoſition; is a Quality, which is eaſy to be removed. *Galen*, *Com.* 5. *in Lib.* 6. *Epid.* tells us, that he calls thoſe Qualities morbous Affections, *νοσώδεις διαθέσεις*, not only when the Patient actually labours under them, but when they begin to ariſe. The Word is alſo uſed by *Galen ad Thraſyb.* in the ſame Senſe as *σχέσις*, Habitude.

DIATHESMOS, *διαθεσμὸς*, is expounded, in *Erotian* upon *Hippocrates*, by *διάφυσις*. See DIAPHYSIS.

DIATRAGACANTHI *frigidæ Species*.

Take of Gum Tragacanth, two Ounces; of Gum Arabic, one Ounce and two Drams; of Starch, half an Ounce; of Liquorice and the Seeds of Melons, and white Poppies, of each three Drams; of the Seeds of Citruls, Cucumbers, and Gourds, of each two Drams; of Sugar-candy, three Ounces: Mix them into a Powder.

This is aſcrib'd to *Nicolaus Myrepſus*, from whom, *Sect.* 1. *Cap.* 98. it is exactly tranſcrib'd by the College into their firſt Diſpenſatory, where alſo it is occaſionally, and at Pleaſure, ordered to be made into an Electuary, with Syrup of Violets; but therein is half a Scruple of Camphire, which they ſince have thought fit to leave out; and there is added one Scruple of Water-lily-flowers; but ſuch a ſmall Proportion is of ſo little Conſequence, as to be here rejected. The *Auguſtan* Diſpenſatory likewiſe hath it both without the Camphire and Lily-flowers; where *Zwelfer*, in his Notes thereupon, recommends it as a good Pectoral, and a Cooler of the Blood; but he greatly blames it as an Ingredient in the *Aqua Dyſenterica Quercetani*, in his Remarks thereupon in the *Pharmacopœia Regia*, becauſe all the Ingredients of it are incapable of giving any Virtues by Diſtillation. This is frequently preſcrib'd in hectical Heats, where the Rapidity of the Blood's Motion is ſubject to abrade and break through its Bounds, by tearing off the Capillaries, and thereby cauſing ſometimes inward Bleeding; for this Medicine is cooling and agglutinating, whereby it helps to keep the Membranes guarded with their proper Mucus, and thereby alſo defends them againſt Acrimonies: And thus it is likewiſe of Service in choleric Conſtitutions, and where the Sharpneſs of Humours threatens Excoriations and Exulcerations. Upon this Account, too, it comes to be uſeful in many Diſtempers of the

Breaſt,

Breaſt, becauſe it will ſoften and thicken ſharp Defluxions, and eaſe the Coughs which proceed therefrom: And thus Stranguries, Heat of Urine, and the Pungency of venereal Gleets, are hereby relieved, both by ſheathing the Acrimony of the Fluids, and defending the Veſſels from their Irritations. For theſe Purpoſes this is a good Compoſition; but the Quantity of Flowers of Water-lilies is merely ridiculous, it bearing no manner of Proportion to its Virtues, ten times the Quantity that is in the Medicine not being more than a Perſon would give at one Doſe, had he any Intention of Moment to anſwer with it. The Doſe of the Whole is from half a Dram to two Drams, and frequently to be repeated. This is much the beſt when freſh-made, becauſe the Seeds, with keeping, grow rancid.

DIATRION PIPEREON SPECIES. A Compoſition in the *London* Diſpenſatory, which is thus directed:

> Take of the black, long, and *Jamaica* Pepper, of each ſix Drams and fifteen Grains; of Aniſeeds, Thyme, and Ginger, of each one Dram; and make them into a Powder.

This is preſcrib'd by *Galen de tuenda Valetudine*, where he recommends it againſt Crudities, and a Redundance of cold Humours. *Meſue* hath likewiſe given a Preſcription under the ſame Title, for the ſame Intentions, which hath alſo been inſerted in the *Auguſtan* Diſpenſatory; but adds ſome more Spices, and carminative Seeds. The College hath thought fit to receive the firſt into their Diſpenſatory, and to continue it without Alteration till the laſt, where the *Jamaica* Pepper is added, becauſe the black and white, before intended as two of the three Peppers, are but the ſame in kind, and differ only in the particular Management to make them appear of two Sorts.

DIATRITOS, διάτριτος.

An Abſtinence for three Days was one of the moſt conſiderable Points in Practice, by which the firſt Methodics diſtinguiſhed themſelves from other Phyſicians. This Term of three Days they called *Diatritos*, and not the Abſtinence itſelf, as *Gorræus* ſuppoſed; and this Space of three Days, or the third Day, to which the Methodics were moſt ſcrupulouſly attached, procur'd them the Name of *Diatritarii*. *Gorræus* obſerves from *Galen*, *M. M. Lib.* 10. *Cap.* 6. that theſe Phyſicians ſuffered three entire Days to paſs, before they allowed any Nouriſhment to their Patients; and adds, that they began to give them ſome Food on the fourth Day, after that on the ſixth, and then on the eighth, and ſo on; ſo that the firſt Nouriſhment was not given till after the firſt *Diatritos*, or after the firſt three Days were paſt; but, from that time, every ſecond Day. It ſeems likely, that *Galen* perfectly knew the Conduct of the Methodics in this reſpect; and yet it is certain, from a Multitude of Paſſages in *Cœlius Aurelianus*, that they made their Patients faſt only the two firſt Days, and gave them ſome Nouriſhment on the third. This Difficulty may be ſolv'd by ſaying, that the Tranſcribers of *Galen* miſtook in a Figure; or that *Soranus*, whom *Cœlius* follows, and who did not agree with other Phyſicians of his own Sect, might have retrenched one Day from the *Diatritos* of *Theſſalus*, and the other Methodics. We muſt obſerve alſo, that *Cœlius* gives the Name *Diatritos*, not only to the Space of three Days, but to the third Day in particular; and that he commonly makes uſe of the Diſtinction *intra Diatriton*, and *in ipſo Diatrito*, that is, as himſelf explains it, *during the Space of three Days*, and *on the very third Day*. Hence it is, that, ſpeaking of the Term of ſeven Days, he ſays, that it comprehends three *Diatritoſes*, the fifth Day being the third, if you begin to reckon from the third Day incluſively; and the ſeventh, according to the ſame Way of counting, the third.

Antipater, a Methodic Author, quoted by *Cœlius*, ſaid, that there was a natural Reaſon, why we ſhould wait till the third Day, before we allowed the Patient any Nouriſhment; but he does not inform us of that Reaſon. *Hippocrates*, or *Polybus*, *de Morbis*, *Lib.* 4. ſeem to have been of Opinion, that there were two entire Days neceſſary for the perfect Concoction of the Food, the Diſtribution of the Juices in the Body, and the Separation and Evacuation of the excrementitious Parts; ſo that, according to theſe Authors, it was not till the third Day that the Body became free and diſengaged from the Aliment which it had received on the firſt. This Notion, perhaps, obliged the Methodics to wait till the third Day, and might be the Reaſon which *Antipater* meant. After this Abſtinence, which extended to the third Day, as we have obſerved, and not to the fourth, *Cœlius* allowed his Patients Nouriſhment one Day in two, except in Caſes of accidental Weakneſs, or Fainting, in which he diſpenſed with the ordinary Rules, and gave them Food every Day indifferently.

It is farther to be obſerved, that the third Day was appointed by *Cœlius*, not only for the beginning to nouriſh his Patients, but to commence exhibiting his moſt conſiderable Remedies. On this Day he took away Blood for the firſt time, unleſs the Violence of the Diſeaſe obliged him to do it ſooner; that is, as he expreſſes it, *intra Diatriton*, within the Space of the two firſt Days, which rarely happened. This Bleeding, which was performed the ſame Day on which he began to nouriſh his Patient, preceded the Nouriſhment; which deſerves to be conſidered by our modern Phyſicians, who are ſometimes afraid of bleeding ſome Patients faſting, leſt it ſhould weaken them too much. The Methodics were ſo far from being uneaſy on that account, that, even after Bleeding, and the Abſtinence which preceded it, they allowed the Patient but a ſlender Nouriſhment, which ordinarily conſiſted in a Broth made of Water and Wheaten-meal, prepared after a particular manner, and reduced into ſmall Grains, which they called *Alica*, that Name being common both to that ſort of Meal, and the Broth made of it. *Cœlius* prefers this Nouriſhment to the Ptiſan of *Hippocrates*, or to Barley-broth, which, he ſays, are flatulent and aſtringent.

We ſaid juſt now, that the Methodics reſerved their choiceſt Medicines for the third Day; which ſuppoſes thoſe they uſed before to be not very conſiderable. And indeed, during the two firſt Days, or the Time of Abſtinence, theſe Phyſicians only ſuffered their Patients to waſh their Mouth with Water, or to drink a little of it. And, as to their other Management, they did nothing but anoint them, and cover them with Cataplaſms, and Wool dipt in *hot* Oils, if it was a Diſeaſe of *Stricture*, but in *cold* Oils for a Diſeaſe of *Relaxation* or *Flux*; to which Remedy, in this laſt Caſe, they added refrigerating Fomentations, and the Application of all manner of aſtringent Topics. And, tho' theſe Remedies may appear to us but of little Significancy, yet the Methodics had quite a different Notion of them. They believed, that, by conſtringing or relaxing the external Parts, the internal were, in like manner, conſtringed or relaxed; and they laughed at other Phyſicians, who, being of a quite contrary Sentiment, pretended, on certain Occaſions, to cure a Flux or Relaxation of the exterior Part, by opening the Pores of the interior. They did not trouble themſelves about diſcovering, to a great Degree of Exactneſs, the proper Seat of the Diſorder; but had recourſe to Relaxation and Conſtriction of the whole Body in general, in whatever Part the Flux or Stricture were diſcovered; and they continued the Uſe of theſe Remedies every ſecond Day, or the Day appointed for Abſtinence.

DIAULOS, δίαυλος, is one who performs a ſtrait Courſe forwards and backwards, or from the Starting-place to the Goal, and back again. The Word ſignifies alſo the Courſe itſelf, and δίαυλοι are accounted among the Sorts of Gymnaſtics by *Hippocrates*, *Lib.* 1. & 2. *de Diæta*.

It is derived from δὶς, twice, and αὐλὴ, a Station, becauſe the Courſe was performed back to the ſame Station; or from δὶς, twice, and αὐλὸς, ſignifying, among other things, a Stadium, becauſe the Place of the Courſe was a Stadium in Length; ſo that, by running it forward and backward, they became δίαυλοι, or ſuch as had run a δίαυλος, that is, two Stadia.

DIAZOMA, διάζωμα. The Diaphragm.

DIAZOSTER, διαζωστὴρ. A Name for the twelfth Vertebra of the Back, ſo called, becauſe the ζωστὴρ, Belt, lies upon it.

DICÆOS, δίκαιος, has a Variety and Multiplicity of Significations in *Hippocrates*; for ſometimes it is the ſame as ἔυλογος, or agreeable to Reaſon; ſometimes it is taken for ὅμοιος, equal or alike; in ſome Places it bears the Senſe of ἴσος and ὁμαλὸς, that is, equal and even, or equable; It ſignifies alſo συμφέρων, convenient or accommodated; alſo juſt, complete, natural, beſt, and fitteſt; in which Senſes it is applied to the Phyſician, Method of Cure, Situation of Parts, Diet, and many other things.

DICENTETON, δικέντητον. The Name of a hot and acrid Collyrium, deſcrib'd by *Paulus Ægineta*, *L.* 3. *C.* 13.

DICHALCON, δίχαλκον. A Weight equal to two Æreola, or one Third of an Obolus.

DICHASTERES, δίχαστῆρες. The *Dentes Inciſores*.

DICHOPHYIA, δίχοφυία. A Diſtemper of the Hairs, which conſiſts in their growing forked. *Galen.*

DICOCTA, δίκοπτα. Water firſt heated, and then refrigerated with Snow. *Galen. Method. Medendi*, *L.* 7. *C.* 4.

DICRÆUS, δίκραιος. Biſid.

DICROTUS, δίκροτος, from δὶς, twice, and κρόω, to ſtrike.

An Appellation of a certain Pulſe, in which the Artery beats, as it were, double. Dr. *Nihill*, a late Author, has given ſome very remarkable Obſervations relative to this ſort of Pulſe, which he calls, not improperly, the *Rebounding Pulſe*, made by Dr. *Solano*, a *Spaniſh* Phyſician, and confirmed by a great many Caſes. The *Pulſus Dicrotus*, ſays he, of the Antients, which, in *Engliſh*, may be properly called the *Rebounding Pulſe*, is a certain Sign of a future critical Hæmorrhage by the Noſe.

When the rebounding Pulſe appears at or about every thirtieth Pulſation, the Hæmorrhage follows in four Days after, ſomewhat ſooner or later; when it recurs at every ſixteenth Pulſation, the Hæmorrhage ſupervenes in three Days; when it is obſerved at every eighth Pulſation, the Hæmorrhage is to enſue in two Days and a half; laſtly, when it returns at every fourth, third, ſecond Pulſation, or is continual, the Hæmorrhage is to

be expected within the Space of twenty-four Hours. Therefore, in general, the ſhorter the Periods of Pulſation, at which the Rebounding recurs, the nearer the Hæmorrhage.

Sometimes Nature runs regularly through all the fore-mentioned Progreſſions of the critical Pulſe, from its firſt Appearance at every thirtieth, down to every ſingle Pulſation; by which the Hæmorrhage is foreſeen gradually approaching juſt in the ſame Degrees: She ſometimes inordinately haſtens or delays the Hæmorrhage, and then the Rebounding of the Pulſe recurs with more or leſs Frequency in the ſame Proportion; and when this returns in variable ſhifting Periods, the Time at which the Hæmorrhage is to happen, cannot be exactly determined.

When the Artery rebounds upon the Finger with great Celerity, and very briſkly follows the firſt Stroke, the Hæmorrhage is juſt at hand; and if then it ſhould delay a little, it will appear on the Patient's blowing his Noſe.

The Quantity of the Hæmorrhage is foreſeen by the Vigour with which the Artery rebounds, compar'd exactly with the Force of the firſt Stroke, be this either vehement or languid. Thus, when the Artery rebounds with leſs Moment than the firſt Stroke has impreſs'd on the Finger, then is the Hæmorrhage to be ſmall, and *vice verſa*; but when the Rebounding of the Artery, and the firſt Stroke, are of equal Vigour, the Hæmorrhage is to be moderate.

According as the Blood flows, the Rebounding of the Artery ſlackens gradually, until it entirely diſappears ſoon after the Criſis; and this gradual Remiſſion of the Rebounding is the Sign of an immediately preceding Hæmorrhage.

If, after the Hæmorrhage, the rebounding Pulſe ſhould continue, or appear again, it denotes another Criſis of the ſame Kind, according to the above-mention'd Rules.

When the Rebounding of the Artery is more evident in one Wriſt than in the other, the Blood frequently flows in great Abundance from the Noſtrils of the ſame Side, in which the Rebounding is more evident. *Nihill.*

Theſe Obſervations will be of very great Importance in Phyſic, provided Experience confirms the Truth of what is here laid down.

DICTAMNITES, δικταμνίτης οἶνος. A Wine medicated with Dittany, deſcrib'd by *Dioſcorides*, *L.* 5. *C.* 57. It is made by macerating four Drams of Dittany in eight Cotylas of Muſt. It is a good Remedy againſt Nauſeas, and promotes the Lochia and Menſes.

DICTAMNUS. Dittany. The Characters are,

The Flower-cup conſiſts of two Leaves; after that, another athwart the former; and again, a third in like manner, until a ſcaly Head be thence form'd: Out of the Centre of all theſe Scales grows a Flower, whoſe Creſt is erect, roundiſh, and bifid: The Beard is divided into three Parts; two Floſcules, one on each Side, come forth from leafy Scales, together with Whorles, collected into a long looſe Spike.

Boerhaave mentions two Species of this Plant; which are,

1. Dictamnus; Creticus. *Offic. C. B. P.* 222. *Park. Theat.* 27. *Raii Hiſt.* 1. 537. *Hiſt. Oxon.* 3. 357. *Boerh. Ind. A.* 178. *Rupp. Flor. Jen.* 191. *Dictamnus Creticus ſive vera*, J. B. 3. 253. *Dictamnus vel Dictamnum*, Chab. 420. *Dictamnum Creticum*, Ger. 651. Emac. 795. *Origanum Creticum latifolium, tomentoſum, ſeu Dictamnus Creticus*, Elem. Bot. 167. Tourn. Inſt. 199. DITTANY OF CRETE, OR CANDY. *Dale.*

The true Dittany of *Crete* is a Plant which riſes not to any great Height, having a woody fibrous Root, from which ſpring ſeveral ſquare hairy Stalks, which have two round Leaves at a Joint, cover'd over pretty thick with a white Down or Cotton: On the Top of the Stalks grow long ſcaly Heads, of a greeniſh purple Colour; among which come forth ſmall labiated purple Flowers, like thoſe of Origanum. The Leaves have an agreeable aromatic Smell. This Plant grows chiefly in the Iſland of *Crete*, or *Candy*, flowering in *June*. The Leaves only are uſed. There is a good Quantity of it put into Venice Treacle, Mithridate, and Diaſcordium. *Miller's Bot. Off.*

Geoffroy informs us, that this Leaf has always been look'd upon as an excellent Vulnerary, and powerful Cordial; it is likewiſe an Emmenagogue and Diuretic.

It has all the Virtues of the Garden *Pulegium* (Penyroyal), but in a much greater Degree; for not only when it is drank, but barely applied, or uſed in Suffumigations, it expels the dead Fœtus. They ſay, that in *Crete*, the Goats, when they are wounded with Arrows, expel them by eating this Herb. The Herb, apply'd, draws out Splinters from the Soles of the Feet, or any other Parts of the Body. It is effectual againſt Pains of the Spleen, by diminiſhing that Part. The Root is heating in the Mouth, and accelerates the Birth; and the Juice, drank in Wine, relieves thoſe who are bit by venomous Animals, which are driven away by the very Smell of the Herb, and killed by its Touch. The Juice inſtil'd into Wounds inflicted by Weapons, or venomous Bites, and drank at the ſame time, is a preſent Remedy. Thus far *Dioſcoridis.*

Hippocrates, as *Galen* informs us, reckon'd Dittany as one of the beſt Medicines that he knew for expelling the Secundines, and, if drank in Wine, for a falſe Conception. It provokes the Menſes, as *Pliny* ſays, and expels the dead Fœtus, even though it lies acroſs in the Uterus; and is not only effectual in Potions, but in Ointments and Suffumigations; and ſo great is its Virtue in ſuch Caſes, that pregnant Women are not to admit it into their Chambers.

Thadæus Dunus, as *J. Bauhine* relates, being call'd to a Woman in Labour of a dead Fœtus, and given over by all, after trying other Medicines, exhibited to her, as ſhe ſat in a Bath, half a Scruple of the Powder of the Leaves of *Cretan* Dittany in Spring-water; which done, he began, as he ſaid, to entertain Hopes of Succeſs; for all Things ſeem'd to tend to the Bottom of the Belly. She paſſed that Night in a tolerable Condition, though without Sleep, and, before Day-break, was happily deliver'd of her Burden. Dittany has, moreover, this Advantage, that it is eaſy to be taken; whereas other Things, which are expulſive of a dead Fœtus, are either too bitter, or fetid, or too acrimonious, or unfriendly to the Stomach, and may poſſibly do Miſchief. *Raii Hiſt. Plant.*

2. Dictamnus; montis Sipyli; Origani foliis, *Flor.* 2. 79. *Origanum montis Sipyli.* H. L. 463. Ic. & Deſcr. *Origanum, ſpicatum, montis Sipyli, foliis glabris.* Whel. Raii Hiſt. 340. DITTANY FROM MOUNT SIPYLUS, WITH WILD MARJORAM-LEAVES. *Boerh. Ind. alt. Plant. Vol.* 1.

DICTYOIDES, δικτυοειδὴς, from δίκτυον, a Net. A Name for the *Rete Mirabile.* See CAPUT.

DIDYME, δίδυμη. A Name for the Root of the Orchis. *Galen, Exeg.*

DIDYMÆA, δίδυμαία. The Name of a Malagma, or Cataplaſm, in *Galen, de Comp. M.* 1. *Loc. L.* 10. *C.* 2.

DIDYMI, δίδυμοι, properly Twins. But the Teſticles are call'd by this Name; as alſo the ſmall Eminences in the Brain, call'd *Teſtes.*

DIECBOLION, διεκβόλιον. The ſame as ECBOLION, a Medicine cauſing Abortion.

DIELECTRON, δι' ἠλέκτρου. The Name of a Troche in *Marcellus Empiricus*, *C.* 16. ſo call'd from Amber, (ἤλεκτρον) a principal Ingredient.

DIEMEÆ. A Term coin'd by *Paracelſus.* It imports a kind of Spirit, which, he ſays, reſides in Stones.

DIENEZ. The ſame as Diemeæ. *Rulandus.*

DIERVILLA. The Name of a Plant ſo call'd by *Tournefort*, from Mr. *Dierville*, a Surgeon, who brought it from *Acadia.* We have no *Engliſh* Name for this Plant.

The Characters are,

It hath a Flower, conſiſting of one Leaf, which is tubulous, and divided into five Parts. The Ovary, which crowns the Pointal, is produc'd from the Centre of the two-leav'd Calyx; and, after the Flower is paſs'd, it becomes a pyramidal Fruit, divided into four Cells, which are fill'd with ſmall Seeds. *Miller's Dictionary, Vol.* 2.

Boerhaave mentions but one Species of this Plant, which is, the Diervilla; Acadienſis; fruticoſa; flore luteo. *T. Ac. Reg. Sc.* 706. *T.* 7. *F.* 1. *H.* SHRUBBY DIERVILLA OF ACADIA, WITH A YELLOW FLOWER. *Boerh. Ind. alt. Plant. Vol.* 1.

I find no medicinal Virtues aſcrib'd to this Plant.

DIESIS, δίεσις, from δίημι, to tranſmit. Tranſmiſſion, or Diviſion. It alſo imports Humectation, or Irrigation; and is then derived from δίημι, to moiſten.

DIEXODOS, διέξοδος, from διὰ, and ἔξοδος, a Way by which any thing paſſes. In *Hippocrates*, it ſignifies the Deſcent or Paſſage of the Excrement by the Anus.

DIFFLATIO. Tranſpiration.

DIGASTRICUS *Muſculus*, from δὶς, importing double, and γαστὴρ, a Belly. A Muſcle of the lower Jaw, deſcrib'd under the Article CAPUT.

DIGESTIO. Digeſtion, in Surgery, is the diſpoſing an Ulcer or Wound to ſuppurate, or diſcharge good Pus, by the Application of proper Medicines.

In Chymiſtry, it imports the expoſing a Body to a ſmall Degree of Heat for a conſiderable time, in order to open it, and diſpoſe its finer Parts to ſeparate from the reſt. Thus, in extracting Tinctures, the Body from whence the Tincture is to be drawn, is ſet, together with the Menſtruum, in a gentle Heat.

DIGESTIVUM. A Digeſtive, or Medicine apply'd to Wounds, in order to promote a good Suppuration, or Formation of Matter. Turpentine, with the Yolk of an Egg, Oleum Hyperici, Linimentum Arcæi, and Baſilicon, are generally uſed with this View.

DIGITALIS.

The Characters are,

The Leaves are produc'd alternately on the Branches. The Cup of the Flower conſiſts of one Leaf, which is divided into ſix ample long Segments: The Flower conſiſts of one Leaf, is tuberoſe and compreſs'd, and a little reflex'd at the Brim: The Flowers are diſpoſed in a long Spike, and always grow upon

upon one Side of the Stalk: The Ovary of the Flower becomes a roundiſh Fruit, which ends in a Point, and opens in the Middle; has two Cells, in which are contain'd many ſmall Seeds.

Boerhaave mentions eleven Species of this Plant; which are,

1. Digitalis; purpurea; folio aſpero. *C. B. Pin.* 243. *Boerh. Ind. A.* 228. *Hiſt. Oxon.* 2. 478. *Digitalis.* Offic. Chab. 267. Rivin. Irr. Mon. 104. Dill. Cat. Giſſ. 145. *Digitalis purpurea.* Ger. 647. Emac. 790. J. B. 2. 812. Raii Hiſt. 1. 767. Synop. 3. 283. Merc. Bot. 1. 32. Phyt. Brit. 35. Mer. Pin. 33. Rupp. Flor. Jen. 199. Tourn. Inſt. 165. Elem. Bot. 134. *Digitalis purpurea vulgaris.* Park. Theat. 653. FOX-GLOVE. *Dale.*

Fox-glove has its lower Leaves long, large, and ſharp-pointed, ſomewhat rough, hairy, and indented about the Edges; the Stalks ariſe to be two or three Foot high, with ſeveral ſmaller Leaves growing on them. The Flowers are ſet in a long Spike, all on one Side of the Stalk; they are large and hollow, in Shape like a Thimble, of a reddiſh Colour, having the under Lip full of white Spots: Theſe are ſucceeded by round oval Seed-veſſels, divided into two Cells, full of ſmall dark-brown Seed. The Root is long and large, of a brown Colour, and full of Fibres: It grows in Hedges and Lanes, and flowers in *June* and *July*.

This Plant is rarely uſed inwardly, being ſtrongly emetic, and working with Violence upwards and downwards: Though *Parkinſon* extols a Decoction of it in Ale, with Polypody-roots, as an approv'd Medicine for the Falling Sickneſs. The Ointment made of the Flowers and *May* Butter is very much commended by the late Dr. *Hulſe* for ſcrophulous Ulcers, which run much, and are full of Matter, dreſſing them with the Ointment, and purging two or three times a Week with convenient Purges. Officinal Preparations are only the *Unguentum Digitalis. Miller's Bot. Off.*

This Plant is eſteem'd a Vulnerary. *Geſner* relates, that in *Bolonia* they call it *Aralda*, and have a Proverb, *Aralda chi tutte piage ſalda. Parkinſon* bruiſed it, and applied it with Succeſs to ſcrophulous Tumors. The Ointment of Fox-glove is very reſolvent. *Lobel* ſays, the Decoction of it purges powerfully, both upwards and downwards. *Martyn's Tournefort.*

The UNGUENTUM DIGITALIS; or, *Ointment of* FOX-GLOVE.

Take of the whole Plant of Fox-glove any Quantity, and boil it in a ſufficient Quantity of freſh Butter; which preſs out, and boil again with more of the Plant, as before; which repeat a third time, and make into an Ointment.

2. Digitalis; rubella; folio aſpero. *b.*

3. Digitalis; alba; folio aſpero. *C. B. P.* 244. *M. H.* 2. 478.

4. Digitalis; Hiſpanica; purpurea; minor. *T.* 165.

5. Digitalis; latifolia; flore ferrugineo. *M. H.* 2. 478. *H. R. Par.* BROAD-LEAV'D FOX-GLOVE, WITH AN IRON-COLOUR'D FLOWER.

6. Digitalis; lutea; magno flore. *C. B. P.* 244. *M. H.* 2. 479. FOX-GLOVE WITH A LARGE YELLOW FLOWER.

7. Digitalis; lutea; minore flore. *M. H.* 2. 479.

8. Digitalis; Orientalis; folio tragopogi; flore albido. *T. Cor.* 9. EASTERN FOX-GLOVE, WITH A GOAT'S-BEARD-LEAF, AND A WHITISH FLOWER.

9. Digitalis; Canarienſis; Acanthoïdes; fruteſcens; flore aureo. *H. A.* 2. 105. *H. R. D.* SHRUBBY FOX-GLOVE, WITH A GOLD-COLOUR'D FLOWER.

10. Digitalis; anguſtifolia; flore ferrugineo. *C. B. P.* 244. *M. H.* 2. 478. NARROW-LEAV'D FOX-GLOVE, WITH AN IRON-COLOUR'D FLOWER.

11. Digitalis; minima; Gratiola dicta. *Hiſt. Oxon.* 2. 479. *Boerh. Ind. A.* 229. *Tourn. Inſt.* 165. *Elem. Bot.* 135. *Gratiola.* Offic. Ger. 466. Emac. 581. Raii Hiſt. 2. 1885. Rivin. Irr. M. 126. Rupp. Flor. Jen. 200. J. B. 3. 434. *Gratiola, Gratia Dei,* Chab. 475. Buxb. 149. *Gratiola vulgaris,* Park. Theat. 220. *Gratiola, Centaurioides,* C. B. Pin. 279. HEDGE-HYSSOP. *Dale.*

Hedge-hyſſop is but a ſmall Plant, having ſlender creeping Roots, from which ſpring ſeveral ſquare Stalks ſcarce a Foot high, with two long, narrow, ſharp-pointed Leaves, like common Hyſſop, ſet at every Joint; among which come forth the Flowers, on ſhort Foot-ſtalks, one at a Joint, being ſmall, long, and hollow, not much unlike the Flowers of Fox-glove in Shape, divided at the End into four Segments, of a pale-yellow Colour; and are ſucceeded by oblong Seed-veſſels, divided into two Partitions, full of very ſmall Seed. It grows on the *Alps*, and other mountainous Countries; and flowers in *July*.

This is a Plant but rarely uſed in *England*, though it is commended by ſome Writers as a good Purger of ſerous and choleric Humours, and ſerviceable againſt the Dropſy and Jaundice; but it is of a rugged churliſh Nature. *Miller's Bot. Off.*

The *Gratiola*, being analyſed, yields no volatile Salt; but a great deal of Acid, Oil, and Earth: *Pena* and *Lobel* affirm, it purges ſtrongly both upwards and downwards; for which Reaſon it is preſcrib'd to thoſe that have the Dropſy, Cachexy, Tertian or Quartan Ague, or are ſubject to the Gout and Sciatica. *Camerarius* ſays, that its Extract ſhould be mixed with Powder of Cinnamon in the Dropſy; and that the Juice of Calamint ſhould be added to it for Intermitting Fevers. One Dram of the *Gratiola* is given in Subſtance, and the like Quantity of the Infuſion in White-wine. They infuſe half a Handful of its Leaves, and two Ounces of Manna, in a Gallon of Water: Let it give one Boil, and ſtrain the Infuſion through a Cloth, and give it to drink warm. *Martyn's Tournefort.*

In the *Hiſtoria Plantarum*, publiſh'd under the Name of *Boerhaave*, it is ſaid, that the firſt, ſecond, third, and fourth Species, are ſo extremely poiſonous, and are poſſeſs'd of ſuch a Degree of Acrimony, that they exulcerate the Mouth, Fauces, Œſophagus, and Stomach; and that ſome, by eating accidentally the Fruit, have contracted Vomitings, and Dyſenteries, which were very difficult to cure.

DIGITELLUS. A Name for ſeveral Funguſes, none of which have any medicinal Virtues attributed to them, that I know of. Dr. *Martyn*, in his Tranſlation of *Tournefort's* Hiſtory of Plants which grow about *Paris*, ſpecifies the following:

1. *Digitellus clavatus croceus. Clavaria militaris, Crocea.* Vaill. 39.

2. *Digitellus clavatus albus. Clavaria alba, Piſtilli forma.* Vaill. 39.

3. *Digitellus clavatus, Ophioglоſſoides, niger. Clavaria ophioglоſſoides, nigra.* Vaill. 39.

This grows on graſs Ant-hills, in a Cloſe next *Hamplewood*; and at *Comb-Park*, in the Way to *Kingſton*. *Mer. Pin.*

4. *Digitellus coralliformis, luteus, minus rameſus. Coralloides flava.* Inſt. 564. *Fungus rameſus flavus.* J. B. 3. 837. This has been found on *Marlborough* Downs in great Plenty, by Mr. *Wilmer*, Apothecary of *London*. I have ſeen it on the *Hill of Health*, and many other Places about *Cambridge*.

5. *Digitellus coralliformis, albidus, minus rameſus. Coralloides albida.* Inſt. 564. *Fungus rameſus, albidus.* J. B. 3. 837.

This differs from the preceding only in Colour.

6. *Digitellus coralliformis, candidiſſimus minus rameſus. Corallo-fungus candidiſſimus.* Vaill. 41.

7. *Digitellus coralliformis dilute purpuraſcens. Coralloides dilute purpuraſcens.* Inſt. 564. XIX. *generis, eſculentorum fungorum, 2 Species.* Cluſ. Hiſt. 275.

8. *Digitellus major nigricans. Hypoxylon excrementum ligni putridi fungoſum, digitatum.* March. Brand. Mentz. Pug. Tab. 6. On rotten Wood, in many Places.

9. *Digitellus rameſus, niger, ſummitatibus pulvere albido obductis. Corallo-fungus digitatus, niger, apicibus albidis.* Vaill. 41. This was found on a rotten Tree in *Moor Barns Thicket*, by Mr. *Halſbyde*, Apothecary of *Cambridge*.

10. *Digitellus croceus, Ornithopodioides. Corallo-fungus croceus, Ornithopodioides.* Vaill. 41.

11. *Digitellus niger, compreſſus, varie divaricatus & implexus inter lignum & corticem. Corallo-fungus niger, compreſſus,* &c. Vaill. 41. This was found in *St. James's Park* by Dr. *Doody*.

DIGITUS. A Finger.

For the Anatomy of the Fingers, ſee BRACHIUM.

For an Account of Fractures of the Fingers, ſee FRACTURA.

For Luxations of the Fingers, ſee LUXATIO.

The Separation of FINGERS *which grow together.*

It ſometimes happens, that the Toes and Fingers of new-born Children are found to be grown together: And this may happen two different Ways; for they may be very cloſely join'd and glued, as it were, together; or they may cohere by an intermediate Coat, like the Feet of a Gooſe. Sometimes the Fingers, both in young and grown Perſons, will grow together, when, after being burnt or exulcerated, they are not treated carefully; and, particularly, if they are bound up without proper Caution.

As a Coheſion of the Fingers not only diſfigures the Hand, but induces a great many Inconveniences, Surgeons ought to make it their Buſineſs to ſeparate them with the greateſt Dexterity: And this may be done two Ways, either by cutting away the intermediate Tunic, by the Help of a Pair of Sciſſars or Knife; or, if they cloſely cohere, without any inter-

mediate Coat, they are to be accurately ſeparated from each other by a ſmall Knife. But, leſt they ſhould grow together again during the Cure, they muſt be bound up with a narrow Roller about a Finger's Breadth, impregnated with Lime-water, Spirit of Wine, or ſome vulnerary Water; and each Finger muſt be ſeparately bound up, till all of them are perfectly heal'd. I have obſerved, frequently, ſome Fingers, after Burning, a Wound, or ſome ſuch Injury, adhere ſo cloſely to the Palm of the Hand, that they could not be extended, nor the Hand opened. But that young Surgeons may not be ignorant of what they ought to do in ſuch a Caſe, I ſhall, in a few Words, deſcribe the Method I uſed in curing three Patients. I carefully ſeparated, with a Knife, thoſe Fingers from the Hand, without doing the leaſt Injury to the Tendons; and after applying Lint, Compreſſes, and vulnerary Balſam, together with a Piece of Paſtboard, I ſo treated all the Wounds, as to preſerve the Fingers always extended, till they were perfectly conglutinated. At each Dreſſing, the Fingers are to be moved for ſome time, in order to prevent their becoming rigid. *Heiſt. Chirurg.*

DIGLOSSON, *Δίγλωσσον*, from *Δὶς*, importing double, and *γλῶσσα*, a Tongue, a Name for the *Laurus Alexandrina*, ſo call'd, becauſe above its Leaf there grows another leſſer Leaf, reſembling a Tongue. *Blancard.*

DIGNOTIO. The ſame as DIAGNOSIS, which ſee.

DIHÆMATON, *Διὰ τῶν αἱμάτων*, from *αἷμα*, Blood; the Name of an Antidote againſt Poiſons, deſcrib'd by *Galen*, *Lib. 2. de Antid. Cap.* 8. and *Ægineta*, *Lib. 7. Cap.* 11. It is ſo call'd, becauſe the Bloods of divers Animals enter its Compoſition.

DIHALON, *Διὰ ἁλῶν*, from *ἅλς*, Salt, the Name of a Plaiſter prepared chiefly of common Salt and Nitre, and adapted to foul Ulcers: It is deſcribed by *Ægineta*, *Lib. 7. Cap.* 17.

DIHIDROS, *Δίιδρος*, from *ἱδρώς*, Sweat, is expounded in *Galen's Exegeſis*, moiſt and ſweating.

DIIPETES, *Δίιπετὴς*, in *Hippocrates*, *Lib.* 1. *περὶ γυναικ.* is applied to *γόνος*, *Semen*, and imports a ſudden or immediate Defluxion.

DIKALEGI, DICALEGI, DITALEM. Tin. *Rulandus.*

DILATATIO, *ἐυρυσμὸς*, *ἀνευρυσμὸς*, *διευρυσμὸς*, a Dilatation, is an Affection of the Veſſels of the human Body, when they have their Dimenſions enlarged; and, in this Senſe, is oppoſed to *Conſtrictio*, a Conſtriction. Sometimes it means the ſame as DIASTOLE, which ſee.

DILATATORES *Alarum Naſi*, are Muſcles which dilate the Alæ of the Noſe; for a Deſcription of which ſee CAPUT.

DILATATORIUM, a chirurgical Inſtrument for dilating the Mouth. *Caſtellus.*

DILUENTIA, Diluents, are ſuch Things as cauſe or increaſe a Fluidity in Subſtances. *Blancard.*

DILUTUM, diluted, is ſpoken of what has paſſed under the Action of Diluents; but *Dilutum*, taken ſubſtantively, is a Liquid in which any thing has been for ſome time macerated and infuſed; and ſo is the ſame as *Infuſio*. *Blancard.*

DILYTÆA, *Διλυταία*, in *Myrepſus*, *Sect.* 3. *Cap.* 12. is, as *Fuchſius* ſays, the Fat of ſome Animal unknown.

DINICA, from *Δινέω*, to turn round, are Medicines againſt a Vertigo. *Blancard.*

DINOS, *Δῖνος*. The Vertigo. See VERTIGO.

DIOBOLON, *Διώβολον*, the Weight of two Oboli, or one Scruple: It is alſo call'd *Gramma*. *Caſtellus.*

DIOCRES, the Name of a Paſtil in *Myrepſus*, *Cap.* 49. *Sect.* 41.

DIODOS, *Δίοδος*. The ſame as DIEXODOS, which ſee.

DIOENANTHES, *Διὰ οἰνάνθης*, the Name of an Epithem againſt the *Cholera Morbus*, in *Trallian*, *Lib.* 7. *Cap.* 44.

DIOLOS *Artos*, *Δίωλος ἄρτος*, in *Hippocrates*, *Lib. περὶ τῶν ἐνλὸς παθῶν*, ſignifies new Bread.

DIOMEDEA AVIS, the Heron, or Hern, ſo call'd from *Diomedes*, whoſe Companions, as the Fable ſays, were converted into Herns. See ARDEA.

DION, *Δῖον*, the Name of a Month in which the autumnal Equinox happen'd: It was only in Uſe among the *Macedonians*. *Gal. Com.* 1. *in* 1. *Epid.*

DIONCOSIS, *Διόγκωσις*, (from *ὄγκος*, a Tumor) Tumefaction, Ampliation, is a Word in Uſe among the Methodics, by which they intend to ſignify a Diſtention of the Body by a Coacervation of excrementitious Parts, or from a Diffuſion of the Humours. *Galen*, *de optima Secta.*

DIONIS COLLYRIUM, the Name of a Collyrium in *Oribaſ. Synopſ. Lib.* 3. from its Author *Dion.*

DIONYSIA, *Διονυσία*, the Name of a Plaiſter for Abſceſſes, invented by *Hera* the *Cappadocian*, and the ſame as *Dionyſianum Emplaſtrum*; the Preparation of which ſee under ABSCESSUS.

DIONYSIANUM EMPLASTRUM. See the preceding Word.

DIONYSISCI, *Διονυσίσκοι*, certain bony Eminences near the Temples; they are alſo call'd *κέρατα*, Horns, from *Διόνυσος*, *Bacchus*, whom the Poets deſcribe with Horns. *Caſtellus.*

DIONYSIUS, *Διονύσιος*, an eminent antient Surgeon, whoſe Plaiſters and Collyria are deſcrib'd in *Celſus*, *Lib.* 6. *Cap.* 6. It is alſo a Name for *Lepidium*, Dittander. *Caſtellus.*

DIONYSOS, *Δίονυσος*, the Name of a Collyrium in *Aetius*, *Tetrab.* 2. *Serm.* 3. which may be reckon'd among the *Diaſmyrna* and *Chiaca*; for it contains Myrrh, and is levigated in *Chian* Wine. *Ægineta* has much the ſame Compoſition under the Titles of *Collyrium Malabathrinum*, and *Iſotheon.*

DIOPORON, the Name of a Medicine for the Quinſey, in *Cælius Aurelianus*, *Acut. Morb. Lib.* 3. *Cap.* 3. which, as *C. Amman.* obſerves, is, perhaps, the ſame with the *Oporice*, deſcrib'd by *Pliny*, *Hiſt. Nat. Lib.* 23. *Cap.* 14. It is derived from *ὀπώρα*, autumnal Fruit.

DIOPSYRUS. A Name for the *Meſpilus*; *folio rotundiore*; *fructu nigro*, *ſubdulci.*

DIOPTRA, *Διόπτρα*, from *Διόπτομαι*, to ſee through. The Name of an Inſtrument for dilating the natural Cavities, in order to examine their State. Thus a *Speculum Uteri*, or a *Speculum Ani*, may be call'd a *Dioptra.*

DIOPTRON, *Διόπτρον*. A Name for the *Lapis Specularis*, Muſcovy Glaſs.

DIOPTRISMOS, *Διοπτρισμὸς*. The Operation which conſiſts in dilating the natural Paſſages with a *Dioptra*, or *Speculum.*

DIOROBON, *Δι' ὀρόβων*. A Medicine deſcrib'd by *Trallian*, *L.* 5. *C.* 4. in which Vetches (*ὄροβοι*) are an Ingredient.

DIORRHOSIS, *Διόρρωσις*, or *Dioreſis*, *Δίρησις*, from *ὄρος*, or *ὀρρὸς*, Serum. A Converſion of the Humours into Serum and Water. *Hippocrates.*

DIORTHOSIS, *Διόρθωσις*, from *ὀρθὸς*, right. A Rectification or Reſtitution of a fractur'd Limb into its natural Situation.

DIOSANTHOS. A Name for the *Caryophyllus*; *tenuifolius*; *plumarius*; *flore pleno*, *purpuraſcente.*

It is a kind of ſingle wild Pink, with ſmall Leaves finely jagged, like Fringe or Feathers, of a white or carnation Colour.

The Flowers are cephalic, reſiſt Poiſon, are good for the Stone and Epilepſy. *Lemery des Drogues.*

DIOSCOREA. A Plant ſo called by Father *Plumier*, in Honour of *Dioſcorides*. We have no *Engliſh* Name for it. The Characters are as follows; It has a ſpreading Bell-ſhap'd Flower, conſiſting of one Leaf, which is divided at the Extremity into ſeveral Parts; from whoſe Cup ariſes the Pointal, which afterwards becomes a triangular Fruit, divided into three Cells, in which are contained orbicular bordered Seeds.

The Species are,

1. *Dieſcorea ſcandens*, *Foliis Tamni*, *Fructu racemoſo.* Plum. Nov. Gen. CLIMBING DIOSCOREA, WITH BLACK BRIONY-LEAVES, AND THE FRUIT GROWING IN CLUSTERS.

2. *Dioſcorea ſcandens*, *Folio haſtato*, *Fructu racemoſo.* Houſt. CLIMBING DIOSCOREA, WITH A SPEAR-SHAP'D LEAF, AND CLUSTER'D FRUIT.

3. *Dioſcorea ſcandens*, *Folio ſubrotundo acuminato*, *Fructu racemoſo.* Houſt. CLIMBING DIOSCOREA, WITH A ROUNDISH LEAF, ENDING IN A POINT; AND CLUSTER'D FRUIT. *Miller's Dictionary.*

I find no Virtues aſcrib'd to this Plant.

DIOSCURI, *Δίοσκοροι*. A Name in *Caſſius*, *Prob.* 30. and the Author of the *Definitiones Medicæ*, for the *Parotides*; given them, as *Caſſius* ſuppoſes, on account of their being a happy Prognoſtic of Recovery from an acute Diſeaſe; as the Appearance of the *Dioſcuri*, or *Caſtor* and *Pollux*, two Lights ſo call'd, were to Mariners a welcome Sign of the Abatement of a Tempeſt. The Word is compounded of *Διὸς*, the Genitive Caſe of *Ζεύς*, *Jupiter*, and *κοῦροι*, for *κόροι*, Sons, that is, Sons of *Jupiter*.

DIOSPHYRON, *Διόσφυρον*, otherwiſe *Διόσπυρον*, in *Theophraſt. Hiſt. Plant. Lib.* 3. *Cap.* 13. is a Sort of Fruit like a Cherry; but reckon'd by *Galen*, *de Alim. Fac. Lib.* 2. *Cap.* 38. among the Aliments of ſmall Nouriſhment, and bad Juice. *Caſtellus.*

DIOSPOLITICON, *Διοσπολιτικὸν*, a compound carminative Medicine, of which we have two Deſcriptions in *Galen*, *de Sanit. tuenda*, *Lib.* 4. *Cap.* 5. And *P. Ægineta*, *L.* 7. *Cap.* 11. reckons it among Antidotes, by the Name of *Dioſpolites*, *Διοσπολίτης.*

DIOTA. A wooden Veſſel or Cup, incruſted with Reſin, Cinnamon, Cloves, and Ginger, in Uſe among the Inhabitants of *Lower Germany*, and other Northern Countries, with an Intent to give a greater Savour to their Beer. *Rhodius ad Scribonium Largium*, *Numb.* 135.

DIOXELÆUM. The Name of a Malagma, mentioned by *Cælius Aurelianus*, *Chron. L.* 5. *C.* 2. as a proper Application at the latter End of the Gout; and deſcrib'd by *Aetius*. It is thus call'd from the Oil and Vinegar in its Compoſition.

DIOXUS. The Name of a Collyrium in *Marcellus Empiricus*, *C.* 8. thus call'd from Vinegar, with which the dry Ingredients in it are reduced to the proper Form.

DIPCADI. A Name for the *Muſcari*, *obſoletiore flore, ex purpura virente.*

DIPHROS, *Δίφρος*. A Seat or Chair. *Hippocrates* mentions a Chair, the Seat of which was to be made of twiſted Ruſhes, for the Convenience of introducing a Pipe through it, into the Vagina of a Woman, ſeated upon it; and through that a Vapour, by way of Fomentation, or Suffumigation.

Moſchion, in his Treatiſe on the Diſeaſes of Women, *C.* 46. 47. deſcribes a Chair convenient for Women in Labour; and *Deventer*, in his Treatiſe on Midwifry, does the ſame.

DIPHRYGES, Offic. Aldrov. Muſ. Metall. 14. Worm. Muſ. 133. Charlt. Foſſ. 55. Schrod. 3. 359. Schw. 376. Matth. Ed. 1366. *Diophryges*, Calc. Muſc. 461. SCURF. *Dale.*

There are ſuppoſed to be three Species of *Diphryges*; one metallic, which is produced only in *Cyprus*, where it is taken up from the Bottom of a certain deep Pool or Gulph, mix'd with Clay and Dirt; then dry'd in the Sun, and afterwards cover'd with dry Sticks, and burnt. Hence it is call'd *Diphryges*, [*διφρυγὲς*, from *δὶς*, twice, and *φρύγω*, to torrefy] becauſe it is burnt, dry'd, and, as it were, torrefy'd by the Sun, and the dry ſmall Wood. Another Species of *Diphryges* is a ſort of Sediment, or Droſs, which is ſeparated in the Working of Copper; for, after the Affuſion of cold Water, in the ſame manner as was directed for the Flos Æris, [See the Article Æs] there will be found, after taking out the Copper, this Kind of *Diphryges*, adhering to the Bottom of the Furnace, and much reſembling the Copper, both in Taſte and Aſtringency. The third Species is made in the following manner: They take the Stone Pyrites, and calcine it for ſeveral Days together in a Furnace, till it acquires the Colour of Vermilion; which done, they take it out, and lay it aſide. Some affirm this Species to be produced only of the Matter which perfects the Copper-ſtone, when this Matter, being torrefy'd in what they call the *Area*, is thence removed into Pits, and there burnt; for it lies all round the Pits, and is found as well after as before the Removal of the Stones. The beſt *Diphryges* is what taſtes of Copper, is æruginous, aſtringent, and vehemently drying upon the Tongue; Qualities, of which burnt Oker, though ſold for *Diphryges*, is deſtitute.

It is an Aſtringent, a potent Cleanſer, Abſterſive, and Drier; repreſſes Excreſcences of Fleſh; induces malignant and ſpreading Ulcers to cicatrize; and, mix'd with Turpentine or Cerate, diſcuſſes an Abſceſs. *Dioſcorides*, *Lib.* 5. *Cap.* 120.

It is a ſort of metallic Recrement, which ſubſides by an Affuſion of cold Water on the melted Copper in the Furnace. At preſent the Shops are unacquainted with it.

It is of a mixed Quality, containing in itſelf ſomething moderately aſtringent, and moderately acrimonious; for which Reaſons it is a very good Remedy for all ſtubborn Ulcers. *Dale.*

DIPHTHERA, *Διφθέρα*. An entire Goat-ſkin. The ſame as Isale, or Ixale.

DIPLANGIUM. The ſame as Diploma, which ſee.

DIPLOE, *Διπλόη*. The ſoft Meditullium, which lies betwixt the two Laminæ of the Bones of the Cranium.

DIPLOMA, *Δίπλωμα*. A double Veſſel. To boil *in Diplomate*, is to ſet one Veſſel, containing the Ingredients intended to be acted upon, in another larger Veſſel full of Water; and to this laſt Veſſel the Fire is to be apply'd.

DIPNOOS, *Δίπνοος*, from *δὶς*, importing double, and *πνέω*, to breathe. An Epithet of Wounds, which penetrate into ſome Cavity, or quite through a Part; or have two *Spiracula*, or Orifices.

DIPSA, *Δίψα*. Thirſt.

DIPSACOS, *Δίψακος*, from *Δίψα*, Thirſt. A Name for the Diabetes. But, in Botany,

DIPSACUS is the Teaſel.

The Characters are,

The Root lives two Years; the Leaves are conjugated and prickly on the lower Part of the Rib. The End of the Pedicle is expanded into many long and narrow Leaves, ending in a Prickle, and, like a Calyx, ſurrounding a conic, long, and obtuſe Head. This Head conſiſts of a long, obtuſe, conoidal Axis; round which grow rigid, ſhort, excavated, and aculeated ſmall Leaves, furniſh'd with a ſerrated Apex, and ſerving as a Calyx to the Floſcules. From the loweſt hollow Part of this ſmall Leaf, ariſes a long tetragonal Ovary, whoſe Apex is furniſhed with a foliaceous quadrangular Crown, and terminated with a fungous orbicular Placenta; from whoſe Centre proceeds a long Tube, furniſh'd with a large Apex. From the Apex of the Ovary, within its Crown, ariſe a tubulous, quadrangular, quadrifid Floſcule, furniſhed with four Stamina, proceeding from the internal Sides of the Floſcule, and raiſed far above the ſuperior Parts of the Floſcule. All theſe Parts, being affixed very cloſely and denſely to the ſame Axis, conſtitute the Head of the Plant. *Boerhaave*, *Index alter*, *Par.* 1.

Boerhaave mentions four Species of this Plant; which are,

1. Dipſacus; Sylveſtris; aut Virga Paſtoris; major. *C. B.* 385. *Hiſt. Oxon.* 3. 168. *Boerh. Ind. A.* 133. *Tourn. Inſt.* 466. *Dipſacus Sylveſtris ſive Labrum Veneris.* Offic. J. B. 3. 74. Raii Hiſt. 1. 382. Synop. 3. 192. *Dipſacus Sylveſtris*, Ger. 1005. Emac. 1167. Park. 984. *Dipſacus, ſive Carduus Fullonum ſylveſtris*, Chab. 352. *Dipſacus, Labrum Veneris ad agrorum margines*, C. B. 35. Merc. Bot. 1. 32. WILD TEASEL.

The wild Teaſel grows as large and high, or rather higher than the manured, with ſuch a ſtiff-creſted and prickly Stalk, eſpecially in the upper Part: The Stalk is generally ſingle, divided into ſeveral Branches; the lower Leaves are long, narrow, and prickly underneath. The Leaves, which grow on the Stalks, are joined together, encompaſſing the Stalk, and catching the Rain; but it more particularly differs in the Heads, which have their Prickles growing erect, and not crooked or hooked, like the manur'd Teaſel; and each Head having at the Bottom ſeveral prickly ſtiff Radii growing in a Circle about it: The Flowers grow in particular Cells, and are ſucceeded by the Seed. The Root is thick, and full of Fibres. It grows upon Banks in the Borders of Fields, and flowers in *June* and *July*.

The Virtues of both this and the manured Teaſel are much the ſame; the Roots, which are the only Part uſed, being reckon'd to have a cleanſing Faculty: The Antients commend a Decoction of them in Wine, boil'd to a Conſiſtence, and kept in a brazen Veſſel, to be applied to the Rhagades, or Clefts of the Fundament; and for a Fiſtula therein; and to take away Warts. The Water, found ſtanding in the Hollow of the Leaves, is commended as a Collyrium to cool Inflammations of the Eyes, and as a Coſmetic to render the Face fair. *Miller's Bot. Off.*

2. Dipſacus; ſativus, *C. B.* 385. *J. B.* 3. 73. *Ger.* 1005. *Emac.* 1167. *Park.* 983. *Raii Hiſt.* 1. 382. *Synop.* 3. 192. *Hiſt. Oxon.* 3. 168. *Dipſacus, ſativus, Carduus Fullonum*, Offic. *Dipſacus, Carduus Fullonum*, Chab. 352. MANUR'D TEASEL. *Dale.*

The manur'd Teaſel grows to be a large tall Plant, with a ſtiff, hard, furrow'd, very prickly Stalk. The lower Leaves are long, large, and ſharp-pointed, indented about the Edges, ſmooth above, but having the middle Rib, of the under Part, full of ſharp Prickles.

The Leaves, which grow upon the Stalks, wholly encompaſs them, like a Trough, or long Baſon, catching the Dew or Rain which falls, and are likewiſe prickly underneath. The Stalks are divided into ſeveral Branches, bearing on their Tops large Heads, full of crooked prickly Hooks; among which grow ſeveral purpliſh hollow Flowers, each in a particular Cell; and after them come longiſh, ſquare, ſtriated Seed. The Root is pretty large and whitiſh.

It is cultivated in the Fields for the Uſe of the Cloth-workers, to dreſs their Cloths with, flowering in *July*. *Miller's Bot. Off.*

It agrees in Virtues with the *Dipſacus Sylveſtris.*

The *Dipſacus* cures the Scrofula, and, in general, reſiſts all Putrefaction, by a ſpecific Quality, and is a medicinal and ſavoury Aliment. Boil'd in Wine, it purges by Urine as effectually as Aſparagus.

The Root bruiſed, and mixed with Honey, has been found of extraordinary Virtue in Conſumptions that have been regarded in a manner as deſperate. *Raii Hiſt. Plant.*

3. Dipſacus; folio laciniato. *C. B. P.* 385. *J. B.* 3. 75. *M. H.* 3. 168. *b.*

4. Dipſacus; ſylveſtris; capitulo minori; vel Virga Paſtoris; minor. *C. B.* 385. *Hiſt. Oxon.* 3. 168. *Boerh. Ind. A.* 133. *Virga Paſtoris.* Offic. Park. 984. *Virga Paſtoris vulgaris.* J. B. 3. 74. Chab. 352. *Dipſacus minor, ſive Virga Paſtoris.* Ger. Emac. 1168. Merc. Bot. 1. 32. Raii Hiſt. 1. 382. Synop. 3. 192. SHEPHERDS-ROD.

It grows in moiſt and watery Places by the Sides of Hedges, and flowers in *July*. The Parts uſed in Medicine are the Leaves; the Water of which is commended by *P. Ægineta*, for a depraved Appetite in Women; and a Dram of the Powder is preſcribed, *Prax. Mayern.* for a Spitting of Blood. *Dale.*

DIPSAS, *Δίψας*. Dry Earth. But a certain Serpent is call'd by this Name, from the immoderate Thirſt which is cauſed by its Bite. This Animal is by ſome alſo call'd *Cauſis*, and is a Species of Viper, moſt generally found in maritime Places, of about a Cubit in Length, thick, and becoming gradually ſmaller towards the Tail. Its whole Body is variegated with black and fallow Spots, and its Head is ſlender. Beſides the other common Effects generally produced by the Bite of a Viper, thoſe bit by the *Dipſas* are ſeized with a Degree of Thirſt which is abſolutely inſatiable even by the largeſt Quantities of Liquor, whilſt, at the ſame time, no Evacuations are made, either by Urine, Vomit, or Sweat. The Patients, therefore, who have the Misfortune to be bit by this

this Animal, die, either of an exceſſive Thirſt, when they do not drink; or, when they do, their Stomach, by the preternatural Repletion, is diſtended and ruptur'd; or the ſame Accident happens to the Parts about the Region of the Groins, and lower Belly, as in dropſical Patients. For the Relief of Patients of this Kind, the ſame Meaſures are to be taken as in the Bite of the common Viper; only ſuch Medicines as provoke Urine are principally to be uſed. The Body is alſo to be render'd ſoluble by purgative Infuſions; and a Vomiting is to be excited by Oil, and Decoctions proper for that Purpoſe. To the Place where the Wound is immediately inflicted, after the Extraction of the Poiſon, Scarification, the Application of Cupping-glaſſes, and Hens cut open, we are to apply Quick Lime with Oil, attractive Plaiſters, and the Theriaca. *Aetii Tetrabibl. 4. Serm. 1. Cap. 22.*

Celſus, in the twenty-ſeventh Chapter of his fifth Book, informs us, that in Wounds inflicted by the Ceraſtes, the Dipſas, or the Hæmorrhois, the Bulk of an *Egyptian* Bean of dried Aſphodel is to be divided into two Doſes, adding a proper Quantity of Rue to each. Trefoil, alſo, Horſe-mint, and All-heal, [*Panaces*] with Vinegar, are equally beneficial: Coſtus, alſo, Caſſia, and Cinnamon, may be exhibited with Succeſs.

Actuarius, in his ſixth Book *de Methodo Medendi*, informs us, that in thoſe Patients who are bit by the Dipſas, a palpable Tumor appears on the Part; and that they are ſeized with a Thirſt which neither intermits, nor is capable of Alleviation. The Wounds inflicted by the Hæmorrhois, and the Dipſas, are fatal, becauſe Proof againſt the Power and Energy of Medicines. But we are to attempt the Relief of the Patient by the actual Cautery, if the Nature of the Part does not contraindicate its Uſe, or by the Amputation of the Member. Then acrid Cataplaſms are to be applied, and Aliments of the ſame Quality are to be exhibited. The Patient is alſo to drink unmix'd Wine, bathe frequently, and carefully perſiſt in the Uſe of ſuch other Meaſures, as are thought to have a Tendency to promote his Cure.

DIPSETICUS, διψητικός. An Epithet for ſuch Things as cauſe Thirſt.

DIPSODES, διψώδης. Thirſty.

DIPYRENON, δισπύρηνον, from δὶς, importing double, and πυρὴν, properly a Berry, or Kernel, or the End of a Probe, reſembling a Berry. The Name of a Probe, with two Buttons at one End. It is mentioned by *Cœlius Aurelianus*, *Acut. L. 3. C. 3.* and by *Galen.*

DIPYROS, or DIPYRITES, δίπυρος, or διπυρίτης ἄρτος. Bread twice baked, from δὶς, twice, and πῦρ, Fire. *Hippocrates* recommends the Uſe of this Sort of Bread in a Dropſy. *Lib. de Morbis internis.*

DIRADIATIO. The ſame as ACTINOBOLISMUS, which ſee.

DIRCÆA. The Name for the CIRCÆA, Inchanters Nightſhade. *Oribaſius, in Medic. Collect. L. 11.*

DIRECTOR. A hollow Inſtrument to guide the Inciſion-knife, from *dirigo*, to direct. *Directores* is alſo a Name for the Muſcles otherwiſe call'd ERECTORES PENIS.

DISCESSUS. A chymical Term, which the *French* call *Depart*, or *Linquart*. It ſignifies in general any Separation of two Bodies before united; but it is peculiarly applied to the Separation of Gold from Silver by *Aqua-fortis*; where the Silver is diſſolv'd by the Menſtruum, but the Gold remains untouch'd.

DISCOIDES, δισκοειδὴς. An Epithet of the cryſtalline Humour of the Eye, in *Aetius*, *Tetrabib. 2. L. 3. C. 1.* from its round Form, like a Diſk.

DISCRETA *Purgatio*, in *Falloppius*, is that Sort of Purgation which evacuates a certain and determinate Humour.

DISCUS, δίσκος. Truth, like ſome of the moſt precious Stones, is often ſo conceal'd and blended with other Things of a near Reſemblance, that it is hard to diſtinguiſh the one from the other, without the greateſt Care and Diligence. In no Inſtance does this Obſervation hold more remarkably true, than with reſpect to the *Diſcus* of the Antients, and the various Manners in which it was uſed. That it was a Body employ'd in their gymnaſtic Art, for preſerving Health, and ſtrengthening the Conſtitution, is a Circumſtance of which we are ſufficiently certain; but, as to its Form, its Dimenſions, and various Uſes, Authors diſagree ſo much, that we are, in a manner, obliged to put up with Probability, inſtead of Certainty: For ſome inform us, that the Diſcus was a certain round Inſtrument, ſometimes ſo heavy, that one Man was ſcarce capable of lifting it. Sometimes we find, that the Figure of this Inſtrument reſembled that of the Sun, ſince *Alexander Trallian* calls the Body of the Sun δίσκος. The Word *Diſcus* alſo ſignified, among the Antients, a certain Veſſel, in which Diſhes of various Kinds were ſerved up to the Table. *Euſtathius*, in commenting upon theſe Words, Δίσκοισιν τέρποντο, in the eleventh Book of *Homer*'s *Iliad*, tells us, that the *Diſcus* was a heavy Stone, thrown in a particular Manner by thoſe who uſed it; and which, when made of Iron, they call'd σόλος. Others, with whom *Hieronymus Mercurialis* agrees, are of Opinion, that the *Diſcus* was a certain Body, three or four Inches thick, ſomewhat more than a Foot in Length, ſometimes made of Stone, ſometimes of Iron, and ſometimes of Braſs. *Hieronymus Mercurialis*, the beſt Judge of theſe Matters now extant, takes the greater Part of the *Diſci* of the Antients to have been of a plain Figure, reſembling that of a Lentil; that, by the Advantage of this Form, they might be ſecured from breaking, when they fell from conſiderable Heights. Theſe Bodies they threw into the Air; but in a manner quite different from that in which they threw their Darts; in throwing which, they extended the Arm, retracted it to a proper Degree, and then diſcharged the Inſtrument; whereas, in throwing the *Diſcus*, they brought the Arm cloſe to the Trunk of the Body, hung it downwards, and ſomewhat backwards; and thus, with a rotatory kind of Motion, threw it into the Air. That this was the manner in which it was thrown, ſeems pretty obvious from this elegant Line in the twelfth Elegy of the third Book of *Propertius*;

Miſſile nunc diſci pondus in orbe rotat.

That the Figure of the *Diſcus* reſembled a Lentil, is not only probable from *Dioſcorides*, who call'd a Lentil δίσκος, but, in a manner, confirm'd by the Marble Statue of a Thrower of the *Diſcus*, preſerved at *Rome*, in the Houſe of *Johannes Baptiſta Victorius*, ſince, in the Hand of this Statue, there is a *Diſcus* of the ſame Form with a Lentil. The Manner of throwing the *Diſcus* we alſo learn from the Statue of a Thrower of the *Diſcus* belonging to the Great Duke of *Tuſcany*. That there was a certain Art in throwing this Inſtrument, is certain, ſince the unſkilful Throwers were ridiculed, and frequently hurt ſome of the Spectators, in conſequence of their Want of due Dexterity. The Intentions of this Exerciſe were various: For it was uſed with a View to render Soldiers, in the Times of Peace, hardy and robuſt: Thus *Homer*, in the eleventh Book of his *Iliad*, ſuppoſes *Achilles*, when angry with *Agamemnon*, to have drawn off his *Myrmidons* from fighting, and exerciſed them on the Sea-ſhore in throwing the *Diſcus* and Darts, in order to prevent that effeminate Turn, which a State of Peace palpably generates in the Minds of Men. All Authors have alſo agreed, that the *Diſcus* was an Exerciſe uſed by the Wreſtlers in their Conteſts, either for Glory, or the Entertainment of the Public. *Galen*, on the other hand, *Aetius*, *Paulus Ægineta*, and *Avicenna*, enumerate the Throwing of the *Diſcus* among thoſe Exerciſes which were performed for the ſake of Health.

DISCUS, in Botany, is explained under the Article BOTANY.

DISCUSSIO, διαφόρησις. See DIAPHORESIS.

DISCUSSORIA, DISCUTIENTIA, διαφορητικὰ, Diſcutients, are ſuch Medicines as by their Subtilty diſſolve a ſtagnating or coagulated Fluid, and diſſipate the ſame without an external Solution of Continuity.

Doctor *Freind*, in his Hiſtory of Phyſic, whilſt giving an Account of *Aetius*, remarks, that he ſpeaks very ſenſibly of Remedies deſign'd for Diſcuſſing or Suppurating.

"When any Hardneſs," ſays *Aetius*, "begins, and ſome "Senſe of Feeling ſtill remains, emollient Medicines ſhould "be applied, ſuch as, at the ſame time, moderately diſcuſs; "and many there are, which partake of both theſe Qualities: "For violent Diſcutients, which evacuate without ſoftening, "do, indeed, leſſen the Swelling; but leave afterwards an "incurable Evil. For, the thinner Humours being exhaled, "thoſe which are more groſs and terrene ſtay behind, and are "not to be removed by Art: Therefore ſuch Applications "ſhould be uſed, as have a Mixture of both. Firſt, there-"fore, we ſhould try Emollients, then proceed to Diſcu-"tients, and mix them, by degrees, with the other. The "Habit of the Body muſt likewiſe be conſidered, as well as "the Condition of the Swelling. By this means we may "attain to a Knowledge, conjectural indeed, but not entirely "devoid of Art: And, by trying the Experiment two or "three Days, in the manner deſcrib'd, we may eaſily diſcern, "whether we ſhould diminiſh or increaſe the Force of the "Medicine." And, when he comes to mention the Diſtinction between Diſcutients and Suppuratives, he is ſtill more explicit: "Thoſe," ſays he, "who have deſcribed the Virtues "of compound Medicines, have called ſome Plaiſters draw-"ing, and ſome diſcuſſing: There are, too, thoſe which ſhare "both theſe Qualities, which have a great Affinity one with "another: For thoſe that draw, do, at the ſame time, diſ-"cuſs; and thoſe that diſcuſs, draw: And they act either "way with more Energy, according as the predominant "Quality prevails. And therefore, when we reduce them to "the Form of a Plaiſter, we mix with them ſometimes Pitch, "ſometimes Wax, ſometimes Oil, or Roſin, and the like; "ſuch Subſtances not having, in any degree, either a drawing "or a diſcutient Faculty."

And

And yet, when he comes to give us a Detail of theſe Plaiſters, he leaves us in Confuſion and Uncertainty as to the Operation of them; and does not diſtinguiſh enough, which are moſt proper for Diſcuſſion, and which for Suppuration; nay, often the ſame Plaiſter is recommended ſtrongly for both Intentions. What he ſays of ſome diſcuſſing Plaiſters, is very extraordinary, not to ſay extravagant; he has one, which he ſtyles a moſt wonderful Diſcuſſer of Abſceſſes; and that called *Helladicum*, he tells us, diſperſes Abſceſſes, when turned into Pus. But I may, I believe, venture to affirm, that 'tis out of the Power of any Medicine, to work ſuch a miraculous Change in Abſceſſes, which ariſe upon an Inflammation: For as many times no Application will hinder the Formation of Matter in a Tumor, ſo, when it is once made, I conceive it is certain, that no Art can give any Cure, but by letting it out. But as this Subject wants ſome farther Explanation, allow me to enlarge upon it, ſo far, at leaſt, as this Author ſhews me the Way. One would naturally think, that the Practice of outward Applications, which began ſo early, and has continued in all Ages almoſt the ſame, might have been ſettled and adjuſted to an exact Nicety. No Diſtempers have ever oftener occurred, than humeral Tumors: And yet, if we look into the Writers of Surgery, antient as well as modern, tho' they have been very luxuriant in diſtinguiſhing theſe Tumors into their proper Species and Families, we ſhall find this Subject handled with ſo much Perplexity and Confuſion, that the Indications, and the Remedies, will appear to us equally uncertain. To re-examine only the two moſt general Ways already mention'd, in which Tumors are treated, and thoſe very diſtinct from, and contrary to, one another, Diſcuſſion and Suppuration: If our Practice muſt be directed by what we read, we ſhall often find ourſelves at a loſs, which of the Methods ought to be followed; or, if we ſhould chance to find it, what Medicines muſt be applied to make that Method ſucceed; one Author extolling that for the beſt Diſcutient, which is as vehemently recommended by another to promote Suppuration; tho' ſure, if we would make uſe of the Light which Anatomy gives us, into the true Texture of the cutaneous Parts, nothing might be more clearly explain'd, than the Nature and Reaſon of theſe Operations. In order, therefore, to form a right Notion of Diſcuſſion, we muſt firſt of all ſuppoſe, that the ſeveral Fluids which make theſe Tumors, are, as yet, contain'd in their proper Veſſels: But an Obſtruction ariſing in the capillary Arteries, either from a Fault in the Blood, or from external Accidents, the Humours, which ſhould circulate, ſtagnate in the Part affected, and, by a continual Afflux, diſtend the Veſſels ſo much beyond their Dimenſions, as to raiſe a Swelling. Now from the very Account here given, of the Production of a Tumor, 'tis plain what are the proper and genuine Intentions of Diſcuſſion, which are two; that is, to open the Pores ſo, as that the redundant Matter may be, in ſome meaſure, diſcharg'd by Perſpiration; and to attenuate and alter the Humours ſo, (and not only by outward, but by inward Methods) that they may recover their uſual Courſe, thro' the capillary Veſſels: And theſe two Deſigns muſt be carried on jointly, which are the adequate Means to make the Tumor ſubſide and vaniſh: For, if we ſhould only purſue the firſt Intention, that of opening the Pores, the thinner Part of the Matter, as *Aetius* very juſtly obſerves, would fly off, whilſt the Remainder grows ſtiffer, fixes the Obſtruction, and thickens the Membranes. Hence ſo often, upon the Uſe of violent hot Diſcuſſives, which promote too free a Perſpiration, is left an incurable Induration and Scirrhus; in the ſame manner as in ſome Fevers, eſpecially what are called the Slow, too liberal a Uſe of Diaphoretics, without proper Evacuations, renders the Blood more viſcous than it was before, and more liable to Stagnation; which ill-judg'd and prepoſterous Method not only gives no Relief to the original Complaints, but lays a Foundation for many Diſtempers, and perhaps of a worſe Kind, to ſucceed. If we conſider this Matter with any Attention, we ſhall eaſily perceive, how ill Diſcuſſion is defined by ſome Writers of Inſtitutions, to be an inſenſible Evacuation; the ſecond Intention to attenuate and alter the Humours, which is of equal Neceſſity, being left out in the Definition. For this Reaſon, in order to make a right Diſcuſſion, we find *Aetius*, and, after him, *Hildanus*, adviſes always ſome Share of emollient Ingredients, whoſe Particles may ſerve to qualify the Force of the others, and reſtrain the too vehement and precipitate Diſſipation, that would otherwiſe be made thro' the Skin. And, with the ſame View it is, that ſome practical Writers commend a Mixture of ſpirituous and oily Medicines, not only to diſcuſs Swellings, but to eaſe Pain. Accordingly our Experience tells us, how effectual Oil of Turpentine, and all chymical Oils are, in theſe Caſes; which are nothing elſe but Spirits locked up, and, as the Phraſe is, concentrated by ſome oleaginous Subſtance; as we may argue from their eaſy Rarefaction, and quick Aſcent, by Fire; and therefore, upon repeated Diſtillations, being more freed from the viſcous Particles, they are converted into Spirits, and are ſo called. So neceſſary it is to carry on the Intention of Attenuating, at the ſame time that we make a Diſcharge. Hence thoſe Applications, which have a Mixture of Mercury in them, prove the moſt effectual Diſcuſſives; and a Medicine chiefly conſiſting of Cinnabar, is what is moſt recommended by *Alexander Trallian*, for diſſolving the Concretions in the Joints, which ariſe from a Rheumatiſm or Gout: Accordingly we ſhould never fail of ſeeing the ſame Effects, if Opium and Camphire, two of the moſt attenuating Subſtances which, perhaps, we have, had a larger Proportion in diſcuſſive Compoſitions. On the other hand, we muſt purſue this Deſign of Attenuating, in ſuch a manner, as not to uſe thoſe Things, which clog or obſtruct the cutaneous Paſſages. Oils, which are very glutinous, come under this Character; and therefore *Aetius*, upon the Application of the *Perſian* Plaiſter, which he deſcribes, and even commends to a degree of Rapture, gives a particular Caution, that no Oil ſhould be ſmear'd upon the Part. *Galen* expreſly ſays, that Oils ſtop the Pores; and, accordingly, adviſes Unction after Bathing, for this Reaſon, that they ſhould not perſpire too much: And Oil of Maſtich is a Remedy much eſteem'd by our Author for the Cure of immoderate Sweats, becauſe it obſtructs the Pores. Upon the ſame Principle, *Cælius Aurelianus* argues againſt the Application of Oil of Roſes, in the Acceſſion of a Phrenſy: And it was more upon this account, no doubt, that the Athletics among the Antients uſed to anoint all their Bodies over with Oil, than for the Reaſon commonly aſſign'd, of making any faſt Hold more difficult: For Perſpiration being ſtopt, there was a larger Supply of Blood and Spirits to the Muſcles, which enabled them to exert a greater Force and Vigour, during their Exerciſes. Therefore, perhaps, the Invention of Unction is generally attributed to *Herodicus*, who was the firſt that preſcrib'd gymnaſtic Medicines. *Hippocrates* and *Galen* forbid the Uſe of Oils and Fats in freſh Wounds and Ulcers; for this Reaſon, that they keep in the Matter, which ſhould be diſcharged, and often occaſion a Fungus: And *Hildanus*, in the Compoſition of his *Unguentum Ægyptiacum*, ſo highly commended by himſelf, and others, for the Cure of Gangrenes, tho' now not ſo much in Vogue, uſes neither Oil nor Fat: And 'tis no impertinent Caution, which he gives about the Cataplaſm he recommends for the ſame Purpoſe, that great Care ſhould be taken, leſt the Flowers of Beans and Lentils he makes it with, ſhould be boiled too much, and, by that means, contract a Viſcoſity, ſo as to endanger a Stoppage of Perſpiration: And the Reaſon is plain to any one, who underſtands the Anatomy of theſe Parts: For we ſee the Plates of the Cuticle ſo diſpoſed and ranged, one over another, in ſuch a manner, that they are often ſtuck and glewed together, even by ſo thin and ſubtle a Subſtance, as that of Perſpiration itſelf: So, in Inflammations and Strains, the glutinous Oils are certainly prejudicial; and, inſtead of diſcuſſing the Swelling, bring it to Matter; and, if this be ſuperficial, and near a Bone, to the no little Hazard of making it foul. The like Obſervations have been made of ſtrong ſuppurative Medicines, uſed at firſt in a Paronychia, when the Tumor has lain deep, and cloſe to the Bone; and, in this very Caſe, you will find a different Practice marked out by *Aetius*. Our own Surgeons with great Judgment divide the Tumor lengthways, upon the Sides of the Tendon, which ſaves the Patient a great deal of Pain, and ſecures him from Danger. Wax is ranked only amongſt the Suppuratives by *Celſus*, and, no doubt, properly belongs to that Claſs: And yet, what a Share is allowed it now in diſcuſſive Applications? Gums and Roſins, tho' they are complex Subſtances, and have a Mixture of penetrating Parts, yet they contain ſome too of ſuch a glutinous Nature, as *Aetius* himſelf acknowledges, that they ſeem adapted more to cloſe the Pores, than to clear them: And therefore, by *Fallopius*, who has diſtinguiſhed better between Diſcutients and Suppuratives, than moſt Writers, are thought improper for the Intention of Diſcuſſing. *Hildanus* gives us many Inſtances of the miſchievous Conſequences of *Paracelſus*'s ſtyptic Plaiſter, ſo mightily cried up in his Time for the Cure of Wounds; and he attributes theſe ill Effects to the large Proportion the Gums have in it, which, he ſays, conſtantly increaſe the Flux of Humours to the Part they are applied to. So in Phlegmons, gummy Plaiſters laid on too early, raiſe the Swelling, and heighten the Pain: For when we rarefy and attract the Humours, and, at the ſame time, obſtruct the Pores, ſo as to hinder a free Diſcharge, we are ſo far from promoting Diſcuſſion, that we put Nature upon another, and, indeed, a quite different Effort, that of Suppuration: And yet, if we examine the Compoſition of the diſcutient Plaiſters and Ointments now in vogue, I am afraid many of them will come under this Cenſure. The Practice of the Antients was, no doubt, more ſimple and uniform. *Hippocrates*, without Diſpute, underſtood Surgery very well; and yet, we read of no Plaiſters in his Works: He uſes a few Cerates only, and thoſe but ſeldom. The Ointments he mentions were not any thing like what we call ſo now; but were either ſimple Oils, or an Infuſion of Herbs made in Oil: But we find his Practice in

Diſcuſſion ran wholly upon Fomentations; a way, perhaps, which he thought moſt proper, both to extract the Virtue of the Plants, and to convey it into the Veſſels, where the Tumor is. In *Celſus*'s Time, the *Materia Medica* was much enlarged; and, as his chief Excellency lay in the chirurgical Part of his Writings, ſo we ſee outward Applications bear the largeſt Share in them. However, if we look into the Malagma's, which he deſcribes for Diſcuſſives, we ſhall find a leſs Proportion in them of Oil, Fat, or Wax, than in our modern Receipts. The Compoſition of Medicines was ſtill much improved in the Time of *Andromachus*, and brought to more Perfection in *Galen*'s; and, even after that, as we may learn from *Aetius*, great Additions were made to this Part of Pharmacy; yet, notwithſtanding the Ingredients were numerous, they were not altogether inconſiſtent: For either there were none of thoſe groſs Subſtances mixt with the Diſcutients; or, if they were put in for the ſake of the Form, a larger Share of warm Ingredients was always added, to make Amends. Upon Examination, I believe it would appear, that theſe Rules have not been ſo well purſued in the ſucceeding Ages; particularly with regard to compound Ointments. Perhaps, what *Zwelfer* obſerves of *Agrippa*'s Ointment, may be juſtly applied to moſt of the others, which are uſed for Diſcuſſing; that the Juices or Roots, boiled, would do better without the Wax or the Oil: And therefore, in moſt Caſes where diſcutient or ſtrengthening Ointments are applied now, *Hippocrates* uſed Fomentations made of the Herbs infuſed in Water. A like Simplicity you may meet with in the Plaiſter of *Nechepſo*, mentioned by *Aetius*: where the Leaves of Cypreſs are only pounded and ſoaked in the ſecond Droppings of new Wine: This he commends for an admirable Diſcuſſive in ſtrumous Swellings, and aſſures us, it will cure in ſeven Days. He ſays there is a natural Property in this Medicine, which makes it a kind of Specific in this Caſe; and therefore adds, that if you would change it, or mix any thing elſe with it, you will do more Harm than Good. Indeed in all the Compoſitions for Diſcuſſion, the Mixture of glutinous Things ſeems not to contribute to their Efficacy, but to their Conſiſtence only. And might not this more particularly be ſaid of mercurial Ointments and Plaiſters? which, perhaps, would ſooner anſwer the End of Diſcuſſing, if the Mercury was only mixed with a little Turpentine, in the manner which *Fallopius* uſed, or with Lard, than, as is the general Practice, with an unreaſonable Heap of glutinous and mucilaginous Subſtances, which by clogging the Pores, only ſerve to hinder the Mercury in its Operation; and, in a literal Senſe, to kill it. As to the Uſe of Plaiſters in this Caſe of Diſcuſſion, *Galen* excepts againſt the very Form, as being too harden'd and ſtiff; and therefore in Phlegmons, which are to be diſcuſs'd, he adviſes Liniments only, as leſs likely to obſtruct the Pores. Of ſuch a Sort of Conſiſtence are the *Emplaſtra ex ſuccis*, deſcribed by *Aetius*, where the Juices of the Plants are boiled up in Oil only. Yet in œdematous Swellings, at leaſt, Plaiſters are proper, and may in ſome Senſe be ſaid to ſerve for a Bandage or Compreſs, to force the Humours into their uſual Chanels.

Thus we ſee what are the proper Methods, which Nature, and her beſt Interpreters, point out for Diſcuſſion: And from what has been ſaid upon this Head, we may eaſily form a right Notion of Suppuration; to effect which, we muſt, indeed ſtop the Pores, ſo as to leave no Vent thro' the Skin, but at the ſame time rarefy and attract the Humours ſo, that by the great Diſtention they make, they may burſt the Veſſels; which, when extravaſated, and brought to Digeſtion, appear in the Form of Pus. And from hence it is, that if we open a Tumor too ſoon, when the Matter is crude, we hinder it from ripening: Therefore all thoſe Medicines, which have been mention'd as improper for Diſcuſſion, are the beſt Suppuratives; accordingly *Galen* ſays, they ought to conſiſt of groſs Parts; and the *Tetrapharmacum*, compoſed of Pitch, Fat, Roſin, and Wax, is throught to be the ſtrongeſt Suppurative by *Celſus*. So in Wounds, the Matter is at length brought to Digeſtion by the Application of emplaſtic Medicines: And, as was obſerved in Diſcuſſion, that extremely viſcous things ought not to be admitted; ſo neither any thing that is very diſcutient or deterſive, ſhould be mixt in thoſe Applications deſigned only to ſuppurate; for the Reaſon *Hollerius* gives in this Caſe, becauſe we then open the Pores which ſhould be ſhut: And there have been too many unfortunate Inſtances, where the Intention has been to ſuppurate, and Applications uſed all the while to diſcuſs. For, when the Matter is of itſelf tending to Suppuration, any Endeavour, by way of Diſcuſſion, or Evacuation, does but divert it from coming to a Head, and ſo prolong, if not wholly fruſtrate, the Cure: On the contrary it is plain, that while we are carrying on the Deſign of Diſcuſſion, we ought to uſe at the ſame time all inward means of emptying the Veſſels, and removing the Obſtructions in them, as *Aetius* every-where inculcates: for elſe, inſtead of Diſcuſſing, we bring the Tumor to Suppuration. Nature is always ſimple and uniform; and Art, to ſucceed well in following her, muſt always tend to the ſame Point. And certainly, if this Part of Surgery were ſet in a more diſtinct View, by thoſe who are Maſters in that Way, and the Effects of outward Applications better adjuſted and explained, nothing would give us a greater Light into the Virtues and Operations of internal Medicines. *Freind's Hiſtory of Phyſic.*

I will not be anſwerable, that the Doctor is entirely in the right, when he ſays, that Oils, and unctuous Ingredients, are not proper for promoting the Intention of Diſcuſſion: For the Diſcuſſion of an inflammatory Tumor is, as I apprehend, brought about, rather by rendering the ſtagnating Matter, which forms the Tumor, capable of circulating in the Veſſels adapted to receive it in a State of Health, than by attenuating it to ſuch a degree, as to make it perſpire thro' the Pores of the Skin. Ingredients, therefore, of an oily Nature, relax the Part to which they are apply'd; and, in conſequence thereof, enlarge the Diameters of the too-much contracted Blood-veſſels, and render them more eaſily pervious to the obſtructing Matter, eſpecially when attenuated by warming Ingredients, apply'd at the ſame time. See ALEIPHA.

DISEPHTHOS, Δισεφθος. The ſame as DIPYROS, which ſee.

DISLOCATIO. The ſame as LUXATIO, which ſee.

DISPENSATOR. The Apothecary is ſometimes ſo called, principally when conſider'd as actually preparing and compounding Medicines; for he who collects Simples, and ranges them in proper Order, is ſaid, in the Language of the Shops, to *diſpenſate*.

The Archeus is called the natural *Diſpenſator* of Minerals by *Ger. Dorneus, in Genealog. Mineral. C.* 8. *Vol.* 1. *Theat. Chym.*

DISPENSATORIUM, Diſpenſatory, is the Place, or Shop, where Medicines are prepared; but more frequently ſignifies a Book treating of the Compoſition of Remedies.

DISPLICENTIA, Δυσαρεστησις. See DYSARESTESIS.

DISPOSITIO. The ſame as DIATHESIS.

DISRUPTIO. A Species of violent Puncture, which penetrates the Skin to the Fleſh. *Caſtellus* from *Avicenna*.

DISSECTIO, Diſſection. The cutting up a Body, with a View of examining the Structure of the Parts.

DISSEPTUM. The Diaphragm.

DISSOLVENTIA. Medicines which diſſolve Concretions in the Body, that form Obſtructions, are call'd diſſolving Medicines.

In Chymiſtry, Diſſolvents are the ſame as MENSTRUA.

DISSOLUTIO, Diſſolution. It imports alſo a Syncope, that is, Fainting, or ſometimes Death.

DISSOLUTUS *Morbus*. A Name for the Dyſentery.

DISTENTIO, Diſtention. It ſignifies either ſimply Dilatation, or Pandiculation; or a Convulſion, as *Nervorum Diſtentio* almoſt always implies.

DISTICHIA, or DISTICHIASIS, Δισιχία, or Δισιχίασις, from Δὶς, importing double, and σἰχη, a Row, or Order. A Diſeaſe of the Eye-lids, which conſiſts in their having a double Row of Hairs, or, at leaſt, ſupernumerary Hairs. *Galen. Aetius.*

DISTICHUM. Of the ſame Derivation as the preceding Word. That Species of Barley, which has only two Rows of Grains. *Blancard.*

DISTORTIO, or DISTORSIO. It is apply'd to the Eyes, when a Perſon ſeems to turn them from the Object he would look at, which is call'd Squinting; or to any Part of the Body, when not in its natural Situation.

DISTORTOR ORIS. A Name for the *Muſculus Zygomaticus*. See CAPUT.

DISTRACTIO, in Chymiſtry, is a forcible Diviſion of Subſtances from each other, which were before united, either by Separation, or Calcination. *Rulandus.*

DISTRIBUTIO, Diſtribution, in Medicine, relates to the nutritious Juices, and is the ſame as ANADOSIS: Or to the Excrements, and is the ſame as *Diachoreſis*, or *Diachorema*. Or it ſometimes implies Diviſion.

DITRICHIASIS, Διτειχίασις. From Δὶς, importing double; and θειξ, a Hair. The ſame as DISTICHIA.

DIVAPORATIO, Exhalation.

DIVERSORIUM. The *Receptaculum Chyli*. *Caſtellus.*

DIVERTALLUM, in *Paracelſus* is whatever is generated of Elements. *Rulandus* defines it, *Generatio Elementorum.*

DIVIDENS FASCIA. The Name of a Bandage for the Neck. See FASCIA.

DIVINUS. A pompous Epithet for many Compoſitions, on account of their ſuppos'd Excellencies.

DIURESIS, Δἰυρησις· from ὑρον, Urine. An Excretion of Urine. Hence

DIURETICA. Medicines which provoke a Diſcharge of Urine.

Thoſe Medicines, which eliminate the ſalt Serum impregnated with groſs, terreſtrial, and recrementitious Parts by the urinary Paſſages, are call'd *Diuretics*. The Medicines of this Kind are, by *Celſus*, in the thirty-firſt Chapter of his ſecond Book, characteriz'd and enumerated in the following Words:

" Every fragrant Vegetable, which is cultivated in Gardens, " provokes a Diſcharge of Urine; ſuch as Smallage, Rue, " Dill, Baſil, Mint, Hyſſop, Aniſe, Coriander, Garden- " creſſes, Rocket, Fennel, Aſparagus, Capers, Cat-mint, " Thyme, Savory, Nipplewort [*Lampſana*], Parſnip, Skir- " ret, and Onions." But of the vegetable Kind, I recommend, ſays *Hoffman*, as Diuretics, the Roots of Parſley, Seleri, Aſparagus, Graſs, Liquorice, Madder, Parſnip, Crow-foot, Pareira-brava, Acmella; the Herbs, Parſley, Ground-ivy, Horſe-tail, Chervil, common Nettle, all Leeks, and all the Species of Garlick; the Flowers of Butchers-broom, and Blue-bottles; the Seeds of Carrot, Parſley, Seleri, Fennel, Gromwell, common Nettle, Violets, the Four greater cold Seeds, the Seeds of Club-moſs, Winter Cherries, Dog-hips, Juniper-berries, Strawberries, the Wood of the Juniper-tree, Saſſafras, and its Bark. Among Reſins and Balſams, Maſtich, Amber, the *Balſamum de Mecha*, and the Balſam Capivi. In the Animal Kingdom, Cantharides, Millepedes, May-worms, Scorpions, Toads, Earth-worms, Cochineal, and Whey. To the Claſs of Diuretics, alſo, belong all alcaline Salts prepar'd by Incineration, as alſo the Salt of Amber, the *Arcanum Duplicatum*, a Solution of Crabs-eyes and Nitre. The compound Medicines belonging to this Claſs are, the *Lixivium Benedictum* of *Mynſicht*, the Tincture of Tartar, the acrid Tincture of Antimony, the *Terra foliata Tartari*, the *Liquor Silicum*, the Lithontriptic Liquor of *Michaeli*, ſoluble Tartar, the Spirits of Turpentine, Maſtich, and Amber, Balſam of Sulphur with Oil of Turpentine, Balſam of Juniper, Oil of Juniper, *Malvaticum Juniperinum*, the *Syrupus Dialthææ* of *Fernelius*, and the *Trochiſci Alkekengi*.

As the Diſcharge of the Urine may be impair'd and render'd difficult from ſeveral Cauſes, ſuch as, firſt, a Defect of due Moiſture in the Blood, or, ſecondly, thick and tenacious Juices, obſtructing the ſmall urinary Ducts of the Kidneys, thirdly, a violent ſpaſmodic Conſtriction of the renal Ducts, or fourthly, their preternatural Relaxation and Weakneſs, ſo alſo the Medicines calculated for reſtoring a due Diſcharge of the Urine, muſt be adapted to the Removal of theſe ſeveral Cauſes. Thus, for Inſtance, ſome Subſtances, by conveying a due Degree of Fluidity to the inſpiſſated Blood, augment the Diſcharge of Urine; of which Kind are all aqueous diluting Medicines, liberal Draughts of Spring-water, whether cold or warm, eſpecially if Herbs of a diuretic Quality are infus'd in them: This Intention is likewiſe anſwer'd by Tea and Coffee, as alſo by mineral Waters, either hot or cold, as they not only dilute the Blood, but, by their alcaline Quality, diſſolve the viſcid and tenacious Humours, and remove the Obſtructions of the Kidneys. The ſame Effect is produc'd by Whey, which is poſſeſs'd of an aqueous, abſtergent, and gently ſtimulating Principle, as alſo of a ſweet nitrous Salt. Other Subſtances diſſolve the tough and viſcid Humours which obſtruct and block up the ſecretory Ducts of the Kidneys, and, by that means, render them fit for performing their Functions. Of this Kind are all fix'd Salts, and the Lixiviums prepar'd from them; as alſo Tincture of Tartar, the acrid Tincture of Antimony, the *Liquor Silicum*, the *Terra foliata Tartari*, the *Tartarus tartariſatus*, the *Arcanum duplicatum*, a Solution of Crabs-eyes, and the *Magneſia alba*, which, with the Acid of the *primæ Viæ*, is converted into an aperient Salt; as alſo, the Tincture of Quick Lime, Mother of Pearl, and Coral, prepar'd with Citron-juice; as alſo the Salts obtain'd by Exhalation from mineral Waters. Other Subſtances ſooth and alleviate the ſpaſmodic Conſtrictions of the Emunctories of the Kidneys, which obſtruct and prevent the due Diſcharge of the Urine. The moſt conſiderable and efficacious of this Kind are, Nitre, the Four greater cold Seeds, and Emulſions prepar'd of them; the Seeds of the white Poppy, of Carrot, and of Club-moſs, as alſo Winter Cherries, and Troches prepar'd of them: The ſame Intention is anſwered by the anodyne mineral Liquor, which is both a ſafe and efficacious Medicine; as alſo by Saffron, and its Eſſence; the Juice of Graſs, in conſequence of its nitrous Salt; a Decoction of the Roots of Graſs and Aſparagus, and Oil of ſweet Almonds, which is a Liquor of a highly demulcent Quality. Other Subſtances, by their oleous, ſubtile, and balſamic Principle, corroborate and ſtrengthen the Kidneys; ſuch as Maſtich, Amber, the *Balſamum de Mecha*, the Balſam of Capivi, Turpentine, the Wood and Berries of the Juniper-tree, Saſſafras, Parſley, Parſnip, Fennel, Aniſe, Crow-foot, Seleri; and the Oils, Eſſences, Spirits, Decoctions, and Infuſions of them. Other Medicines corroborate the Kidneys, by their ſtrengthening, fix'd, terreſtrial, and ſulphureous Principle. Of this Kind are Dog-hips, Rob of Juniper, and the *Malvaticum Juniperinum* prepar'd of it, dried Strawberries, Pareira-brava, Ground-ivy, the Bark of the Root of *Egyptian* Thorn, Horſe-tail, Paul's-betony, and Chervil. Laſtly, other Medicines powerfully ſtimulate the renal Ducts, when they are ſo far weaken'd as to have their Functions either impair'd, or totally deſtroy'd: Of this Kind are almoſt all Inſects, eſpecially Cantharides, Millepedes, Spiders, Scorpions, and dried Toads: And, in the Vegetable Kingdom, all the Species of Leeks and Garlick.

Since there is ſo great a Difference among diuretic Medicines with reſpect to their Principles, and Manner of Operation, their Uſe muſt, of courſe, be different, and they muſt be judiciouſly adapted to the particular Natures of different Caſes; for if to plethoric Patients, labouring under the Stone, we ſhould before Veneſection, and the Diminution of the Quantity of the Blood, exhibit hot Subſtances impregnated with a ſubtile balſamic Oil, ſuch as Preparations of Turpentine, and Juniper, or the Balſams of *Mecha*, *Capivi*, or *Peru*, or acrid Subſtances; or ſuch Inſects as abound with a cauſtic Salt, Garlick, Onions, or Leeks, we ſhould certainly injure the Patient, bring on an Inflammation of the Kidneys, and promote the Generation of Stones. On the contrary, in moiſt, leſs delicate, and more robuſt Patients, who live upon coarſe Food; as alſo in Diſeaſes ariſing from a Redundance of impure Serum, a Fluor Albus, a Gonorrhœa, a Diſpoſition to an Anaſarca, and Leucophlegmatia, theſe draſtic Medicines are of ſingular Uſe and Service.

Still greater Misfortunes are produc'd by acrid and ſtimulating Subſtances, in Caſes where, in conſequence of ſpaſmodic or nephritic Pains, a Diſcharge of the Urine is ſuppreſs'd. Diſorders of this Nature are far more ſafely and efficaciouſly remov'd, by ſuch Medicines as alleviate Pain, and relax Strictures; ſuch as Winter Cherries, the Seeds of Carrot, Club-moſs, white Poppy, and Gromwell; as alſo Emulſions of the Four greater cold Seeds, the *Trochiſci Alkekengi* with Opium, antimoniated Nitre depurated, the Waters of the Leaves of Meadow-ſweet, of the Lime-tree, and of the *Egyptian* Thorn; Oil of ſweet Almonds, ſweet Spirit of Nitre, the anodyne mineral Liquor, Whey; and externally, emollient Baths, and Fomentations; the Virtues of all which are ſo great, that, by alleviating the racking Spaſms, they not only reſtore the free Diſcharge of the Urine, but alſo facilitate the Progreſs of the Stone thro' the Ureters, and promote its Expulſion.

In Diſorders ariſing from a Redundance of Salt and tartareous Serum, which is generally the Cauſe of arthritic and rheumatic Pains, this peccant Humour is carried off by gentle Diuretics, tho' not of the hot Kind, leſt, by their means, the Spiculæ of the Salts ſhould be put into a briſker Motion, and the Parts in which they are lodg'd, be more violently rack'd. The gentle Diuretics, by which this Intention is moſt effectually anſwered, are, the Roots of Sarſaparilla, Pareira-brava, Saſſafras, and China-root; as alſo thoſe of Liquorice, Aſparagus, Madder, Succory, Fennel, Parſley, and Graſs, together with the Wood of the Juniper-tree; and the Preparations of theſe boil'd in Broth made with Fleſh, or in Water. To this Claſs, alſo, belong Whey, and, more eſpecially, the temperate mineral Waters, and warm Springs.

But in Caſes where peccant, viſcid, and tenacious Humours are lodg'd in the urinary Bladder, and eſpecially when the Intention is to expel the firſt Beginnings of a Stone, more acrid and powerful Medicines become neceſſary. This Intention is anſwered by Garlick, exhibited with Spirit of Juniper; as alſo by the Powder of Millepedes, May-worms, Eſſence of Cantharides, and Tincture of Antimony, *Liquor Silicum*, and Tincture of Quick Lime; which may alſo be cautiouſly exhibited in a virulent Gonorrhœa, when a viſcid and tenacious Matter lodg'd in the Proſtatæ, the Neck of the Bladder, or the Urethra, is to be carried off by Urine.

But the moſt ſafe and efficacious Medicines for procuring a free Diſcharge of the Urine, are all Kinds, not only of alcaline fixed Salts, but alſo thoſe call'd neutral; for they not only diſſolve the tough and viſcid Juices, which obſtruct the urinary Ducts, but alſo, by a gentle Stimulus, promote their Diſcharge. This Intention is excellently anſwer'd by Solutions of the Salt of Tartar, Pot-aſh, and fix'd Nitre, as alſo the *Tartarus vitriolatus*, Salt of Wormwood, the *Arcanum duplicatum*, a Solution of Crabs-eyes, *Tartarus ſolubilis*, the *Terra foliata Tartari*, antimoniated Nitre, and *Sal Polychreſtum*.

Theſe Medicines not only contribute to reſtore a due and natural Diſcharge of the Urine, but alſo produce ſome other excellent Effects in the Cure of Diſeaſes: For, as many of them are poſſeſs'd of an aperient and inciding Quality, as others of them are corroborative, balſamic, and reſtore the Tone of the Parts; and others of them of an anodyne Nature; ſo they prove highly efficacious in thoſe chronical Diſorders, which ariſe from an Obſtruction of the Glands of the Viſcera, and Emunctories, or from an Impurity of the Juices, or a Redundance of ſaline, acrid, and tartareous Serum. And certainly, if Relief is to be expected from any Medicines in Dropſies, œdematous Swellings, ſtony Concretions, the Gout and arthritic Pains, we are to look for it from the prudent Uſe of Diuretics: But we are to beware of all hot, acrid, and cauſtic Diuretics, and uſe thoſe which are of a milder Nature, and fit for common Uſe, ſuch as ſmall *Moſelle* Wine, the *Selteran* mineral Waters, and ſuch Ales and Decoctions as are gently diuretic. *Frederic. Hoffman. Medicin. Rational. Syſtemat.*

That

That many have been freed from Fevers after copious Discharges of Urine, we are informed of by the judicious *Hippocrates*, in his Epidemics; who, as he was a careful and diligent Observer of the various Species of Urine, so he seems principally to have drawn his curative Indications from them; but whether, in Fevers, he exhibited such Medicines as provoke Urine, is a Circumstance, of which we are not absolutely certain: Nor is there hitherto any Medicine found, which, in Cases of this Nature, is capable of provoking so powerful a Discharge of the Urine, that we have any Reason to hope for an Elimination of the febrile Matter by it, as we observe in Purging. In the Management of Fevers, therefore, Diuretics are not much to be confided in, with respect to the Evacuations they procure. The Reason of this is sufficiently obvious to any Person, who will only be at the Pains to reflect on the Structure of the Parts; for tho' the renal Arteries are almost as large as those of the Mesentery, and perhaps transmit an equal Quantity of Blood, yet since, in the Kidneys, the Vessels destined for the Secretion of the Humours are much fewer in Number than those of the Intestines, an equally large Evacuation is not, of course, to be expected from the former as from the latter. Besides, we may lay it down as a Maxim, that Diuretics are not, like Emetics and Purgatives, possessed of such a Power and Energy, as always to answer the Intention of the Physician. Tho' I cannot deny, that they sometimes provoke a copious and liberal Discharge of Urine, yet it is certain from Experience, that they often fall short of answering this Intention, as we too frequently observe in Anasarcas, and Cases where the Urine is discharged with Difficulty; which are the Disorders, in which the Relief proposed by Diuretics is principally wanted: So that, at present, that Part of Medicine, which relates to the Discharge of the Urine, is, of all others, the most uncertain and imperfect.

It is a Custom of long standing to exhibit very frequent and liberal Draughts of diluting Liquors to Patients seized with the Small-pox or Fevers. This Piece of Practice is not, as some imagine, of a modern Date, but handed down to us from *Hippocrates*, who, that he might, with the greater Accuracy, prescribe the Regimen proper in acute Disorders, has described various Kinds of Sorbitions, and more especially the Ptisan; so that those who first introduced what we call the temperate and diluting Regimen, borrowed almost the Whole of their Practice, in that respect, from *Hippocrates*'s Treatise *de Ratione Victus in Acutis*: And certainly this Method is not only highly rational in itself, but also productive of the best and most happy Effects, since, by these diluting Draughts, the febrile Heat is abated, and the Mass of Blood so attenuated and divided, as to pass freely thro' the Vessels; by which means the superfluous and peccant Matter is more effectually carried off, either by the Emunctories of the Skin, or the urinary Passages. Nor are these diluting Draughts to be classed among the Evacuants, because they provoke Urine, since they produce this Effect not so much by any inherent diuretic Quality, as because they are highly diluting, and used in large Quantities. Thus, tho' a copious Discharge of Urine be promoted, it may happen, that the Vessels may not be emptied, but continue to have the same Quantity of Humours still circulating in them. Let us, therefore, be content to ascribe only a diluting Quality to these Draughts, without running counter to Nature, by placing them among the Evacuants. *Freind. Comment. in Hippocrat.*

DIUTURNUS. Chronical, when applied to Diseases.

DIVULSIO *Urinæ* is an irregular Separation of the Urine, when the Sediment is divided, ragged, and uneven.

DIURNUS. Diseases, especially Fevers, whose Exacerbations are in the Day-time, have sometimes this Epithet applied to them.

DIWIPAHURU. A sort of *Convolvulus*, which grows in the Island of *Zeilon*, mentioned by *Breynius*.

DIYDROS, διυδρος. Very moist. *Hippocrates*.

DIYGROS, διυγρός. The same as DIYDROS.

DIYLYSMOS, διυλισμὸς, from διυλίζω, to strain. The Percolation or Straining a Liquor, in order to its Depuration.

DOCHME, δοχμὴ. A Measure, among the *Greeks*, of Length. A Palm, the Breadth of four Fingers.

DOCIMASTICE. The Art of examining Fossils, in order to discover what Metals or Minerals they contain.

DOCTILETUS, in *Paracelsus*, is a certain Medicine, which, he says, cures a Cancer; but he does not explain what it is.

DODARTIA. A Plant so called by Dr. *Tournefort*, from Monsieur *Dodart*, a Member of the Academy of Sciences at *Paris*. We have no *English* Name for this Plant.

The Characters are,

The Calyx is monopetalous, tubulous, and divided into five long Segments. The Flower is monopetalous, bilabiated, with a small, horned, bifid Galea, and a long, trifid, trisulcated Beard. It is tubulous in the lower Part, which is furnished on the Inside with four Stamina, having each two Testes. The Flowers grow always solitary, and not in Whorles. In the very Bottom of the Calyx is situated the Placenta, on which, within the Flower, grows a spherical Ovary; from the Centre of whose Apex proceeds a long Tube or Pointal, which, increasing in Bulk at the Apex, becomes a globous, bicapsular, bivalve Fruit, divided by a Partition into two Cells full of small Seeds.

Boerhaave mentions but one Species of this Plant, which is

Dodartia; Orientalis; flore purpurascente. *T. C.* 47. *Voy.* 2. 350. EASTERN DODARTIA, WITH A PURPLISH FLOWER. *Boerh. Ind. alt. Plant. Vol.* 1.

To this *Miller* adds another, which is,

Dodartia, bellidis folio, flore albo spicato. DODARTIA WITH A DAISY-LEAF, AND WHITE FLOWERS GROWING IN A SPIKE.

I find no medicinal Virtues attributed to either of them.

DODECADACTYLON, δωδεκαδάκτυλον. A Name for the *Duodenum*, because said to be twelve Fingers Breadth in Length.

DODECAPHARMACUM. A Composition, in which there are twelve Ingredients; for this Reason the *Unguentum Apostolorum* is called by this Name.

DODECATHEON, δωδεκάθεον. The Name of an Antidote consisting of twelve Simples, and described by *P. Æginet. Lib.* 7. *Cap.* 11.

DODRA. A kind of Potion among the Antients, made of nine Ingredients. *Castellus.*

DODRANS, σπιθάμη, is the Name both of a Weight and a Measure, signifying three Fourths of an Integer. Thus *Dodrans* is the Weight of three Quarters, or nine Ounces, of the *Libra*; and also three Quarters, or nine Inches, of the *Foot*.

DŒDYX, δοίδυξ. The same as COCHLEARE, which see. It signifies also a Pestle. *Gorræus.*

DOGGA. An *Arabic* Term for PARONYCHIA, which see.

DOGMA, δόγμα, from δοκέω, to be of Opinion, in Medicine, is a Sentiment founded upon Reason and Experience, which are the professed Rule and Principles of the Dogmatists, or Dogmatic Sect, in Medicine, as distinguish'd from the Methodics and Empirics. See a full Account of these Sects in the Preface.

DOGMATICI. The Physicians of the Dogmatic or Rational Sect. See the Preface.

DOLET. Red Vitriol. *Rulandus.*

DOLICHOLITHOS, δολιχόλιθος, from δόλιχος, a Kidney-bean. A Name given by *Velschius* to certain blackish Stones brought from *Tyrol*, of the Shape of a Kidney-bean, and emitting odorous Effluvia upon Attrition. *Castellus* from *Ephem. Natur. curios. Ann.* 1. *Obs.* 157.

DOLICHOS, δολιχὸς, imports long or prolix. But δόλιχος is a Pod, or a Kidney-bean; or a Course or Race of twelve Stadia, or, according to *Suidas*, of twenty-four.

DOLOR. Pain.

Prognostics from PAIN *in acute Diseases.*

Galen, in his first Book of Elements, has defin'd *Pain*, in Opposition to Pleasure, a disagreeable and troublesome Sensation. Of Pain there are various Kinds: One is attended with Pulsation; another with a Sense of incumbent Weight; another with a Tension. There is a Pain which attends Erosion, Incision, Punction, and Perforation, comprehended, with these and the like Differences, under the Name of *Acute*. And, lastly, there is a Pain attended with a Torpor or Numbness.

The first Kind of Pain is called by Physicians *pulsative*, which, according to *Galen*, *de Loc. affect. Lib.* 2. *Cap.* 3. always succeeds some remarkable Inflammation in the Arteries, and the containing Parts, which, oppressing and straitening them upon every Diastole or Elevation, if the Part affected be naturally sensible, causes a dolorific Percussion. Sometimes a Pain with a Pulsation is observ'd in Abscesses hastening to Suppuration.

A second Kind of Pain is call'd *gravative*, because it is attended with a Sense, as it were, of a Weight incumbent on the Place affected, which is some carnous Part; as the Kidneys or Liver suffer under an Inflammation, according to the Observation of *Galen* on 6 *Aph.* 5. That such a Pain is proper to the Kidneys, we are told by *Hippocrates*, 6 *Epid. Sect.* 1. *T.* 5. And *Galen*, *de Locis affect. Lib.* 2. *Cap.* 4. observes those gravative Pains to be incident to the Kidneys, Liver, Spleen, Skin, Glands, and Lungs; for these Parts, he says, are molested with this kind of Pain from a Distention, because the Membrane, in which these Viscera are involved, being oppressed and distended, labours under a Pain attended with a Sense of Gravity.

A *tensive* Pain, which *Archigenes* called *distending*, is excited by a Distention or Convulsion of the nervous, muscular, or membranous Parts, from some Humour, flatulent Spirit, or Inflammation.

A fourth Kind of Pain, which is called *acute*, comprehends Sensations arising from Erosion, Punction, Perforation, and the like. Substances excessively salt or acrimonious, by a violent Abstersion or Abrasion, excite an acute Pain; as under the Dysentery, and other Disorders, in which some of the Parts are corroded. Pungent Pains are proper to the Membranes affected with

with acrimonious Bile; as is the Caſe in Pleuriſies, where the Membrane called the *Pleura* is inflam'd with Bile. Much of the ſame Nature ſeem to be thoſe Pains, which are excited by a Humour inciding or perforating the Parts of the Inteſtines.

Laſtly, there are Pains attending or producing a Torpor or Numbneſs, which, by their Violence, cauſe a Reſolution of the natural Heat of the Part affected, or proceed from an Inflammation ſtrongly compreſſing the Nerves and Arteries, ſo that little or no Heat can thence be communicated; as, for Inſtance, in the Pain of the Kidneys, excited by an Inflammation, the Legs are often ſeized with a Numbneſs.

Beſides the before-mentioned, there are other Diſtinctions of Pain: Thus ſome Pains are fixed; others moveable and wandering, as it often happens in a Redundance of Humours; ſome Pains are continual, and others intermittent; ſome intenſe, others remiſs; ſome again afflict the Patient in the Beginning of a Diſeaſe, others afterwards; and ſometimes they ariſe on the critical Day, ſometimes not; and, to mention no more, ſome Pains are ſeated in the external Parts, others in the internal; ſome in the noble, others in the ignoble Parts. Theſe Diſtinctions of Pains are of great Moment in prognoſticating the Events of Diſeaſes, in the Opinion of *Galen*, *Com. in* 6 *Aph.* 5. All Pain proceeds from ſome Injury done to the Part affected; this is too clear to require a Demonſtration. *Galen*, who accurately examined into all the Cauſes of Pain, tells us, in ſeveral Places of his Works, that they proceed from one or other of theſe two Cauſes; that is, either from a ſudden Alteration of the Part, or a new Temperament ſuddenly induced, or elſe from a Solution of Continuity. Others make only one Cauſe; that is, Solution of Continuity, ſince neither Heat nor Cold excite Pain without a Solution of Continuity; and all immoderate Qualities, as they aſſert from *Galen*, effect ſuch a Solution: For *Galen* himſelf often confeſſes and teaches, that theſe Qualities cauſe a Solution of Continuity, particularly *de Simpl. Med. Fac. Lib.* 4. *Cap.* 2. *Com.* 3. *in Hip. de Fract.* and *Lib. de Inæqual. Temp. Cap.* 6. We conclude, therefore, that the Cauſe of Pain is a Solution of the Continuity of Parts, either from an immoderate Temperament ſuddenly induced, or by Inciſion, Corroſion, Fracture, or, laſtly, by Tenſion. The internal Parts ſuffer Pain from the Violence of a Fever, by which the nervous Parts are tried and vellicated; or from an Inflammation, an Eryſipelas, ſome great Obſtruction or Abſceſs in the Viſcera, or, laſtly, from a Flatus. Now, ſince Pains owe their Riſe to ſuch Cauſes as before-mentioned, they are juſtly denominated bad, as well when alone, as when attendant on other Diſtempers; for all Pain exhauſts the Strength, promotes Crudities, and impedes the Concoction of the Humours. The worſt Pains are ſuch as are excited in the Viſcera, and noble Parts; and of theſe the moſt pernicious, on all accounts, are Pains affecting the Viſcera in a violent manner, and of a long and conſtant Duration; by which the natural Heat of the Viſcera is deſtroyed or reſolved, and no room left to hope for a happy Event. Pains, which are remiſs, moveable, and of ſhort Duration, are accounted not ſo bad, becauſe not excited by an Injury of the Viſcera, but rather of ſome ignoble Part. Sometimes Pains in acute Diſeaſes, tho' in their own Nature bad, prognoſticate Good, and contribute not a little towards prognoſticating a Recovery; as, for Inſtance, ſuch Pains as affect the Patient on a critical Day, in ſome ignoble Part, as the Legs, Feet, or the like; and are attended with Signs of Concoction. But I proceed to treat of good and bad Pains in acute Diſeaſes, as they furniſh us with Grounds and Occaſions for predicting the Death or Recovery of the Patient.

Pains *conſidered as Prognoſtics of a* Recovery.

Pains affect the Patient in the Beginning of a Diſeaſe, or afterwards. In the Beginning they are, for the moſt part, to be accounted as pathognomonic Signs, ſignifying, that ſome Part among the Viſcera labours under an Inflammation. Thus it is when the Pain begins with a Fever, and a Tumor or Tenſion of ſome Part; and theſe Sorts of Pains are called inflammatory. It is beſt for the Patient, when theſe Pains are neither violent nor continual, but, after a ſhort Duration, are either quite removed, or elſe mitigated, and are, beſides, attended with no other pernicious Sign. But it is beſt of all, and ſafeſt, in ſuch a Caſe, when theſe Pains ceaſe or remit with Reaſon, or for ſome manifeſt Cauſe; as it happens when ſuch Ceſſation or Remiſſion is owing to ſome beneficent Evacuation excited by Nature, or procured by Art; ſuch as Veneſection, ſpontaneous Bleeding at the Noſe, Sweats, Stool, Spitting, or when a ſubſequent Fever removes the Pain by the Virtue of its Heat, as we learn from *Hippocrates*, 6 *Aph.* 40. where he ſays, "That a "Pain excited about the Hypochondria, without an Inflam- "mation, is removed by a ſupervening Fever." And afterwards, 7 *Aph.* 52. "They who are moleſted with Pains about "the Liver, are freed by a Fever ſucceeding them." Again, ſpeaking of ſuch Pains as are relieved by ſome Evacuation, he tells us, 1 *Prorrhet.* 152. "That Pains of the Head and Neck, "with a Weakneſs and Tremblings of the whole Body, are "reſolved by an Hæmorrhage, or are removed by Time." And in *Prognoſt.* "Pains and Elevations of the Hypochon- "dria, if recent, and without an Inflammation, termi- "nate in Rumblings in thoſe Parts, or are more effectually "relieved by diſcharging the Flatulencies and Excretions "by Stool and Urine." To the ſame Purpoſe we read, *Coac. Præn.* 67. that "a Pain of the Side in Fevers is mitigated "by a plentiful Evacuation of aqueo-bilious Matter by Stool." And, *ibid.* 172. "A Cephalalgy is relieved by a Flux of "Pus from the Noſe, or a Diſcharge of thick and inodorous "Matter by Spitting. Sometimes the Diſorder is removed by "an Eruption of Ulcers, or by Sleep, or a Flux of the Belly." Again, 6 *Aph.* 10. "A violent Pain of the Head is relieved by "a Diſcharge of Pus, Water, or Blood, through the Noſtrils, "Mouth, or Ears;" as it happened to *Echecrates* the blind Man, 7 *Epid. Text.* 95. of whom it is related, "That he was "afflicted with a violent Pain of the Head, eſpecially in the "back Part, where it is joined to the Neck, whence it "reached to the Top. At length it extended itſelf to the "Left Ear, and affected half the Head. He had a conſtant "Diſcharge of Mucus, moderately aduſt, and attended with "a ſmall Degree of Heat. His Appetite was gone, and, tho' "in the Day-time he was tolerably well, yet his Pain return'd "at Night. At laſt, towards Winter, there was an Eruption "of Pus through his Ear, when all the Symptoms vaniſhed." On theſe Conſiderations, *Hippocrates*, *Prognoſt.* condemns all Excretions which neither remove nor leſſen the Diſorder, and particularly ſuch as are of no Uſe in alleviating the Pain; as, on the contrary, he commends thoſe, by which the Pain is mitigated. We conclude, therefore, that Pains which leave the Patient for ſome manifeſt Reaſon, that is, on account of ſome proper Evacuations, give us very good Hopes of a Recovery. But Pains which are not removed, but continue for a long time, are often Prognoſtics of Abſceſſes; of which we ſhall only ſay at preſent, that they are of good Signification when affecting the ignoble Parts, provided they are not render'd of bad Preſage by other bad Signs.

As for thoſe Pains which ariſe in the Progreſs of the Diſtemper, I judge thoſe, which the Phyſicians call *critical*, to be the moſt kindly and favourable, becauſe, partly as a *Sign*, and partly as a *Cauſe*, they prognoſticate a happy Criſis. As a *Sign*, they indicate a Hæmorrhage, Vomiting, or ſome other Evacuation, agreeable to the Obſervations of *Hippocrates*, 1 *Epid. Sect.* 2. where he ſays, "In burning and other Fevers, a Pain of the "Neck, a Senſe of Weight on the Temples, and a Dimneſs of "Sight, attended with a Tenſeneſs of the Hypochondria, but "without Pain, indicate an Hæmorrhage form the Noſe; but a "Heavineſs of the whole Head, with a *Cardiogmos* and Nauſea, "precede a Vomiting of bilious and phlegmatic Humours." And, in *Prognoſt.* "If, without theſe [bad] Signs, the "Pain continues beyond the twentieth Day, and the Fever "does not leave the Patient, expect an Hæmorrhage from the "Noſe, or an Abſceſs in the inferior Parts; but, if the Pain "be recent, you are to expect, in like manner, an Hæmor- "rhage, or a Suppuration, and eſpecially if the Pain be ſeated "in the Temples or Forehead." Again, 1 *Prorrhet.* 137. "A Pain of the Neck, and great Redneſs of the Eyes, indicate "an Hæmorrhage." And, *ibid.* 142. "A Fever, with a "great Senſe of Laſſitude, ſucceeding a Rigor, prognoſticates "a Flux of the Menſes; but a Pain of the Neck, in that Caſe, "indicates an Hæmorrhage." Again, *ibid.* 247. "A Tenſe- "neſs of the Hypochondria, with a Heavineſs of the Head, "Deafneſs, and a dim and confuſed Sight, predict an Hæmor- "rhage." Alſo, in *Coac. T.* 142. we are told, that, "in a "Fever, Redneſs of the Face, with a violent Pain of the Head, "and Pulſation of the Veins, generally predict an Hæmor- "rhage."

Theſe are the Pains, which, by indicating a happy Criſis, prognoſticate a Recovery; but the moſt ſalutary, in every reſpect, are thoſe, which the Phyſicians call *critical*, on account of their being the Cauſe of a good Criſis: Such are the Pains which affect, ſometimes for a long while together, the ignoble Parts, which lie remote from the Viſcera; and are principally to be regarded, as well as other Signs, when they happen on a critical Day, with manifeſt Tokens of Concoction; in which Circumſtance we may, with Confidence, predict a Recovery, if none of the mortal Signs appear: For Nature, by this Method, has given us a plain Intimation, that the principal Members are delivered from their Burden, by the Expulſion of the noxious Humours to a remote Diſtance; and the farther they are removed, the ſooner is Health to be expected. Such a Proceeding, then, argues great Strength of Nature; and theſe Pains are often productive of Tumors, which are of the beſt kind, and ſuch as *Hippocrates* mentions, *Lib. Prognoſt.* where we read, "That, under a violent and dangerous Peripneumony, "Abſceſſes in the Legs are always of Service;" and theſe, according to *Galen*, in his Comment on the Place, are beſt, when they are removed at the greateſt Diſtance downwards, and fartheſt from the principal Seat of the Diſorder. *Hippocrates* alſo, *Coac. Prænot.* 118. informs us, "That long Fevers "produce Tubercles, or Pains in the Joints; which, however,

" are not unſerviceable." Hence Pains of the Feet, Legs, Knees, Hips, and Groin, being of conſiderable Duration, are very good, as well as thoſe in the Arms, Hands, and behind the Ears, when critically obſerved. It often happens, in acute Fevers, that Nature, having diſcharged itſelf of Part of the Humours, by expelling them to ſome of the before-mentioned ignoble Parts, is better enabled to deal with the Remainder, and attempts an Evacuation, by which, in Conjunction with the Pains, which are continually attracting the Humours to the ignoble Part, the Diſeaſe is brought to a perfect Criſis. It ſeldom happens, but that, in a Criſis occaſioned by Pain, the Patient ſuffers a Relapſe; becauſe the Matter thus thrown upon the Legs, or ſome other ignoble Part, by no means carries off the whole morbific Cauſe; but if with theſe Pains be joined ſome copious Evacuations, a perfect Criſis is happily effected.

But if theſe Pains are to be of any Service in a Fever, they ought to be long and vehement; by which means they will attract a very conſiderable Quantity of the noxious Humour, and ſo make a Revulſion of great Part of the Cauſe of the Diſeaſe; as was obſerved by *Hippocrates*, in the Caſe of *Heropytus*, 3. *Epid. Sect.* 3. *Ægr.* 9. " About the ſixtieth Day, " it is ſaid, the Bleeding at his Noſe ceaſed; but he was ſeiz- " ed with a great Pain in his Right Hip, and his Fever increaſ- " ed; and, not long after, he was affected with Pains in all his " lower Parts; and ſuch were the Circumſtances of his Caſe, " that either his Fever was more intenſe, attended with a con- " ſiderable Difficulty of Hearing; or theſe Diſorders were " remitted and alleviated, but the inferior Parts about the " Hips the more vehemently pained. About the eightieth " Day, all the Symptoms were mitigated, though none " entirely removed; for his Urine was well coloured, and had " a copious Sediment, and his Delirium was abated." And, relating the Caſe of the Wife of *Epicrates*, 1. *Epid. Sect.* 3. *Ægr.* 5. he ſays, that on the tenth Day ſhe was taken with a Pain in her Legs, which, ſome Days after, was ſucceeded by a very friendly Sweat, which allayed the Fever. But there is one thing to be regarded in relation to Pains; which is, as we obſerved before, that Pains ſeldom induce a true Criſis, of themſelves, without the Aſſiſtance of ſome other Evacuation of Humours: For which Reaſon, a Diſeaſe, owing its Criſis to Pain, is ſubject to return upon the Patient; becauſe Pains are incapable of making a Revulſion of all the morbific Matter from the Viſcera, but only a Part; whence it will be neceſſary for Nature to renew the Combat, in order totally to ſubdue the Diſeaſe. Hence proceed frequent Relapſes, according to the Obſervations of *Hippocrates* on the Wife of *Epicrates*, before-mentioned, on *Cleonactydes*, 1 *Epid. Sect.* 3. *Ægr.* 6. and the Virgin of *Abdera*, 3 *Epid. Sect.* 3. *Ægr.* 7. in deſcribing which laſt, he ſays, that " On the twentieth " Day ſhe had a Pain in her Feet, her Deafneſs and Delirium " left her, a ſmall Quantity of Blood came from her Noſe, " ſhe fell into a Sweat, and was freed from her Fever. The " twenty-fourth Day the Fever returned, with the Deafneſs; " her Feet were conſtantly pained, and ſhe grew delirious. On " the twenty-ſeventh ſhe fell into a plentiful Sweat, was free " from a Fever, and her Deafneſs was removed; the Pain of " her Feet continued, but, in all other reſpects, ſhe underwent " a perfect Criſis." *Galen*, *Comm.* 1. *in* 3 *Epid. T.* 19. gives it as his Opinion, that, in an acute Diſeaſe, a Pain and Tumor in the Left Hypochondrium and Spleen are not unſerviceable. Pains excited in the lower Belly, by acrimonious Humours vellicating the Inteſtines, frequently ſignify a Criſis by Stools. Pains behind the Ears, of long Continuance, with a ſufficient Meaſure of Strength, predict thoſe critical Tumors called Parotids. No leſs ſalutary are thoſe Pains which deſcend from the ſuperior to the inferior Parts; for it is beſt for the Patient, when the Diſeaſe, in whatever Manner, recedes to a Diſtance from the principal Parts. Of this Sort of Pains ſpeaks *Hippocrates*, 2 *Epid. Sect.* 5. " A Pain in the Head, he ſays, " deſcends from thence into the Breaſt, thence into the Hypo- " chondrium, and thence into the Hip; for all theſe Parts " cannot poſſibly be pained at the ſame time." And 1 *Prorrhet.* 114. " Pains in the inferior Parts are eaſily ſupported." The ſame is exemplified in the Caſe of *Herophon*, 1 *Epid. Sect.* 3. *Ægr.* 3. of whom *Hippocrates* obſerves, that " On " the eighth Day he had a Fever, his Spleen, before elevated, " ſubſided, and he underſtood every thing; he was affected " with a Pain firſt in his Groin, on the ſame Side with the " Spleen, and afterwards in both Legs; he had a tolerable " Night, his Urine was of a better Colour, and depoſited a " ſmall Sediment. The ninth Day he fell into a Sweat, under- " went a Criſis, and the Diſeaſe intermitted. The fifth Day " afterwards, it returned upon him, together with a Tumor " of the Spleen; he had an acute Fever, and was deaf as before; " and on the third Day after the Relapſe, his Spleen ſubſided, " his Deafneſs was diminiſhed, he had a Pain in his Legs; at " Night he fell into a Sweat; and the Diſeaſe terminated in a " perfect Criſis, on the ſeventeenth Day." Thus much have we ſpoken concerning good or ſalutary Pains; in order to deſerve which Denomination, they muſt firſt begin on ſome critical Day, with Signs of Concoction, and either follow or precede ſome very beneficial Evacuation, either by Hæmorrhage, Vomiting, Stool, Urine, Sweat, or Spitting: And that they may be juſtly called good Pains, it is neceſſary alſo, that the Patient ſhould immediately, or ſoon after, find himſelf either totally cured, or much relieved; and laſtly, they muſt be no ſmall and inconſiderable Pains, but great and afflictive; and not ceaſe after a few Moments, but endure for a conſiderable Time. In general, all continued Pains of the Extremities, eſpecially of the Feet, are of good Preſage in acute Diſtempers.

Pains *prognoſticating* Death.

All Pains affecting a noble Part of the Body are bad, whether they are produced together with the Diſeaſe, and ſo are eſteemed pathognomonic Signs, or are excited afterwards; for the former, in Conjunction with other pathognomonic or proper Signs, form a Prognoſtic: Thus a violent and continual Pain of the Head in a Phrenſy, with other proper and deſtructive Signs of a Phrenſy, is mortal. Some Pains are generally mortal from the Excellence and Uſefulneſs of the Part which they affect; thoſe, for Inſtance, which ſeize the Heart, or cauſe Strangulations in the Mouth of the Stomach, the Fauces, Head, Ears, Breaſt, or Bladder. For Pains in theſe Members are always pernicious; and eſpecially when attendant on a continual Fever, with other bad Symptoms, indicating an Inflammation, which is generally mortal. Of theſe Pains *Hippocrates*, 4 *Aph.* 64. thus pronounces: " In Fevers, a violent burning " Heat about the Stomach, with a *Cardiogmos*, or gnawing " Pain at the Mouth of the Stomach, are bad;" and *Aph.* 65. " In acute Fevers, Convulſions, and violent Pains about the " Viſcera, are bad." In 1 *Prorrhet.* 86. it is ſaid, that " a " Pain of the Fauces, without a Tumor, but attended with " an Anxiety and Suffocation, is deſtructive beyond meaſure." And *Hippocrates*, in *Prognoſt.* ſays, that this Pain, and an Orthopnœa without any Appearance of a Tumor in the Fauces, or Neck, bring very ſpeedy Death; for the Pain of the Throat indicates an internal and violent Inflammation, according to *Galen* in his Comment on the Place, which muſt of neceſſity be mortal. A conſtant and violent Pain of the Head, attending a continual and high Fever, is alſo very much to be dreaded; ſince it exhauſts the Strength, inducing Want of Sleep, and a Delirium; and, at laſt, mortal Convulſions; agreeable to the Sentiments of *Hippocrates*, *Prognoſt.* where he ſays, " that a " violent and continual Pain of the Head in a Fever, if there " are, beſides, other mortal Signs, is a very fatal Prognoſtic." Of which he gives Inſtances in *Philiſtes*, 3. *Epid. Sect.* 2. *Ægr.* 4. *Polyphantus*, 7 *Epid. T.* 120. and the Maid-ſervant of *Eualcidas*, *ibid.* 121. three phrenetical Patients. Of a Pain in the Ears, he ſays, *Lib. Prognoſt.* " that an acute Pain of " the Ears, in a continual and high Fever, is dangerous; for it " threatens a Delirium and Death." Again, concerning Pains in the Belly, we read in *Coac. Text.* 130. " that a burning " Fever, proceeding from a ſevere Pain in the Belly, is mor- " tal." And, as to thoſe in the Breaſt, we are told, 1 *Prorrhet.* 70. " that a Pain ſettled in the Breaſt, with a Numbneſs, is " bad; for if they happen to be taken with a Fever, it proves of " the burning and mortal Kind." And, of thoſe in the Bladder, *Prognoſt.* and *Coac.* 471. " A Hardneſs and Pain in the Blad- " der are very difficult and deſtructive on all Accounts, but " moſt fatal when attended with a continual Fever; for the " very Pain of the Bladder is ſufficient to deſtroy the Patient." Pains of the noble Parts therefore, if violent, are very dangerous in the Beginning of acute Diſeaſes; and, if attended with other bad Signs, mortal.

As for Pains of the Viſcera and noble Parts, which affect not the Patient in the Beginning of acute Diſtempers, but are felt afterwards in the Progreſs of the Diſeaſe; if ſevere and conſtant, they are to be eſteemed very pernicious, as ſhewing ſome noble Part of the Viſcera to be afflicted with an high Inflammation, acceſſory to the Fever, and not to be ſubdued but by extraordinary Strength of Nature. Wherefore theſe Pains are uſually ſucceeded by very formidable Symptoms; ſuch as a Coldneſs of the extreme Parts, which is the ordinary Conſequence of violent Pains, according to *Hippocrates*, 7 *Aph.* 26. where he ſays, that " Coldneſs of the extreme Parts, from a " violent Pain of the Parts about the Belly, is a bad Symptom." The Conſequences of Pains of the Head are Deliriouſneſs, mortal Phrenſies, virulent Vomitings, Convulſions, Abſceſſes, and Suppurations. The Author of the *Prorrhetics*, *Lib.* 1. *T.* 7. ſays, " that, in Pains of the Head, æruginous Vomitings, Want of " Sleep, and Deafneſs, ſignify the Patient to be near to Mad- " neſs." We find the ſame in *Coac. Prænot.* 169. In theſe Caſes virulent Vomitings are very mortal, according to the Obſervation of *Hippocrates*, 1 *Epid. Sect.* 2. " Pains and Heavineſs " of the Head and Neck, attended with a Fever, or without " a Fever, in thoſe afflicted with a Phrenſy, terminate in Con- " vulſions, or in æruginous or virulent Vomiting, in which " latter Caſe the Patient ſometimes dies ſuddenly." Again, 1 *Prorrhet.* 115. we are told, that " a Pain of the Head in " a Fever, attended with Coſtiveneſs, and a thin aqueous Sweat,

" indicates

" indicates the Patient to be ſubject to Convulſions." The ſame we find, almoſt Word for Word, in *Coac.* 154. 177. And, *Coac.* 171. it is ſaid, that " acute Pains of the Head, attend-" ed with a Torpor, and a Senſe of Weight, indicate a Diſ-" poſition to Convulſions." The ſame, in effect, is repeated, *ibid.* 174. In 1 *Prorrhet.* 104. " Suffocating Pains of the " Fauces, without a Tumor, threaten Convulſions; eſpecially " if they owe their Original to the Head." And, *ibid.* " A " Pain of the Loins, a Cephalalgia, and Cardialgia, with ſtrong " Efforts to expectorate, threaten Convulſions." From theſe and a Multitude of other Places in *Hippocrates*, it appears, that violent Pains of the principal Parts are ſometimes ſucceeded by Convulſions. Abſceſſes are, alſo, conſequent to ſuch Pains. Thus, 1 *Prorrhet.* 168. " In a Pain of the Head, a Coma " and Deafneſs indicate an Abſceſs behind the Ears." Continual Pains are Signs of a Suppuration, according to *Hippocrates*, 7 *Aph.* 22. " Pains of long Continuance, in the Parts about the " Belly, produce a Suppuration." And, in *Prognoſtic.* we are informed, that long Pains in the Region of the Thorax and Lungs, which can neither be removed by Expectoration, nor Purging, nor Phlebotomy, nor Medicines, nor Diet, indicate a Suppuration; provided, as *Galen* has it in his Comment, there be no mortal concomitant Sign. We have an Inſtance to this Purpoſe, 7 *Epid. Text.* 60. in the Son of *Hegeſipolis*.

And thus we ſee what Judgment is to be made, and what Prognoſtics to be drawn, from Pains moleſting the Viſcera, or noble Parts; but if theſe Pains are accompanied or ſucceeded by ſome mortal Sign, no leſs than the Deſtruction of the Patient is indicated. The ſame Conſequence may be prognoſticated from a Variety of Pains affecting the noble Parts, or other ſevere Symptoms of a different Kind, appearing at the ſame time; for theſe, as they are Indications of ſeveral dangerous Diſorders in Conjunction, ſo when attendant on Pain, or a Multiplicity of Pains, they portend nothing but the worſt of Events; for if Nature finds it difficult to ſubdue one conſiderable Diſtemper, it muſt certainly ſink and give way to the joint Attacks of ſo many Diſeaſes, unleſs it be endowed with an extraordinary Meaſure of Strength. To this Purpoſe we read, 1 *Prorrhet.* 38. " that in thoſe who are afflicted with a Looſe-" neſs, Laſſitude, Pain of the Head, Thirſt, Want of Sleep, " Obſcurity of the Speech, and a Feebleneſs, there is Reaſon to " fear a high Delirium." And, *ibid.* 95. " A Trembling of " the Hands, a Pain of the Head and Neck, with a Dulneſs " of Hearing, and thick and black Urine, are pernicious Signs, " and portend black Vomitings." Of different Pains affecting the noble Parts at the ſame time, he thus expreſſes his Judgment, *ibid.* 72. " A Pain of the Stomach, with Tenſion of " the Hypochondria, and an Head-ach, are malignant Signs."

We proceed to conſider the Pains of the ignoble Parts, which we have before declared to be good, if attended with a Concoction of the Humours, of conſiderable Duration, and effectual in removing, or, at leaſt, what uſually happens, in mitigating the Fever, with its threatening Symptoms, and putting the Patient in a better State. Such Pains begin, as we ſaid, on critical Days, and are not concerned in exaſperating any of the Symptoms. But Pains of the ignoble Parts in the Beginning of a Diſeaſe, when all Things are crude, by which no Symptoms of the noble Parts are removed or diminiſhed, but rather exaſperated and multiplied, and the Sick rendered worſe, are of a bad Kind. But Pains ariſing in the ignoble and remote Parts, ſuch as the Feet, Legs, Knees, Hips, Groins, and the like, are moſt to be dreaded, when ſucceeded by a Fever, and other no leſs ſevere and dangerous Symptoms, under which the Patient grows worſe and worſe. On theſe we read, in *Coac.* " Convulſions in a Fever, attended with Pains of the Hands " and Feet, are malignant; as are alſo violent Pains of the " Thigh. A Pain in the Knees is no good Symptom; but a " Pain in the Calves of the Legs is malignant, eſpecially when " there is a Cloud in the Urine." We have Inſtances of the Events of theſe Pains in the Caſes of *Crito* and *Phalacrus*, who died under them. Of *Crito*, who lived in *Thaſus*, it is related, 1 *Epid. Sect.* 3. *Ægr.* 9. " That, as he was walking, a " Pain ſeized him in the great Toe; he took his Bed the ſame " Day, being affected with a Shivering and Nauſea, and ſome-" what hotter than ordinary; at Night he was delirious. The " next Day, a reddiſh Tumor, with a Tenſion, aroſe over all " his Foot, and about his Ancle; he had an Eruption of " black Puſtules, with an acute Fever; and raved. Great " Quantities of a purely bilious Matter came away from him " by Stool; and he died the ſame Day, being the ſecond of his " Illneſs." The Caſe of *Phalacrus*, who was of *Lariſſa*, 3 *Epid. Sect.* 3. *Ægr.* 5. was as follows: " He was taken " on a ſudden with a Pain in his Right Thigh, which yielded " to no Remedies: The firſt Day an acute burning Fever came " on by ſlow Degrees, and unattended with Pains. The ſe-" cond Day the Pains of his Thigh remitted, but his Fever in-" creaſed, and he grew reſtleſs, and could not ſleep; his ex-" treme Parts were cold, and he made Plenty of Water, but " not of a laudable Kind. The third Day, the Pain in his " Thigh ceaſed, but he became highly delirious, with much " Reſtleſſneſs and Jactation of the Body. On the fourth Day, " about Noon, he died ſuddenly." In theſe two Patients the Pains of the Foot and the Thigh were of the worſt Kind, becauſe they aroſe at the firſt Commencement of the Diſorder; which Seaſon is by *Galen*, *Lib.* 1. *de Criſibus*, *Cap.* 8. reckoned the worſt for all Kinds of Pain; and were ſucceeded by an acute Fever, Delirium, Anxiety, Want of Sleep, and other dreadful Symptoms, indicating a Redundance of Humours, which affected different Parts, and produced a Variety of Diſeaſes and Symptoms. The ſame fatal Event had the Diſeaſe deſcribed 1 *Epid. Sect.* 3. *Ægr.* 12. when the Patient, being feveriſh, went to Supper; and, being taken very ill in the Night, after vomiting up all he had eaten, was ſeized with an acute Fever: After many ſevere and threatening Symptoms in the Progreſs of the Diſeaſe, on the tenth Day he was taken with a Pain in his Legs, which was ſucceeded by an Exacerbation of all the Symptoms; and the next Day he died. Another Inſtance to this Purpoſe is the Woman of *Thaſus*, 3 *Epid. Sect.* 3. *Ægr.* 2. who, being in Child-bed, was on the third Day, for want of her due Purgations, taken ill of a Fever: The twenty-ſeventh Day, being free from a Fever, ſhe was taken with a violent Pain in her Right Hip, which held her a long time; her Fever returned, her Urine became pale; after which ſhe ſtill grew worſe, and died on the eightieth Day.

Pains of the ignoble Parts are no leſs formidable, and to be ſuſpected when they vaniſh and become inſenſible on a ſudden, or when they begin in a remote Part, and thence remove towards the Viſcera; which indicates a Conflux of Humours to the noble Parts. The Author of the *Prorrhet. Lib.* 1. *T.* 170. pronounces " Pains *(about the Ears)*, ceaſing without a Criſis, a bad " Sign *." *Galen*, in his Comment on the Place, to *ceaſing* adds, *on a ſudden*; becauſe, he ſays, the Word καταμωλυθέντα, there uſed, imports " a gradual Ceaſing, or Solution; but dolo-" rific Affections becoming ſuddenly inſenſible, without a " manifeſt Abſceſs formed in ſome other Part, indicate a Tranſ-" lation of the bad Juices upon the Viſcera." Pains which vaniſh immediately after their Commencement, or violent Pains diminiſhed, are of very bad Signification, as indicating great Weakneſs of Nature, which is diſabled from expelling all the noxious Matter, or ſuch a Redundance of Humours, as the Part affected is incapable of containing; as *Galen* obſerves in the Caſe of *Crito* before-mentioned. To this Purpoſe, 1 *Prorrhet.* 36. we read, " that Pains in the Calves of the Legs [ſuddenly ceaſing without manifeſt Cauſe] " are ſucceeded by " a Delirium." And, *ibid. T.* 37. " If there appears a Cloud " in the Urine, after the ſudden Ceſſation of a Pain in the " Thigh, it portends a Delirium." Again, *ibid.* 97. " A " Pain of the Side, accompanied with bilious Spit, ceaſing on " a ſudden, without manifeſt Reaſon, prognoſticates Madneſs." This Event however, as *Galen* obſerves, does not always, nor for the moſt part, ſucceed ſuch a Suppreſſion; yet ſome other ſevere Diſorder, beſides a Delirium, may be excited by the Diverſion of the Humour to the Brain. We conclude, therefore, that Pains in the ignoble Parts ſuddenly ceaſing, or becoming quite inſenſible, are of a very bad Kind. No leſs are thoſe to be dreaded, which, being firſt excited in ſome Part remote from the Viſcera, aſcend afterwards to the upper Parts: On ſome Pains of this Kind *Hippocrates*, *Lib. Prognoſt.* makes the following Remarks: " Pains of the Loins, and the inferior Parts, " attendant on a Fever, if they leave thoſe Parts, and aſcend " to the Diaphragm, become highly pernicious: For which " Reaſon we are to take into Conſideration the other Signs; and, " if any one of theſe appears to be bad, the Caſe of the Patient " is deſperate; but if, upon the Tranſlation of the Diſeaſe to " the Diaphragm, no bad Signs can be perceived, there is good " Reaſon to expect an *Empyema*." A Recourſe then of the Humour from the inferior and remote Parts, to the ſuperior, is of bad Signification; which is farther confirmed by 1 *Prorrhet.* 69. where we are told, " that a Diſtortion of the Eye, from " the Recourſe, or Tranſlation, of a Pain, or Diſeaſe, from " the Loins, is a bad Sign." And, *ibid.* 83. " that a Pain " of the Loins recurring to the Mouth of the Stomach, and " attended with a Fever, Shiverings, Vomiting of much thin " and watry Matter, with a Delirium, and Loſs of Voice, " terminates in black Vomitings and Death." Again, *ibid.* 100. we read, that " Long and ſlow Pains of the Loins, " which extend themſelves about the Hips, and excite a Nau-" ſea and Fever, if communicated to the Head in an intenſe " Degree, ſoon become mortal, and the Patient dies in a " kind of Convulſions." And, *Coac.* 70. " that Pains in-" ſenſibly increaſing, if they communicate themſelves to the " Clavicles, and ſuperior Parts, become fatal." Pains then, in ſhort, which affect remote Parts, and ſuddenly ceaſe, or are tranſlated to the ſuperior Parts, are very dangerous; and, if attended with ſome bad Sign, mortal. And, laſtly, Pains in any Part of the Body, which are not felt by the Patient, are a very

* *Proſper Alpinus*, after *Galen*, reads this Aphoriſm without the Words παρ' ὃς, and ſo makes it a general Prognoſtic applicable to all Pain.

bad

bad Prognoſtic; as ſignifying a Delirium, or an Extinction of the ſenſitive Faculty. Theſe are the Sentiments of *Hippocrates*, who tells us, 2 *Aph.* 6. that "They who are affected with "Pain in any Part of their Body, but are, for the moſt part, "inſenſible of the ſame, are not in their right Mind." *Proſper Alpinus de Præſag. Vit. & Mort.*

With reſpect to Pain; *Aſclepiades* conſidered Pain as a principal Indication for Bleeding; for he thought Pain was cauſed by a Retention of the larger Molecules in the Pores or Paſſages, (ſee the Preface) which nothing but Bleeding could diſlodge. This Rule is excellent, whatever the Reaſon he gives for it may be; for it would be difficult to lay down a Maxim in Phyſic either more univerſal, or of greater Importance. See VULNUS.

DOMESTICUS, domeſtic, in Zoology, imports *tame*; and diſtinguiſhes Animals which are nouriſhed at home, from thoſe which are wild.

In Botany, it ſignifies *cultivated*; and diſtinguiſhes Plants which are improved by Cluture, from thoſe which grow wild.

In Pharmacy, ſome Purges are called domeſtic; which are ſuch as People keep at home, or may prepare themſelves, and may take occaſionally, without the Advice of a Phyſician.

DOMINARUM AQUA, the Name of a Water deſcribed by *Mynſicht*, which he recommends for facilitating Delivery, and provoking the Menſes.

DONAX. See ARUNDO.

DORA. A Name for the *Milium Arundinaceum, ſubrotundo Semine, Sorgho nominatum.* See MILIUM.

DORCADIZON, δορκαδίζων. The ſame as CAPRIZANS, which ſee.

DOREA. A Perſon who can ſee by Day, and not by Night, is thus called by *Rhaſes*.

DORIA.

The Characters are;

It hath a perennial fibroſe Root; the Leaves are almoſt whole, and oblong; the Cup of the Flower is cylindrical, and in form of a Tube; the Flowers grow upon the Summits of the Branches, and are diſpoſed either in form of an Umbel, or in a looſe Panicle, which are radiated like the Ragwort.

Boerhaave mentions fifteen Species of this Plant, which are;

1. Doria; Narbonenſium. *Boerh. Ind. A.* 98. *Herba Doria*, Offic. *Herba Doria Lobelii*, Ger. 349. Emac. 431. Raii Hiſt. 1. 279. *Herba Doria vulgaris*, Park. Theat. 541. *Doria*, Dill. Cat. Giſſ. 164. *Virga aurea major vel Doria*, C. B. 268. *Virga aurea major carnoſis ſucculentis foliis ad caulem latis.* Hiſt. Oxon. 3. 123. *Aliſma Matthioli ſive Doria*, J. B. 2. 1064. *Aliſma ſive Damaſonium, Doria & Virga aurea Monſpelienſium*, Chab. 333. *Jacobæa pratenſis altiſſima Limonii folio*, Elem. Bot. 387. Tourn. Inſt. 485. DORIA'S WOUNDWORT.

It grows on the Banks of Rivers, and flowers in *July* and *Auguſt*. The Leaves are uſed in Medicine. It is an excellent Vulnerary, and agrees in Virtues with Golden-rod. *Dale.*

2. Doria; quæ Jacobæa; foliis integris & mucronatis. *M. H.* 3. 110. *Jacobæa paluſtris, altiſſima; foliis ſerratis.* T. 485. *Virgæ aureæ ſive Solidagini anguſtifoliæ affinis, Lingua avis Dalechampii*, J. B. 2. 1064. *Lingua major*, Lugd. 1037. *Conyza paluſtris, ſerratifolia*, C. B. P. 266. DORIA WITH WHOLE SHARP-POINTED LEAVES.

Mr. *Ray* ſays he has found it in the Fen-ditches in the Iſle of *Ely*; and particularly near *Stretham* Ferry. I have ſought for it ſeveral times in vain.

Tabernæmontanus has a good Figure of this Plant. The *Hiſt. Lugd.* has a good Figure of it alſo, and deſcribes it very well, and compares its Flower, not without Reaſon, to that of the Ragwort. But the Figure of *Camerarius* and *Thalius* are good for nothing. *Martyn's Tournefort.*

3. Doria; quæ Jacobæa; Alpina; foliis longioribus ſerratis. *Boerh. Ind. A.* 98. *Conſolida Saracenica, Solidago*, Offic. *Solidago Saracenica*, Ger. 347. Emac. 429. Raii Hiſt. 1. 279. *Solidago Saracenica vera, ſalicis folio*, Park. 539. *Virga aurea anguſtifolia ſerrata*, C. B. 268. *Virga aurea, alias Conſolida Saracenica*, Schrod. 177. *Virga aurea anguſtifolia ſerrata, ſive Solidago Saracenica*, J. B. 2. 1063. Hiſt. Oxon. 3. 124. *Virga aurea anguſtifolia ſerrata, quibuſdam etiam Solidago Saracenica dicta*, Chab. 333. *Jacobæa Alpina, foliis longioribus ſerratis*, Tourn. Inſt. 485. Elem. Bot. 387. SARACENS CONSOUND.

It flowers in *September*. The Leaves are in Uſe, which are long, broad, crenated at the Edges, and of an aromatic and aſtringent Taſte.

It is an excellent Vulnerary, and fit to be uſed either internally or externally; it alſo heals Fiſtulas, and cleanſes and heals malignant Ulcers. *Dale* from *Schroder.*

4. Doria; quæ Jacobæa; Orientalis; Limonii folio. *T. C.* 36. *H. R. D.* EASTERN DORIA, WITH A SEA-LAVENDER-LEAF.

5. Doria; Americana; lato, rigido folio. *Virga aurea Novæ Angliæ, lato, rigidoque folio*, Par. Bat. M. H. 3. 125. *Virga aurea, ex Nova York, foliis ſymphyti majoris hirſutis*, Sc. Bot. Par. t. H. AMERICAN DORIA, WITH A BROAD STIFF LEAF.

6. Doria; quæ Jacobæa; Africana, fruteſcens; folio rigido & hirſuto, major. *H. A.* 2. 149. *H. R. D.*

7. Doria; Africana; arboreſcens; craſſis & ſucculentis foliis, atriplicem referentibus. *H. R. D.* AFRICAN TREE DORIA, WITH THICK SUCCULENT LEAVES, SOMEWHAT LIKE THOSE OF ATRIPLEX.

8. Doria; quæ Jacobæa; Africana; fruteſcens; craſſis & ſucculentis foliis. *H. A.* 2. 147. *H. R. D.* AFRICAN SHRUBBY DORIA, WITH THICK SUCCULENT LEAVES.

9. Doria; quæ Jacobæa; Africana; Hederæ Terreſtris folio; repens. *H. A.* 2. 145. *H. R. D.* AFRICAN CREEPING DORIA, WITH A GROUND-IVY-LEAF.

10. Doria; quæ Jacobæa; Africana; fruteſcens; Coronopi folio. *H. A.* 2. 139. *H. R. D.* AFRICAN SHRUBBY DORIA, WITH A HARTSHORN-LEAF.

11. Doria; quæ Jacobæa; Alpina; foliis rotundis, ſerratis. *C. B. Pr.* 66. *M. H.* 3. 110. *Jacobæa Alpina, foliis ſubrotundis, ſerratis.* C. B. P. 141. T. 485. *Conyza Alpina.* J. B. 2. 1055.

12. Doria; Alpina; foliis ſubrotundis, pedunculo folioſo.

13. Doria; quæ Jacobæa; Hiſpanica; folio Roſmarini. *T.* 486. *Jacobæa, folio Crithmi Littorei.* M. H. Blæſ. M. H. 3. 111. *Jacobæa, lini folio, Hiſpanica, & Italica.* Bocc. Muſ. p. 2. T. 49. a.

14. Doria; quæ Jacobæa; Latifolia, paluſtris; ſive aquatica. *Raii Syn.* 82. *Raii H.* 285.

15. Doria; quæ Jacobæa; lacus Agnani, facie ſenecionis; odore Fœniculi. *a. Boerhaave's Index alter Plantarum*, vol. 1. p. 98.

DORIS. A Name for the ECHIUM, in *Paulus Ægineta*, *L.* 7. *C.* 3. *Doridis Humor* is Sea-water, in *Serenus Samonicus.*

DORONICUM.

The Characters are,

It hath an intricate knotted Root: The Leaves are produced alternately on the Branches: The Stalks are a little branch'd: The Flowers (which grow on the Tops of the Stalks) are radiated, like the greateſt Starwort. The Half-florets, in the Diſk of the Flower, are trifid. The Cup of the Flower is expanded, and cut into many Parts, almoſt to the Bottom; and is not ſcaly, but each ſingle Segment is in the Form of a Diſh.

Boerhaave mentions five Species of this Plant; which are,

1. Doronicum; maximum; foliis caulem amplexantibus. *C. B. P.* 185. *M. H.* 3. 127.

2. Doronicum; Plantaginis folio; alterum. See ALISMA.

3. Doronicum; integro & craſſo hieracii folio. *Bot. Monſp.* 295. *M. H.* 3. 128. *Jacobæa integro & craſſo hieracii folio.* T. 486.

4. Doronicum; longifolium; hirſutie aſperum. *C. B. P.* 184. *M. H.* 3. 127.

5. Doronicum; Plantaginis folio; Luſitanicum. *T.* 488.

We are inform'd in the *Hiſtoria Plantarum*, publiſh'd under the Name of *Boerhaave*, that the celebrated *Geſner*, who was a very diligent Searcher into the Virtues of Plants, took ſome of this Plant in the Morning faſting, and two Hours afterwards wrote a Letter to his Friend, in which he ſaid, That he was then in good Health; but, ſoon after, it appear'd, by Letters from other Hands, that he was taken ill, and died an Hour after he had finiſh'd and ſent away the before-mention'd Letter to his Friend: Hence *Doronicum* came to be juſtly reckon'd among poiſonous Herbs. It has been diſputed, whether *Doronicum* ought to be admitted into the Compoſition of the *Theriaca: Matthiolus* was for its Admiſſion, and aſſerted, that it had no venomous Quality.

Beſides the foregoing Species of *Doronicum*, *Dale* mentions the three following; which are,

1. *Doronicum*, Offic. *Doronicum*, Cod. Med. 46. *Doronicum Officinarum*, Rupp. Flor. Jen. 141. *Doronicum vulgare*, Park. 319. Raii Hiſt. 1. 274. *Doronicum majus Officinarum*, Ger. 600. Emac. 759. Hiſt. Oxon. 3. 127. *Doronicum radice Scorpii*, C. B. 184. Dill. Cat. Giſſ. 83. Tourn. Inſt. 487. *Aconitum Pardalianches*, Mont. Plant. Var. Ind. 35. LEOPARDS-BANE. *Dale.*

The Roots of this *Doronicum* are, by ſome, fanſied to be like Scorpions in Shape, being thick towards the Head, and narrower towards the End, with ſeveral Fibres growing on each Side. The lower Leaves are ſet on long Foot-ſtalks, and are in Shape like Violet-leaves, of a pale-green Colour, hairy and ſoft in handling. The Stalk grows to be a Foot or more high, ſtriated, and ſomewhat hairy, having the like Leaves, ſet on without Foot-ſtalks. It is divided into two or three Branches, each of which has on its Top one pretty large yellow Flower, like a Chryſanthemum, or Marigold; but having narrower Petala,

which paſſes away into Down, including ſmall, long, black Seed. It grows in many Places upon the *Alps*, flowering in *May*.

The Root only is uſed, and that but ſeldom; ſome commending it againſt the Poiſon of Scorpions; others reckoning it a Poiſon itſelf, affirming, it will deſtroy Wolves, Dogs, and other Animals. They who have a mind to ſee the Arguments on both Sides, may conſult *Lobel* and *Matthiolus*. *Miller's Bot. Off.*

2. *Doronicum minus*, Offic. Ger. 600. Park. 319. Raii Hiſt. 1. 277. *Doronicum minus Officinarum*, Ger. Emac. 759. Hiſt. Oxon. 3. 127. *Doronicum Plantaginis folio*, C. B. 184. Tourn. Inſt. 487. *Doronicum folio ferè Plantaginis oblongo*, J. B. 3. 18. Chab 339. LESSER LEOPARDS-BANE.

Its Roots, eſpecially thoſe which are old, are Tubercles of about an Inch in Length, and about ſeven or eight Lines broad, vaulted on the Back, raiſed with ſome ſemicircular Ridges, like little Scales; their Tubercles may be compared for Shape to a Scorpion; for they are accompanied at each Rib with two or three Pair of rugged, and, as it were, ſcaly Pairs of Fibres, two or three Lines thick, ending in a Point, pretty like the Claws of a Scorpion: The Tail is repreſented by a long Fibre, which, however, is not crooked, but creeps, and ſerves to multiply the Plant. The Part oppoſite to the Tail prolongs itſelf after the manner of a ſcaly Neck, which ſuſtains a little Root, much like the firſt. Below theſe Roots grow Fibres, more or leſs ſmall, three or four Inches long, not very capillary: Theſe Roots are fleſhy, of a dirty white Colour, ſweet at firſt like Liquorice, but afterwards leaving a little Bitterneſs. The Leaves uſually proceed from the young Tubercles; their Pedicle is white, three or four Lines broad, hairy, then contracted to two Lines, furrow'd, pale-green, rounded and angular at the Back. Theſe Leaves are like thoſe of the common Plantain, veined in like manner, inſipid, mix'd with a little Acrimony, four Inches long, and three broad, ſoft, pale-green, ſcatter'd with very ſhort Hairs, and having the Edges waved, and lightly notched. The Stalks are about two Foot high, two or three Lines thick, chanelled, hollow, hairy, accompanied with ſome alternate Leaves, pretty diſtant one from another. Theſe Leaves encompaſs them with two Wings, like Ears; whereas the under ones have no Ears at all. The Leaves of the Stalks are uſually cut like a Heart on each Side; the laſt are very narrow, and pointed. Each Stalk ſuſtains a yellow Flower, two Inches in Diameter: The Diſk is convex, eight or nine Lines broad, compoſed of ſeveral Florets, three Lines high, fiſtular, cut like a Star, with five Points: They ſend from their Bottom a forked Thread; the Horns of which are crooked, and appear out of a chanelled Sheath: The Ray of this Flower conſiſts of Semiflorets, about nine Lines long, and a Line and half broad, blunt and notched at the End. From their Baſe alſo, which is fiſtular, ariſes a little forked Thread: Each of the Florets and Semiflorets ſits upon a greeniſh Embryon, which afterwards becomes a chanelled blackiſh Seed, one Line long, adorned with a whitiſh Down, two Lines and a half long. *Martyn's Tournefort.*

3. *Doronicum radice dulci*, C. B. Pin. 184. Chom. 313. Raii Hiſt. 1. 275. Tourn. Inſt. 487. *Doronicum folio ſubrotundo ſerrato*, J. B. 3. 17. Hiſt. Oxon. 3. 127. *Doronicum Brachiatâ radice*, Park. Theat. 320. *Doronicum radice repente*, Ger. 621. Emac. 760. CREEPING LEOPARDS-BANE.

The Hunters and Shepherds who live on the Mountains, and call this Plant by the Name of the *wild Goat's-root*, account it, together with the largeſt Sort of *Doronicum*, as effectual a Remedy againſt the Vertigo, as the *Auricula Urſi*, with a yellow Flower; and affirm it to be of extraordinary Uſe for confirming their Strength. *Raii Hiſt. Plant.*

DORPESTOS, δόρπηστος, or δορπηστὸς, Supper, or the Time of Supper.

DORPOS, δόρπος. The ſame as DORPESTOS.

DORSALIS TABES. A Species of Atrophy. See TABES.

DORSIFEROUS PLANTS, of *Dorſum*, the Back, and *fero*, to bear; ſuch Plants as are of the capillary Kind, without Stalks, and which bear their Seeds on the Backſide of their Leaves.

DORSTINEA. The Name of the Plant of which the *Contrayerva* is the Root.

It was ſo named by Father *Plumier*, from Dr. *Dorſten*, a *German* Phyſician, who publiſhed a Hiſtory of Plants in Folio.

The Characters are,

It hath a thick fleſhy Placenta, which is flat, and ſituated vertically; upon which are placed many apetalous Flowers, which are ſucceeded by roundiſh Seeds, ſomewhat like thoſe of Gromwell.

The Species are,

1. *Dorſtinea dentariæ radice, Sphondylii folio, Placenta Ovali*, Houſt. CONTRAYERVA WITH A TOOTHWORT-ROOT, COW-PARSNIP-LEAF, AND AN OVAL PLACENTA. This is the Plant already mentioned under the Name of *Contrayerva Radix* of *J. Bauhine*.

2. *Dorſtinea dentariæ radice, folio minus laciniato, Placenta quadrangulari & undulata*, Houſt. CONTRAYERVA WITH A TOOTHWORT-ROOT, LESS JAGGED LEAF, AND A QUADRANGULAR UNDULATED PLACENTA.

3. *Dorſtinea Sphondylii folio ſerrato, Placenta quadrangulari; radice dentariæ*. CONTRAYERVA WITH A TOOTHWORT-ROOT, SAWED COW-PARSNIP-LEAF, AND A QUADRANGULAR PLACENTA. This is the Plant already mentioned under the Name of *Contrayerva Officinarum*.

The firſt of theſe Plants was diſcovered by the late ingenious Dr. *William Houſtoun*, near *Old Vera Cruz*, in *New Spain*. The ſecond was found by the ſame Gentleman, on the rocky Ground about *Campechy*. The third Sort was found in great Plenty in the Iſland of *Tobago*, by Mr. *Robert Millar*, Surgeon. But the Roots of all theſe Species are indifferently brought over, and uſed in Medicine, and for Dying.

Theſe Plants are at preſent very rare in *Europe*; nor was it known what the Plant was whoſe Roots were imported, and had been long uſed in Medicine in *England*, until the late Dr. *Houſtoun* informed us; for although Father *Plumier* had diſcovered one Species of this Plant, and given the Name of *Dorſtinea* to the Genus, yet he ſeems not to take notice, that the *Contrayerva* was the Root of that Plant. *Miller's Dictionary, Vol.* 2.

DORSUM. The Back.

What we commonly call a Gibboſity, is a preternatural Incurvation of the Spine of a Back, either to the poſterior, or lateral Parts. This Misfortune is more incident to Infants, than to Adults; and more frequently draws its Origin from external, than from internal Cauſes; for it is ſcarce poſſible, but the ſoft and tender Bones of Infants muſt be violently hurt and diſtorted by Falls, and ſevere Blows, and by wearing too tight Stays, and other Garments. This Diſorder may alſo ariſe from internal Cauſes; when, for Inſtance, thoſe Ligaments which ſuſtain the Back, are become too lax and flaccid; or when the Vertebræ themſelves are become carious; though *Gouey*, in his Surgery, furniſhes us with a memorable Example of the Poſſibility of a ſignal Diſtortion and Incurvation of the Back, in conſequence of a preternatural Contraction of the Muſcles of the Abdomen. And, certainly, unleſs this Species of Diſorder be ſpeedily relieved, the ſmall diſtorted Bones of the Back are gradually indurated, and aſſume a Figure and Attitude ſo much deform'd, that 'tis impoſſible ever after to reſtore them to their natural Situation; ſo that 'tis not to be wonder'd at, if inveterate Gibboſities are generally entirely incurable: But, when proper Meaſures are ſeaſonably and ſpeedily taken, this Diſorder ſometimes admits of a Cure, or, at leaſt, becomes more mild and tolerable.

In Caſes of this Nature, the moſt effectual Relief is obtain'd from Stays, made either of Plates of Iron, thick Paper, or Whale-bone, and arm'd with proper Truſſes, eſpecially in the Part where the Gibboſity appears. This ought to be worn by Infants both Day and Night, till there remains no Danger of the Diſorder becoming worſe, and more terrible. Surgeons have alſo invented an Inſtrument on purpoſe for this Diſorder, reſembling the Figure of a particular Species of Croſs, and repreſented by *Fig.* 5. in *Tab.* 45. The Part A A being applied to the Back, B B to the Neck, C C and D D to the Shoulders, and E E being tightly tied about the Belly, the Spine of the Back is by this means kept ſtraight, and defended againſt farther Injury. By theſe Meaſures Children are either gradually reſtored to their former Shape, or, at leaſt, preſerv'd from greater Degrees of Calamity and Deformity. It is alſo highly expedient, in Caſes of this Nature, carefully to anoint the Part with *Hungary Water*, Spirit of Lavender, the *Spiritus Matricalis*, deſcrib'd in the *Leyden Diſpenſatory*, or ſome other corroborating Spirit. It is alſo to be carefully cover'd with ſome corroborating Plaiſter, ſuch as Oxycroceum, Opodeldoc, the *Emplaſtrum Nervinum* of *Vigo*, or others of a like Nature; not neglecting, in the mean time, proper internal Medicines, accommodated partly to ſtrengthen the weak and infirm Members, and partly to evacuate the ſuperfluous and peccant Humours. Theſe Meaſures, unleſs the Diſorder is inveterate, are generally of ſingular Service in reſtoring Incurvations and Diſtortions of the Back. *Heiſter. Inſtitut. Chirurg.*

DORYCNIUM.

The Characters are,

The Leaf is divided into five Segments, quite to the Pedicle, ſo as to appear like five Leaves; the Pod is ſhort, and contains only one Seed, like the *Barba Jovis*.

Boerhaave mentions but one Species of this Plant; which is,

Dorycnium Monſpelienſium, *Lob. Ic.* 51. *Dorycnium Monſpeſſulanum, fruticoſum*, J. B. 1. 388. *Lotus Polyceratos, frutescens, incana, filiculis ſubrotundis, erectis*, M. H. 2. 178. *Trifolium, album, anguſtifolium, floribus velut in capitulum congeſtis*. C. B. P. 329. H. R. D. SHRUB TREFOIL OF MONTPELIER. *Boerh. Ind. alt. Plant. Vol.* 2.

It grows in rocky Places near *Montpelier*. *Ray*.

DORYCNIUM IMPERATI. A Name for the *Convolvulus, major, rectus*; *Creticus*; *argenteus*; which ſee.

DOSIS, δόσις, from δίδωμι, to give. A Doſe. The Quantity of a Medicine exhibited at one time.

DOSITHEI PASTILLUS. The Name of a Paſtil in *Aetius*, *Tetrabib.* 3. *Serm.* 1. *C.* 63. and in *Nicolaus Myrepſus*, *Sect.* 41. *C.* 78.

DOTHIEN, δοθιήν. A Boyl, a kind of inflammatory Tumor. The ſame as FURUNCULUS.

DOUGLASSIA. This Plant was ſo named by the late Dr. *William Houſtoun*, in Honour of Dr. *James Douglas*.

The Characters are,

It hath an anomalous Flower, conſiſting of one Leaf, whoſe lower Part is tubulous; but the upper Part is expanded, and divided into five Segments. The Fruit, which is roundiſh, is divided into two Parts, which contain two Seeds.

There is but one Sort of this Plant at preſent known, which is,

Douglaſſia fruteſcens & ſpinoſa, Liguſtri folio, flore albo. Houſt. *Paliuro affinis liguſtrifolia ſpinoſa, flore monopetalo diſformi, fructu ſicco ſubrotundo.* Sloan. Cat. Jam. SHRUBBY PRICKLY DOUGLASSIA, WITH A PRIVET-LEAF, AND A WHITE FLOWER. *Miller's Dictionary*, *Vol.* 2.

DRABA. A Name for the *Thlaſpi*. *Lepidium*. *Leucoium*, and ſeveral ſorts of *Heſperis*.

DRACATIUM, Lead. *Rulandus*.

DRACHMA.

The *Greeks* made uſe of *Drachmæ* in reckoning Sums, either in their own or *Roman* Affairs; as the *Romans* did of *Nummi Seſtertii*, of which there are many Examples in all Authors, eſpecially in *Plutarch*.

A *Drachm* is the hundredth Part of a *Mina*.

Δραχμὴ, *quaſi* δραγμὴ, is a Thing taken or apprehended by the Hand, from δράσσομαι· or, as you would ſay, a Handful of ſix *Oboli*, which are equal in Value to it.

It is a Weight, as well as a Coin. The *Attic Drachm* is commonly reputed equal in Value to the *Denarius*; and, as amongſt the *Romans* the *Denarius*, ſo amongſt the *Greeks* the *Drachma*, was coin'd both of Silver and Gold: But, in reckoning Sums, where it is not otherwiſe ſpecified, the Silver Coin is underſtood.

The learned Biſhop *Hooper* makes the Value of the *Attic Drachma* different in different Ages; and the higheſt, according to the Weight of the Standard *Mina* of *Solon* 68,4 Grains; but he owns, that it fell afterwards to about the Value of 62,57. And upon this *Drachma*, and the Equality of it to the *Roman Denarius*, almoſt all the Computations in claſſical Authors are founded; which we did not think worth the while to change or diverſify in a few Inſtances, that may be in earlier Times. But if this Suppoſition be true, and the Reader of antient Authors is reſolved to be nice, the Value of the ſeveral Drachmas, according to the Biſhop's Suppoſition, from 70 Grains downwards, is as follows:

Weight.	Value.	
gr.	d.	q.
70	8	3
68,4	8	2 1/2
65,5	8	0 1/4
62,57	7	3 3/7

The *Drachma* was divided into 18 κεράτια, or *Siliquæ*, as well as into 6 *Oboli*. There were different *Drachms* in different Countries.

The *Drachma Æginæa* is commonly reckon'd to be equal to 1 1/2 of an *Attic Drachm*, or 10 *Attic Oboli*. The *Athenians* call it παχεῖαν, or thick. It was the Pay of a Horſeman even amongſt the *Athenians*. There is frequent Mention of it in *Hippocrates*.

There is mention likewiſe made of the *Corinthian Drachm*; but its Value is uncertain: It is ſuppoſed by ſome Authors equal to the *Attic*.

The *Egyptian Drachm*, according to *Cleopatra*, was equal to an *Obolus*, or ſixth Part of the *Attic Drachm*.

There were coin'd likewiſe the Parts and Multiples of a *Drachma*, the *Semidrachma*, *Didrachmum*, *Tridrachmum*, and *Tetradrachmum*, which was call'd the Γλαῦξ, or Owl; likewiſe *Pentadrachmum*, and *Hexadrachmum*. In ſome Authors you find the Word *Pentecontadrachmum*, or 50 *Drachms*; which, if it were a ſilver Coin, muſt have been very large.

When the Word ἀργυρεῖον is joined with a Number, it is to be underſtood of *Drachms*.

A *Drachma* was 1/96 of the Ounce, and 1/6000 Part of a Mina; though, perhaps, this Way of Reckoning by Ounces and *Drachms* was borrowed by the *Greeks* from the *Romans*; for the old Diviſion of the *Drachma* was into 6 *Oboli*. *Suidas* δραχμὰ ἓξ ὀβολῶν. The *Didrachmum*, *Hemidrachmum*, &c. expreſs'd Weights, as well as Coins. The *Greeks* uſed the Expreſſion τρίτον ἡμιδραχμον, to ſignify 2 1/2 *Drachms*, as well as τρίτον ἡμιτάλαντον.

Hippocrates divided the *Drachma* (which I will ſuppoſe to be the *Attic*, except where he mentions another) into 6 *Oboli*, according to the uſual manner of reckoning in *Greece*; and, no doubt, in Imitation of him, *Celſus* divides the *Denarius*, which was always ſuppoſed equal to the *Drachma*, into ſix Parts.

The learned and accurate Dr. *Hooper*, Biſhop of *Bath* and *Wells*, has obſerved, that the Phyſicians made their Preſcriptions by *Drachmas*; not according to the Standard-weight, but by the current Coin of their Time. He ſuppoſes, indeed, the *Denarius* to have been equal to 64 Grains: According to my Computation, it is only 62 22/29: Perhaps, he is in the Right. There is ſome ſmall Difference between us in the *Engliſh* Weights; for he aſſumes a different Proportion of the *Engliſh* Averdupois Pound to the *Troy* Pound. It is allowed, that the *Roman* Ounce is equal to the Averdupois Ounce; and, conſequently, the *Roman* Pound, conſiſting of 12 Ounces, and the Averdupois of 16, the *Roman* Pound muſt be, according to both Reckonings, 3/4 of the Averdupois Pound: But he makes the Proportion of the Averdupois Pound to the *Troy* Pound, 175 to 144; perhaps a more accurate Proportion than mine. According to Dr. *Wibert*, whom Sir *Jonas Moor* quotes as very accurate, it is only as 17 to 14; and, conſequently, the Averdupois, or *Roman* Ounce, to the *Troy* Ounce, is as 51 to 56. According to the Biſhop, there are in the *Roman* Ounce 437,5 *Troy* Grains.

The *Paris* Pound conſiſts of 16 Ounces, of which the Ounce is equal to 472,5 *Engliſh Troy* Grains. The Phyſicians reckon to their Pound 12 of thoſe Ounces: Conſequently, their medical Pound is equal to 5670 *Troy* Grains, and leſs than ours by 90 Grains; and their Ounce leſs by 7 1/2; and their *Drachm*, which is the eighth Part of their Ounce, is leſs than ours by 11/16 of a Grain. But they reckoning 576 Grains in their Ounce, makes ſtill a greater Difference in the Quantity of the Grain; for 105 of our Grains make 128 of theirs. *Arbuthnot on Weights and Meaſures.*

DRACHUM is an obſcure Term in *Paracelſus*, *Philoſoph. Lib.* 4. *Tract.* 1. *Cap.* 3. *in Fin.* It ſeems to import the ultimate Diſſolution of the Element of Water, or its Conſumption. *Caſtellus.*

DRACO.

The Characters are,

The Leaves, which are like thoſe of Hyſſop, are produced alternately on the Branches, the lower being divided, and the upper ones whole: The Flowers are ſmall, diſcous, and diſpoſed in a long Spike.

Boerhaave mentions but one Species of this Plant; which is,

Draco Herba, *Ger.* 193. *Emac.* 249. *Hiſt. Oxon.* 3. 33. *Boerh. Ind. A.* 127. *Raii Hiſt.* 1. 373. *Dracunculus*, Offic. *Dracunculus hortenſis*, C. B. 98. *Dracunculus hortenſis ſive Tarchon*, J. B. 3. 184. Chab. 168. *Draco Herba, ſive Tarchon, & Dracunculus hortenſis*, Park. Parad. 500. *Abrotanum Lini folio acriori & odorato*, Tourn. Inſt. 459. *Abrotanum mas Lini folio acriori & odorato*, Elem. Bot. 364. TARRAGON.

Tarragon ſhoots up a great many round Stalks, full of Branches, cloathed with long narrow Leaves, like thoſe of Hyſſop, but ſharper pointed, ſmooth, and ſhining. On the Top of the Stalks grow the Flowers, ſmall and greeniſh, reſembling thoſe of Southern-wood, but fewer in Number, and thinner ſet, and upon longer Foot-ſtalks. The Leaves have a pretty ſtrong Smell and Taſte, ſomewhat like Fennel: It is planted in Gardens, flowering in *July* and *Auguſt*.

The Leaves, which are chiefly uſed, are heating and drying, and good for thoſe who have cold Stomachs; and to that End are frequently put into Sallads: It expels Wind, provokes Urine, and the Menſes, but is not often uſed in Medicines. *Miller's Bot. Off.*

As this Plant is endu'd with an extraordinary Acrimony, we cannot doubt but that it powerfully heats, dries, cuts, opens, and digeſts. *Tarragon*, therefore, as *Matthiolus* writes, muſt be good for a cold Stomach: It excites an Appetite, diſſipates Flatulences, ſtrengthens the Limbs, provokes Urine and the Menſes, and opens Obſtructions. Being chewed, it draws forth Phlegm and Spittle, like *Pyrethrum*; whence it eaſes the Tooth-ach, and purges a humid Brain. The diſtil'd Water, according to *Lobel*, is in principal Eſteem among the *Engliſh* againſt the Contagion of the Peſtilence, provokes Sweat, and concocts Phlegm. If we well conſider the Acrimony of this Herb, which is extremely vellicating to the Tongue, we cannot deny it a Place among the moſt potent heating Medicines. *J. B. Ray*, *Hiſt. Plant.* 373.

Draco marinus Offic. Bellon. de Aquat. 215. *Draco*, Jonſ. de Piſc. 60. Charlt. de Piſc. 27. Aldrov. de Piſc. 255. Rondel. de Piſc. 1. 300. *Draco*, Geſn. de Aquat. 77. Salv. de Aquat. 72. Raii Icht. 288. Ejuſd. Synop. Piſc. 91. THE WEAVER.

This

This Fiſh is taken in the Ocean, and alſo in the *Mediterranean* Sea. The Parts uſed, are the Head, newly burnt to Aſhes, and the Bones. *Rondeletius* affirms, that the Aſhes of the Head, newly burnt, are good againſt all Poiſons; and *Pliny* writes, that the Tooth-ach is eaſed by ſcarifying the Gums with the Bones of the Fiſh.

Draco, ſylveſtris. A Name for the *Ptarmica*; *vulgaris*; *folio longo, ſerrato*; *flore albo.*

DRACOCEPHALO-AFFINIS. A Name for the *Moldavica*; *Americana*; *trifolia*; *odore gravi.*

DRACOCEPHALON.

The Characters are;

The Calyx is long and tubulous, and the Leaves narrower than thoſe of the Peach-tree: The Galea is hollow, entire, opening and ſhutting; the Beard divided into three Segments, which are bifid, in the manner of Jaws, ſo that the Flower repreſents the open Jaws of a Dragon, or rather, the Flower of Fox-glove. The Flowers grow in thin Whorles, two or three in a Whorle, at the Joints of the Stalks.

Boerhaave mentions but one Species of this Plant, which is the Dracocephalon; Americanum. *Breyn. Prodr.* 1. 34. *Dracocephalus, anguſtifolius, folio glabro, ſerrato.* M. Par. *Digitalis, Americana, purpurea, folio ſerrato.* A. R. Par. 79. H. AMERICAN DRAGON'S HEAD.

Boerh. Ind. alt. Plant. Vol. 1. *p.* 176.

DRACONIS SANGUIS, Dragon's Blood. This is the Gum of of the

Draco Arbor, Ger. 1339. Emac. 1523. Park. Theat. 1531. J. B. 1. 402. Chab. 30. C. B. Pin. 505. Raii Hiſt. 2. 1598. Jonſ. Dendr. 288. *Ezquahduitl*, Hern. 59. *Palma Pruniſera foliis Yuccæ, fructu in racemis congeſtis, ceraſiformi, duro, cinereo, piſi magnitudine; hujus Lacryma Sanguis Draconis dicta*, J. Comm. Hort. Amſt. 261. Cat. Jam. 179. Sloan. Hiſt. 1. 20. Pluk. Almag. 277. Hort. Beaum. 33. *Palma foliis longiſſimis, pendulis abſque ullo pedunculo ex caudice glabro enatis*, Boerh. Ind. A. 2. 169. THE DRAGON-TREE.

This Tree grows in the Iſland of *Porto Santo*, which is one of the *Canaries*, and in *Madera*. Dragon's Blood is an obſcure, red Reſin, eaſily melted by the Fire, and kindling into Flames when caſt into it: When rubbed, it appears of a red ſanguine Colour: It has a reſinous and aſtringent Taſte. There are two Kinds to be met with in the Shops, which differ only in being more or leſs pure: The moſt eſteemed is what is imported in Drops, wrapt up in Leaves.

It is a potent Drier, Aſtringent, and Repellent: Its principal Uſe is external, in drying up Defluxions, ſtopping Hæmorrhages, conglutinating Wounds, and faſtening looſe Teeth. *Schroder.* The Learned generally take the *Sanguis Draconis* of the Moderns, for the Cinnabar of *Dioſcorides*; the Cinnabar of the later Antients is *Minium*, *Raii Hiſt. p.* 1598. *Ray*, as well as *Parkinſon*, reject, as a mere Fable, what *Monardus* relates, of the Figure of a Dragon, naturally impreſſed on the Fruit of this Tree. *Dale.*

Sanguis Draconis, taken inwardly, is a very great Aſtringent and Drier. The late *Helvetius* melted it with powder'd Alum, and then made them into Pills for Diarrhœas, Hæmorrhages, and the like; but the Patient ought firſt to be prepared by Bleeding, and other due Management. It is entirely ſoluble in Spirit of Wine. The *Dutch* counterfeit it, with Gum Arabic and Alum diſſolved in Water, with *Braſil* Wood to give it the true Colour; but this factitious Kind ought not to be taken inwardly, tho' it be very proper for Painters. *Geoffroy.*

The Dragon's Blood, produc'd by the Tree above-mention'd, is eſteem'd the coarſeſt: But a better Sort is produc'd by the *Draco Arbor Indica ſiliquoſa, Populi folio, Angſana vel Angſava Javanica.* Commelin. Hort. Amſt. See ANGSANA. This *Commelinus* will have to produce the Dragon's Blood in Drops, tho' others much doubt it; as believing it to come from the *Arundo farcta Indiæ Orientalis Sanguinem Draconis manans*, Hiſt. Oxon.

The *Sang. Dracon. fundens foliis & caudice undique Spinis nigris armata* D. Sherrard. is another Plant, which affords a third Sort of Dragons Blood. This bears a ſmall ſcaly Fruit, which being infuſed in hot Water, it extracts a red Matter from it; which ſubſiding, and the Water evaporated, is made up in thoſe ſmall Lumps we call Drops, wrapt up in Palm-leaves. *Miller's Bot. Off.*

DRACONIS SANGUIS, or *Herba Draconis*, is a Name for the *Lapathum*; *folio acuto, rubente.*

DRACONITES, DRACONTIAS, DRACHATES, δρακοντίας λίθος· a precious Stone, generated of the Brain of a Dragon; but, unleſs the Head be cut off while the Animal is alive, no Gem is produced; for which Reaſon, they cut it off, while the Dragon is aſleep. *Solæus*, who writes that he ſaw this Gem in the King's Poſſeſſion, relates, that they go a hunting for it in Chariots, and, when they ſee the Dragon, ſcatter ſoporific Drugs, and ſo take the Opportunity to cut it off; it is of a tranſparent Whiteneſs, and will not admit of Poliſhing or Art. *Pliny, Lib.* 37. *Cap.* 10. The *Draconites* is alſo pretended to be ſometimes found in the Heads of *Hydri* and *Chelydri*, Kinds of Water-ſerpents.

Rulandus aſcribes to it a Virtue of expelling all Poiſons, and curing all venomous Bites. But the Whole is either a Fable, or an Impoſture.

DRACONTHEMA; from δράκων, a Dragon; and αἷμα Blood; the ſame as *Draconis Sanguis*, which ſee.

DRACONTIA, DRACONTIUM, the ſame as DRACUNCULUS, which ſee.

DRACONTIDES, δρακοντίδες. A Name given, as *Ruffus Epheſius* ſays, to ſome Veins proceeding directly from the Heart. *Ruffus Epheſius, Lib.* 1. *Cap.* 33.

DRACONTIUM. A Name for the *Dracunculus, polyphyllus*, which ſee.

DRACUNCULI. Small long Worms, which breed in the muſcular Parts of the Arms and Legs, call'd *Guinea* Worms.

Plutarch, in his *Sympoſiacs, L.* 8. *C.* 9. quotes *Agatharchides* for an Account of theſe Animals, which, he ſays, the People about the *Red Sea* were, at a certain time, very much afflicted with. *Plutarch* calls them δρακόντια μικρά, which, he ſays, were bred in the Arms and Legs, and which put out their Heads, and, upon being touch'd again, hid themſelves in the Muſcles, and caus'd an intolerable Inflammation.

Agatharchides liv'd in the Reign of *Ptolemy Philometor*, who began to reign A. M. 3770. *Voſſius de Hiſtor. Græc. Strabo L.* 14. *Le Clerc. M. H.*

Dr. *Freind* is therefore miſtaken, when he ſays *Aetius* is the firſt, that gives any Account of the *Dracunculi.*

The *Dracunculus* reſembles a common Worm; is ſometimes great, ſometimes ſmall; is moſt commonly found in the Legs, but ſometimes in the muſcular Parts of the Arms. They are generated in *Ethiopia* and *India*, and principally affect Children; and their Generation is not unlike that of the broad Worms of the Belly. While they move under the Skin, they create no Trouble; but, in Length of Time, the Place near the *Dracunculus* ſuppurates, and the Animal puts forth his Head. If it be drawn, it excites a violent Pain, eſpecially if you draw it ſo forcibly as to break it off; for the Part left within, creates moſt intolerable Torment. To prevent, therefore, the *Dracunculus* from recurring, or ſlipping back, the Arm muſt be ty'd with a ſtrong Thread, which muſt be repeated every Day, that the Animal, proceeding forwards by degrees, may be included within the Ligature, and not be ſubject to be broken off. During this, the Place is to be fomented with Hydromel, and Oil, in which Wormwood or Abrotanum hath been boiled; but all acrimonious things are to be avoided, for fear of an Inflammation. *Aetius, Tetrab.* 4. *Serm.* 2. *Cap.* 85. from *Leonidas.*

In *India*, and the Countries above *Egypt*, certain ſmall Animals, like Worms, called *Dracunculi*, are generated in the muſcular Parts, as the Arms, Thighs, and Legs; and in Children they lodge in the Sides, under the Skin, and manifeſtly appear to move. In Proceſs of Time, the Place near one End of the *Dracunculus* ſuppurates, and the Skin opening, the End of the *Dracunculus* appears; but, if you attempt to draw it, a Pain is excited, and, eſpecially, if it happens to be broken off. Some, therefore, adviſe, to hang a Bit of Lead to the *Dracunculus*, that the Weight thereof may extract it not precipitately, but after a ſlow and gentle manner. Others condemn this Method, becauſe the *Dracunculus* is no leſs ſubject to be broken off by the Weight of the Lead, and alſo cauſes a violent Pain; for which Reaſons, they adviſe, to put the Part affected into warm Water, the Heat of which may force the *Dracunculus* to ſhew itſelf, and afford an Opportunity of extracting it Piece-meal, with the Fingers.

Soranus ſuppoſes the *Dracunculus* to be nothing of an Animal, but a Concretion of ſome Nerve; and that it has only an imaginary Motion: But whether this, or the former Opinion, be the Truth, it is the Advice of *Soranus, Leonidas*, and others, in ſuch Caſes, to make uſe of Affuſions of warm Water, and digeſtive Cataplaſms, prepared of Hydromel and Wheaten or Barley-meal; and they approve of a Plaiſter of the ſame Nature to be ſometimes apply'd: A proper Plaiſter for this Purpoſe, is one compoſed of Bay-berries and Honey. By the Uſe of theſe Applications, the *Dracunculus*, or whatever be the Subſtance contained in the Part, is mortify'd, and falls out; but, if it falls not out after Suppuration, the Part is to be lanced; and, being laid open, the Contents are to be removed; after which, the Place is to be dreſſed with Lint, and the Cure accompliſh'd by the Method of Suppuration. *P. Ægineta, Lib.* 4. *Cap.* 59.

The Worm is, ſometimes, extremely long, commonly of ten or fifteen Palms Length: *Albucaſis* tells us, he ſaw one of twenty; and *Rhaſes* mentions a Caſe, where a Perſon had forty of theſe Worms in his Body, and recover'd; *Avicenna* ſays fifty. Several Paſſages we may find, to the ſame Purpoſe, in modern Hiſtorians. The *Arabians* call it *Vena Medinenſis*; *Vena*,

Vena, becauſe they doubted, as *Soranus* did before, whether it was a living Animal, or rather ſome concreted Subſtance, like a Nerve; and *Medinenſis*, from its being frequent at *Medina*: And therefore *Avicenna* treats of it, not amongſt Worms, but amongſt Abſceſſes. In this, certainly, they are miſtaken; and *Leonidas*, in direct Terms, calls it an Animal. The *Vena Medinenſis* is miſtaken by many, and by Mr. *Le Clerc* himſelf, in his Supplement, for another Diſtemper deſcrib'd by the *Arabians*, the *Affectio Bovina*; which is a little Worm, and often found in Cows. But *Aetius* plainly diſtinguiſhes the two Sorts, large and little; and *Albucaſis* has two ſeparate Chapters, concerning theſe two Diſeaſes; and the Deſcription he gives of them is very different.

This Diſtemper is often attended with a Fever, for two or three Days; and ſometimes brings on terrible Symptoms, and ends in Abſceſſes, which require many Months to cure them. It is very common in *Guinea*, and, principally, amongſt the Natives: *Kempfer* found it ſo too at *Ormuz*, upon the *Perſian* Gulf; and therefore calls it *Dracunculus Perſarum*; and not only there, but in *Tartary*. He obſerves, that the Diſeaſe prevails moſt in the hotteſt Climates, and in the hotteſt Weather; and attributes the Production of theſe Worms to the ſtagnating Rain-water, which is ſo much made uſe of in theſe Countries. It is eaſier, he ſays, to be cur'd in the Climate it is bred in. He ſaw this Worm twice alive; and deſcribes the manner of extracting it, at large; which is much the ſame as the Surgeons now uſe in the *Weſt Indies*, with the Blacks.

To preſerve ourſelves from the *Dracunculus*, Regard is to be had to the Country where, and the Food of which, it is generated; and ſuch means are to be uſed, as are deſtructive of its Cauſe: Theſe are, Evacuation of the corrupted Blood, by opening the Baſilic Vein, or the Saphena, near the Part affected, with Adminiſtration of proper Cathartics; ſuch as Syrup of Myrobalans, Decoction of Epithymum, *Pilulæ Cochiæ*, and Tryphera, prepared with Sena and Fumitory. The Body is alſo to be moiſten'd with proper Food, Bathing, and a Regimen in other Points ſuited to that Purpoſe.

As ſoon as the *Dracunculus* is diſcover'd by evident Signs, it will be adviſeable, after Purging, and the Application of Leeches, to refrigerate the Part with cooling and moiſtening Cataplaſms; ſuch as thoſe prepared of the known cooling, expreſſed Juices, with Sanders and Camphire. Among Remedies by way of Inunction, there is a good Liniment prepared of Aloes, Sanders, Camphire, or Myrrh, the Seed of *Pſillium*, [Fleawort] and new Milk. If the Part be not pained, but yet a Veſicle is excited, it is ſometimes repreſſed, and vaniſhes, and the Patient is relieved, by taking a Dram of Aloes every Day, for three Days together; or by taking half a Dram the firſt Day, a full Dram the next, and a Dram and half the third Day; and by the Application of Aloes, or the viſcid Juice of recent or green Aloes to the Part, or to the Orifice at which the *Dracunculus* appears. If theſe Remedies prove ineffectual, and the *Dracunculus* comes forth, it will be proper to provide ſomething, to which you may tie it, and on which it may gently roll itſelf, by degrees, till it be all come forth, without breaking. The moſt convenient thing, on which it can roll itſelf, is a Piece of Lead, of a juſt Weight, to draw in ſo gentle a manner, as not to break off what is faſten'd to it. The utmoſt Care is to be taken to render its Paſſage eaſy, by ſtrengthening the Member, and opening the Pores, by fomenting it with warm Water, refrigerant Mucilages, and emollient Oils, endu'd with a Coolneſs, and a ſubtile Heat, and whatever other things are, for the like Reaſons, qualify'd to promote its Egreſs. Sometimes theſe Means will not anſwer the Purpoſe; and therefore we muſt have recourſe to Liniments prepared of *Oleum Cheirinum*, [Oil of the *Viola lutea*] *Oleum Jaſminum*, [Oil of Jeſſamy] or *Balaninum*, [Oil of the Ben-nut] applying thereon a Plaiſter of Pitch. If the Place ſeems to require Opening, in order to take out the *Dracunculus* entire, and nothing forbids, let it be opened, and the *Dracunculus* extracted; but if its Egreſs be not facilitated by the Method before deſcrib'd, and the Opening be impracticable, attempt the Suppuration of it with Butter; for, by this means, it will all be putrefy'd, and ſo come away. But avoid the Uſe of acrid Medicines, by which the Sore has been, ſometimes, converted into a *Phagedæna*. Moreover, if you rub its Extremities gradually, every Day, with Salt, or uſe gentle Frictions of its hinder Parts, or if the Place whence it proceeds, be tenderly and ſkilfully anointed, it will come away entire: And the Effect will be more certain, if an Inciſion be made, according to the Length of the *Dracunculus*, and it is looſen'd and rais'd, by introducing a Probe under it; and the Place, while you are removing it, is continually abſterged, in a tender and gradual manner, with Salt; for, by this Method, you will be entirely deliver'd from it: But if it breaks, and, retiring, lies conceal'd, the Place is, without the leaſt Scruple, to be lanced, that you may again take hold of it, and gently extract it; which done, the Place muſt be treated like other Wounds. *Avicenna.*

The modern Accounts of theſe *Dracunculi* agree pretty exactly with thoſe already ſpecify'd: Thus Dr. *Towne*, in his Treatiſe of the Diſeaſes of the *Weſt Indies*, informs us, that this Diſtemper is not ſo frequent any-where, as on the Gold-coaſt, about *Anamboe* and *Cormantyn*.

This Worm is white, round, long, and uniform, very much reſembling white round Tape, or Bobbing; nor have I ever ſeen any of them broad and flat, as they are deſcrib'd by Authors. It is lodged between the Interſtices and Membranes of the Muſcles, where it inſinuates itſelf to a prodigious Length, ſometimes exceeding five Ells. It occaſions no great Pain in the Beginning; but, at ſuch time as it is ready to make its Exit, the Part adjoining to the Extremity of the Worm, where it attempts its Excluſion, begins to ſwell, throb, and be inflam'd: This generally happens about the Ancle, Leg, or Thigh, and rarely higher.

The Countries where this Diſtemper is obſerved, are very hot and ſultry, liable to great Droughts; and the Inhabitants make uſe of ſtagnating corrupted Water, in which it is very probable that the Ova of theſe Animalcula may be contained; for the white People, who drink this Water, are obnoxious to the Diſeaſe, as well as the Negroes.

The Surgeons ſeldom attempt to extract this Worm, by making an Inciſion; but, as ſoon as they perceive the Tumor riſe to a competent Bulk, they endeavour to bring it to Suppuration, with all convenient Expedition; and then the Head of the Worm diſcovers itſelf, which they ſecure, by tying it to a Bit of Stick or Cotton, that it may not contract, and draw itſelf up again: Thus they continue to roll it round the Stick daily, ſometimes one Inch, ſometimes two or more each Day, taking great care not to break the Worm, which if they chance to do, it will be very difficult to recover the End of it again; and an Abſceſs will be formed, not only at the ſuppurated Part, but alſo thro' the whole Winding of the Muſcles, where the dead putrifying Worm remains: So that, from an Accident of this Kind, you ſhall have Apoſtumations produced in ſeveral Places in the Limbs, which generally occaſion very obſtinate Ulcers, and give the Surgeon great Perplexity in the Cure of them.

I muſt likewiſe take notice, that, during the Extraction of the Worm, the Patient ſhould be plied with bitter aloetic, and other anthelmintic Medicines, in order to diſlodge the Worm the ſooner from his Tenement; and it is obſerved, that theſe Vermin protrude themſelves much faſter, when theſe Remedies are given.

When the Worm is totally extracted, the remaining Ulcer, thro' which it paſſed, may be treated in the ſame manner as other common Ulcers; nor does any farther Inconvenience remain in the Parts of which it had Poſſeſſion.

This Diſeaſe, ſimply conſidered, very rarely, if ever, proves mortal. I have myſelf a young, and otherwiſe hale, Negro Girl, who had nine of theſe *Guinea* Worms extracted from her, without any bad Conſequence enſuing. *Towne's Treatiſe on the Diſeaſes in the Weſt Indies.*

Under the Article BOVINA AFFECTIO, I have taken notice of a Diſorder, the only one that occurs in our Climate, in *Man*, which can properly come under this Appellation. But becauſe the *Affectio Bovina* is not unfrequent in ſome Climates, and has been confounded with the *Dracunculi*, I ſhall here inſert the *Arabian* Account of this Diſtemper.

The Diſeaſe called by the *Arabians*, or their Interpreters, the *Paſſio* or *Ægritudo Bovina*, is ſeldom known in *Europe*, and is not ſo much as mentioned by the antient *Greeks*. *Avenzoar* gives an Account of it, *Lib.* 2. *Cap.* 7. *Tract.* 20. in the following Words: Sometimes a Worm breeds between the Skin and the Fleſh; which Diſeaſe is called *Ægritudo Bovis*, "the "Diſtemper of Black Cattle," becauſe theſe are moſt ſubject to it. If the Phyſician neglects to kill this Worm, the Conſequences of ſuch an Omiſſion may be very pernicious. As ſoon, then, as you find yourſelf moleſted with this Animal, at its firſt Appearance, burn the adjacent Parts with a hot Iron, that the Heat may penetrate to the Worm, in a Degree ſufficient to kill it. This done, the Sore muſt be healed after the manner of other Combuſtions, by ſuch means as follow: Apply Lint mix'd with Barley-meal and freſh Water; apply alſo Vinegar, but in ſo ſmall a Quantity as not to give Pain, but to be ſufficient for conveying the Virtue of the Medicine to the Depth of the Burn. When the Pain is ceaſed, anoint the Place with Ointment of *Agrippa*, and Oil of Roſes, till the Tumor be removed. After this, waſh the Place with Hydromel, and ſprinkle it with Powder of Roſes. If the Fleſh be burnt away, apply ſome proper Ointment, and Powder of Roſes, till the Cavity be filled with Fleſh, and the Whole conſolidated: And this is the general Method of Cure for all Injuries by Fire. If the Patient be fearful of Burning, take a middling Walnut-ſhell, and, having excavated it, fill it up with equal Quantities of Meal of Lupines, Soot, Pepper, and Root of Scara, pounded together, and moiſtened with *Alchytran* [ſee the Word]: Then put the Shell upon the Place where the Worm lies, and hold it there, till the Virtue of the Medicine has penetrated to it. This Medicine is included in a Walnut-ſhell for the more convenient ſurrounding of the Worm on

every Side, and preventing its Eſcape, till it be killed. Purge the Patient alſo with the Medicines preſcribed for the *Vena Medinenſis*.

Albucaſis, treating of the ſame Diſorder, *Lib.* 2. *Cap.* 25. thus expreſſes himſelf: This Diſeaſe, he ſays, in ſome Parts of our Country, is called *Ægritudo Bovina*, becauſe it frequently happens among Black Cattle, being a ſmall Worm generated between the Skin and the Fleſh. This Worm takes its Courſe over the whole Body, aſcending and deſcending, and is plainly perceivable in its Motion from one Part to another, till it breaks the Skin; and where-ever it makes a Breach, there it finds an Egreſs. It is generated of the Putrefaction of ſome Humours, after the manner of Aſcarides, and Worms in the Belly, and is to be dreaded for the Miſchief it often does; for, in the Courſe of its Progreſs, when it aſcends to the Head, it frequently opens in ſo inconvenient a Place, and ſo unfortunately for the Patient, as to occaſion the Loſs of an Eye. When you have a mind, therefore, to be cured, by extracting this Animal, it will be firſt neceſſary, that it ſhould move, and that you ſhould plainly perceive it; after which, make a ſtrait Ligature above and below it; then make an Inciſion, and extract it. If it lie deep in the Fleſh, ſo as not to be found, apply an actual Cautery over it, till you have killed it. The worſt thing to be feared from it is its Corruption, which may affect and ruin the Eye, if it happens to be lodged near it. If you perceive, that it is aſcended to the Head, and arrived near the Eye, ſecure the Eyebrow under it with a good Ligature, and then cut upon the Worm, and extract it. The Patient alſo muſt take care to cleanſe his Body by Medicines which diſſolve putrid and ill Humours, and avoid ſuch Meats as are diſpoſed to generate them.

Alzaravius, another *Arabian* Author, *Sect.* 2. *Tract.* 31. *Cap.* 13. has theſe Words: The *Paſſio Bovina* is ſo called, becauſe it commonly affects Black Cattle. It is a Worm, which is generated between the Fleſh and the Skin, and takes its Progreſs over the whole human Body, till it perforates the Skin, and makes its Egreſs where-ever the Perforation happens, which may poſſibly be near the Eye, to the utter Ruin and Deſtruction of the ſame by the Worm's paſſing out that Way. This little Animal is of the Colour of the Body of the Patient, with a black Head, and is generated of the ſame Humour as Lice and Nits. This Humour putrefies under the Skin, which is a Diſorder incident to ſome Perſons in certain Countries, and known by perceiving the Motion of the Animal creeping under the Skin. The Cure preſcribed by *Alzaravius* conſiſts principally in Purging, and the Uſe of the hot Bath, as the Method is for the moiſt Scabies. The Cure, by Surgery, is the ſame as was directed by *Avenzoar* and *Albucaſis*. Thus far the *Arabian* Phyſicians.

Another *Bovinus Affectus*, of a different Nature, is very well deſcribed in a late Diſſertation *de Boum Oeſtro*, written in *Italian* by the famous *Walliſnerius*. This *Oeſtrum*, or vexatious Fly, pitches on the Backs of Black Cattle, and, with a kind of Sting growing to its hinder Part, perforates them, as with an Augre, in many Places, and into each Perforation introduces an Egg, which, ſome time after, gives Birth to a Worm, and this to a Fly, which, in due Seaſon, will, in all reſpects, be like its Parent. The Cattle very much dread this miſchievous Fly, which has Force enough deeply to penetrate the hard Skin of an Ox, exciting an intolerable Pain; and run from it with all their Might. The Worm, however, which is depoſited, grows, without any remarkable Injury to the Health of the Animal; and the Farmers are even perſuaded, that thoſe Cattle are ſoundeſt, who have this Worm lodged in their Hides. This Inſect never creeps, nor moves from Place to Place, but remains quiet in its firſt Settlement during the Winter, till, as it increaſes, a Tumor begins to appear, in which it lies concealed; and this Tumor is inſenſibly dilated to ſuch Dimenſion, that the Inſect may conveniently reſide and grow therein, till it arrives at its due Size and Perfection; after which, in the following Summer, it breaks forth, and afterwards is changed into a Chryſalis, of which Shape at length it diveſts itſelf, and aſſumes that of a Fly. *Le Clerc. Hiſt. Lumbric.*

The *Chicos* or *Chicres*, as I think they are called, may properly enough come under this Article. Theſe are ſmall Worms, which, in the warmer Parts of *America*, frequently breed in the muſcular Parts, and particularly in the Feet. The *Indians* and Negroes are very dextrous at picking theſe out; and then they cure the Sore, by rubbing it with the Aſhes of Wood.

Beſides the Worms which breed in the Skin, already mentioned, the Inhabitants of *Miſnia*, eſpecially the Children, are ſubject to another, of which *Frederic Hoffman*, in his Treatiſe on endemical Diſtempers, gives the following Account: The Children of this Country (*Miſnia*) are frequently ſeized with a Tabes or Conſumption, which ſo deſtroys their Fleſh, that they appear like ſo many Shades or Phantoms. Tho' thoſe who labour under this Diſtemper are commonly thought to be under the Influence of Witchcraft, yet ſuch as have inquired more narrowly into this Diſorder, have obſerved Worms, like black Hairs or Cords, lodged under the Skin. Theſe Animals are uſually called *Comedones*, or *Gluttons*, becauſe they intercept and devour the nutritive Juices in their Diſtribution. When the Skin is rubbed with Honey, either in a Bath, or any other warm Place, they come out; but when it is contracted, and braced up by Cold, they keep concealed within.

I don't know whether this Diſtemper is the ſame as that which the *Germans* call *Seuren*, *Sirenes*, or *Crinones*, of which *Sennertus* gives the following Account: "A Species of Puſtules, "by the *Germans* called *Seuren*, ariſe on the Palms of the "Hands, and Soles of the Feet, in which are lodged a ſmall "kind of Worms, which they call *Sirones*, or *Chirones*. The "Puſtules of this kind are principally produced in theſe Parts, "becauſe the Skin being thicker, the viſcid Ichor is detained "and pent up by it.

"That Worms are lodged in theſe Puſtules, may be known "from the greater Itching of theſe Parts, than is at other times "perceived.

"Theſe are, for the moſt part, extracted with a Needle; "and, in order to prevent their future Formation, the Parts "are to be waſhed with Wine or Vinegar, in which Salt, "Alum, or Nitre, have been diſſolved; or with a Lixivium "prepared of the Aſhes of Broom or Oak-branches. After the "Parts are waſhed and dried, they are to be anointed with the "following Ointment:"

Take of ſharp-pointed Dock, Scabious, Wormwood, Tanſey, the Leaves of the Peach and Aſh-trees, Henbane, and Acorns, each an Handful: Bruiſe all together; then add two Pounds of old Hog's-lard; and let the Whole boil to a Conſumption of the Moiſture; then add a Pound and a half of common Pitch, and ſtrain the Whole through a Cloth: Then put into the ſtrain'd Liquor Myrrh, Frankincenſe, and Maſtich, each two Ounces, reduced to a fine Powder; and ſtir all with a Spatula, till they aſſume the Conſiſtence of an Ointment, to ſix Ounces of which, when you intend to uſe it, you may add one Ounce of Quickſilver, extinguiſhed with Spittle, or the White of an Egg. By means of this Ointment, theſe Scabs may be cured, the Worms extracted, and the Itching removed, in fifteen Days. *Sennertus*, *Lib.* 5. *Par.* 1. *Cap.* 24.

DRACUNCULOIDES. Baſtard Dragon.

The Characters are,

The Root is white, pellucid, and conſiſts of a Multitude of oblong Tubers, without Fibres, like the Root of the Aſphodel. On the Top grows a ſmooth orbicular Tuber, as in the *Arum* or *Dracunculus*. From this Tuber ariſe thick ſucculent Pedicles, ſmooth on the back Part, and excavated on the Inſide, where, with their membranaceous Alæ, they involve the Leaves. Theſe Pedicles are of a white Colour, and painted with round Spots of a purpliſh Red. From them proceed long, broad, entire Leaves, terminating in a Point, ſomewhat like the Leaves of the *Muſa* (Plantain-tree), but leſs. From the Middle of this Tuber, amidſt the Leaves, ſprings up a tall, upright, flattiſh Stalk, ſpotted like the Pedicles of the Leaves. The Top of this Stalk is expanded into a hexapetalous Calyx, from the Centre of which ariſe many Pedicles, which ſpread themſelves almoſt in the Form of an Umbella. The Apex of each Pedicle becomes a round umbilicated Berry, containing one Seed. On the Apex of the Ovary grows an hexapetalous expanded Flower, furniſhed with ſix reddiſh Stamina. *Boerhaave*, *Ind. alt. Pars* 2.

DRACUNCULUS.

The Characters are,

The Leaves are deep-cut, with various, large, and profound Jags. In other reſpects, this Plant agrees with the Arum. *Boerhaave*, *Ind. alt. Par.* 2.

Boerhaave mentions three Species of this Plant; which are,

1. Dracunculus; polyphyllus, *C. B. Pin.* 195. *Tourn. Inſt.* 160. *Elem. Bot.* 130. *Boerh. Ind. a.* 2. 75. *Dracontium*, Offic. *Dracontium majus*, Ger. 682. Emac. 831. R. Hiſt. 2. 1211. *Dracunculus major vulgaris*, J. B. 2. 789. *Dracunculus hortenſis, ſive ſerpentaria*, Park. Parad. 529. *Arum Polyphyllon*, Rivin. Irr. Hex. Rupp. Flor. Jen. 203. *Arum Polyphyllum Dracunculus, & ſerpentaria dictum, caule maculato, majus & elatius*, Herm. Cat. Hort. Lugd. Bat. 62. *Arum Polyphyllum, ſive Dracunculus Polyphyllus*, Hiſt. Oxon. 3. 548. *Serpentaria, Dracunculus*, Chab. 259. *Erva de Sancta Maria, ſive Dracunculus major*, Piſon. 240. DRAGONS.

This Plant has a pretty thick whitiſh Stalk, made up of ſeveral Coats wrapt over one another, having the Outſide ſpotted with reddiſh and purple Streaks and Spots. It ariſes to a Foot and a half, or two Foot high, bearing on the Top two or three ſmooth, ſhining, green, winged Leaves, cut each into ſeveral Sections; among which comes forth a large Hood, green on the Outſide, and of a deep ſhining Velvet-purple within, covering a large purple Piſtillum, in Shape like that of *Arum*, but much larger, being ſucceeded by ſeveral large red Berries. The Root is large, round, and knobbed, with ſeveral Fibres at the Bottom. The Herb, with the Stalks, is uſed.

Dragons are accounted a good Alexipharmic, and uſeful in malignant contagious Diſtempers, and peſtilential Fevers; and,

as the Vulgar phraſe it, to drive any thing from the Heart. Wherefore it is given in Medicines to drive out the Small-pox and Meaſles, and cauſe Sweat. *Miller's Bot. Off.*

2. Dracunculus; polyphyllus; foliis ex luteo variegatis, *H. R. Par. co.* THE YELLOW STRIP'D LEAV'D DRAGON.

3. Dracunculus; Americanus; quod Arum hederaceum; triphyllum, & auritum, *Plum. Pl. Am.* 41. *Fig.* 51. *e. & 58. H. co. Boerh. Ind. alt. Vol.* 2.

Beſides the three preceding Species of the *Dracunculus*, *Dale* mentions a fourth; which is,

Dracunculus major, Offic. *Dracunculus biſtorti folio*, C. B. Pin. 194. *Dracunculus major Matthioli*, Ger. 683. Em. 832. *Arum cauleſcens Ramicis agreſtis foliis ſibi invicem implicatis Virginianum*, Pluk. Phytog. Tab. 271. Fig. 1. Almag. 50. *Arum major caulèſcens Lapathi foliis*, Hiſt. Oxon. 3. 545. GREAT DRAGONS.

It grows ſpontaneouſly in *Virginia*; and the Root is uſed in Medicine, which, according to *Dioſcorides*, is good for the Orthopnœa, Ruptures, Convulſions, Coughs, and Diſtillations. *Dale, ibid.*

Dracunculus hortenſis. See DRACO HERBA.

Dracunculus pratenſis & Alpinus are Names for ſeveral Species of the PTARMICA.

DRAGANTUM. The ſame as TRAGACANTHUM, or, according to *Rulandus*, *Spaniſh* Vitriol.

DRAGETA. The ſame as TRAGEA, which ſee.

DRAGMA. The ſame as MANIPULUS, a Handful. *Blancard.*

DRAGMIS, δραγμὶς, in *Hippocrates*, is a Pugil, or as much as can be held between the Thumb and two Fingers. It is ſometimes written with a χ, δραχμὶς, *Drachmis.*

DRAKENA. See CONTRAYERVA.

DRANGÆA. The Name of ſeveral Antidotes in *Myrepſus.* It is a Compoſition, according to *Fuchſius*, which anſwers to what the Moderns call *Tragæa.*

DRAPTA, δεπτὰ, in *Galen's* Exegeſis on *Hippocrates*, is expounded by ἱσπαεαγμένα, dilacerated.

DRASTICOS, δραστικὸς, (from δράω, to act, perform, effect) draſtic, or active, is an Epithet beſtowed on ſuch Medicines as are of preſent Efficacy, and potent in Operation; and is commonly applied to Emetics and Cathartics of a violent Quality. *Caſtellus.*

DRIFF. A Name given by *Helmont* to *Butler's* Stone, or ſome other powerful fermentative Remedy of that kind. It is what is prepared of *Uſnea*, [ſee the Word] Sea-ſalt, and Ens Veneris, with a Solution of Ichthyocolla, which is accounted the *Periapton Salutis Magneticum*, that cures Diſeaſes by only touching it with the Tip of the Tongue, *Ephem. N. C. Ann.* 2. *Obſ.* 53. *Schol.* Others of the Moderns direct a Preparation of *Driff* from a Caput Mortuum of Vitriol of Copper, with the Help of volatile Salt of Urine, diveſted of its fetid Quality. This *Driff* is different from the Mercurius Diaphoreticus, and from the Oil of Vitriol of Copper. *Caſtellus.*

DRIMYLEON, DRUMYMOROS, δριμυλέων, δριμύμωρος, (from δριμὺς, eager, ſharp, ſhrewd, and the like, and λέων, a Lion, and μωρὸς, a Fool) were Terms beſtowed by *Menodotus* the Empiric, by way of Jeſt or Reproach, upon the Phyſicians and Philoſophers, who profeſſed to govern their Speculations and Practice by Reaſon. *Galen. Lib. de Subſig. Emp. Cap.* 13.

DRIMYPHAGIA, δριμυφαγία, from δριμὺς, acrid, and φάγω, to eat. The eating of acrid Subſtances.

DROMA. The Name of a Plaiſter deſcribed in *Nicolaus Myrepſus*, *Sect.* 10. *C.* 26.

DROMEDARIUS. The Dromedary. See CAMELUS.

DRONTE or *Dod-aers.* The Name of a Bird, a Native of an Iſland in the *Eaſt Indies*, which *Lemery* ſuppoſes to be *St. Maurice.* This Animal ſhould be very large, or very nouriſhing, or both; for the above-quoted Author informs us, that three or four of them are a ſufficient Repaſt for a hundred Men.

The Fat is eſteemed emollient and reſolvent.

DROPACISMUS, δροπακισμὸς. The ſame as DROPAX, which ſee.

DROPAX, δρόπαξ. See CEROPISSUS.

DROSATUM, δρόσατον. The ſame as ROSATUM.

DROSERON. The Name of an Ointment in *Nicolaus Myrepſus*, *Sect.* 3. *C.* 93.

DROSIOBOTANON, δροσιόβοτανον. Betony. *Nicolaus Myrepſus.*

DROSION. A Name for the *Ros Solis*; *folio oblongo.*

DROSOMELI, δροσόμελι. Manna. *Galen.*

DRUPA. An Epithet for Olives, which, when ripe, fall from the Tree ſpontaneouſly. *Caſtellus* from *Paulus Ægineta*, *L.* 1. *C.* 81.

DRYINUS, δρύϊνος, from δρὺς, an Oak. A ſort of Serpent.

The *Dryinus*, according to *Galen*, lives about the Roots of Oak-trees, and is of ſuch a miſchievous Nature, that, if a Man ſhould happen to tread on one of them, he will find his Feet excoriated, and his Legs ſwelled; and, what is more ſurpriſing, we are told, that even Perſons who dreſs and apply Remedies to the affected Parts, will find their Hands excoriated; and that whoever kills one of them, contracts a very bad Stench, and can ſmell nothing elſe himſelf. In thoſe who are bit by the *Dryinus*, the Swelling riſes about the Place with a Redneſs, and an Eruption of Puſtules in the adjoining Parts. The Bite is attended with Pains about the Mouth of the Stomach, and Gripes; and a Diſcharge of aqueous Sanies ſometimes ſucceeds. Birthwort taken in Wine, Treſoil, and the Root of Aſphodel, taken in the ſame manner, and all Sorts of Acorns triturated and taken, are very proper Remedies in this Caſe; and the Roots of the Ilex bruiſed, and applied to the Part affected, afford great Relief. *Paulus Ægineta*, *L.* 5. *C.* 14.

DRYOPETIS. A ſort of green ſmall Frog, which lives in Thickets. It agrees in Virtues with other Frogs. See RANA.

DRYOPTERIS, from δρὺς, an Oak, and πτέρις, Fern, that is, Oak-fern. A Name for the *Polypodium*, *tenerum*, *minus.*

DRYPA. See DRUPA.

DRYPETES, δρυπετὴς, from δρὺς, and πίπτω, to fall. The ſame as DRUPA.

DUAMIR. A Viper. *Rulandus.*

DUBEL COLEPH. A Compoſition of Coral and Amber. *Rulandus.*

DUBELECH. The Cavity of an Apoſtem, with a manifeſt Solution of Continuity. *Rulandus.*

DUBLETUS. An incyſted Tumor, or an Abſceſs in general. *Amatus Luſitanus.* The Word is of *Arabic* Original.

DUCCIA, according to *Baccius*, and DUCIA, according to *Foreſtus*, are barbarous Terms for *Gutta*, a Drop, and imply that ſort of Bathing, which we call *Pumping*; that is, letting medicinal Waters fall on any Part of the Body. *Baccius*, in his Treatiſe of Baths, *L.* 2. lays down Rules for this Species of Bathing.

DUCTUS. A Duct or Canal, frequently applied to many Parts of the Body, which convey particular Fluids.

DUDAIM. A Name for the Mandragora. *Schroder.*

DUDASALI. A Species of *Lignum Colubrinum.* Snakewood.

DUELECH. The ſame as DULECH, which ſee.

DUELLA. The third Part of an Ounce, or eight Scruples. *Rhodius in Scribon. Larg.*

DUENEC. Mercury of the Philoſophers. *Libavius.*

DUENECH. Antimony. *Rulandus.*

DUENEZ. Filings of Steel. *Rulandus.*

DULCACIDUM. A Medicine prepar'd of acid and ſweet Ingredients; or any thing which taſtes acid, and, at the ſame time ſweet.

DULCAMARA. See AMARA-DULCIS.

DULCEDO *Saturni*, is Ceruſs.

DULCEDO *Veneris*, is the CLITORIS.

DULCHICHINUM. A Name for the *Cyperus*; *rotundus*; *eſculentus*; *anguſtifolius.*

DULCICHINUM. A Name for the BULBOCASTANUM.

DULCIS-AMARA. See AMARA-DULCIS.

DULECH, or DUELECH. A Term us'd by *Paracelſus* and *Helmont*; importing a Sort of Tartar, or ſpongy Stone, generated in the Body, and cauſing great Pain and Danger. *Paracelſus* diſtinguiſhes it from Tartar, and ſays, it is a Subſtance of a middle Nature, betwixt Tartar and Stones.

DULESH. The Name of a Species of *Alga*, which the *Iriſh* chew for their Diverſion, contorted like a Roll of Tobacco. *Raii Hiſt. Plant. Appendix.*

DUODENUM. The firſt of the ſmall Inteſtines, ſo call'd, becauſe it is about twelve Fingers Breadth in Length. For a Deſcription of this, ſee COELIA. As this Inteſtine is the Seat of many troubleſome and dangerous Diſtempers, I believe, whoever reads for Information, will not be diſpleas'd at the following Diſſertation.

Sylvius eſtabliſhes the whole Art of curing the Diſeaſes of the Body, on the following Foundation: He aſſerts, that the human Body is entirely govern'd by the Bile, Phlegm, and pancreatic Juice; and accounts not only for the Digeſtion, but alſo Life and Health, from the Temperature, Mixture, and mild Effervеſcence of theſe: As, on the other hand, he aſſerts, that all the Diſeaſes of the Body, and the very Method of Cure, ariſes from their Intemperature, their Exceſs, or Defect.

When *Sylvius* publiſh'd his Opinion, it was received with great Applauſe, becauſe there was nothing obſcure or imaginary, nothing like the Dreams of the *Galeniſts* in it, and becauſe it ſeem'd to be founded on the Nature of Things: But when this Scheme began, ſome time after, to be canvas'd, and more narrowly look'd into, it loſt much of the Character, which was given it on the firſt Publication: For Perſons ſkill'd in Phyſic and Anatomy could not fail to diſcover ſeveral Blemiſhes in it; and, particularly, his Raſhneſs in affirming, that there is an Effervеſcence of Juices in the Duodenum. To

ſupport

ſupport this Opinion, he aſſerts, that the Bile is purely alcaline: But this is a great Miſtake; for if you pour any ſtrong Acid, ſuch as the Spirit of Vitriol, upon Bile, it will make no Effervescence, but becomes a yellow and mucilaginous Maſs; and if you add the Spirit of Nitre, which is as ſtrong an Acid, they will coagulate, aſſume a green Colour, and have but very little Motion.

He is as much miſtaken, when he aſſerts, that the pancreatic Juice is acid, ſince we know by Experiments, that, whatever alcaline Subſtance be pour'd thereon, it raiſes no Effervescence, and much leſs, when mix'd with the Bile. And the celebrated *Brunnerus*, in his learned Book of the Pancreas, has demonſtrated, that Animals will breathe and live, after their Pancreas is cut out; which Experiment alone is ſufficient to overthrow *Sylvius*'s Opinion in this reſpect.

He has committed a great Error, in pretending to account for Life and Health, from his Triumvirate of Humours, if I may ſo call it; and in deriving the whole Art of Medicine, both with reſpect to Theory and Practice, from the ſame Source: For many things relative to the Uſe of Remedies, and the Explication of natural Phænomena, which cannot be well derived from theſe Principles, abundantly demonſtrate its Weakneſs and Inſufficiency. Not to ſay any thing of thoſe Diſeaſes, which are incident to certain Conſtitutions and Families, and rage at certain Ages and Seaſons; it is ſufficiently evident, that many mortal Diſeaſes may take their Riſe from the Bite of a mad Dog, the putrid peſtilential Contagion, and the Venereal Diſeaſe, and even from the Paſſions alone, without any previous Corruption of the Humours: We alſo know by Experience, that many contract Diſtempers, and even die, of a Redundance and Extravaſation of Blood, and of Corruptions of the Viſcera; and, to aſcribe theſe to Defects in the Bile, Phlegm, and pancreatic Juice, is abſurd to the laſt degree. I have the longer inſiſted on this Subject, in order to make it evident, that *Sylvius*'s Hypotheſis, tho' uſeful in other reſpects, is by no means adequate to the Explanation of the whole Art of Medicine; and, tho' it be neither univerſal, nor ſufficiently explain'd, yet it ought not to be deſpis'd, as it may be of conſiderable Uſe in Medicine, if due Care be taken, not to follow him ſo cloſely, as to adopt his Errors. He is, however, in the right, when he aſſerts, that many chronical Diſtempers are ſeated in the Duodenum, and there generated; and my Deſign, in the preſent Diſſertation, is, to eſtabliſh and explain, in a more rational Senſe, this Opinion of *Sylvius*, which is, at preſent, partly neglected, and partly exploded. When any new Opinions, of real Uſe, are advanced, it is the way of Mankind, inſtead of canvaſing them carefully, to embrace them haſtily at firſt; and, when Experience does not confirm them, to relinquiſh them as haſtily; ſo difficult a matter it is to keep a due Medium in any thing: And this exactly happened to be the Fate of *Sylvius*'s Hypotheſis; for, when it firſt appear'd in the World, it was eagerly embrac'd; but when it was found not to anſwer in all things, as it was impoſſible it ſhould, it loſt, on a ſudden, all the Reputation it had acquir'd but a little before; tho' there are, at the ſame time, a great many Truths in his Syſtem, which ought to be regarded in the Method of Cure. My Buſineſs, therefore, at preſent, ſhall be, to examine *Sylvius*'s Hypotheſis, and ſo bring it, as it were, from Darkneſs to Light.

My real and firm Opinion, then, is, that the firſt of the ſmall Inteſtines, which is call'd by the Name of *Duodenum*, performs Offices utterly remote and diſtinct from thoſe of the other Inteſtines; and, for this Reaſon, deſerves a particular Conſideration; for Nature, not content with furniſhing us with a large and ſuperior Stomach, has alſo provided us with a leſſer Stomach; and as in the former, there is a coarſer and more ſimple Solution of the Aliments, ſo, in the latter, the Solution is more refin'd and elaborate, and the Aliments more perfectly mix'd and attenuated: And as, on the one hand, this Inteſtine is of the greateſt Uſe and Service to the animal Œconomy; ſo, on the contrary, if it labours under any Diſorder, and becomes incapable of performing its Functions, it gives Occaſion for many, and thoſe very ſevere Diſtempers.

But, that the Truth of my Aſſertion may be the more evident, I ſhall conſider the Structure of the Duodentum, that thence we may form a Judgment of its Uſes. To me, the Duodenum ſeems to be a ſmall ſuccedaneous Stomach, and the great Laboratory for the Digeſtion of the Aliments. Now the principal thing requir'd in the Structure of a Stomach is, to have a Flexure, and a Bottom to retain, for ſome time, the Aliments it receives: And all Anatomiſts generally agree, that the Duodenum begins at the Right Orifice of the Stomach, and makes a remarkable Flexure towards the Spine of the Back. *Riolanus in Enchirid. Anatomic. Patholog.* ſays, that the Duodenum bends towards the Spine. *Blancard. in Anatom. p.* 410. is of the ſame Opinion: The Duodenum, ſays he, runs from the Pylorus towards the Spine, under the Stomach, almoſt round the Centre of the Meſentery; then it is join'd, by membranous Ligaments, to the Vertebræ of the Loins; and, without making any further Circumvolution, ends at the Left Kidney, where the Windings of the *Jejunum* begin. In like manner *Hornius*, in *Microcoſm.* ſays, that the Duodenum begins at the Stomach, and, making a ſmall Flexure downwards, runs directly to the Spine; and there, near the Centre of the Meſentery, lies tranſverſely on the Vertebræ of the Loins. And *Munyks, de re Anatomic.* aſſerts, that the Duodenum, the firſt of the ſmall Inteſtines, lies tranſverſely on the Spine; that it admits the biliary and pancreatic Ducts, and is connected with the broad Extremity of the Pancreas; and that, when it begins to make Circumvolutions, it acquires the Name of *Jejunum*. *Veſalius*, in *Anatom. p.* 379. expreſſes himſelf, relative to the Duodenum, after this manner: The firſt of the Inteſtines, ſays he, begins at the inferior Orifice of the Stomach, whence immediately being reflected backwards, under the poſterior Part of the Stomach, it is carry'd directly downwards upon the Right Side of the Spine, without any Circumvolutions: And therefore many Anatomiſts are miſtaken, who aſſert, that the Duodenum terminates, where the Orifice of the biliary and pancreatic Ducts opens into its Cavity; for the Extremity of this Inteſtine is more properly fix'd at the Part where its Flexure ends, and begins to form Circumvolutions. And hence *Verebeyen*, in *Anatom.* p. 41. very juſtly obſerves, that the Duodenum begins at the Right Orifice of the Stomach, then turns towards the Spine, and ends on the Left Side, where the Circumvolutions begin. *Hornius*, in *Opuſcul. Anatom.* ſays, that Authors have not determin'd where the Duodenum ends; for thoſe who will have it to be twelve Fingers Breadth long, from which it has acquir'd the Name of Duodenum, ought not to ſeek for the End of it at the Inſertion of the biliary Duct, but rather on the Left Side, where the Inteſtine begins to form Circumvolutions: And *Highmore*, in *Anatom. p.* 27. makes the End of the Duodenum to be, where the Circumvolutions begin. Another thing requiſite in the Structure of a Stomach is, to have a capacious and ample Cavity: Now tho' the Cavity of the Duodenum is not ſo large as that of the Stomach, yet it far exceeds the reſt of the ſmall Inteſtines in Capacity; and hence *Veſalius*, in *Anatom.* p. 379. obſerves very juſtly, that the Part of the Duodenum, under the Stomach, which is connected to the Spine, is found, upon Diſſection, to be more capacious than the other Parts of the inteſtinal Duct. *Veſlingius*, in like manner, aſcribes a Laxity and Largeneſs to it; which is confirmed by what *Diemerbroek* advances, *p.* 153. that anatomical Obſervations diſcover, in this Inteſtine, a remarkable Largeneſs and Laxity. *Bartholine*, therefore, *Bauhine*, and *Blancard*, with other Anatomiſts, err egregiouſly, when they aſſert, that the Duodenum is, indeed, thicker than the other Inteſtines, but leſs capacious: That the Duodenum is a ſort of Stomach, and performs the like Functions, appears from its internal Structure, which is the ſame with that of the Stomach; for the Stomach is furniſh'd with a glandulous and villoſe Coat, out of which there continually diſtils a ſolvent Juice; and the ſame Coat is continued thro' the Duodenum. This Coat abſorbs no Fluid from the Cavity of the Inteſtine, as having no patent Ducts to receive it; but it ſecretes from the Blood, a Juice of the ſame Nature with that, call'd the Menſtruum of the Stomach: And, what is particularly remarkable, beſides this glandulous Coat, the Duodenum is furniſh'd with innumerable ſmall Glands, which, upon a Separation of the *Tunica villoſa*, are very conſpicuous, and are ſituated in the nervous Coat. *Wepfer*, in *Hiſtor. Cicut. aquatic. p.* 190. informs us, that he found ſcatter'd here and there, above a Hand's Breadth from the Pylorus, a great Number of Glands in the Duodenum, which, upon taking off the fibrous Coat, appear, as it were, conglomerate; that they were about the Size of half a Hemp-ſeed; and that, being macerated in Water, they diſcharg'd a large Quantity of Mucus, even for the Space of eight Days after the Death of the Subject. The famous *Brunnerus* has the Reputation of having firſt diſcover'd theſe Glandules. See *Miſc. Natur. Curioſ. Dec.* 11. *ann.* 5. *p.* 464.

Theſe Glands were certainly deſign'd to ſecrete the ſolvent Lymph, and pour it into the Cavity of the Duodenum. Another principal Quality of a Stomach is, to diſſolve the Contexture and Adheſion of the Aliments: And this Solution is principally carried on in the Bottom of the Stomach, where the Aliments continue for a conſiderable time. The Duodenum, which I call a Stomach, has, in ſome reſpects, a kind of Privilege and Prerogative above the Stomach; for the latter only receives the fermentative Juices from the glandulous and villoſe Coat; whereas the former, beſides this Coat, and its proper Glands, has alſo ſome peculiar and remarkable Ducts, which diſcharge into its Cavity a highly active Menſtruum: For the bilious Juice runs in a leſs Quantity from the Gall-bladder, but in a larger from the Liver, and its biliary Ducts; and, from ſuch a great Quantity of Juice convey'd into it, the Importance of the Duodenum is evident. In like manner the Duct emerging from the pancreatic Gland, which is remarkably large, conveys into it a great Quantity of Lymph, of a ſolvent Nature; which is a further Proof of its ſingular Uſe: And it is further obſervable, that theſe two Ducts run together in a human Body, and their Orifices end in a Papilla, and are directly

directly plac'd over the Bottom of the Flexure of the *Duodenum*, as I have frequently obſerv'd in Diſſections; that the Liquids convey'd by theſe Ducts, might deſcend in ſuch a manner, Drop by Drop, on the ſubjacent Maſs of Chyle, as to form a Menſtruum, of wonderful and univerſal Uſe in the animal Œconomy, and a true Balſamic, compos'd of Bile, which is an alcalino-ſulphureous Fluid, and the pancreatic Juice, of a very thin and ſpirituous Nature.

In the Stomach the Aliments are only diſſolv'd, and their Juices are not there ſeparated, and convey'd to the Blood; for all Anatomiſts agree, that the Stomach is not furniſh'd with lacteal Veſſels: In like manner, we do not obſerve any Lacteals in the Duodenum, and, conſequently, there is no ſuch Secretion made there, as is carried on in the other Inteſtines, particularly in the *Jejunum*; and, for this Reaſon, the Meſentery does not reach to the Duodenum, though all the other ſmall Inteſtines adhere to it; and becauſe it not only ſupports, but affords a freer Paſſage to the lacteal Veſſels, the lower and more prominent Part of the Pancreas, together with the Centre of the Meſentery, which is cloſely connected to the Vertebræ of the Back, rather poſſeſſes the Interſtice of the Duodenum. The Centre of the Meſentery is that Part of it, to which the Artery is convey'd from the Trunk of the Aorta; and where a remarkable nervous Plexus from the ſpinal Marrow conveys Nerves to the Meſentery and Intertines; and where a Branch is extended from the Trunk of the *Vena porta* to the Meſentery, on the Right Side.

From what has been ſaid, it evidently appears, that the Duodenum ought more properly to have the Name of a Stomach, than be rank'd among the Number of the Inteſtines, which ſerve rather for Secretion than Digeſtion; and it is ſtill a Queſtion, whether the Buſineſs of Digeſtion be not more effectually carried on in the Duodenum, or ſuccedaneous Stomach, than even in the principal Stomach, where the Aliments undergo a crude, and but imperfect Solution; whereas, in the Duodenum, the Maſs of Aliments is farther elaborated, attenuated, and reduced to a more ſpirituous Nature. In the Stomach there is only a lymphatic Juice, together with the acid Relicts of the Aliments; but in the Duodenum, beſides this Juice, there flows another of a penetrating and active Nature, far more rich, of a pinguious, viſcid, and tenacious Subſtance, which attenuates, diſſolves, and perfectly incorporates with the alimentary Juices; which is abundantly evident, from the yellow Colour of the Excrements. 'Tis very obſervable, that there is not any Animal, but what has this Flexure of the Inteſtine, or little ſuccedaneous Stomach; and that no Animal is without the bilious Juice, which is generated in the Liver, and poured copiouſly into their Duodenum; which manifeſtly proves, that Nature has exerted her utmoſt Skill in faſhioning this Part of the Body, ſo neceſſary for the Preſervation of the Life and Health of Animals.

And as the Duodenum is of the greateſt and moſt extenſive Uſe; ſo, if it labours under any Defect, if there be not a proper Temperature in the ſolvent Juices, or if the due Tone of this noble Part be any-ways injur'd or deſtroy'd, a great Diſorder through the whole Œconomy of the Body muſt, of conſequence, ariſe, and a long Train of Evils neceſſarily enſue. My principal Buſineſs, therefore, at preſent ſhall be, to inquire after what manner many morbific Cauſes may be generated in this ſmall Stomach, if it happen to be preternaturally effected. *Helmont* and *Sylvius* aver, that the Cauſe and Sources of moſt Diſeaſes are diſcoverable in the Duodenum.

No material Principle of Diſeaſes, which can come under the Denomination of morbific Cauſes, can be ſaid to reſide in the Humours, whilſt they continually circulate through the Veſſels; for ſo long as they are conveyed regularly through the Canals, which muſt prevent their Corruption, they can never ſufficiently injure any Part to cauſe a Diſeaſe; but, before the Humours can, in any Degree, be corrupted, change their natural Diſpoſition, and introduce any Diſorder in the Body, they muſt previouſly be in a State of Reſt, and ſtagnate. Now, there is no Part in the Body more ſubject to Stagnations and Corruptions of the Humours, and conſequently to the Generation of morbific Cauſes, than thoſe which have a Flexure, ſuch as the Stomach and Duodenum; for the Humours are corrupted, and have their benign innocent Nature changed into the Reverſe, firſt, merely by Stagnation; and, then, degenerate by the Admixture of other heterogeneous Subſtances.

'Tis moſt probable, that as all Humours in general, ſo the Bile in particular, if it be in an unactive State, contracts a malignant and virulent Nature: And hence *Hippocrates de Natur. Human.* ſays, "That green Bile ſettling near the Liver, "when it effervesces, generates a Corruption in the human "Body, and is a pernicious Inmate." By this is meant no more, than that the Bile, ſtagnating, is corrupted in the Duodenum, and becomes very noxious to our Bodies. There is a Paſſage in *Lib. de Medic. priſca*, much to the ſame Purpoſe, as follows: "When a certain bitter Humour, which we com-"monly diſtinguiſh by the Name of yellow Bile, is diffuſed "through the Body, it brings on great Anxieties, Heat, and "Weakneſs; but when it is purged off, either ſpontaneouſly, "or by the means of Medicine, provided this be done ſoon "enough, we are freed from all inordinate Heat and Pain. "But if, by its Continuance, it ſhould be highly exalted, crude, "unmixed, and intemperate, no Art can allay either the Pains "or Fevers thence ariſing. And, when acrid and acrimonious "Bile abound in the Body, Phrenſies, and a Gnawing of the "Bowels, with great Anxiety, ſucceed; and theſe are never "cur'd, 'till the Humour is purg'd off, render'd mild, and "mix'd with other Humours." From this elegant Paſſage we ſee, what violent Diſorders are conſequent to the Corruption of the Bile.

I ſhall firſt treat of the preternatural Stagnation of the Bile, to which not only an Inactivity and Deficience of ſalino-ſulphureous Particles in it, but alſo a Diſorder in the Tone and periſtaltic Motion of this Inteſtine, in a great meaſure contribute; for upon any Defect in the periſtaltic Motion, the Bile, which continually flows out, being collected in great Quantities in this Part, ſurpriſingly diſtends the Inteſtine: Concerning which, there is a remarkable Paſſage in *Diemerbroek, in Anatom. p.* 53. We find, ſays he, daily, by anatomical Diſſections, that this Inteſtine is ſometimes of a remarkable Largeneſs, which is conſiderably increas'd by the fermentative, acrid, and peccant Juices, which fall upon it; and hence ariſe ſtrong fermentative Effervescences, which not only diſtend it to a great degree, but create alſo moſt troubleſome Rumblings, violent lancinating Pains, and the greateſt Uneaſineſs in the Perſons affected. And we learn from *Miſcel. Natur. Curioſ. Dec.* 11. *ann.* 2. *p.* 186. that in a cachectic Patient, the Gall-bladder was utterly void of Bile, but that the Duodenum was full of bilious Humours, and dilated, like a Bag, ſo much, that it was capable of containing a Pint of Liquor: And upon opening it, more than half of the groſs Humour iſſued out, which was of a yelloviſh-black Colour; and, for all this, there remained above twelve Spoonfuls therein. It frequently happens, that too large a Collection of Bile in the Duodenum is the Cauſe of a great many Diſorders; for, when the Inteſtine is much diſtended, not only the Coats, which are endu'd with an exquiſite Senſation, are affected, but the nervous Branches of the meſenteric Plexus are diſtended, and the Blood-veſſels being compreſs'd, a Congeſtion of Blood is form'd about the Trunk of the *Vena Porta*, and the Beginning of the meſeraic Artery: Hence a fixt Pain about the firſt Vertebra of the Loins, Uneaſineſs about the Præcordia, Loſs of Appetite, Coſtiveneſs, Want of Reſt, and Decay of Strength. I have frequently obſerved theſe Diſorders in weak Perſons, in Women whoſe Menſes were deficient, in hypochondriac People, and after intermittent Fevers prepoſterouſly ſuppreſs'd; after Errors in point of Diet, but, particularly, after a Fit of Anger: And, in this Caſe, ſtomachic Carminatives, Abſorbents, and relaxing Medicines, do but little Service; and Anodynes much leſs, but are rather extremely pernicious. It would be more proper to evacuate the *primæ Viæ* of the biliary ſtagnating Juices, by adminiſtring an Emetic, with proper Caution. This Subject brings to my Remembrance the Caſe of a Gentleman, of a weak Conſtitution, who, by a conſtant Application to the Studies of his Profeſſion, and a ſedentary Life, us'd to have a great Quantity of impure Humours collected about the *primæ Viæ*. If, at any time, he had eat too large a Quantity of Aliments, of difficult Digeſtion, he found himſelf oppreſs'd with Anxiety and Heat about the Præcordia, a Pain about the Pit of the Stomach, and Right Side; he would, alſo, vomit up his Aliment, could ſleep but little, and complained of a Laſſitude all over his Body; his Skin was ting'd with a yellow, diſagreeable Colour, and ſuch Symptoms recur'd pretty frequently. Some Preparations of Rhubarb, mixt with abſtergent and aperient Salts, were of conſiderable Uſe; but they did not perfect the Cure in leſs time, commonly, than the Space of three Weeks. The Gentleman laying his Caſe before me, ſays *Hoffman*, I ſoon diſcover'd, that the principal Cauſe of his Diſtemper proceeded from a Stagnation of the bilious Humours in the Duodenum; and, for that Reaſon, I directed a gentle Emetic, for carrying off the Load of Humours. The Patient, who had not ſlept the preceding Night, but was tormented with the moſt violent Symptoms, took, next Morning, a Vomit, conſiſting of one Grain of emetic Tartar, diſſolv'd in Mint-water; and, a little after, he vomited up, into a Baſon, a conſiderable Quantity of groſs viſcid Bile, of a dark-yellow Colour; and this was ſucceeded by four Stools. After this Operation, all his Symptoms left him at once, he recover'd his Appetite, and could ſleep as well as ever, and had no bad Symptom remaining. We may learn from this ſingle Inſtance, the great Efficacy and Virtue of an Emetic, in Diſorders which proceed from the *primæ Viæ*.

A Stagnation of Bile in the Duodenum creates a Coſtiveneſs; for it ought to be obſerved, that if there be a Defect of the periſtaltic Motion in the firſt Inteſtine, the other Inteſtines muſt ſuffer alſo; ſo that the Progreſs of the Fæces, through the Inteſtines, will be retarded. This is confirmed by an Obſervation in *Miſcell. Nat. Cur.* above quoted. Beſides, the Bile remaining

remaining in the Duodenum, together with the pancreatic Juice, and the Mucus of the Aliments, excites Flatulencies, which create Pains and Uneaſineſs in the Lines, not unlike thoſe of a nephritic Colic. *Pechlinus*'s 57th Obſervation is a Confirmation of this: "That Part of the ſmall Inteſtines, ſays he, "riſing obliquely towards the Spleen, and being thence reflected "in a more acute Angle, by the very Nature of its Situation "muſt cauſe every thing, that is too viſcid, to remain the longer "in that Part, whether it be Phlegm, pancreatic Lymph, "Bile, or even Flatulencies." Women are in more Danger of contracting ſuch Diſorders in this Part, on account of lacing their Stays too tight; and if they eat immoderate Quantities of Summer Fruits, this affords abundant Matter for flatulent Crudities, and Fermentations; for the Juices being in a violent Effervеſcence, they require greater Room than uſual, to expand themſelves freely: And therefore, when the Hypochondria, which ought to be dilated, are compreſſed, the Juices and Flatulencies muſt fix there, and lay a Foundation for new Corruptions and Fermentations. After the ſame manner, from a Diſtention of the Duodenum by Flatulencies, there frequently ariſes a fixed chronical Pain in the Loins, as *Sylvius* obſerved in his Days; who imagined, that this Pain, which ſeems to pierce, as it were, the Loins, was ſeated in that Part where the Bile and pancreatic Juice meet together. It is well known, that febrile Paroxyſms generally begin with a fixed Pain of the Loins, in that Part where the Centre of the Miſentery is connected to the Vertebræ of the Back; and as the Duodenum likewiſe adheres to it, by the Intervention of ſtrong Membranes, it is no Wonder, that a violent Expanſion of theſe Membranes, which are poſſeſſed of an exquiſite Senſation, ſhould ſtimulate the adjoining Plexus of Nerves to Spaſms. Both Solids and Liquids ſtagnate in the Stomach and Duodenum, upon a ſpaſmodic Contraction of the latter, which obſtructs the Paſſage to the other Inteſtines. We know by daily Experience, that ſolid and liquid Aliments are diſcharged in great Quantities, even three Days after they are received into the Stomach; and that drunken Perſons frequently evacuate a ſurpriſing Quantity of Fluids twelve Hours after their Reception. Thus *Helmont*, *Lib. de Febrib. C.* 10. ſays, that "If the Pylorus be too much contracted, Drink "will ſometimes remain in it for the Space of three Days; "and more will be thrown up at one ſingle Vomit, than was "drank for two Days before." It is owing to theſe ſpaſmodic Contractions, that not only corrupted Humours, but Flatulencies alſo, ſubſiſt in hypochondriac and hyſteric Perſons; and hence it is, that in the Paroxyſms of a Fever, Anxieties, Reſtleſſneſs, Oppreſſion of the Spirits, and Pains about the Pit of the Stomach and Loins, a Nauſea and Vomitings, are produced. This Contraction of the Duodenum very frequently brings on a Jaundice; for, when its Coats are too ſtrongly contracted, the *Ductus Cholodechus*, which paſſes obliquely, about the Length of a little Finger, through theſe Coats, is ſtraitened and compreſſed, ſo that the Bile cannot eaſily deſcend to the Duodenum: Hence it is, that the Bile, ſtagnating both in the biliary Ducts and Gall-bladder, not only occaſions Pains and Spaſms, but, by returning to the Blood through the lymphatic Veſſels, overſpreads the Skin with an unſeemly yellow Colour.

There are many other Diſeaſes, which proceed from this Intemperature and Corruption of the Bile and Juices concurring in the Duodenum, ſuch as all intermitting, continual, tertian, choleric, ſlow, and burning Fevers, Small-pox, Meaſles, Diarrhœas, Dyſenteries, Heart-burns, violent chronical Coughs, Gouts, wandering Pains, and many others of a like Nature. The Humours in this Part are not only corrupted by Stagnation but alſo by their being mixed with other impure excrementitious Juices, which flow too copiouſly to the Bile and Juices there lodged, either from the Stomach, or Maſs of Blood. It alſo frequently happens, that when acid, corroſive, and ſaline Humours, which are generated in the Stomach, either by Aliments of the like Qualities, or by continuing too long there, deſcend to the Duodenum, and are there mixed with the Bile, they ſurpriſingly corrupt and contaminate the bilious balſamic Humour: And the Bile, being mixed with ſuch an Acid, is not only coagulated, and rendered corroſive, but alſo changes its natural Colour, and aſſumes a green æruginous Tincture. Whilſt ſuch a Humour reſides in the Duodenum, it corrodes and vellicates the adjoining Parts, and excites Gripes, ſpaſmodic Contractions, and violent Pains, both in the Stomach, and the more ſenſible Inteſtines; and eaſily creates Convulſions and Epilepſies in Children. If, therefore, the Excrements in ſuch Diſtempers be green, it is a very bad Sign; for in that Caſe they are ſometimes of ſuch an acrimonious Nature, as to corrode a Piece of Linen. From the ſame æruginous ſtagnating Bile ariſe Coughs of various Kinds, and that not only in Children, but alſo in Adults; and theſe Coughs are frequently attended with intermitting Fevers, and hypochondriac Diſorders, in which Caſe all ſweet and pectoral Medicines do more Harm than Good; and it is to be obſerved, that ſuch Coughs generally recur both Day and Night at ſtated Periods; for the Juice of the Aliments, mixing with this corroſive Acid, in ſome meaſure leſſens the Vellication of the ſubjacent Parts; but when the alimentary Juice recedes, and is conveyed to other Parts, the corroſive Humour, ſtill remaining, reſumes its former Force, and ſeizes upon the tender Membranes of the Duodenum, at that time diſtorted by Flatulencies: And Diſorders in theſe affect by Conſent the Diaphragm, the Meſenteric, ſtomachic and pulmonary Plexuſes, and excite a violent Cough, which is ſometimes attended with ſevere Vomitings, and Danger of Suffocation, occaſioned by the Afflux of the viſcid Serum upon the Bronchia of the Lungs. Theſe violent Coughs I have, in a ſhort time, very happily cured by a compound Powder of Crabs Claws, with the Addition of the Oil of Aniſe; giving one Dram for a Doſe twice a Day. To Children under this Diſtemper I preſcribed gentle Emetics, and an Infuſion of Rhubarb with Manna, which are of ſingular Service in carrying off theſe viſcido-bilious Collections of Humours.

When this cauſtic Bile is reſolved into Flatulencies, it produces violent Diſorders in the Parts of the Body. *Riverius*, *Cent.* 2. *Obſ.* 8. mentions a remarkable Caſe of this ſort. The Patient was every Night afflicted with a ſevere Pain, which began in his Left Side, and extended to the anterior and poſterior Part of the Thorax, to the Left Side, and the Scapulas, with ſuch Violence, that he could not obtain Eaſe in any Poſture: Theſe Pains continued till Morning, and then they were removed, and did not recur the whole Day. *Riverius* juſtly determines, that this Effect was produced by Flatulencies generated during Sleep, by the intenſe Heat of the Body, and the Collection of peccant and crude Humours lodged in the Primæ Viæ, in conſequence of his irregular Method of living. And I have frequently obſerved, plethoric Perſons, who eat too liberally, wake out of their Sleep at certain Hours after the Digeſtion of the Aliments, with a great Uneaſineſs, Shortneſs of Breath, and Danger of being ſuffocated; to whom Bleeding, Vomiting, and abſtaining from Suppers, have afforded immediate Relief. Sometimes the Effects of theſe peccant Humours ſtagnating in the Duodenum, and the firſt Inteſtines, extend to the Head, and produce Head-achs, Vertigos, and a Torpor of the Senſes, and ſometimes apoplectic Fits. *Borelli*, *Cent.* 2. *Obſ.* 1. ſays, that Bile, which, when vomited up, bubbled up like Aqua-fortis, was the Cauſe of a Hemicrania. "A certain Perſon, ſays he, in "a tertian Fever, was tormented with an exceſſive lancinating "Pain, affecting one Half of his Head, who, on taking a "Vomit, threw up a Pint of green Bile; and, diſcharging the "like Quantity at the next Paroxyſm, he found himſelf freed "from all his Pains." See *Riverius*, *Cent.* 1. *Obſ.* 27. I know a Gentleman, who, a few Days after letting Blood, indulged himſelf in drinking Wine too liberally, and eating Oyſters, and other Aliments of difficult Digeſtion: Afterwards he began to languiſh, and grow dull; and, his Appetite failing by degrees, he was ſeized at Table, on a ſudden, with a great Heat above the Præcordia, which was followed by a vehement Cold, and Fainting; and all his Senſes ſeemed to be extinguiſhed. By the Injection of a Clyſter he had ſix Stools, which gave him no ſmall Relief; and, a few Days after, he was able to walk abroad; but ſoon after, being at an Entertainment, he was ſeized with the ſame Diſtemper, though not in ſo violent a Degree. At laſt I diſcovered, ſays *Hoffman*, the Cauſe of his Diſtemper; and gave him a gentle Emetic, which made him throw up great Quantities of viſcid Matter, and green Bile. This was the Source of his Diſorder; for he immediately recovered. And it is not to be doubted, but all theſe Diſorders aroſe from a porraceous Bile, which irritated the Orifices of the Stomach.

The Cauſe of a Vertigo, a troubleſome Diſorder, frequently alſo reſides in the Duodenum; and hence it is, that it ſeizes with a Nauſea, and a bitter Taſte in the Mouth, when the Stomach is empty; and is ſomewhat mitigated after eating. *Galen* takes notice of an Epilepſy proceeding from a Diſorder of the Stomach, and conjectures that it may be owing to Bile lodged in the Duodenum. I have had, in the Courſe of my Practice, ſays *Hoffman*, a remarkable Inſtance of a Diſtemper, which proceeded from the ſame Cauſe: A *Saxon* Count, having retired hither, on account of the Troubles of the State, conſulted me about a violent Diſorder, which had afflicted him for near a Year. He, by long Grief, Errors in point of Diet, and a ſedentary Life, had contracted a cacochymico-plethoric Habit of Body; and he found himſelf every Night, about Three or Four of the Clock, ſeized with moſt violent Pains, which began about his Navel, and, paſſing along his Back, at laſt affected the Præcordia with ſuch Violence, that he was in danger of being ſuffocated: He was ſeized alſo with the greateſt Anxiety, and frequently with epileptic Contractions, and a Dulneſs of his Senſes; which Symptoms were always aggravated, whenever he was coſtive. Carminative and gently laxative Clyſters, and a Vomit, afforded him conſiderable Relief; but could not remove the Diſtemper, which was too deeply rooted. We learn from *Helmont*, as well as from daily Experience, that an Apoplexy is frequently generated in the Stomach and Duodenum; for he tells us, in the Book he wrote to prove, that all Diſeaſes proceeded from the ſenſitive Soul, that he frequently cured a recent Apoplexy by the Exhibition of a Vomit, and Aromatics. This is confirmed by *Wedelius*, in

Pathologia Dogmatica; who tells us, that by ſuch Remedies he reſtored a Tiler of *Jena*, who was ſeized with an Apoplexy, to perfect Health. And we know by Experience, that Perſons who have a Redundance of Blood, are frequently ſeized with an apoplectic Fit about the Equinoxes, at Full-moons, and in the Winter-time, after a Fit of Anger or Intemperance; and that it is either preceded or attended by Efforts to vomit, whilſt what is this Way diſcharged, is tinged with a black and diſagreeable Colour.

From ſuch Collections of Humours reſiding in the Stomach and Duodenum, ariſe many other very ſevere Diſtempers, among which we may reckon ſlow Fevers, which are generated of intermitting and acute Fevers; for when they are ſuddenly checked by Aſtringents, among the Number of which is the Peruvian Bark, before the Primæ Viæ are firſt unloaded, the ſordid Collection of Humours lodged in the Stomach may eaſily become the Source of more violent Diſtempers. The like Effects may be produced by eating too large a Quantity of Aliments, immediately after any chronical or acute Diſeaſe, where the Stomach, in conſequence of the Violence of the Diſtemper, is too weak for the Digeſtion thereof. Among the Number of ſuch Diſorders we may reckon, as I have ſaid, ſlow Fevers, which ſeize the Patient with the following Symptoms; a ſlow Heat of the Body, with a quick and frequent Pulſe, a Laſſitude, nocturnal Sweats, Faintneſs, and Emaciation. When, therefore, we have diſcovered the Source of this Diſorder, we may eaſily perceive, that refrigerating Remedies are no ways ſuitable to ſuch a Caſe, but do more Injury than Good: We ought rather to attempt the Cure with abſtergent Salts, and gentle Emetics, relaxing and bitter Medicines, which in this Caſe ſeem to promiſe the moſt certain Relief to the Patient.

I have already ſhewn, that the Bile, by ſtagnating, and mixing with acid Humours, may become the Occaſion of many violent Diſtempers; and, in purſuance of my Deſign, I ſhall now inquire, after what Manner its natural Texture and Temperature may be diſordered and corrupted by the Admixture of other Particles; and I am inclined to think, that this is principally effected by a Suppreſſion of other Excretions, particularly Tranſpiration. It is evident, of how much Importance to the Preſervation of Life and Health, this Evacuation of Humours through the Pores of the Skin is; which is juſtly eſteemed the Emunctory of the whole Body, and of the Blood: For all things, which are either ſuperfluous or injurious, are exhaled and perſpire through the Pores, and are expelled, as Sordes, out of the Limits of the vital Circulation of the Blood: Of this Sort is that ſalino-ſulphureous and ſubtle aëreo-aqueous Principle, which, being retained in the Body, eaſily corrupts and vitiates the Blood, which is the Fountain of Life. Hence many dangerous Diſeaſes, eſpecially Fevers of all Kinds, and Diſtempers which are attended with critical Eruptions. But, in order to account for this, we may obſerve in general, that the Humours of our Bodies are injured by an Obſtruction of the Excretions, and particularly of Perſpiration; for when the acrimonious Sordes do not find a Paſſage, on account of an Obſtruction of the Pores, they return to the Lymph and Bile, which, on that account, aſſume a quite different Nature; and, being thus vitiated, when it falls into the Inteſtines, and happens not to be evacuated in due time, but ſtagnates and continues long there, it changes its very Nature, and becomes a Seminary of Diſeaſes, eſpecially of Fevers. Wherefore it is not without Reaſon I aſſert, that the Seeds of periodical Diſeaſes, particularly of Fevers, reſide in the Duodenum: And in this the two eminent Phyſicians *Sylvius* and *Helmont* are on my Side. The former everywhere, throughout his Writings, aſſigns the Duodenum as the Seat of many Diſeaſes; and the latter, *Lib. de Febrib. Cap.* 17. expreſly affirms the ſame. "A Fever, ſays he, is cauſed by "a virulent Humour, which is lodged about the Pylorus, and "a little below it." And, *Cap.* 10. *N.* 3. he ſays, "that "the Seat of Fevers is in the *Primæ Viæ*, and extends from "the Pylorus to the Duodenum." *Fernelius* is of the ſame Opinion; who, *L.* 6. *C.* 7. aſſures us, "that the Seat of "intermitting Fevers is about the Stomach, the Duodenum, "and Pancreas."

The Seat, therefore, of theſe Fevers is juſtly determined to be in the Duodenum, ſince they proceed from a corrupted Lymph and Bile; and they are generally produced by a Suppreſſion of Tranſpiration, a Plethora, a Weakneſs of the Stomach and Inteſtines, occaſioned by Intemperance; all which greatly promote this Corruption: For, if the Sordes be not carried off by Perſpiration, they communicate an Infection to the Bile, by mixing with it; and if the Tone of the Stomach be diſorder'd, and Nature not ſtrong enough to diſcharge it by Stool, it muſt be detain'd in the Inteſtines; and, when it is corrupted, and continues long there, it not only exerciſes its Tyranny in that Region, but, being conveyed to the Blood, opens a new Scene of Evils, by racking the membranous and nervous Parts of the Body with Spaſms and Pains.

I have affirmed above, that the Seat of intermitting Fevers, eſpecially thoſe of the tertian Kind, was in the Stomach and Duodenum; which is confirm'd by the Symptoms that appear both in the Beginning and Progreſs of theſe Diſorders; for, in the Beginning of them, the Patient is troubled with Flatulencies, and a Hardneſs of the Abdomen, a Nauſea, and fixed Pain in the Back, and an Anxiety and Uneaſineſs about the Præcordia: Soon after, the Coldneſs goes off, a Vomiting enſues, the Colour of the Face turns yellow, and the Body burns with exceſſive Heat; the Patient is tormented with a Thirſt, that no Liquor can quench; his Urine is high-colour'd; and the Stools procur'd by Cathartics are very yellow; bilious, and ſometimes viſcid, Matter is diſcharged by Vomit; and a bilious Diarrhœa not unfrequently ſucceeds the Exhibition of the *Peruvian* Bark, eſpecially if the Duodenum happens to be turgid with a Redundance of Bile. The true Reaſon of this is, that the Bark, reſtoring the diſorder'd Tone of the Inteſtines, increaſes their periſtaltic Motion; whence they are enabled to diſcharge the contained Sordes. When the Bile returns to the Blood, from whence it had been before ſecreted, a Jaundice ſometimes accompanies the Fever. All theſe Symptoms, however violent in intermitting Fevers, are much more ſo in continued Tertians, and, moſt of all, in thoſe burning Fevers which the *Greeks* call'd *Cauſi*; becauſe the abundant Quantity of acrid Bile ſtimulates the reſpective Parts; and, therefore, all Medicines which deſtroy the Acrimony of the Bile, and render its ſtimulating Force leſs active, and which carry off the Sordes from the *Primæ Viæ*, are the moſt powerful Remedies in ſuch Diſtempers; ſuch are, gentle Emetics, nitrous, ſaline, and abſorbent Medicines, which have juſtly acquir'd great Reputation for the Cure of theſe Diſorders: And, indeed, theſe Remedies ought always to be made uſe of in Diſtempers of this Kind; though they are not ſo efficacious, when the intermitting Fevers are extremely obſtinate; for Example, in a Quartan; for, in theſe Caſes, the Diſeaſe is ſometimes too ſtubborn to yield to the Remedies above-ſpecified; a plain Indication, that it is too deeply rooted, and that the Cauſe lies more remote, even in ſome of the Viſcera. And it is no leſs evident, that the Pancreas, Liver, and Spleen, when labouring under Obſtructions, muſt continually ſupply the Inteſtines with a corrupted Bile, and pancreatic Juice, and, conſequently, furniſh freſh Supplies for the Diſtemper. And, therefore, when Caſes of this Kind occur, it will be proper to adminiſter ſtronger Medicines than the above-mentioned; ſuch as ſtrong Aperients, Salts, and Preparations of Rhubarb, Steel, and Mercurius Dulcis. Neither will it be improper to exhibit Emetics, as they frequently penetrate to the very Viſcera, and expel the Sordes retained in them. The Powder invented by *Riverius*, that ſucceſsful Practitioner, may be of great Uſe here, as it operates both by Stool and Vomit; and the Inventor aſſures us, that he has carried off a Quartan above a hundred times by the means of it, as may be ſeen in his Obſervations. Intermitting Fevers, which, about the third Day, are exaſperated, require the ſame Cure, as they in like manner ariſe from acrimonious corrupted Bile, as *Thonnerus*, *L.* 1. *Obſ.* 1. *p.* 10. remarks.

Riverius declines giving us the Method of preparing the celebrated Febrifuge above-mention'd, unleſs we can gueſs at its Compoſition from the following obſcure Deſcription: "This precious Remedy, ſays he, is compoſed of a triple "*Hercules*, [perhaps Gold, Antimony, and Mercury] by "twelve Operations, [perhaps Diſtillations] raiſed to the "higheſt Degree of Perfection. To theſe three *Herculeſes* "there is added a fourth Champion, [perhaps Spirit of Wine] "which renders the Remedy complete and perfect." This Medicine may be given to Children, from ten or twelve, to fifteen Grains; and to Perſons farther advanced in Years, from twenty to thirty or forty Grains. It operates in a mild and eaſy Manner, when exhibited in a due Doſe; nor does it produce any greater Commotions than the common Medicines, or the Compoſitions of Sena and Rhubarb. Sometimes it operates by Vomit, if any Part of the morbific Matter is lodg'd about the Stomach; for it has this Advantage peculiar to itſelf, that it goes directly to the morbific Matter, where-ever it is lodg'd, attacks it with Vigour, and perſiſts in the Encounter, till it has ſubdued it. In ſome Caſes, where it finds the Paſſages open, and no great Quantity of morbific Matter, it performs its Buſineſs without any Trouble, and with a very inconſiderable Evacuation. But, in other Inſtances, where the Patients have uſed no Remedies through the whole Courſe of the Diſorder, where the Body is ſtuffed with the Juices of peccant Aliments, where the Quantity of noxious Humours is large, where the Obſtructions are obſtinate, or the Crudities great, it does not ſurmount the Diſeaſe, without exciting conſiderable Commotions, and creating ſome Uneaſineſs to the Patients; as happened to ſome poor and vulgar Perſons, on whom the firſt Experiments, for inveſtigating the Virtues of this Remedy, were made.

But *Hartman*, that celebrated *German* Chymiſt, *Rolfinkius*, and ſeveral others, have been more explicit, and given us full Directions for the Preparation of this ſpecific Febrifuge. They direct the Proceſs to be perform'd in the following Manner:

Take

Take of the pureſt and beſt refin'd Gold, half an Ounce; reduce it into ſmall Portions; and, in the ordinary Manner, diſſolve it in *Aqua Regia*, prepared with common Salt; but not with Sal Ammoniac, becauſe that Species of Salt renders Mercury volatile; of the Glaſs of Antimony half an Ounce; and of well purified Mercury, three Ounces: Diſſolve each ſeparately, and in different Glaſſes, by means of *Aqua-fortis*, in ſuch a manner, that the Solutions may be ſufficiently clear and tranſparent. Mix all theſe Waters together, and draw off the Waters by Diſtillation. Add a freſh Quantity of *Aqua Regia*, and draw it off frequently, till the Precipitate, when placed upon a red-hot Iron, ſends forth no Fume at all. When this is obtain'd, calcine the whole Precipitate, carefully cover'd with a Tile; by which means, all the Spirits of the *Aqua Regia* are exploded and diſſipated. Then, from this Precipitate, diſtil Spirit of Wine, ſix times, till the Mercury is in ſome meaſure fixed. Then the Mercury is to be ignited, and ſlowly calcin'd, cover'd with a Tile. *Riverii Obſervat. Cent.* 3.

Having conſider'd the Nature of Fevers, we now proceed to the Conſideration of thoſe Diſeaſes, which are attended with Eruptions: And the firſt of this Kind I ſhall mention, is the purple Fever, a kind of Diſtemper little known in other Parts of the World; but which is very frequent in theſe Parts (*Saxony*). It is generally obſerved to accompany other Diſeaſes, eſpecially when they are upon the Turn; the Reaſon of which is, that the Inteſtines being dry'd by the preceding Heat of the Fever, and, in conſequence of this, a Coſtiveneſs ſucceeding, the corrupt bilious Matter, in the *Primæ Viæ*, cannot be ſo well corrected; and, when it is not diſcharged by Medicines, it muſt mix with the Blood, and occaſion the Diſtemper we are treating of. And what makes this the more probable is, that a *Purpura* frequently happens, when the Belly is for any conſiderable time coſtive, and is not rendered ſoluble by Clyſters, and gentle Laxatives. This Diſtemper alſo frequently ſeizes Infants, together with a Vomiting, Diarrhœa, a Fever, Cough, and difficult Dentition; and, beſides, it is alſo attended with an immoderate Thirſt, an Anxiety about the Præcordia, and want of Sleep: Perſons who are accuſtomed to bleed frequently, if they neglect it for a conſiderable time, are very ſubject to this Diſorder; and it is principally carried off by purging; and, therefore, Care ought to be taken to keep the Body in a ſoluble State. Some, under this Diſeaſe, ſweat much in the Night; others in the Morning; and others there are again, who every Year are ſubject to a chronical *Purpura*, and have evident Symptoms of a Diſorder in the Liver and Bile. In ſuch Caſes, 'tis moſt proper to begin the Cure by Emetics, and gentle Laxatives, which cannot fail to be of ſingular Service, ſince this Diſtemper frequently proceeds from a Stagnation of acrid Bile. *Borelli*, *Cent.* 2. *Obſ.* 36. has obſerved, that perpetual Sweats, attended with an Itching, have been carried off by a like Method of Cure, and the Exhibition of a Vomit, if the Patient abſtains from Wine. The Gout alſo ſeems to have its Reſidence in this Source of chronical Diſeaſes. Men of a weak Conſtitution, who have a ſort of hereditary lax and ſoft Texture of the Membranes, and hypochondriacal Perſons, are moſt ſubject to arthritic Pains, eſpecially in the Spring and Autumn; becauſe, in theſe Seaſons, on account of the Inequality and variable State of the Air, Perſpiration is moſt ſubject to be obſtructed; and, conſequently, the tartareous Salts, which abound in ſuch Conſtitutions, are more ſlowly carried off by Urine. And, therefore, when theſe Salts have not a free Paſſage, they are conveyed to the ſalival, bilious, and pancreatic Humours, and affect the *Primæ Viæ* with various Diſorders; ſuch as Flatulencies, Pains about the Præcordia, Coſtiveneſs, a wandering Pain about the Loins, accompanied, at the ſame time, with a febrile Commotion. That the Cauſe of the Diſorder reſides in the *Primæ Viæ*, is evident from hence; that if you adminiſter a gentle Emetic, about the Approach of the Diſorder, if it does not entirely ſuppreſs, it will ſurpriſingly alleviate it. *Martianus*, in his Comments on *Hippocrates*, ſays, that he has known Perſons ſeiz'd with arthritic Pains, from peccant Acrimony in the Stomach, who, upon vomiting up acid Humours, have been either entirely delivered, or, in a great meaſure, relieved from the ſame. And this is confirm'd by *Sylvius*, who informs us, that a Vomit is the moſt proper Remedy for a Gout; and that he has known it ſucceed in many Inſtances in the Courſe of his Practice. He alſo aſſures us, that he has ſeen a Vomit not only prevent an impending Paroxyſm, but alſo to deſtroy ſo far the Seeds of the Diſtemper, as to prevent a freſh Attack. *Hildanus* is of the ſame Opinion, *Cent.* 6. *Obſ.* 84. where we read of a Vomit's removing all the Pain of a Gout, if it be adminiſtered at the Beginning of the Paroxyſm: And I myſelf, ſays *Hoffman*, have obſerved, in my Notes on *Poterius*, that the Exhibition of a Vomit, at the Beginning, has mitigated the Violence of the Pain; and, being repeated the Day after, had the ſame Effect. *Alpinus*, *in Medicina Ægyptiorum*, ſays, that he has obſerved many Perſons, rack'd with Gout and Stone, who have procur'd great Relief from the frequent Uſe of Vomits.

Many violent Diſorders frequently ariſe from the Paſſion of Anger, for no other Reaſon, but becauſe the Bile, being pour'd in great Quantities from the biliary Ducts, into the Duodenum, affects the Membranes and nervous Syſtem; for if there be a Redundance of Bile in the Body, but, at the ſame time, no Evacuation of it, either by Vomit or Stool, it muſt neceſſarily create a Bitterneſs in the Mouth, a Nauſea and Inclination to vomit, with many other Diſorders; and the beſt Remedies for ſuch are Abſorbents, and Preparations of Rhubarb, gentle Laxatives, and Emetics; but we muſt carefully avoid all ſpirituous volatile Salts, and warming Infuſions.

The Cauſes of the Eryſipelas, Small-pox, Hæmorrhages, Aphthæ, Diarrhœas, hypochondriac and hyſteric Diſorders, as alſo malignant and petechial Fevers, in like manner reſide in the Duodenum; ſince they ariſe from Bile, and a Stagnation of putrid Lymph lodg'd therein. And hence the practical Maxim, *That we ought principally to regard the Primæ Viæ.* But I have already treated this Subject at large under the Article BILIS, which ſee: I ſhall therefore ſuperſede any further Explanation of it.

As to Practice, and the Method of curing theſe Diſeaſes, which are ſeated in the Duodenum; from what has been ſaid, it is evident, that Emetics, carefully prepared, and prudently exhibited, afford the moſt certain, and, perhaps, the only Relief, in ſuch Diſorders: They are generous and important Remedies, and excel in Virtue all other Medicines; and, if a Phyſician would perform any remarkable Cure, he will find his Deſign beſt anſwer'd by Emetics: For ſometimes a ſevere Diſeaſe is carried off, at the Beginning, by one ſingle Vomit; and he that neither makes uſe of Emetics, nor knows how to exhibit them juſtly, in my Opinion, is quite ignorant of true Practice. For, when impure Humours abound in the Stomach and Duodenum, Emetics are abſolutely neceſſary, for ſpeedily evacuating the peccant Matter at the Beginning; becauſe it is dangerous to carry it off through the long Canal of the Inteſtines by Stool; for thus it will be more likely to paſs into the Maſs of Blood: And it is particularly worthy of Obſervation, that moſt Purgatives neither move, nor propel, the ſtagnating Matter in the Stomach and Duodenum, but rather operate upon the ſmall Inteſtines. Anatomy manifeſts the Reaſon of this; for 'tis well known, that the Stomach and Duodenum are furniſhed with a glandulous Coat, under which lies the nervous Coat. For this Reaſon, the Spicula of the Cathartics cannot ſo effectually penetrate and ſtimulate the nervous Coat, as Emetics, which are of a far more penetrating and ſubtile Nature. Liquid Emetics are always preferable to ſolid, as they do not adhere to any one Part of the Stomach, but are diffuſed equally on all Sides, and operate more eaſily, and with leſs Trouble to the Patient. In the next Place, with regard to the Diſeaſes which are ſeated in the Duodenum and Inteſtines, I would recommend all ſuch Medicines as rectify and ſtrengthen the Tone, and preſerve the periſtaltic Motion, and, by theſe means, promote the Expulſion of the Fæces, and, conſequently, render the Body more ſoluble. To this Claſs belong deterſive Salts, ſuch as Arcanum Duplicatum, Terra Foliata Tartari; as alſo bitter Medicines, mix'd with Gums and Reſins of the temperate Kind, Preparations of Rhubarb, Amber, Myrrh, and Aloes.

Whoever attempts to cure chronical Diſtempers, and ſuch as are ſeated in the *Primæ Viæ*, ought principally to regard the periſtaltic Motion of the Inteſtines; the good State of which is known by the regular Diſcharge of Stools: And, when this is the Caſe, all Diſorders are the more eaſily ſubdued. As to the Cure of Diſeaſes which ariſe from the Duodenum, abſorbent and precipitating Medicines, which deſtroy the Acrimony of the Humours, are the moſt effectual: If the Bile be too hot, acrid, and volatile, nitrous Medicines, which correct it, afford the greateſt Relief: And, if it ſhould be viſcid and unactive, it ought to be rectified by bitter balſamic Elixirs.

Laſtly, with regard to the Cure of ſuch Diſorders as ariſe from a Collection of many impure Humours in the *Primæ Viæ*, we are to conſider, that Sudorifics, hot Medicines, and volatile Salts, are not ſo proper; ſince they not only attenuate the peccant Matter, but alſo convey it to the Maſs of Blood and Humours, which may be of dangerous Conſequence; whereas it ought rather to be carried off by Stool or Vomit. I am much pleaſed with a Paſſage in *Sylvius*, *Prax. Med.* 145. in the following Words: "Whenever there is a Redundance "of impure Humours in the *Primæ Viæ*, we ought not to "exhibit Sudorifics; becauſe Sweat cannot be excited without "a Commotion of the whole Blood, which, being at that "time more fluid than uſual, muſt, of conſequence, convey "through the whole Body every Impurity, ſooner, and in "larger Quantities." 'Tis a great Miſtake, to exhibit Medicines of a hot Nature, and eſpecially Sudorifics, before the *Primæ Viæ* are clear'd; and, when they are fill'd with impure Humours,

Humours, 'tis as improper to adminiſter Anodynes; becauſe they retain the offending Matter, which ought to be evacuated. But ſhould this peccant Matter incorporate with the Blood, as happens in an Eryſipelas, the Small-pox, and Gout; in that Caſe we muſt uſe great Caution in adminiſtering Emetics; becauſe, by inviting the Matter from the Extremities to the Viſcera, they may poſſibly excite Convulſions, and other violent Diſtempers: And, therefore, we ought, in ſuch Caſes, to make uſe of gentle Abſterſives and Clyſters, and exhibit Emetics rather at the Beginning of the Diſeaſe, and when the Patient is not under an immediate Paroxyſm. *Frederic Hoffman.*

DUPONDIUM, δισσόντιον. A Weight equal to four Drams. *Caſtellus* from *Galen.*

DURA MATER, or *Meninx.* The Name of the thick external Membrane, which covers the Brain. See CAPUT.

DURACENA. An Epithet for a particular Sort of Peaches, which adhere ſtrongly to the Stone. *Caſtellus* from *Langius.*

DURATUS, harden'd, properly; but uſed in *Scribonius Largus, Comp.* 35. to expreſs, macerated.

DURDALES, certain imaginary Spirits, which *Paracelſus* fanſied to reſide in Trees.

DURIO. The Name of a very large Tree, which grows in the *Eaſt Indies*, and bears a Fruit as big as a Melon.

The Fruit, to thoſe who never taſted it, ſmells at firſt like putrid Onions; but, after it has been once eaten, recommends itſelf before all other Food, both for Smell and Savour; and is in ſuch high Eſteem with thoſe who indulge their Appetites, that they believe it impoſſible for any Perſon to be ſatisfied with it: And yet ſo great is the Plenty of this Fruit in *Malaca*, that they are ſold for no more than four Maravedis apiece, eſpecially in the Months of *June*, *July*, and *Auguſt*; for in the other Months they raiſe their Price at Pleaſure.

The Antipathy between this Fruit and Betle is very ſurpriſing, being ſo great, that if you carry a few Leaves of Betle into a Ship, full of the Fruit of the *Durio*, or into a Houſe, or a Chamber, where they are kept, they will every one be corrupted and putrefy; and if any one has his Stomach inflamed, or oppreſſed with immoderate eating the Fruit, the Inflammation is mitigated, and the Tumor removed, by only applying a Leaf of the Betle to the Stomach; and if, after eating the Fruit, you ſwallow ſome Leaves of the Betle, you will ſuſtain no Injury, though you eat never ſo much of the Fruit. *Raii Hiſt. Plant. p.* 1652.

DYAHIBALA. A Name for the Mimoſa; non ſpinoſa; major; *Zeilanica.*

DYNAMIS, δύναμις, from δύναμαι, to be able, is the Faculty or Power from whence an Action proceeds. Hence *Galen, Lib. de Plenitud.* defines it δεκτικὴν αἰτίαν ἢ οὐσίαν, "an "efficient Cauſe or Subſtance;" and ſays, it is no Difference, whether you call it ποιητικὴν, or δεκτικὴν, αἰτίαν, or οὐσίαν. The ſame Author deſcribes τῆς δυνάμεως οὐσίαν, "the Subſtance "or Eſſence of the Faculty," to be the Quality of the Temperament of any compound Subſtance, which conſiſts in the due Temperament of each of its Parts. Δυνάμεις, in *Hippocrates*, περὶ ἀρχ. ἰητρ. are the prevailing Qualities and Forces of the Humours. The Word δύναμις is frequently uſed by *Galen* for a Preparation or Compoſition of a Medicine, ſometimes particularly of an approved Medicine. Thus *Plutarch*, in *Sympoſ.* makes mention τῆς ἀλίμου δυνάμεως, "a Medicine of "approved Virtue againſt Hunger," uſed by *Epimenides. Foeſius.*

DYOTA, or rather DIOTA. A Pelican, or circulating Veſſel, with two Ears, reſembling in Shape a Man ſtanding with his Arms a-kembo.

DYSALTHES, from δύς, importing Difficulty, and ἄλθω, to cure. Difficult of Cure.

DYSANAGOGOS, δυσανάγωγος, an Epithet for tough viſcid Matter, which is expectorated with Difficulty.

DYSÆSTHESIA, δυσαισθησία, from δύς, importing Difficulty, and αἰσθάνομαι, to feel, or perceive. A Dulneſs or Difficulty of Senſation.

DYSARISTESIS, δυσαρίστησις, from δύς, and ἀρίσκω, to pleaſe. A Moroſeneſs which frequently precedes acute Diſtempers, and Melancholy. *Aetius, Tetrabib.* 2. *Serm.* 1. *C.* 5. *Galen.*

DYSCINESIA, δυσκινησία, from δύς, and κινέω, to move. Difficulty of Motion.

DYSCRASIA, δυσκρασία, from δύς, importing bad, and κεράννυμι, to mix. Dyſcraſy, Intemperature. Such a Mixture of the Fluids in the Body, as is inconſiſtent with Health.

DYSCRITOS, δύσκριτος, from δύς, importing Difficulty, and κρίσις, a Criſis. Difficult to be brought to a Criſis, or brought to an imperfect or bad Criſis.

DYSECOIA, δυσηκοΐα, from δύς, importing Difficulty, and ἀκούω, to hear. Deafneſs, or Difficulty of Hearing.

DYSELCES, δυσελκὴς, from δύς, difficult, and ἕλκος, an Ulcer. An Epithet for ſuch Perſons, whoſe Ulcers are difficult to cure.

DYSENTERIA, δυσεντερία, from δύς, importing Difficulty, and ἔντερα, the Inteſtines, is defin'd a Difficulty, or a Diſturbance, of the Functions of the Inteſtines, attended with an Exulceration. A Dyſentery, according to *Galen, Lib.* 6. *de Locis affect.* is properly call'd ἕλκωσις ἐντέρων, "an Exulceration of "the Inteſtines," attended in the Beginning with an Excretion of a biting bilious Humour; afterwards, of Abraſions of the Inteſtines; and, at laſt, Blood in moderate Quantities is voided; which latter Caſe only, as he informs us, *Lib.* 5. *de Sympt. Cauſis*, is by ſome taken for the proper Dyſentery. An Exulceration of the Inteſtines, according to the ſame Author, *Com. ad Aph.* 3. *Lib.* 6. is, when there happens firſt an Abraſion of the outer Superficies of thoſe Parts, and, in Length of Time, a deeper and ulcerous Putrefaction. The Author of the *Definitiones Medicæ* defines a Dyſentery to be an Exulceration of the Inteſtines, attended with an Inflammation, and an Excretion of bloody, feculent, and ſometimes ſtrigmentitious Sordes, and a Pain and biting Senſation of the Belly and Inteſtines. *Hippocrates, Lib.* περὶ παθῶν, ſays, that a Dyſentery is attended with Pain and Gripes in all Parts of the Belly, and Excretions of Bile, Phlegm, and aduſt Blood. In another Place of the ſame Book he tells us, that this Diſeaſe ariſes from a Settlement of Bile and Phlegm in the Veins and Belly. The Blood is diſorder'd, and depoſits its corrupted Part; the Inteſtine alſo is affected, and is abraded and exulcerated. The Diſeaſe is long, painful, and mortal; and, if the Patient be of a robuſt Conſtitution, there is room to expect a Cure; but when there is a Colliquation, and total Exulceration of the Belly, there are no Hopes of Life. Again, *Lib.* 3. περὶ διαίτης, when the Body is heated, he ſays, and there is an acrimonious Purgation, with an Abraſion and Exulceration of the Inteſtines, and bloody Stools, the Diſeaſe is call'd a Dyſentery, and is a ſevere and dangerous Diſorder. The Word δυσεντερεῖν, in *Hippocrates*, ſometimes alſo ſignifies bloody Excretions, or a bloody Flux of the Belly, without an Exulceration of the Inteſtines, as *Aph.* 65. *Lib.* 5. according to *Galen*'s Expoſition of the Place. And this Kind of Dyſentery, *Lib.* 2. *Epid.* he expreſly calls δυσεντερεῖν ἐρυθρὸν, "the red Dyſentery;" where the ſame Aphoriſm is repeated. Agreeably hereto, *Galen*, in his Comment on *Lib.* 3. *Epid.* explains δυσεντερώδεα πάθη, by bloody Dyſenteries; and informs us, that there are two Kinds of Dyſentery, one from an Ulceration of the corroded Inteſtines; another, conſiſting in an Evacuation of much Blood, proceeding from the Veins of the Inteſtines. Again, in his Comment on *Lib. de Artic.* he tells us, that *Hippocrates* ſeems not to uſe the Term δυσεντερεῖν, [in that Place] as the Generality of Phyſicians do, for an Exulceration of the Inteſtines, but for Excretions of Blood by Stool. *Hippocrates, Lib.* 2. *Epid. Sect.* 6. ſeems to uſe δυσεντερεῖν, in a general Senſe, for any Flux of the Belly whatſoever.

OBSERVATION I.

At a certain Seaſon, when a Dyſentery happened to be epidemical at *Amſterdam*, a Woman of about forty Years of Age, and of a corpulent and good Habit of Body, had the Misfortune to be ſeized with the reigning Diſorder, under which ſhe labour'd for three Weeks. In the firſt Stage of the Diſeaſe, her Excrements were black; but, in Proceſs of Time, aſſuming a reddiſh Colour, they were at laſt mixed with a whitiſh kind of Subſtance. Her Belly was in Pain in various Manners; for the Pain was either fix'd at her Navel, in which Caſe her Belly was depreſſed; or, if her Belly was elevated, the Pain, like a Girdle applied, affected the whole Region of the Navel. She was tormented with an intolerable Thirſt, which ſhe endeavoured to ſatiate with any Liquor ſhe pleaſed, uſing at the ſame time large Quantities of Brandy. She could not be prevailed upon to take any Medicines, except an alterative Decoction, and the *Amſterdam Pilulæ de Laudano*; by the Uſe of which, her Pain was alleviated, and Sleep, to which ſhe was otherwiſe a Stranger, procured. When ſhe went to Stool, ſhe felt a very conſiderable Pain about her *Anus*. She was ſeveral times purged during the Courſe of the Diſeaſe; ſometimes with Powder of Rhubarb alone, by which ſhe diſcharged little or nothing, without the leaſt Degree of Relief; at other times, with Powder of Rhubarb, in Conjunction with that of Jalap-root, by which copious Stools were evacuated with Eaſe. A Clyſter was alſo injected, by which ſhe was render'd worſe; neither could ſhe bear Unctions of any kind; for which Reaſon the Uſe of theſe Medicines was dropt. During the Courſe of the Diſorder, the Flux was three times ſtopt, and the Patient apparently in a fair Way of Recovery; but, as ſhe uſed a very bad and improper Regimen, ſhe relapſed, and fell a Sacrifice to her Folly.

Upon laying open her Body, the following Phænomena occur'd: Firſt, the Omentum, though of a due and natural Bulk, was yet ſphacelated, and of a blackiſh livid Colour. Secondly, the Duodenum and Jejunum were very full of Bile; a Circumſtance ſufficient to account for her inſatiable Thirſt. Thirdly, about a Cubit Length of the Ilium, where it tends towards the Inteſtinum Cæcum, was corrupted and ſphacelated. Fourthly, the Colon, for about four Fingers Breadth from the Cæcum, was ſound; but, for about eight

Fingers

Finger-breadths farther, corrupted. Fifthly, the Gall-bladder was very large, and diſtended with Bile, as green as Graſs. The other Parts ſeem'd to be in an excellent State; for nothing amiſs appeared, either in the Rectum, or any of the reſt of the Inteſtines. The Liver alſo, the Spleen, and Pancreas, were in their due and natural Condition. *Alard. Herman. Cummen. in Miſcel. Curioſ. An.* 1673. *Obſervat.* 116.

Observation II.

A Dyſentery may ariſe from preternatural Tumors form'd in the Inteſtines; a memorable Inſtance of which we have in the Son of *Jacobus Fontanus*, who, in the ninth Year of his Age, died of a Dyſentery. As the preciſe Seat of the Diſorder was dubious, and its immediate Cauſes unknown, the Father took care to have his Body laid open, after his Death.

The Surgeon appointed for this Purpoſe, between the Beginning of the Colon, and the End of the Rectum, found more than two hundred round Ulcers intermix'd with Impoſtumations. Some of theſe Ulcers had corroded the whole Coats of the Inteſtine; ſome Parts of which were found ſound and entire between the Ulcers. *Jacob. Fontan. Pract. Lib.* 3. *Cap.* 23.

Observation III.

A certain young Man, accuſtomed to drink too large Quantities of Brandy, had the Misfortune to be ſeized with a Dyſentery, accompanied with violent Pain. During the Courſe of this Diſorder, he frequently diſcharged by Stool about two Pounds of concreted Blood; which, from the Fineneſs of its Colour, was concluded to have come from a ruptur'd Artery.

Upon laying open his Body after Death, I found the ſmall Inteſtines here and there ſphacelated, their Coats corroded, and in four Places totally perforated. *Barbette, Prax. Lib.* 4. *Cap.* 5.

Observation IV.

In the Year 1624. I opened the Bodies of ſeveral Perſons, who died of Dyſenteries; and, among the reſt, that of a Soldier, whoſe Diſorder had been of a long ſtanding. In this Subject I found the Inteſtines highly inflated, and their interior Coat totally abraded. And, what was ſtill more ſurpriſing and uncommon, the Gall-bladder was diſtended with a tough, viſcid, and white Humour, reſembling a Poultice of Starch, whilſt, at the ſame time, the ſmalleſt Remains of Bile were not to be diſcovered. *Bontius Med. Indorum, Lib.* 3. *Obſ.* 3.

Observation V.

A Countryman, of about forty Years of Age, after the prepoſterous and imprudent Suppreſſion of a Dyſentery, was, for ſeven Weeks, rack'd with continual Pains of his Belly, which, however, were more intenſe than ordinary at certain ſhort Intervals. Upon laying open his Body, his Liver was dry, and of a pale Colour. On the Gall-bladder there was an Abſceſs as large as one's Fiſt, which diſcharged Pus near the Cavity of the Liver. There was alſo another Abſceſs found in the Meſentery. *De Lamoniere, de Fluxu Hepatico, Cap.* 1.

Observation VI.

In the Year 1608. a certain Boy was ſeized with a Dyſentery, which only diſcovered itſelf, and exerted its Fury, at certain Intervals. This Circumſtance I ſuſpected to proceed from the Gnawing of Worms: Nor, indeed, was I wrong in my Conjecture; for, upon laying open his Body, I found the Inteſtines very full of Worms. *Jacobus Fontanus, Practicæ Lib.* 3. *Cap.* 21.

A Dyſentery, attended with a Fever, various Stools, an Inflammation of the Liver, Hypochondria, or Belly, Pain, Loathing, or Thirſt, is always bad; but the Patient, who is affected with moſt of them together, ſoon ſinks under them; and, by conſequence, he who labours under feweſt, is in leaſt Danger. This Diſeaſe is principally fatal to Children from five to ten Years old; the other Ages are more ſecure. A Dyſentery which proves beneficial to the Patient, is attended with none of theſe Symptoms. Where Blood and Strigments are voided by Stool, the Diſeaſe terminates on the ſeventh, fourteenth, twentieth, or ſortieth Day, or within thoſe Periods. Theſe Sorts of Fluxes are effectual towards extirpating Diſeaſes out of the Body, the more inveterate in a longer Time, the recent, perhaps, in a few Days; for even pregnant Women often labour under a Flux of Blood, and Strigments, for many Months together, and yet ſupport themſelves under it till the Time of Birth, and afterwards, and preſerve the Fœtus, unleſs a Pain happens to moleſt them, or ſome other of the bad Signs attending a Dyſentery before-mention'd. But if any of theſe makes its Appearance, it prognoſticates Deſtruction to the Fœtus, and Danger to the Mother, unleſs the Dyſentery ceaſes the ſame Day, or in a ſhort time after the Delivery of the Fœtus, and bringing away the Secundines. *Hippocr. Prædict. Lib.* 2. See ALCALI.

Among the Diſeaſes of the Inteſtines may be reckon'd the *Tormina*, by the *Greeks* call'd *δυσεντερία*, "the Dyſentery." In this Diſorder the Inteſtines are exulcerated on the Inſide; Blood flows from them, mix'd ſometimes with Fæces, which are always liquid; ſometimes with a kind of mucous Excretions; and ſometimes Caruncles are diſcharged with the Excrements: There is a frequent Deſire of evacuating, with a Pain in the Anus; ſome inconſiderable Diſcharge is made with the ſame Pain, and the Torment becomes more intenſe; which, however, after ſome time, is alleviated: The Patient has very little Reſt; his Sleep is interrupted; he becomes feveriſh; and, after a conſiderable Length of Time, either periſhes under the Inveteracy of the Diſtemper, or eſcapes with much Difficulty and Torment.

Firſt of all, the Patient muſt have Reſt; for all Agitation promotes the Exulceration of the Parts: Then he muſt drink, faſting, a Cyathus of Wine, in which the bruiſed Root of Cinquefoil has been added. Apply repellent Cataplaſms to the Belly: As often as he goes to Stool, let him waſh with a Decoction of Vervain; let him eat Purſlain boil'd, or out of ſtrong Pickle, and uſe an aſtringent Diet.

If the Diſorder be of pretty long ſtanding, Clyſters are to be injected of warm Cremor of Ptiſan, or Milk, or melted Fat, or Stags Marrow, or Oil, or Butter and Oil of Roſes, or Oil of Roſes with the raw White of an Egg, or a Decoction of Linſeed; or, if Sleep be wanting, the Yolks of Eggs, with a Decoction of Roſe-leaves. Such Medicines alleviate the Pain, and are of great Service, eſpecially if a Loathing of Food be conſequent upon the Diſtemper. *Themiſon* has adviſed the Uſe of the ſtrongeſt Brine in ſuch Caſes.

The Food ought to be ſuch as gently binds the Belly: As for Diuretics, if they have their proper Effect, they are of Service, by diverting the Humour another Way; otherwiſe they increaſe the Diſeaſe: For which Reaſon they are not to be uſed, but on ſuch Subjects as have been accuſtom'd readily to receive Benefit from them. The Drink, if the Patient be feveriſh, is to be pure Water warm, and alſo Water endued with an aſtringent Quality; or, if that be wanting, thin auſtere Wine. If theſe Remedies give no Relief, after they have been uſed for ſeveral Days together, and the Diſorder grows inveterate, the Drinking of Water, of a good Degree of Coldneſs, aſtringes the Ulcers, and lays the Foundation of Recovery; but, when the Evacuations are ſuppreſſed, we are immediately to return to warm Potions.

Sometimes a putrid and very fetid Sanies is diſcharged, and ſometimes pure Blood comes away in the Stools: In the firſt Caſe, the Belly is to be well cleanſed with Injections of Hydromel, and thoſe other Remedies before preſcribed. An effectual Remedy againſt a Cancer of the Inteſtines is a Lump of Minium bruiſed, with half a Pound of Salt, or a Clyſter of the ſame, with Water: If Blood be voided in the Stools, the Patient is to eat and drink ſuch Things as are of an aſtringent Quality. *Celſus, Lib.* 4. *Cap.* 15.

The ſuperior Inteſtines, which reach as far as the Cæcum, are ſmall, and contain Bile, are called *Choladet*; whereas the Inteſtines inferior to theſe are large, carnous, and extended to the Beginning of the Rectum.

As Ulcers are formed in all theſe Inteſtines, ſo Dyſenteries, which are produced by theſe Ulcers, muſt, of courſe, be of various Kinds; for ſome Ulcers only affect the Surface of the Inteſtines, and are without Danger, when they only produce a gentle Excoriation: They are alſo ſafer in the inferior than in the ſuperior Inteſtines. But, when theſe Ulcers become pretty deep, they are certainly of a bad Kind. There are others ſtill of a worſe Kind, which do not continue in the ſame State, but are deep, corroding, glandulous, ſpreading, productive of a Sphacelus, and Death; for, whilſt they ſpread, the ſmall adjacent Veins are corroded, in conſequence of which, large Diſcharges of Blood are made into the Ulcers. There are other Ulcers of the Inteſtines, which are tumid, rough, anomalous, callous, and reſembling ſuch Knots as are generally found in the Branches of Wood. Theſe with Difficulty admit of a Cure, ſince they are not eaſily brought to a Cicatrix, and, when they are, break out again upon the ſlighteſt Occaſion.

The Cauſes of a Dyſentery are various; but the moſt conſiderable are Crudities, continued Colds, the Uſe of acrid Aliments, ſuch as the *Myttotum* [*a kind of Food made of Garlick, Onions, and Cheeſe, bruiſed together*], or Onions or Garlick, or old and acrid Fleſh, the Uſe of which generates Crudities. This Diſorder is alſo produced by drinking Liquors, to which Perſons have not been accuſtomed; ſuch as the *Cyceum*, the *Bryton*, and other Liquors uſed in various Nations for common and ordinary Drink. Wounds alſo, Cold, and the Drinking of cold Water, produce Exulcerations of the Inteſtines.

But, in different Ulcers, the Excretions, and other Signs, are different; for, if theſe Ulcers only affect the Surface of the ſuperior Inteſtines, then bilious Excrements, and ſuch as are free from all Smell, except what they contract from the Inteſtines, are diſcharged. But, when the Jejunum is exulcerated, the Excrements are more ſaturated with Bile of a Saffron-colour, and

ſetid Smell. This Diſcharge is made together with the Aliments, which are colliquated, but unequal; and the Smell of the Excrements is ſometimes highly fetid, and the Ulcers putrid; at other times the Humours have no other Smell than that of the Excrements. But, when the inferior Inteſtines are exulcerated, the Excrements are aqueous, thin, and inodorous. If the Ulcers are deep, an Humour like Sanies, reddiſh like Wine, or the Waſhings of Fleſh, is diſcharged, ſometimes alone, and ſometimes along with the Excrements. It is ſometimes humid, and diſſolved by the ſurrounding Fluid, without Bile, and void of Smell; or compact and dry, but ſlippery on account of the Fluid which ſurrounds it. If large and ſmooth Ulcers are form'd in the ſuperior Inteſtines, a bilious Humour is diſcharged, both on account of the Inteſtines from which it comes, and through which it paſſes. This Humour alſo ſtimulates the Anus, becauſe the Bile, eſpecially when flowing from an Ulcer, is acrid: The Bile is alſo pinguious, reſembling Fat. But thick and concreted Blood, together with Phlegm, and ſome carnous Shreds, and even entire Parts, of the Inteſtines, which are not very pinguious, are diſcharged from deep Ulcers of the inferior Inteſtines. Sometimes a white, thick, mucous Subſtance, like Fat cut ſmall, with a certain Humour, is diſcharged; but this comes from the Inteſtinum Rectum. Sometimes a mucous Subſtance, ſmall in Quantity, round, pungent, and exciting an Itching of the Parts, and a frequent Deſire of going to Stool, attended with a Senſe of Pleaſure, is evacuated. This Species of Diſorder is called *Teneſmus*. But from the Cæcum large reddiſh Portions of Fleſh are evacuated; the Ulcers are generally deep, the Blood diſcharged thick and feculent, and the Smell more fetid than that of other Humours. If the Ulcers are of a ſpreading and corroding Nature, and cannot be check'd by any means, bilious Humours, of a deep Colour, reſembling that of Saffron, frothy, ſometimes black, reſembling the Fæces of Wine, the Herb ἰσάτις [Woad], or Leeks, are evacuated. It is alſo thicker than the above-mentioned Humours, and of a putrid Smell. Sometimes the Aliment is diſcharged, as it were, undigeſted, and as if haſtily maſticated by the Teeth. If, on the contrary, the inferior Inteſtines are corroded, black Concretions, and groſs, carnous, reddiſh, grumous, and ſometimes black and much variegated, and fetid Humours are evacuated; and ſometimes there is an involuntary Diſcharge of a Liquid. Sometimes a Subſtance of a conſiderable Length, very much reſembling an entire Inteſtine, is diſcharged, and ſtrikes the Minds of the Ignorant with a Dread of having loſt Part of their Inteſtines; but this Accident is to be accounted for in the following manner: The Inteſtines, as well as the Stomach, have two Coats, one of which lies obliquely on the other. When the Union and Connection of theſe is deſtroyed, the interior Coat, being ſeparated longitudinally, is diſcharged; and the external Coat, remaining, contracts and cicatrizes; by which means the Patient is recovered: But this only happens in the inferior Inteſtines, whoſe Coats are fleſhy. But, if the Blood flows from any Veſſel, it is yellow, black, or pure, and unmixed with any Aliments, or with the common Excrements. A certain Concretion, reſembling a Spider's Web, alſo floats on its Surface; and, when it becomes cold, it is formed into grumous Clots; ſo that one could ſcarcely believe it was Blood diſcharged from the Body: But, as it is evacuated with much Wind and Noiſe, the Quantity diſcharged ſeems to the Patient to be much larger than it really is. Purulent Abſceſſes are alſo ſometimes formed in the Colon; in which Caſe there is nothing extraordinary, more than in other internal Ulcers, ſince the Signs, the Nature of the Pus, and the Method of Cure, are the ſame. But, if fleſhy Subſtances are diſcharged, hard, compact, and rough, it is a Sign, that the Abſceſs is malignant. Sometimes a large Quantity of Water is diſcharged from the Colon in the manner of a Dyſentery; by which Circumſtance many have been freed from a Dropſy. Theſe are the various Species of Ulcers, which are formed in the Inteſtines, and the different Kinds of Humours diſcharged from them.

It now remains, that we conſider the prognoſtic Signs of theſe Ulcers, whether good or bad. In general, therefore, if the Excoriation is only ſuperficial, either in the ſuperior or inferior Inteſtines, the Patients are free from every Degree of Fever or Pain, and may, without Decubiture, by a ſlender Regimen adapted to each Caſe, be reſtored to perfect Health. But if, in caſe of an Ulcer in the ſuperior Inteſtines, ſevere griping Pains are excited, as it were, by a ſmall Quantity of overheated Bile, theſe Ulcers of the Inteſtines generally come to a Suppuration, tho' at different times. The Concoction and Digeſtion of the Aliments are imperfect, tho' the Patient's Appetite does not fail him. Exulcerations happening in the inferior Inteſtines are far leſs dangerous than thoſe of the ſuperior, becauſe the former are much more fleſhy than the latter. But, if hollow and ſpreading Ulcers are formed in the ſuperior Inteſtines, acute and obſcure Fevers in the Viſcera are produced; a Chilline ſeizes the whole Body; the Patient loaths his Food, and is afflicted with Watchings, fetid Eructations, a Nauſea, a Vomiting of Bile, and a Vertigo. If there is a copious Diſcharge of bilious Matter, the Gripings continue, and the other Pains are increaſed; the Strength is rendered languid, and the Knees paralytic; the Patient is ſcorch'd with a burning Fever, becomes thirſty, is ſeized with a Nauſea, and vomits a black Matter. His Tongue becomes dry, and his Pulſe ſmall and weak. All theſe Symptoms are accompanied with others, which are fatal in malignant Ulcers. The Patient is ſeized with the cardiac Paſſion to ſuch a Degree, that he faints away, and dies, before he can be recovered. The ſame Accidents are common to Eroſions of the inferior Inteſtines, if the Ulcers are of the ſpreading Kind, and if the Diſcharge of the Humour cannot be check'd. Beſides, Gripes and Pains ariſe below the Navel, where the Ulcers are perceived, and the Humours diſcharged are ſuch as we have above repreſented them. If at firſt the Ulcers are ſmall, and do not for ſome time begin to ſpread, theſe ſmall Ulcers, like the Waves of the Sea, ſucceed each other; ſome of them ſubſiding, whilſt others riſe to an Apex. If Nature is as yet ſufficiently ſtrong, and duly aſſiſted by the Phyſician, the Ulcers may be kept from ſpreading; neither is there any Danger of Death. The Inteſtines, however, remain hard and tumid, and require a long time before they can be reſtored to their natural State.

A Diſcharge of Blood from the Inteſtines, if proceeding from ſome large Vein or Artery, ſoon proves mortal; ſince the Hand can neither have Acceſs to the Part affected, nor any Medicine be applied to the Ulcer. Beſides, though the Diſcharge of Blood ſhould be ſuppreſſed by Medicines, the Patient is not by that means placed beyond the Reach of Danger; becauſe, in ſome Caſes, the Separation of a large Eſchar renders the Orifice of the Vein or Artery ſtill larger. When the Blood is formed into grumous Concretions, and remains undiſcharged, the Diſorder admits of no Cure. A ſpeedy Stop is therefore to be put to ſuch Hæmorrhage, which, when approaching, may, though not very certainly, be prognoſticated from the following Signs; that is, a reſtleſs and uneaſy State; a Senſe of Weight in the Part where the Rupture is about to happen; and a Redneſs of the Countenance at the very Time it happens. When the Vein is recently ruptured, it is, for the moſt part, capable of being ſoon conſolidated; but, when the Rupture is of long ſtanding, it is more ſlowly, and with greater Difficulty, cured.

Theſe Ulcers of the Inteſtines happen moſt frequently in the Summer; next to which, the Autumn is the moſt general Seaſon for their Production. They happen more rarely in the Spring, and never in the Winter. Diarrhœas are principally incident to Children, and very young Perſons; whereas Perſons in the Vigour of Youth, and ſuch as are arrived at the Years of Maturity, are more generally afflicted with Dyſenteries. In old Age theſe Ulcers are with Difficulty cur'd, and require a long time before a Cicatrice is form'd on them. But in old Perſons, corroding Ulcers are ſcarce to be met with: Beſides, Diſcharges of Blood are beneficial to old Age. *Aretæus, de Cauſ. & Sign. Morb. diuturn. Lib.* 2. *Cap.* 9.

This Diſeaſe took its Name δυσεντεία [Dyſentery] from its cauſing the Inteſtines to perform their Function with Pain. It may be defined, A Rheumatiſm of the Belly, attended with an Exulceration; and it is preceded either by the Flux, which the *Greeks* call *Diarrhœa*, the *Cholera Morbus*, or a Tumor of the Belly. The Diſtemper is ſometimes acute, but more frequently of the chronical Kind. The Symptoms are, mucous Excretions, mix'd with Strigments, and a thick Humour: Firſt, comes away the natural Mucus of the Inteſtines; after that, the Excrements are various, as ſanguineous, bilious, ſanious, and feculent, mixed with Corpuſcles of congealed Blood, which the *Greeks* call θρόμβοι· livid; carnous, mix'd with Membranes of a very great Length, intolerably fetid, attended with a Pain from the Ulcerations, a Loathing, Thirſt, and a burning Heat of the internal Parts: Theſe Symptoms are ſucceeded by a Want of Sleep, and, ſometimes, a feveriſh Diſorder, Anxiety, Toſſing, Dulneſs of the Senſes, and, in ſome Caſes, a Rumbling of the Inteſtines, with a Tenſion, Flatulencies, and a Difficulty of making Water. Sometimes the Diſorder is attended with Vomiting, and a Palpitation of the Præcordia, or a cold Numbneſs, the Tongue humid, or very dry and rough, and aſh-colour'd or livid, with Extenuation of the Body, Corruption of the Aliment from a diſtemper'd Heat, an inceſſant Deſire to excrete, attended with a biting Senſation in all the Inteſtines, the Anus, and Parts adjacent: The Ulceration happens either in the ſmall Inteſtines, as the Duodenum, Jejunum, or Cæcum; or in the great ones, as the Colon, or Rectum. But we can by no means believe the Ulceration to be univerſal in all the Inteſtines at one time, becauſe ſuch a Caſe would be prevented by the Death of the Patient. An Ulceration in the ſmall Inteſtines is known by a Pain ſeated above the Navel, or taking its Beginning from that Place, and by the conſtant and remarkable Thinneſs of the Fæces. If the great Inteſtines are ulcerated, the Pain lies below the Navel, and the Excrements appear carnous, and are frequently more ſolid and coagulated, if the Rectum be the only Part affected, and eſpecially its inferior Parts: For an

Ulcera-

Ulceration of the ſmall Inteſtines prevents a Digeſtion of the Food, and a Converſion of it into a ſtercoraceous Subſtance. Sometimes, at the End of a Stool, the Fæces, ſtriking on the Ulcers, excite a Bleeding, and Drops of Blood come away, giving manifeſt Signs of a Teneſmus; by which we know, that the Part of the Rectum near the Fundament, which the *Greeks* call ἕδρα, is ulcerated: For the Patients are affected with a frequent Irritation to Excretion, which is perform'd with much Straining and Labour, and a Tenſion of the *Nates*, and the *Pecten*, as far as the *Pubes*, as if cauſed by ſome ſolid Body contained in them: But the Diſcharges are but ſmall, and ſomewhat mucous, mix'd with a groſs Humour; for the firſt Excretions are pinguious, the next ſanguineous, mix'd with coagulated Fæces. We are of Opinion with thoſe who comprehend a *Teneſmus* under a Dyſentery, ſince it is an Ulceration of Part of an Inteſtine; unleſs you had rather beſtow the Name of *Teneſmus* on the Tumor before Exulceration. *Cælius Aurelianus*, *Morb. Chronic. Lib.* 4. *Cap.* 6.

Among the ſpaſmodic and convulſive Diſorders we may juſtly rank that Diſcharge of bloody Excrements, which Phyſicians, in a ſtrict Senſe, call Dyſentery, and which *Cælius Aurelianus* defines, A Rheumatiſm of the Inteſtines, attended with an Ulcer; and, the judicious *Sydenham*, A Fever, in which the peccant Humours are thrown upon the Inteſtines: For a Dyſentery is nothing but the periſtaltic Motion of the Inteſtines, ſo increas'd, as to become a Species of Convulſion, by Humours of a cauſtic and ulcerating Quality adhering to their Coats, and which bring on a frequent Deſire of going to Stool, and as frequent a Diſcharge of mucous and bilious Sordes, ſtain'd with more or leſs Blood, or Sanies, and attended with violent Gripes, and a febrile Commotion.

This Diſorder ought to be diſtinguiſh'd from other Fluxes, tho' accompanied with Gripes, that go by the Name of Diarrhœas; for in theſe, the Gripes of the Inteſtines are not, by far, ſo violent, as in a Dyſentery, and the Humours diſcharg'd are never bloody, but only pituitous, or mix'd with a bilious Sordes; whereas, in a Dyſentery, the Humours are bloody, ſanious, putrid, and fetid. With reſpect to the Difference betwixt a *Cholera* and a Dyſentery, that has been ſpecified under the Article CHOLERA.

It requires greater Judgment, to diſtinguiſh a Dyſentery from an hæmorrhoidal Flux, which is attended with violent Gripes; for the Blood in this Caſe evacuated, is generally pure, and, as it is frequently diſcharg'd along with the Stools, it contributes, almoſt always, to the Improvement of Health; whereas, in a Dyſentery, the Blood is diſcharg'd with a troubleſome Teneſmus, and violent Gripes; and is ſeldom or never pure, but rather diluted, and mix'd with a ſanious, frothy, and fetid Matter, the Evacuation of which is not ſucceeded with an Increaſe of Strength, but rather renders the Patient worſe. Beſides, the Fever which generally attends it, and the peculiar Time of the Year it rages in, may eaſily diſtinguiſh it from an hæmorrhoidal Flux. There is alſo a Difference betwixt a Dyſentery, and that endemial Diſtemper at *Paris*, which commonly ſeizes all Strangers; tho' they reſemble one another in ſeveral reſpects; for, tho' this Diſorder be attended with frequent Stools, which are firſt mucous, and afterwards bloody, yet it is not, by far, ſo malignant and contagious as a Dyſentery; beſides, it is never accompanied with a Fever; ſeizes Perſons at any time of the Year; and, tho' it continues longer with them, yet it never hinders them from going abroad, and purſuing their Buſineſs, which is far from being the Caſe of thoſe who are troubled with a Dyſentery.

Dyſenteries are diſtinguiſh'd into benign and malignant. The former continues longer, but proceeds more gently, and is leſs dangerous: The latter is not only of a contagious Nature, but is alſo attended with ſome fatal Symptoms, ſuch as a malignant Fever, a Defect of Strength, and exanthematous Diſorders. We ought alſo to obſerve, that Dyſenteries are diſtinguiſh'd into red and white: In the former, the Humours evacuated are always bloody; but, in the latter, ſanious, and mix'd with carnous Filaments, and ulcerous Shreds, abraded from the Coats of the Inteſtines.

The Dyſentery is a peculiar Kind of Diſtemper, being ſeldom ſporadic, but generally epidemic; and then it is attended with various Degrees of Malignity. It ſpares neither Sex nor Age, but ſeizes Men, Women, and Infants, without Diſtinction; ſo that the tender ſucking Children are not exempted from its Tyranny. The People more generally ſubject to this Diſtemper, are thoſe of a plethoric or bilious Habit of Body, and ſuch as labour under a great Weakneſs of the Stomach; and it is generally moſt ſevere in Perſons that live intemperately, or eat too much Summer Fruits, eſpecially if they be unripe, and have a Tendency to Fermentation. A Dyſentery has alſo a more violent Effect on ſuch as expoſe themſelves, when they are warm, to the cold Air of the Night: And hence it is, that Soldiers in a Camp are very ſubject to it: And, for that Reaſon, it is diſtinguiſhed by the Epithet *Caſtrenſis*; and, becauſe it rages frequently and ſeverely in *Hungary*, it ſometimes acquires the Name of the *Hungarian* Diſtemper.

We ought, alſo, to advert to the Seaſon when Dyſenteries principally rage: And, if we conſult *Hippocrates* on this Head, he informs us, *Sect.* 3. *Aph.* 2. that Dyſenteries rage in thoſe Summers, which ſucceed an intenſely cold and dry Winter, and a rainy Spring: And, *Aph.* 12. that a rainy Winter, and a dry Spring, have a Tendency to produce them. The hotteſt Seaſon is obſerved to have the moſt natural Tendency to bring on a Dyſentery; and about the End of Summer, or Beginning of Autumn, that is, in *Auguſt* and *September*, when the cold Nights ſucceed the intenſe Heat of the Sun in the Day-time, this Diſtemper is obſerv'd to rage: For this Reaſon, in all hot Climates, it is found to be more frequent and ſevere; and in *Egypt*, *India*, or *Arabia*, this Diſorder is endemial. See *Bontius*, *Lib.* 2. *Hiſt. Nat. Ind. Orient.* Malignant Dyſenteries are alſo obſerv'd to rage, when great Numbers of Flies, Caterpillers, Spiders, and other Inſects, are obſerved in the Air.

A conſiderable time before People are ſeiz'd with a Dyſentery, they are obſerved to complain of a Wearineſs of Body, of a Swelling and other troubleſome Motions in their Bellies. And *Cælius Aurelianus*, *Lib.* 4. *Morb. Chron. Cap.* 6. long ago obſerv'd, that a Diarrhœa, a Cholera, or a Swelling of the Belly, uſually precedes Dyſenteries. This Diſorder often begins with feveriſh Cold, or at leaſt ſome Shivering of the Body; which is ſucceeded by a Heat more or leſs violent, which accompanies the Diſeaſe thro' all its Stages, and is attended with a quick Pulſe, and intenſe Thirſt. Vehement Gripings, in the lower Part of the Belly, either precede, or very ſoon ſucceed, this feveriſh Chilneſs: Then the Belly becomes ſoluble: And, firſt, the Fæces, Crudities, and mucous Humours, are diſcharg'd: A little after, pinguious, and almoſt oleous Juices; and laſtly, a frothy Matter, mix'd with Blood, ulcerous Sanies, Shreds, and membranaceous Filaments, generally evacuated in ſmall Quantities. Perſons that have a great deal of Sordes in their Stomachs, are troubled with a Nauſea, a great Deſire of Vomiting, and, frequently, actual Evacuations of that Kind. Many are afflicted with a vehement Cardialgia, and an Anxiety about the Præcordia. Every one under this Diſtemper is afflicted with a perpetual Deſire of going to Stool, and ſuch a ſtrong Teneſmus of the Anus, that a moſt irkſome Falling down of the ſame frequently enſues: Every Stool is preceded, accompanied, and followed by moſt violent and ſevere Gripes; and that not in one Part, but thro' the whole Canal of the Inteſtines; and, when the Patient goes to Stool, he feels, as it were, all his Bowels deſcend with exquiſite Pain. Laſtly, Perſons under this Diſtemper loſe all Appetite for Food, and are oppreſs'd with Reſtleſſneſs, becauſe of the Frequency of Stools; Sleep is baniſh'd, and their Strength much impair'd.

Theſe are the ordinary Symptoms of Perſons in a Dyſentery, which, upon the Increaſe of the Diſtemper, are followed by others much more dangerous and fatal: For ſome, while they are cold without, are burnt up within, and tormented with continual Heats and Pulſations of the Inteſtines. Hickups, cold Sweats, Paleneſs of the Viſage, Leanneſs, Inflammations and Aphthæ of the Fauces, ſoon ſucceed theſe. It rarely happens, that Dyſenteries are free from Pain. See *A. N. C. Dec.* 1. *anno* 2. *Obſ.* 43. and *Act. Med. Haffn. Vol.* 2. *p.* 138. Sometimes Perſons, in the Extremity of the Diſtemper, loſe all Senſe of Pain, feel no Thirſt, make an involuntary Diſcharge of Excrements, which are of an highly fetid and cadaverous Smell, and the Pulſe becomes ſmall, and then certain Death enſues. It ought, alſo, to be remark'd, that a Dyſentery has often prov'd contagious: Thus, contrary to what commonly happens, the Infection has been propagated to others ſolely by the Smell of the diſcharg'd Sordes, as we find in *A. N. C. Dec.* 2. *Ann.* 6. *Obſ.* 25. And we have ſome Inſtances of Mothers labouring under a Dyſentery, who have propagated the ſame Diſorder to their ſucking Infants. *A. N. C. Dec.* 2. *Ann.* 6. *Obſ.* 195. Whilſt we are giving this hiſtorical Account of Dyſenteries, it will not be improper to make ſome Remarks on the anatomical Diſſections of Perſons that have died of this Diſtemper: And, firſt, all Writers affirm, that, in Subjects of this Sort, both the large and ſmall Inteſtines are inflamed, mortified, or exulcerated, and overſpread with Bile, after Death, as may be ſeen at large in *Bartholine*, *Cent.* 6. *Inſt.* 2. and *Barbette*, *Lib.* 4. *Cap.* 3. And particularly *Joannes de la Moniere*, in his Treatiſe *de Fluxu dyſenterico* ſays, he ſaw the Pylorus, and ſmall Inteſtines, inflam'd. That the ſmall Inteſtines have been found of a livid Colour, and overſpread with Bile on the Outſide, and gangren'd on the Inſide, appears from *A. N. C. Dec.* 2. *Ann.* 6. *Obſ.* 104. And *Platerus*, *Lib.* 3. *p.* 875. and *Riverius*, *Cent.* 3. *Obſ.* 2. have obſerved the large Inteſtines, in like manner, livid, and affected with a Gangrene. And the ſame *Platerus*, *Mantiſſ. Obſ. p.* 25. found a Gall-bladder, entirely deſtitute of Bile; but the Ileon and Colon, which abounded with Ulcers on the Inſide, were ſtain'd with Bile. *Bontius*, inſtead of Bile, found in the Gall-bladder, a Liquor very much reſembling Chyle; and the *A. N. C. Dec.* 2. *Ann.* 6. teſtify, that the Bile,

Bile, in Perſons who have died in this Diſtemper, is of a porraceous Colour, or nearly that of Graſs.

By comparing carefully theſe things with the Symptoms of the Diſtemper, it will be an eaſy matter to diſcover the true Seat of a Dyſentery. It lies in the large Canal of the Inteſtines, which, according to *Sydenham*, *Sect.* 4. *Cap.* 3. are ſucceſſively affected, till the whole Violence of the Diſtemper fall down on the Inteſtinum Rectum, which is tormented above the reſt with an exceſſive Pain, and a vehement Teneſmus. Nor can I deny, but that the adjoining Parts, eſpecially the Liver and biliary Ducts, may, thro' Sympathy, feel the Tyranny of the Diſtemper: But, as to the Inteſtines, we can eaſily diſcover which of them ſuffers moſt: For, if the Vehemence of the Pain be felt about the Navel, and if ſlower Stools follow thereon, we may infallibly conclude, that the Seat of the Diſorder lies in the ſmall Guts: But when, on the other hand, the Violence of the Gripes falls either on that Part of the epigaſtric Region, where the Colon is ſituated, or on the hypogaſtric Region, and the Fæces are ſoon after diſcharg'd, in that Caſe, 'tis evident, that the Diſtemper is ſeated in the larger Inteſtines: And, laſtly, when People under this Diſtemper, have a continual, tho' fruitleſs, Inclination to go to Stool; or when they void nothing but a tough, clammy, acrid, and virulent Mucus, and that but in ſmall Quantities; it ſeems highly probable, that there is an Ulcer in the *Inteſtinum Rectum*.

'Tis not my Buſineſs, at preſent, to enlarge on the Structure of the Inteſtines, much leſs to enumerate the various Names, Situations, and Windings of the ſame; but it may not be improper to take notice of ſome Particulars, that have a more immediate Connection with our preſent Deſign. Both the larger and ſmaller Inteſtines, like the Stomach, are made up of four Coats: The muſcular Coat is made up of two Series of Fibres, one longitudinal, the other ſpiral, by the Help of which the periſtaltic Motion is perform'd: The nervous Coat is furniſh'd with a large Number of Blood-veſſels, which ſeem to make a peculiar Coat of themſelves, the Inſide of which is cover'd with a great Number of ſmall Glands, which by their excretory Ducts ſecrete from the Maſs of Blood, into the Cavity of the Inteſtines, not only that ſerous and mucous Humour, which, like Glue, adheres to the Tunica Villoſa, and defends both that and the ſubjacent nervous Coat from the Acrimony of the Subſtances uſed as Aliments; but alſo another Liquor, of a ſtill more excrementitious Nature: For it is carefully to be obſerv'd, that the Humours, eſpecially of the ſerous Kind, are ſecreted in any Parts, the Bulk of whoſe Pores is proportion'd to the Particles to be ſecreted: Thus, the more ſubtile Parts of theſe Liquors are exhaled through the Pores of the Skin. What is proportionably groſſer, is convey'd to the Kidneys; and what is ſtill thicker, is carried to the Inteſtines, as the common Receptacle of all the groſſer Humours.

From what has been ſaid, we may more eaſily diſcover the genuine Nature of a Dyſentery, and account for the ſeveral Symptoms with which it is accompanied. That the ſecondary and remote Cauſe of it conſiſts in the periſtaltic Motion of the Inteſtines, ſo increaſed as to become a Species of Convulſion, is obvious to every one, who but allows himſelf to reflect on the violent Pains and Gripes, with which thoſe labouring under this Diſorder are afflicted: Nor can it be denied, that its more direct and immediate Cauſe conſiſts in a highly acrid and cauſtic Humour, which vellicates and ſtimulates the Coats of the Inteſtines. But the Qualities of this Liquor, and the Method in which it is generated, are Points hitherto ſo obſcure and latent, that Phyſicians and Anatomiſts run into different Opinions concerning them.

Some of the Antients maintain'd, that this Humour, in its Nature and Qualities, reſembled Coloquintida: And, if we compare the Effects produc'd in the human Body by Coloquintida, and which are enumerated by *Stalpart Vanderwiel*, in *Obſ.* 41. with the Symptoms attending a Dyſentery, we have ſome Reaſon to conclude, that they were pretty much in the right. But the Opinion moſt generally received is, that the immediate Cauſe of a Dyſentery is ſeated in the Inteſtines, and is a highly acrid Humour, generated by Summer Fruits, eſpecially when unripe, fermenting with the other Juices, eſpecially thoſe of the bilious Kind, and vellicating, corroding, and excoriating, the nervous Coats of the Inteſtines. Tho' I readily grant, that this Cauſe may often concur to the Production of a Dyſentery, yet I will not affirm, that the Diſorder proceeds univerſally from it, ſince a Dyſentery is of ſo contagious a Nature, as to ſeize Perſons who have eaten no Kind of Fruits, as alſo ſucking Infants: For this Reaſon, others have had recourſe to a certain ſpecific kind of Miaſma, whoſe particular Quality it is, to ferment in the Inteſtines with the Bile eſpecially, and then to corrode them. But neither can I agree, in every reſpect, with this Opinion, when I conſider, that ſometimes an Humour is diſcharg'd from the Inteſtines, ſo highly acrid, as to corrode Silver Veſſels, tho', at the ſame time, the Coats of the Inteſtines are neither corroded by it, nor ſo violent Gripes excited, as in a Dyſentery. Nor is it ſufficient to retort, that in a Dyſentery the villous Coat is firſt abraded, and then the nervous Coat vellicated; for the ſame Effect may be produc'd by any other acrid Humour; and 'tis, beſides, confirm'd by Experience, that the Gripes of dyſenteric Patients begin with the very firſt Appearance of the Diſeaſe, before the villous Coat of the Inteſtines could poſſibly be abraded.

For this Reaſon I am inclin'd to think, that the genuine and moſt immediate Cauſe of a Dyſentery, which produces the ſevere Gripes, and all the other Train of Symptoms, is principally lodg'd in the Blood-veſſels, which ſurround the nervous Coat of the Inteſtines: And I am of Opinion, that this Cauſe is nothing more than a ſerous, lymphatic, and mucous Matter, coaleſcing into a viſcid and cauſtic Maſs with the ſaline, acrid, and ſulphureous Particles fluctuating in the Maſs of Blood, and ſometimes mixing with an adventitious Taint, convey'd to the Body by external Cauſes: For this Matter being, by a certain febrile Motion, ariſing from a Conſtriction of the Surface of the Body, convey'd thro' the Blood-veſſels into the nervous Canal of the Inteſtines, does, partly by its Acrimony, vellicate, corrode, and ſtimulate their delicate Coats ſo as to bring on Gripes and Conſtrictions; and, partly by its Viſcidity and Toughneſs, diſtend and rupture the Veſſels in which it is lodg'd. Hence we diſcover the Origin of the Convulſions and Gripes, which are heighten'd, and render'd more atrocious, in proportion to the Quantity of the acrid Sordes contain'd in the Inteſtines. During theſe violent Contractions of the Inteſtines, their Contents muſt neceſſarily, and in the very Nature of the Thing, be evacuated; for, after the remaining Crudities of the Aliments are eliminated, the Conſtriction continuing, the Mucus, which covers the villous Coat, is forcibly abraded and diſcharg'd with the more or leſs noxious Humour dropping from the Glands of the Inteſtines, under the Form of a pinguious and oleaginous Mucus. Whilſt theſe Effects are producing, and whilſt the biliary Ducts, together with the Gall-bladder, are, by the Conſent of Parts, violently compreſs'd, they diſcharge all their Bile into the inteſtinal Duct; and this Bile is evacuated by Stool, along with the reſt of the Mucus. Beſides, ſo long as this Diſtention of this membranaceous Canal continues, the Blood-veſſels, already turgid with the Blood convey'd to them, are compreſs'd, the Regreſs of the Blood thro' the Veins is hinder'd, and its Afflux being ſtill continued, it ſtagnates, breaks thro', or extravaſates itſelf into the Inteſtines. Hence the Excrements appear ting'd with Blood, or a dangerous Inflammation of the Inteſtines is brought on, and is to be diſcover'd by the continual Senſe of Heat, and a beating Pain. This Inflammation either degenerates into a ſanious Ulcer, which preys upon the villous Coat of the Inteſtines; and, in this Caſe, an ulcerous Sanies is evacuated by Stool, along with fleſhy Filaments; or it plainly terminates in a Gangrene, or fatal Mortification, which is accompanied with no Degree of Pain; and the Excrements, in in this Caſe, diffuſe a cadaverous Smell.

We now come to inveſtigate thoſe procatarctic Cauſes, which by giving Birth to this noxious Humour, produce a Dyſentery: And the Cauſes of this kind may, in my Opinion, be principally reduced to three Claſſes; the firſt of which is, the State of the Weather; for after a long-continued Series of hot and dry Weather, when, for the moſt part, cold Nights ſucceed the intenſe Heat of the Sun, Dyſenteries are obſerved to rage. Diſorders of this Kind, ariſing from too dry a State of the Atmoſphere, are deſcribed in *A. N. C. Dec.* 2. *an.* 4. *Obſ.* 24. Beſides, this Diſorder is principally incident to Patients, who, being over-heated, and ſweating too copiouſly, during the Day, allow the cold Air of the Night too free an Acceſs to their Bodies by being ſlightly covered. The Reaſon of this is ſufficiently obvious; ſince, by the long-continued Heat and Drineſs of the Air, the Maſs of Blood is reſolved and colliquated, and the Sweat flows too copiouſly. Hence the finer, more fluid and balſamic Juices being diſſipated, the remaining Humours become mucous, acrid, impure, and ſulphureous; and the Patients are by this means rendered proportionably weaker. If therefore, to a Body thus diſpoſed, the cold and pinching Night Air is freely admitted, its Surface is by this means conſtricted, and the farther Diſſipation of the more ſubtle and ſulphureous Sordes obſtructed: Hence theſe Sordes, uniting with a mucous Lymph, degenerate into a tough and highly acrid Matter; which, by the febrile Motion, is conveyed to the Inteſtines, as the largeſt Receptacle and Strainer of mucous Sordes, where it generates and produces a Dyſentery. That Species of Dyſentery which is peculiar to Camps, is alſo generated in the ſame manner; and may be produced without the Concurrence of any malignant and external Taint.

When, to the now mentioned State and Conſtitution of the Atmoſphere, there are added any Exhalations of a virulent Nature, which conſtitute another Claſs of procatarctic Cauſes; then are produced epidemical Dyſenteries, more or leſs malignant and contagious; and rage far and near, ſpreading their baleful Influences over large and ſpacious Tracts of Land. Thus

Fernelius,

Fernelius, de abd. Rer. Cauſ. Lib. 2. *Cap.* 13. makes mention of an epidemical Dyſentery, which, in the Year 1538. raged over all *Europe*. Theſe Miaſmata are either generated in the Air, from the malignant Effluvia ariſing from the Earth, and the particular Conſtitution of the Winds; and then they are drawn into the Body in Inſpiration: Or when Aliments, eſpecially hot Herbs, and Summer Fruits, covered with the malignant Eggs of the Inſects at theſe Seaſons obſerved to be very numerous in the Air, are eaten, theſe ſmall Eggs are mixed with the Chyle, and conveyed to the Maſs of Blood. But it is to be obſerved, that, during ſuch a Conſtitution of the Atmoſphere, the Contagion received into the Body lies latent for ſome time, and waits for ſome accidental Cauſe to make it exert its Virulence. For this Reaſon I have often obſerved, that, during Seaſons of this Kind, the ſlighteſt Stimulus of the Inteſtines, brought on by a Purgative, forthwith produces a Dyſentery. Beſides, the Cauſe and Origin of the Contagion is to be accounted for, from the Evacuations, the Milk, or the Sweat exhaling from the Bodies of dyſenteric Patients.

A third Claſs of procatarctic Cauſes, concurring to the Production of a Dyſentery, is the too liberal and immoderate eating of Fruit, eſpecially if unripe; or if fermentative Liquors are drank after them. The Fruits which have the moſt direct and immediate Tendency to produce this Diſorder, are ſweet Cherries, Peaches, and Plums, eſpecially thoſe of the yellow Kind; the frequent bad Effects of which are ſhewn by *Foreſtus, in Lib.* 2. *Obſ.* 23. Impure fermentative Liquors, when copiouſly drank, alſo contribute to the Production of this Diſorder; ſuch as Muſt, and Ales, which at theſe Seaſons are generally in a bad State. They have alſo a Tendency to produce the ſame Effect, when recent, impure, thick, and loaded with Fæces, as alſo when they are acid; for when Subſtances of this Kind, furniſhed with an acrid fermentative Juice, are mixed with the Bile in the Duodenum, they undergo a violent Fermentation with it; by which means not only ſubtile and highly acrid Vapours are conveyed into the Maſs of Humours, but alſo the Sordes are rendered thicker, and of a more cauſtic Quality; which, remaining within the Inteſtines, corrode their nervous Coats, and ſurpriſingly increaſe the Gripes. To this Collection of impure and ſordid Humours ſtagnating in the Stomach and Duodenum, we are principally to aſcribe the Nauſea, the Retchings to vomit, and the Vomitings themſelves, which ſometimes accompany a Dyſentery. But thoſe are exempted from theſe Symptoms, who, without this concurring Cauſe, are ſeized with the Diſorder; as is obvious from the Dyſenteries, which, in the Year 1726. raged in *Germany*, ſince theſe, in the Month of *June*, when there is no Fruit to be had, either ripe or unripe, raged with uncommon Fury; but were not, at the ſame time, attended with Vomitings.

But, with reſpect to this, we muſt obſerve, firſt, that theſe Fruits alone are ſufficient to generate a Dyſentery: When, for Inſtance, the acrid Vapours, ariſing from their Fermentation with the Bile in the Stomach, are conveyed into the Maſs of Humours, they there corrupt the laudable Juices, and by that means diſpoſe the Habit for generating the Matter of a Dyſentery. But this Matter, the Stimulus of the Inteſtines produced by the Sordes lodged in them concurring as an accidental Cauſe, is by a certain febrile Motion conveyed from the Surface of the Body to the Inteſtines. Secondly, we muſt obſerve, that, in ſuch Caſes, a certain Weakneſs of the Stomach and Inteſtines muſt neceſſarily be brought on. Hence we may be enabled to aſſign a Reaſon, why ſome great Devourers of Fruit ſhould be ſometimes free from Dyſenteries; whereas others, who either eat no Fruit at all, or, at moſt, uſe them very moderately, are ſeized with this Diſorder. For ſo long as the Primæ Viæ are ſtrong, and in a good State, the Errors committed will eaſily be corrected, and the noxious Sordes carried off: Whereas thoſe, in whom theſe Parts have a weaker Tone, and are filled with an acid Sordes, its perpetual Concomitant, generally pay dear for the Indulgence they grant themſelves in this way. Thirdly, very often the immoderate Uſe of Summer Fruits, and fermentative Liquors, is to be conſidered as the concurring and additional Cauſe of a Dyſentery; whereas the principal Cauſe is to be aſcribed to an obſtructed Perſpiration, or a Reception of the Contagion into the Body. In this Caſe the Symptoms of the Diſorder, produced by the united Agency of two Cauſes, muſt, in the very Nature of the Thing, be ſurpriſingly exaſperated.

Having thus conſidered the Nature, and productive Cauſes, of a Dyſentery, we now come to take a View of its Prognoſtics. Dyſenteries, then, happening to Women in Childbed, are highly dangerous. And this Diſorder is more fatal to old Perſons and Children, than to thoſe of a middle Age; as we are informed by *Hippocrates, Sect.* 2. *Text.* 30. as alſo by *Sennertus, in Lib.* 3. This Diſeaſe generally proves fatal, when it ſeizes Patients who are cachectic, ſcorbutic, phthiſical, weak, or who by long Afflictions of Mind are become extenuated: It is alſo highly dangerous, when it ſeizes Perſons who have Worms lodged in their Inteſtines. Dyſenteries, accompanied with Vomiting and a Hiccup, are not without Danger, ſince they lay a Foundation for an Inflammation of the Stomach. Nor is it a leſs inauſpicious and unlucky Omen, when green, black, and highly fetid Excrements are diſcharged, together with a Species of Caruncles; ſince, according to the 26th Aphor. of the fourth Section of *Hippocrates*, theſe Signs generally indicate an Ulcer of the Inteſtines. Dyſenteries, in general, are more or leſs mild, in proportion as the Inteſtines are more or leſs exulcerated. It is a highly unlucky Sign, either when Clyſters injected immediately ſlip back again, or when the Anus is ſo cloſely ſhut up, that nothing can be injected; ſince the former Symptom indicates a Palſey of the Inteſtines, eſpecially of the Rectum; and the latter a violent ſpaſmodic Stricture of the ſame Inteſtine. An unlucky Event is alſo to be expected, if, whilſt the Pulſe is weak, the Extremities are cold, and the internal Parts either burnt with Heat, or entirely free from Pain. Alienation of Mind, Inflammation of the Fauces, Aphthæ, or ſuch a total Palſey of the Œſophagus, that the Aliments cannot be ſwallowed without a certain Noiſe, are alſo bad Signs. We muſt alſo obſerve, that this Diſorder, eſpecially if joined with a malignant Fever, ſometimes makes a quick Progreſs; and often deſtroys the Patient within ſeven, nine, or fourteen Days; whereas at other times it is protracted for many Days, perhaps to the fortieth, or farther; that when it has become inveterate, and of long ſtanding, it either cuts off the Patient; or, if it ſhould happen to terminate without Death, afflicts him very ſeverely, as *Celſus* has obſerved in the 15th Chapter of his 4th Book; that it often degenerates into a Dropſy or Lientery, according to the Obſervation of *Hippocrates*, in the ſixty-third Aphoriſm of his ſixth Section; as alſo, that it is frequently changed into the Cœliac Paſſion, a Conſumption, or an incurable Hectic.

The Method of CURE.

There is ſcarce any Diſeaſe, in the rational Cure of which the Skill and Judgment of the Phyſician is more neceſſary than in a Dyſentery; ſince there is a great Variety of Medicines preſcribed in this Diſorder, which are ſo far from being equally beneficial to all Patients, that we often find what is of Advantage to one, proving highly noxious and injurious to another. But, generally ſpeaking, theſe following are the principal Intentions of Cure: Firſt, that the peccant, acrid, and cauſtic Matter, of whatever Kind, be corrected, and carried through its proper Emunctories. Secondly, that the violent Gripes and ſevere Spaſms of the Inteſtines be ſoothed and alleviated. And, thirdly, that the Inteſtines themſelves, whether exulcerated or weakened, ſhould be relieved by proper and well-choſen Remedies.

As for the firſt of theſe Intentions, the prudent Phyſician ought carefully to obſerve, whether any groſs Crudities are lodged in the alimentary Tube; which he may diſcover partly by a previous Error with reſpect to Regimen, ſuch as the eating too liberally of Summer Fruits; and partly by the Nauſea, Cardialgia, and Retching to vomit, with which the Patient is afflicted. In Caſes of this Nature, Phyſicians highly extol one Scruple, or half a Dram, of Ipecacuanha, in Conjunction with Crabs Eyes, exhibited by way of Vomit, in the Beginning of the Diſtemper; and to be frequently repeated, drinking a large Quantity of warm Water after it. Nor is it leſs expedient to carry off the groſs and acrid Sordes by Stool: This Intention is moſt effectually anſwered by the Powder of Rhubarb mixed with Abſorbents; becauſe, beſides its detergent and laxative Effects, it gently corroborates and reſtores the Tone of the Inteſtines. The Pilulæ Balſamicæ are alſo of ſingular Service in Caſes of this Nature, ſays *Hoffman*, when prepared in the manner directed by *Becher*, *Stahl*, or myſelf; and more eſpecially when mixed with Extract of Rhubarb.

It will alſo be expedient to correct the Acrimony, and allay the corroding cauſtic Quality, of the Sordes in the Inteſtines; to which End mucilaginous Preparations, given inwardly, will conduce very much; ſuch as the recent Oil of Sweet Almonds expreſſed without Fire; recent Sperma Ceti, which is not rancid; with Decoctions of Barley, Oats, the Shavings of Hartſhorn, the Roots of Vipers-graſs, and China-root; Emulſions alſo prepared of ſweet Almonds, and Pine-kernels; pectoral Waters, and ſweet Whey; as alſo the Selteran Waters, mixed with Aſſes Milk. Theſe Medicines excellently anſwer the Intention by ſheathing up the Acrimony, and lubricating the Paſſages. This Effect is alſo produced, and the Sordes at the ſame time evacuated, eſpecially from the large Inteſtines, by emollient Clyſters, prepared of Barley-water boiled with Bran, ſweet Whey, the Yolks of Eggs, Oil of Chamomile, ſweet Almonds, and Goats Greaſe.

In like manner we ought to take great Care to correct and carry off, through the Surface of the Body, the ſubtle Impurities, more or leſs malignant, that are yet fluctuating in the Maſs of Blood, and to mitigate the concomitant Fever, becauſe by this means the Afflux of the Sordes is drawn back from the Inteſtines to the Surface of the Body. And, for anſwering this Intention, Abſorbents mixed with fixed Diaphoretics are much commended. We may alſo, in theſe Caſes, exhibit Powders of calcined or philoſophically prepared Hartſhorn, foſſile Ivory, Terra Sigillata, Armenian Bole, diaphoretic and chalybeated Antimony,

Antimony, Amber, Crabs Eyes, red Coral, Mother of Pearl, and eſpecially mountain Cryſtal; to which, if there be an exceſſive Heat and Thirſt, a ſmall Doſe of Nitre, and, for allaying the Vehemency of the Pains, Caſcarilla-bark, or a Grain or two of the Theriaca cœleſtis, may be added. But particularly, for expelling a malignant Taint got by Contagion, half a Grain of Camphire, mixed with Nitre and Abſorbents, is of great Uſe and Efficacy.

In order to anſwer the ſecond Intention, and to reſtrain all violent and exceſſive Commotions, ſafe Anodynes, and mild Aſtringents, ought to be uſed alternately with the above-mentioned Medicines. The moſt conſiderable of theſe are the Theriaca cœleſtis, the Aqua theriacalis, the Diaſcordium, the Pilulæ de Styrace, the Pilulæ de Cynogloſſo, the Pilulæ Wildeganſii, and *Sydenham's* Liquid Laudanum. But the Anodyne Liquor, mixed with a ſmall Quantity of the Balſamum Vitæ, is a much ſafer and moſt effectual Remedy in more Caſes: I have, ſays *Hoffman*, exhibited about twenty Drops of it, three or four times a Day, with great Succeſs. To this Claſs, alſo, may be referred, on account of their antiſpaſmodic Virtue, the diſtilled Waters of the Lily of the Valley, of the Flowers of the Alder, Lime, Oranges, Mint, black Cherries, and Caſcarilla, in which the above-commended Powders may be exhibited. External Paregorics may alſo be uſed; of which, if the Gripes be very violent, a Liniment may be compounded in the following manner:

Take of the Oil of white Lilies, one Ounce; of the diſtilled Oil of Mint, of Wormwood, (which is an excellent Anodyne) of Nutmegs, and of Caraway, each half a Dram; and of Camphire, one Scruple.

Anointing the Abdomen with this Liniment will be of ſingular Service in abating the Violence of the Pain; and by that means the other Medicines will more eaſily operate on the material Cauſe of the Diſeaſe, and more ſucceſsfully conquer it.

When the peccant Humours are thus carried off, and the Spaſms ceaſe, we ſhould next ſuccour the injured Inteſtines; in which, if there yet remain any Ulcers, beſides the Continuation of Abſtergents given inwardly, we ought to uſe frequent Injections of Clyſters, mixed with Goats and Deers Suet, the Yolks of Eggs, Turpentine and *Lucatellus's* Balſam. But it generally happens, that, after we have got the better of the Diſeaſe, there remains a Want of the due Tone in the Inteſtines; which may be reſtored by the Exhibition of corroborative Remedies, the moſt conſiderable of which are, the Bark of the Caſcarilla, exhibited either in the Form of an Eſſence, a Powder, or an aqueous Extract; or even Peruvian Bark reduced to an Electuary, with abſtergent and corroborative Extracts, or the Eſſence of Orange Peel, mixed with the Eſſence of red Gentian and Amber. The external Application of Spirit of Wine rectified is of conſiderable Uſe in this Caſe, as alſo Hungary-water, or the Spirit of the Flowers of Roman Chamomile mixed with the diſtilled Oil of Mint.

The before-mentioned Remedies will not anſwer the Deſign, if we are not very careful to obſerve a ſtrict Regimen; and we ought to preſerve, as much as poſſible, an equal Temperament of Air about the Patient: For, as all Refrigeration, either by external Cold, or by drinking cold Liquors, is manifeſtly dangerous, ſo exceſſive Heat and Exæſtuation, occaſioned either by the Room's being too warm, or by heaping on too many Bed-clothes, muſt increaſe the febrile Heat, and be of as dangerous Conſequence. Therefore Perſons labouring under a Dyſentery, and who ſtudy Eaſe either of Body or Mind, ſhould neither have too warm Beds nor Rooms; and the Liquors they uſe for Drink ought to be tepid, or moderately warm. Malt Liquors are by no means proper for them; but rather gelatinous Decoctions, Infuſions by way of Tea, Whey; and, about the End of the Diſtemper, at proper times, a Draught of generous Wine, for ſtrengthening the Inteſtines. They ought to make uſe of ſoft Aliments, and ſuch as are of eaſy Digeſtion, as the Yolks of Eggs and Rice, Broths made of Veal, Hens, Roots of Vipers-graſs, Succory, China-root, Juice of Plantain, and bruiſed Crabs, which with ſome are in great Repute for conſolidating the Ulcers of the Inteſtines.

The beſt way to prevent a Dyſentery, when it becomes contagious and epidemical, is to ſhun all Exceſſes, and ſudden Changes of the Air, and not to come nigh ſuch as labour under the Diſtemper. A Man may with greater Certainty preſerve himſelf from that Species of it which derives its Source from other Cauſes, provided he guards againſt the Injuries of the Air, abſtains from eating Summer Fruits, eſpecially if they be unripe, and keeps his Body ſoluble. And, at the time when the Dyſentery rages, a Man ought to take all proper Care to cover himſelf in the Night-time, leſt Perſpiration be obſtructed. And, if he is to be purged, he ought not to make uſe of acrid Purgatives; becauſe, as I have before obſerved, they have a great Tendency to excite the Contagion, and bring on the Diſeaſe.

Cautions *to be obſerved in* Practice.

Perſons labouring under a Dyſentery ought by all means to abſtain from groſs Opiates, Aſtringents, and Styptics, ſince theſe are ſo far from alleviating, that they aggravate the Diſtemper; for, if they be exhibited at the Beginning of the Diſeaſe, the cauſtic Matter, lodged in the Habit, induces a great Uneaſineſs about the Præcordia, Hiccups, Aphthæ, and dangerous Inflammations: If at the Height of the Diſorder, when the Strength of the Patient is much impaired and weakened, they eaſily induce a Gangrene, and change the preſent Inflammation into a mortal Sphacelus: See *Thonerus Obſ. Lib.* 3. *Obſ.* 8. *p.* 167. *M. N. C. dec.* 2. *anno* 3. *Obſ.* 88. Laſtly, the ſame Medicines, being adminiſtred on the Decline of the Diſeaſe, create ſpaſmodic and œdematous Diſorders, Languors, and a Fever. *Galen*, 2 *Simpl.* 12. & 14. informs us, that a Dyſentery, unſeaſonably ſtopt, has been ſucceeded by Melancholy; and, according to *Holler*, by an Epilepſy and Pleureſy. *Martinus*, *de Morb. Meſent.* alſo informs us, that it brings on Inflammations and Abſceſſes in the Meſentery, with many dangerous Diſtempers; and even haſtens Death itſelf, which may be confirmed by many Examples, according to *Crato*, *Conſil.* 22. *Lib.* 5. In which Caſe it is expedient to provoke the obſtructed Evacuations by Stool, by Clyſters, and prevent the threatening Inflammation by Abſorbents and fixed Diaphoretics, taken inwardly.

Remedies taken from the Animal Kingdom, which are ſedative and anodyne, may be uſed with the greateſt Safety to the Patient in ſuch Diſtempers. Among the Number of theſe Remedies we reckon the Spine and Liver of Vipers, the Shavings of the Teeth of the Sea-horſe, or Sea-cow, the Penis of a Whale, and the Powder of a human Secundine dried; all which, being mixed with lenient bezoardic Powders, are of excellent Uſe in compoſing the ſpaſmodic and convulſive Strictures of the Inteſtines.

Tho' gentle and lenient Laxatives are known to afford great Relief in a Dyſentery; yet we ſhould take care to uſe them with the utmoſt Caution. For, firſt, the more acrid Cathartics, which have a Mixture of Jalap, Scammony, and Coloquintida, act like ſo many Poiſons in exaſperating the ſpaſmodic Motions; and Mercurial Preparations produce the ſame Effect. For this Reaſon I cannot but wonder at ſome Writers, and particularly Mr. *Boyle*, who recommends Mercurius dulcis in a Dyſentery; for it is of ſuch a Nature, that, when mixed with acrid Salts, which in this Diſtemper always abound in our Bodies, it is rendered cauſtic. Laxatives which are ſweet, and eaſily undergo a Fermentation, are by no means proper in this Diſorder; and therefore a Patient ought to abſtain from Decoctions of Prunes, Sena-leaves, and laxative Syrups. Though the Pilulæ Polychreſtæ, and temperate balſamic Pills, exhibited in ſmall Doſes frequently are of ſingular Service, the firſt Days of the Diſeaſe, for correcting and evacuating; yet when the Diſtemper ſeizes plethoric Perſons with Heat, and a quick Pulſe, I have frequently obſerved theſe Pills of dangerous Conſequence. In ſuch a Caſe, it will be better judged to abſtain from all Laxatives, that raiſe even the leaſt Commotion of the Humours, and rather attempt a gentle Evacuation, by a Decoction prepared of Whey, Tamarinds, and Rhubarb. When the Diſeaſe begins with violent Gripes in the lower Belly, I uſually preſcribe Anodynes, in Conjunction with Evacuants; and, for this End, I generally exhibit, with good Succeſs, two or three Doſes, in twenty-four Hours, of the Pilulæ Aloephanginæ, or rather Becherianæ, mixed with an equal Quantity of the Pilulæ de Styrace.

And I have frequently obſerved, that a laxative Infuſion of Manna, taken at the End of a long-protracted Dyſentery, and when all dangerous Symptoms have ceaſed, has again brought on the Gripes, and other noxious Diſtempers: The Cauſe of ſuch a Cataſtrophe muſt be owing to the Deſtruction of the Tone of the Inteſtines, which was before impaired by the violent Spaſms; and, therefore, the beſt Way to reſtore this loſt Strength, is by an Exhibition of proper Corroboratives.

The Root of Ipecacuanha, which by many is accounted a Specific againſt a Dyſentery, ſee *A. N. C. Dec.* 2. *Anno* 10. *Obſ.* 115. does not want its Uſe, though it very frequently produces unhappy Effects. It may be exhibited with the greateſt Succeſs to robuſt Patients, as well as to thoſe of a moiſter Nature, ſuch as Women.

An Exhibition of it may be alſo expedient, when a redundant Collection of Crudities adheres in the Primæ Viæ, or when a contagious Miaſma is recent, and afflicts the Patient with a Nauſea, a Retching to vomit, an Uneaſineſs about the Præcordia, and a cutting Pain. It will be proper to adminiſter a Remedy of this Sort, during the firſt Days of the Diſtemper; and if the Patient be ſeized with a Plethora, or Fever, it will be expedient previouſly to open a Vein. But when the Diſeaſe becomes more inveterate, and Stools which are both bloody and mucous are diſcharged, it may then be exhibited; for it checks them a little, though, at the ſame time, it creates a greater

greater Uneaſineſs about the Præcordia; ſo that we frequently find it neceſſary to reſtore the Evacuation by Stool, by means of emollient Clyſters. Laſtly, if a Redundancy of Crudities be lodged in the Primæ Viæ, it will be moſt proper to exhibit half a Dram of this Root, with a laxative Decoction prepared of Manna, Rhubarb, and Tamarinds.

We ſhould never make uſe of ſuch Remedies as ſtimulate the Inteſtines, ſuch as all neutral and digeſtive Salts, as the Tartarus Vitriolatus, the Arcanum Duplicatum, and the Salts obtained from hot mineral Waters. And yet Nitre, as alſo Sal Prunellæ, which is greatly extolled by *Riverius* for its refrigerating and temperate Quality, is ſometimes recommended as a proper Remedy; and it ſhould be mixed with abſorbent Powders, if the Patient is either oppreſſed with Heat and Thirſt, or of a choleric and bilious Conſtitution.

It is the general Opinion of many Phyſicians, and even of *Hippocrates* and *Galen*, as alſo of *Martian in Comment. in Lib. Hippocratis de Ratione Victus in Acutis*, that Veneſection ought not to be uſed in a Dyſentery: And this may be laid down as a Maxim to be obſerved in Practice by our Countrymen (the *Germans*). But, after a long Courſe of Experience, I can affirm, that if the Patient is plethoric, and accuſtomed to drink Wine, and is, at the ſame time, ſeized with a continual Fever, together with the Dyſentery, it is highly neceſſary to open a Vein, at the Beginning of the Diſtemper: For it is vain to dread a Diminution of Strength by Veneſection, ſince not only more People, who labour under a Dyſentery, die of an Inflammation of the Inteſtines, but alſo plethoric Subjects, when oppreſſed with continual Fevers, die of Stagnations, Gangrenes, and Sphacelus, which are occaſioned by nothing but a Redundance of Blood. And, therefore, Veneſection is the moſt proper Remedy for preventing Diſtempers of ſuch a dangerous Conſequence. And there are not wanting Teſtimonies of the moſt approved Writers, who greatly extol this kind of Remedy. Thus *Julius Cæſar Claudinus* informs us; that he has cured many of a Dyſentery, by letting Blood. And *Riverius*, *Cent.* 2. *Obſ.* 37. & 44. *Amatus Luſitanus*, *Cent.* 2. *Obſ.* 48. *Altomarus de Medend. Corp. human. Malis Cap.* 74. *Botallus*, *Cap.* 4. *Sydenham*, *Oper. Med. Cap. de Dyſent.* and, among the more modern Authors, *Paſcoli*, have ſupplied us with Obſervations of this Kind.

I have been told by a Phyſician, who attended a Camp, that in curing a Dyſentery, which raged there, upon the firſt Suſpicion of the Contagion, and even when the Signs appeared pretty evidently, a Diaphoretic, prepared of calcined and philoſophically prepared Hartſhorn, of diaphoretic Antimony, of the volatile Salt of Hartſhorn, and Saffron, each ten Grains, exhibited with a warm Vehicle, produced excellent Effects, by diſpoſing the Body to Sweat, and, after a Repetition of ſome Doſes, checking the pernicious Violence of the Diſtemper. But ſhould a great Quantity of Sordes be lodged in the Primæ Viæ, I am inclined to think, that a Remedy of this kind may be much more ſafely uſed after the previous Exhibition of a proper Evacuant. It is a very common and fatal Miſtake of Phyſicians, when, in order to cure a violent Dyſentery, they make an immoderate Uſe of the alexipharmic and theriacal Remedies, ſuch as Electuaries made of Diaſcordium, Theriaca Andromachi, Mithridate, and the Pulvis Pannonicus ruber, alexipharmic Eſſences, and bezoardic Tinctures; for I have frequently obſerved, that the Symptoms of an epidemic Dyſentery have been exaſperated by too large an Exhibition of ſuch hot and dry Remedies; and that Fevers, a Thirſt, and great Heat within, have been occaſioned by the Uſe of them: And our Reaſon may inform us, that Medicines, which raiſe Commotions in the Blood, can by no means be proper Remedies in a Diſeaſe which derives its Source from a long-continued inward Heat, which changes the ſweet and temperate Humours of the Body into thoſe of the bilious and ſalino-ſulphureous Quality.

In a Dyſentery, many Phyſicians, in order to correct the Acrimony of the Humours, to ſoften the Malignity of the Ulcers, and conſolidate the corroded Subſtance of the Inteſtines, make too much uſe of glutinous and mucilaginous Remedies, as well internally as externally, eſpecially in the way of Clyſters; ſuch as the Milk of various Animals, Decoctions of Sheeps-feet, Solutions of Gum Tragacanth and Gum Arabic, Jellies of Animals, Sperma Ceti, and the Root of the larger Comfrey. Though theſe Remedies ſhould not be entirely exploded, yet Phyſicians ſhould obſerve a proper Medium, and proceed with great Caution in exhibiting them; for theſe glutinous Subſtances, when injected into the Anus, produce a certain Vicidity, render the Ulcers much worſe, and hinder their Cicatrization: And it frequently happens, that, upon a Suppreſſion of the Flux, they occaſion a greater Collection of Sordes in the Belly, which induces more violent Spaſms and Gripes.

Milk alone is not a proper Remedy in a Dyſentery, eſpecially if there be a Redundance of Sordes in the Primæ Viæ, becauſe of the Coagulum which it eaſily undergoes there, and the Symptoms which are to be dreaded from thence; but if it be boiled and mixed with pure running or Fountain-water, or even *Seltern* Mineral-waters, it will be of conſiderable Uſe. And Whey, which is ſo highly commended by *Hippocrates* for its Efficacy in moderating Heat and Thirſt, and for correcting, in ſome meaſure, the Acrimony of the Humours, is no contemptible Remedy in a Dyſentery, and is much extolled by *Raymundus A Fortis*, *Conſult. Cap.* 2. and *Sydenham*. Beſides, pure Fountain-water, either chalybeated, or boil'd with the Sea-unicorn or calcin'd Hartſhorn, or Bole, is an excellent Drink for Patients of all Ages for allaying Thirſt and Heat, and diluting the acrimonious Humours. *Sydenham*'s Decoction may be alſo very proper in this Caſe, which is made of Fountain-water, calcin'd Hartſhorn, and the Crum of Bread made of the fineſt Flour. And 'tis well known how much celebrated the Waters in *Italy* are for curing Dyſenteries; ſuch are thoſe of *Tutia*, *Villa*, and ſome others; concerning which ſee *Fallopius de Thermis*, and *Cæſalpinus in Quæſt. Med.* 21. *L.* 2. *de Medic. Facul. Cap.* 10. The *German* Waters are of excellent Uſe in curing Dyſenteries, as you may ſee *A. N. C. Dec.* 1. *Anno* 2. *Obſ.* 213. As there is no kind of Diſtemper ſo loathſome, naſty, and abominable, or which infects and vitiates the Air with putrid Exhalations ſo much as a Dyſentery, we ought to direct the Patient not to diſcharge his Stools in the ſame Room he ſleeps in, but rather in ſome one adjoining to it, if it be tolerably warm, and he has Strength to retire to it; and they ſhould be forthwith removed. The noxious Quality of the Air ſhould alſo be corrected by Suffumigations of Maſtich and Amber. For this Purpoſe I alſo warmly recommend to my Patients, in all contagious Diſeaſes, to have Camphire about their Necks, if they can poſſibly bear the Smell of it. If Perſons who labour under this Diſeaſe, have Strength to get out of Bed, it is proper for them to have ſome Veſſel convenient for receiving the Excrements under their Beds, upon which they may ſit down, and eaſe Nature, provided it be firſt tinctured and ſeaſoned with a warm Decoction of the Flowers of Mallows, Elder, and Fenugreek-ſeed.

There is ſcarcely any Diſeaſe, wherein a Refrigeration of the Feet is attended with ſuch dangerous Conſequences as a Dyſentery. This is confirmed by Experience, and we ſee it frequently brings on Death. By this means I have often obſerved an Inflammation of the Inteſtines, which ended in Death, brought on; for the Feet being refrigerated, the Skin is contracted, and the peccant Humours flow in greater Quantities into the Inteſtines: For which Reaſon it is highly expedient always to keep warm Bricks at the Soles of the Feet. Nothing is a greater Affliction to Perſons labouring under this Diſtemper, than the perpetual Deſire of going to Stool, and a moſt troubleſome Teneſmus, in which they evacuate either nothing at all, or a very ſmall Quantity of Mucus, more or leſs mixed with Blood: In which Caſe, the moſt efficacious Remedy is a Fomentation, prepared of Milk, in which Chamomile and Elder-flowers are boiled; or a Portion of the Mucilage of Fleawort, or of Quinces, or of Oil of ſweet Almonds and the Yolk of Eggs, mixed with Saffron, injected into the Anus. Thoſe who, after a long-protracted Dyſentery, begin to recover, and gather Strength, in order to regain the former Strength of their Stomach and Inteſtines, which has been much weakened by the Diſeaſe, ought to be particularly careful in obſerving a ſtrict and exact Regimen; for I have frequently obſerved a Lientery, ſlow Fevers, a Conſumption, and other chronical Diſtempers, follow a Neglect of this Kind. *Frederic Hoffman.*

The incomparable *Sydenham*, treating of the epidemical Diſtempers which raged in 1669. 1670. 1671. and 1672. gives the ſubſequent admirable Obſervations, relative to a Dyſentery.

In the Beginning of *Auguſt* 1699. the dry Gripes appeared, and, during the Courſe of that Autumn, equalled, or rather exceeded, the Dyſenteries which began to appear with them, with reſpect to the Numbers they attacked. Sometimes a Fever accompanied them, and ſometimes not; but they exactly reſembled the Gripes which attended the Dyſentery, that prevailed at the ſame time; for they were extremely violent, and attacked at Intervals, but no natural or mucous Stools ſucceeded. They prevailed equally with the Dyſentery throughout this Autumn; but appeared no more epidemically in the following Years of this Conſtitution. As theſe dry Gripes differ little either in their Nature, or the Method whereby they are to be cured, from the Dyſentery, I proceed to treat of this laſt Diſtemper.

The Dyſentery generally makes its firſt Attack, as it did at this time, in the Beginning of Autumn, and diſappears for a time, upon the Approach of Winter; but when a Number of Years tend much to produce it epidemically, it may ſeize a few at any other time; and abundance at the Beginning of Spring, or, perhaps, earlier, if warm Weather immediately ſucceeds a ſevere Froſt, that went off ſuddenly. And though very few may be attacked with it, yet as this happens at ſo unuſual a Time, I am well convinced, that the Conſtitution eminently favours this Diſeaſe. And thus it happened in thoſe Years wherein the Dyſentery was very epidemical;

mical; for ſometimes it ſeiz'd a few towards the End of Winter, or Beginning of Spring.

It ſometimes begins with a Chilneſs and Shivering, immediately ſucceeded by a Heat of the whole Body, as is uſual in Fevers; and, ſoon after, Gripes and Stools ſucceed: It is indeed, frequently, not preceded by a Fever; but the Gripes attack firſt, and Stools ſoon enſue: Intolerable Gripings, however, and a painful Deſcent, as it were, of all the Bowels, always accompany the Stools, which are very frequent, and all mucous, not excrementitious, unleſs ſometimes an excrementitious one intervenes, without any conſiderable Pain: The mucous Stools are generally ſtreak'd with Blood; but ſometimes not the leaſt Blood is mixed with them, throughout the whole Courſe of the Diſeaſe: Nevertheleſs, if they be frequent, mucous, and accompanied with Griping, the Diſtemper may as juſtly be intituled a Dyſentery, as if Blood was diſcharged along with them. Further, if the Patient be in the Vigour of Life, or has been heated by Cardiacs, a Fever ariſes, and the Tongue is covered with a thick white Mucus; and, if he has been very much heated, it is black and dry; great Loſs of Strength, Lowneſs of Spirits, and all the Signs of an ill-conditioned Fever, are joined with it. This Diſeaſe occaſions extreme Pain and Sickneſs, and greatly endangers Life, if unſkilfully treated; for when the Spirits are much exhauſted, and the vital Heat diminiſhed, by frequent Stools, before the Matter cauſing the Diſeaſe can be expel'd from the Blood, a Coldneſs of the Extremities enſues, and the Diſorder terminates in Death in as little time, as that in which acute Diſeaſes prove fatal: But if the Patient eſcapes for this time, ſeveral Symptoms, of a different Kind, ſucceed: For Inſtance; ſometimes, in the Progreſs of the Diſeaſe, inſtead of thoſe ſanguineous Filaments which are uſually mix'd with the Stools in the Beginning, a large Quantity of pure Blood, unmix'd with Mucus, is voided at every Stool; which, as it manifeſts an Eroſion of ſome of the larger Veſſels of the Inteſtines, threatens Death. Sometimes, alſo, the Inteſtines are affected with an incurable Gangrene, cauſed by the violent Inflammation ariſing from the plentiful Afflux of the hot and ſharp Matter to the affected Parts. Moreover, at the Decline of the Diſeaſe, *Aphthæ* frequently affect the internal Parts of the Mouth, eſpecially when the Patient has been kept very hot for a long time, and the Evacuation of the peccant Matter check'd by Aſtringents, the Matter of the Diſeaſe not having been firſt carried off by Cathartics: Theſe Aphthæ generally portend approaching Death.

But if the Patient ſurvive the before-mentioned Symptoms, and the Diſeaſe proves laſting, the Inteſtines, at length, ſeem to be affected ſucceſſively downwards, till it be driven to the Rectum, and ends in a Teneſmus; upon which Occaſion, the natural Stools (otherwiſe than it happens in a Dyſentery) occaſion great Pain in the Bowels, the Fæces, in their Paſſage thro' them, abrading the ſmall Inteſtines, ſtill very tender, whereas the mucous Stools only offend the Rectum, during the time that the Matter is form'd therein, and diſcharg'd. But tho' this Diſeaſe often proves mortal in grown Perſons, and eſpecially in the Aged, it is, nevertheleſs, very mild in Children, who have it ſometimes for ſome Months, without any Inconvenience, provided the Cure of it be left to Nature.

What Similitude there is between the Dyſentery here deſcrib'd, and the endemic Dyſentery of *Ireland*, I know not, having hitherto had no Account of the latter. Neither have I diſcovered how far this Dyſentery reſembles thoſe happening in other Years here in *England*. For poſſibly there may be as many Species of Dyſenteries, as there are Kinds of Small-pox, and other epidemical Diſtempers, peculiar to different Conſtitutions, and which may therefore require a different Method of Cure in ſome Particulars. Nor ſhould this Procedure of Nature ſo much raiſe our Wonder, ſince 'tis univerſally acknowledged, that the further we penetrate into any of her Works, the clearer Proofs we have of the exceeding Variety, and almoſt divine Contrivance of her Operations, which far ſurpaſs our Comprehenſion. So that whoever has undertaken to fathom theſe Matters, and ſearch after the various Operations of Nature, will find himſelf diſappointed in his Expectation, and not ſucceed in the Attempt; and beſides, if he be a judicious Perſon, he may expect to be cenſured for making the moſt uſeful Diſcoveries, for no other Reaſon but becauſe he was the firſt Inventor.

It muſt be further obſerv'd, that all epidemical Diſtempers, at their firſt Appearance, as far as can be judg'd from their Phænomena, ſeem to be of a more ſpirituous and ſubtile Nature, than when they become older; and, that the more they decline, the more groſs and humoral they daily grow: For whatever kind of Particles thoſe are, which, being intimately mix'd with the Air, are eſteem'd to produce an epidemical Conſtitution, 'tis reaſonable to conclude, that they are poſſeſſed of a greater Power of acting at their firſt Appearance, than when their Force is weaken'd. Thus, in the Infancy of the Plague, ſcarce a Day paſſed but ſome of thoſe who were ſeized with it, died ſuddenly in the Streets, without having any previous Sickneſs; whereas, after it had continued for ſome time, it deſtroy'd none, unleſs a Fever and other Symptoms preceded: Whence it clearly follows, that this Diſeaſe, tho' it then took off fewer Perſons, was more violent and acute in the Beginning, than afterwards, when its Influence was more extenſive.

In like manner in the Dyſentery under Conſideration, all the Symptoms were moſt ſevere in the Beginning, tho', with with reſpect to the Numbers affected thereby, it increaſed daily, till it came to its Height, when, conſequently, more Perſons died than in the Beginning: Yet the Symptoms in the Beginning were more violent than in its Height, and much more ſo, than in the Decline thereof: And, at firſt, abundance more periſhed, in proportion to the Numbers of thoſe affected. To this may be added, that the longer it continued, the more humoral it ſeemed to be: For Inſtance, the firſt Autumn, ſeveral had no Stools at all: But, with reſpect to the Severeneſs of the Gripings, the Violence of the Fever, ſudden Decay of Strength, and other Symptoms, it much exceeded the Dyſenteries of the following Years. And further, the Dyſentery accompanied with Stools, which appeared firſt, ſeemed to be of a more ſpirituous and ſubtile Nature, than thoſe that ſucceeded; for in the firſt Dyſenteries, the Inclination to Stools and Straining were greater and more frequent; and the Stools, eſpecially the natural ones, leſs, both in point of Quantity and Frequency: But generally as the Diſeaſe proceeded, the Gripings abated, and the Stools became more natural; and, at length, the epidemical Conſtitution declining, the Gripes were ſcarce felt, and the excrementitious or natural Stools exceeded the mucous ones in Number.

To proceed, at length, to the curative Indications: After having attentively conſidered the various Symptoms attending this Diſeaſe, I diſcovered it to be a Fever of a particular Nature, turned inwards upon the Inteſtines; by means of which, the hot and ſharp Humours that were contained in, and agitated by the Blood, were thrown off by the meſeraic Arteries, upon theſe Parts, whence Blood was diſcharged by Stool, the Mouths of the Veſſels being opened by the Impulſe of the Blood and Humours flowing thereto: And by the violent and frequent Efforts of the Inteſtines, to diſcharge the ſharp Humours that continually vellicate them, the Mucus, wherewith their Inſide is naturally covered, is diſcharg'd more or leſs copiouſly at every Stool. The Indications of Cure, therefore, ſeem to be obvious: For nothing more appears to be neceſſary, than, firſt, to make an immediate Revulſion of theſe ſharp Humours by Bleeding; and, afterwards, to reduce the Remainder to a due Temperature; and, then, to evacuate them by Purgatives.

I therefore uſed the following Method: Upon being call'd in, I immediately directed Bleeding in the Arm, gave an Opiate the ſame Evening; and, the next Morning, this gentle purging Potion, which I frequently uſe:

> Take of Tamarinds, half an Ounce; the Leaves of Sena, two Drams; Rhubarb, one Dram and an half: Boil them together in a ſufficient Quantity of Water, to leave three Ounces of the ſtrain'd Liquor; in which diſſolve Manna, and ſolutive Syrup of Roſes, of each an Ounce: Mix them together for a purging Potion, to be taken in the Morning early.

I commonly prefer this Draught to an Electuary made of a ſmall Quantity of Rhubarb; for tho' this Root be exhibited to evacuate Choler, and acrimonious Humours, yet, unleſs a proper Quantity of Manna or ſolutive Syrup of Roſes be mixed with it, to quicken its Opeeation, it avails little in curing the Dyſentery. And becauſe it is certain, that the moſt gentle Cathartics ſometimes increaſe the Gripings, and occaſion a general Depreſſion and Diſorder of the Spirits, by the adventitious Commotion they raiſe in the Blood and Humours, during their Operation, I therefore commonly give an Opiate earlier than is uſual after Purging; for Example at any Hour in the Afternoon, provided it ſeems to have done operating: And this I do, in order to quiet the Diſturbance I have raiſed. I repeat the Cathartic twice more, interpoſing a Day between each, and exhibit an Opiate after every Purge, at the Time above-mentioned; and direct it to be repeated Morning and Night, on the intermediate Days, in order to diminiſh the Violence of the Symptoms, and obtain a Reſpite, whilſt I am employed in evacuating the peccant Humour. The Opiate I principally uſed was liquid Laudanum, in the Quantity of ſixteen or eighteen Drops, in any cordial Water, for a Doſe.

After Bleeding and Purging once, I allowed ſome mild Cardiac to be taken between whiles, throughout the Courſe of the Diſeaſe, as Plague-water, compound Scordium-water, and the like: For Inſtance,

> Take of the diſtilled Waters of black Cherries and Strawberries, of each three Ounces; Plague-water, compound Scordium-water, and ſmall Cinnamon-water, of each an Ounce; prepared Pearl, one Dram and an half; fine Sugar,

Sugar, enough to ſweeten it; and half a Dram of damaſk Roſe-water, to give it an agreeable Taſte: Mix all together for a Julap; of which let the Patient take four or five Spoonfuls, when faint, or at Pleaſure.

But I uſed theſe principally, in aged and phlegmatic Perſons, in order to raiſe their Spirits in ſome meaſure, which are much depreſſed in this Diſeaſe by the Violence of the Stools. Their Drink was Milk, boil'd with three times as much Water, or the white Decoction, as it is called, made of burnt Hartſhorn, and the Crumb of white Bread, of each two Ounces, boil'd in three Pints of Water to two; and afterwards ſweetened with a ſufficient Quantity of fine Sugar, and ſometimes Poſſet-drink; or, where the Loſs of Spirits required it, they drank cold, for their common Drink, a Liquor made by boiling half a Pint of *Canary*, and a Quart of Spring-water together. Their Diet was ſometimes Panada, and ſometimes Broth, made of lean Mutton. I kept the Aged more in Bed, and allowed them a freer Uſe of any cordial Water they had been accuſtom'd to, than was proper for Children, or young Perſons. This Method exceeded all thoſe I had hitherto experienced, in conquering this Diſeaſe, which, for the moſt part, yielded to the third Purge.

But, if it proved ſo obſtinate as not to yield to theſe Means, I gave the former Opiate every Morning and Evening, till it went quite off; and the more effectually to conquer it, I have ventur'd to give a larger Doſe of Laudanum, than that above ſpecified, that is, twenty-five Drops every eighth Hour, if the former Doſe proved too weak to ſtop the Flux. I likewiſe ordered a Glyſter, made of half a Pint of Milk, and an Ounce and half of *Venice* Treacle, to be injected every Day, which is, in effect, an admirable Remedy in all kinds of Looſeneſſes. Nor indeed have I hitherto found the leaſt Inconvenience happen from ſo frequent a Repetition of Opiates, (whatever Miſchief the Unexperienced imagine will follow from hence) tho' I have known ſeveral who have taken them every Day, for ſome Weeks, when the Diſeaſe prov'd inveterate. But it muſt be noted here, that when the Flux amounts only to a Looſeneſs, omitting Bleeding and ſtrong Purging, it will ſuffice to give half a Dram of Rhubarb, more or leſs, in proroption to the Strength of the Patient, every Morning, made up into a Bolus, with a ſufficient Quantity of Diaſcordium, adding to it two Drops of Oil of Cinnamon; and exhibiting an Opiate the following Evening: For Example,

Take of ſmall Cinnamon-water, one Ounce; liquid Laudanum, fourteen Drops: Mix them together.

In the mean time uſe the Diet above ſpecified in the Cure of the Dyſentery, and inject the Glyſter there commended, every Day, if there is Occaſion.

Now to evince the Excellence of the Method here deliver'd by a ſingle Inſtance; for I will not trouble the Reader unneceſſarily with many: The Rev. Mr. *Belke*, Chaplain to the Earl of *St. Albans*, being ſeized with a violent Dyſentery, during this Conſtitution, ſent for me to attend him, and he was recovered by this Method.

Children affected with this Diſeaſe are to be treated in the ſame manner, but the Quantity of Blood to be taken away, and the Doſes both of the Purgative and Opiate muſt be diminiſhed in proportion to their Age; ſo that, for Inſtance, two Drops of liquid Laudanum is a ſufficient Doſe for a Child of a Year old.

The liquid Laudanum, which I conſtantly uſe, as above intimated, is prepar'd in the following manner:

Take of *Spaniſh* Wine, one Pint; Opium, two Ounces; Saffron, one Ounce; Cinnamon and Cloves, reduc'd to Powder, of each one Dram: Infuſe them together in a Bath-heat for two or three Days, till the Tincture becomes of a due Conſiſtence; and after ſtraining it off, ſet it by for Uſe.

I do not indeed judge that this Preparation is to be prefer'd to the ſolid Laudanum of the Shops, on account of its Virtues; but I give it the Preference for its more convenient Form, and the greater Certainty of dividing it into Doſes, as it may be dropt into Wine, a diſtil'd Water, or any other Liquor. And here I cannot forbear mentioning, with Gratitude, the Goodneſs of the Supreme Being, who has ſupplied afflicted Mankind with Opiates for their Relief; no other Remedy being equally powerful to overcome a great Number of Diſeaſes, or to eradicate them effectually. And, notwithſtanding there are Perſons who endeavour to perſuade the Credulous, that almoſt all the Virtues of Opiates in general, and of Opium in particular, chiefly depend on their artful Preparation of them; yet whoever puts it to the Teſt of Experience, and uſes the ſimple Juice as frequently, and as cautiouſly, as any of its Preparations, will certainly find very little Difference between them, and be convinced, that the wonderful Effects of Opium are owing to the native Goodneſs and Excellence of the Plant that affords it, and not to the Dexterity of the Artiſt. Moreover, this Medicine is ſo neceſſary an Inſtrument in the Hands of a ſkilful Perſon, that the Art of Phyſic would be defective and imperfect without it; and whoever is thoroughly acquainted with its Virtues, and the manner of uſing it, will perform greater things than might reaſonably be expected from the Uſe of any ſingle Medicine. For it muſt certainly argue Unſkilfulneſs, and a very ſlender Knowledge of its Virtues, to underſtand only how to apply it, in order to procure Sleep, eaſe Pain, and check a Looſeneſs, ſince it may be ſuited to ſeveral other Purpoſes, and is, indeed, a moſt excellent Cardiac, not to ſay the only one hitherto diſcover'd.

Dyſenteries were in general to be treated in this manner: But it muſt be obſerved, that as this Dyſentery was of a more ſpirituous and ſubtile Nature at firſt, when it appear'd, than in the ſubſequent Years, it yielded leſs readily to Purgatives, than to thoſe Medicines that diluted and cooled the Blood, as well as the ſharp Humours ſeparated from it into the inteſtinal Duct: And therefore, during the firſt Autumn, wherein the dry Gripes and Dyſentery prevail'd, I always uſed the following Method with Succeſs for both, till colder Weather ſucceeded, when I found it leſs effectual, even in the ſame Year; and in the following Years, when the Diſeaſe had loſt much of its Subtilty, and prov'd more humoral, it availed not at all. I proceeded in this manner: If the Patient was young, I directed Bleeding in the Arm, and, an Hour or two after, a large Quantity of Liquor to be taken, with a View of diluting, according to the Method I practis'd in the *Cholera Morbus*; except that here, inſtead of Chicken-broth or Poſſet-drink, I ſubſtituted Whey to be drank cold, in the ſame Quantity as in that Diſeaſe, but ordered the Glyſters of the ſame to be injected warm, without an Admixture of Sugar, or any other Ingredient. I always found the Gripes and bloody Stools go off upon the Diſcharge of the fourth Glyſter. This Buſineſs being over, and all the Whey evacuated, which, if the Patient diligently purſues it, takes up only two or three Hours, he was immediately put to Bed, where he ſoon fell into a ſpontaneous Sweat, (occaſion'd by the Mixture of the Whey with the Blood) which I ordered to be continued for twenty-four Hours, but not at all provok'd by Medicines; allowing him nothing more than warm Milk during this Time, which he likewiſe uſed, without any thing elſe, three or four Days after he left his Bed. If a Relapſe happens, either from riſing, or leaving off the Milk-diet, too ſoon, the ſame Proceſs muſt be repeated. Now if this Method be certain and ſpeedy, no judicious Perſon will reject it, becauſe it does not come recommended with a pompous Multiplicity of Remedies.

That a Fever, attended with ſuch Symptoms as we have enumerated above, happens in thoſe Countries, and at thoſe Times, wherein Dyſenteries prevail epidemically; and that the Method of Cure, here delivered, is agreeable thereto; is ſtill further confirmed by the Teſtimony of Dr. *Butler*, who accompanied his Excellency *Henry Howard*, Embaſſador from his *Britannic* Majeſty to the Emperor of *Morocco*, in *Africa*. This Gentleman aſſured me, that the Dyſentery raged at that time epidemically, in that Kingdom, as it generally does; and that the Fever accompanying it, reſembled the Fever above deſcribed, which he treated according to our Method, with conſtant Succeſs, both at *Tangier*, and other Places, whether the Patients were *Moors* or *Engliſhmen*. Now neither of us was obliged to the other for this Method; but, being at ſo vaſt a Diſtance we both caſually fell upon the ſame. And he alſo informed me, that the Method of diluting plentifully in the Dyſentery ſucceeded admirably in thoſe Parts; and, indeed, I conceive it reaſonable, that this Method ſhould be attended with greater Succeſs in that hot Climate, than in *England*.

In the firſt Autumn wherein this Conſtitution prevail'd, Dr. *Cox*, being ſeiz'd with a very acute Dyſentery, by my Advice, followed the above-mentioned Method, whereby he was ſoon, ſafely, and expeditiouſly cured: For after the Diſcharge of the fourth Glyſter, at which time I happened to be with him, the Gripes and bloody Stools diſappear'd; and there was occaſion for nothing further to complete the Cure, except keeping his Bed for the Time above ſpecified, and uſing a Milk-diet. And this Gentleman afterwards recovered ſeveral by the ſame Method, at the Cloſe of Autumn; but the following Year, making Trial of it again, he found it fail him.

We have already taken notice, that when this Diſeaſe runs to a great Length, it often affects all the Inteſtines gradually downwards, till at length it fixes in the Rectum, with a continual Inclination to go to Stool; whereby only a Mucus, ting'd with Blood, is diſcharged. In this Caſe, I conceive, it would be uſeleſs to attempt the Cure, either by any of the above-mentioned Methods; by detergent, agglutinant, or aſtringent Glyſters, which are ordinarily injected, according to the different States of the ſuppoſed Ulcer; or by Fomentations, Baths, Fumigations, and Suppoſitories, ſuited to the ſame Purpoſes: For 'tis apparent, that this Diſorder does not

proceed from an Ulcer of the Rectum, but rather from this, that in proportion as the Inteſtines recover their Tone, they depoſit the Remains of the morbific Matter on this Part, which, being continually irritated thereby, diſcharges Part of the mucous Matter at every Stool, wherewith the Inſide of the Inteſtines is naturally covered. For this Reaſon, the Part affected muſt be ſtrengthened to expel the ſmall Remains of the morbific Matter, as the other Inteſtines have already done. And this Purpoſe is only anſwered by ſuch Medicines as ſtrengthen the Body in general; for the Application of any kind of Topic to the Part affected, being incommodious, will rather debilitate than ſtrengthen it. The Diſeaſe, therefore, muſt be borne, till the Strength can be recovered by a reſtorative Diet, and the freer Uſe of ſome particularly grateful cordial Liquor; for the Teneſmus will go off ſpontaneouſly, in the ſame Degree as the Strength returns.

It ſometimes happens, tho' very ſeldom, that a Dyſentery, ill-treated in the Beginning, afflicts a particular Perſon for ſeveral Years, the whole Maſs of Blood having obtain'd a dyſenteric Diſpoſition; whence the Inteſtines are continually ſupplied with hot and acrimonious Humours, whilſt the Patient, in the mean time, continues pretty capable of following his Buſineſs. I met with an Inſtance of this lately in a Woman, who was perpetually afflicted with this Diſeaſe, during the three laſt Years of this Conſtitution; and as ſhe had Abundance of Medicines before applying to me, omitting other Remedies, I only directed Bleeding, and was encouraged to repeat it frequently, at conſiderable Intervals, as well from the Colour of the Blood, which reſembled that of pleuritic Patients, as from the great Relief the Patient obtained by every Bleeding: By which means ſhe at length recovered her former Health.

Before I finiſh, this Particular is to be remarked; which is, that tho' in thoſe Years, wherein Dyſenteries rag'd ſo epidemically, the above-mention'd Evacuations were abſolutely neceſſary to be made, previous to the Uſe of Laudanum; yet in any Conſtitution, which has a leſs Tendency to this Diſeaſe, they may ſafely be omitted, and the Cure completed by the ſhorter Method, that is, by exhibiting Laudanum alone, in the manner already delivered. And let this ſuffice for the Dyſentery. *Sydenham.*

The illuſtrious Author above-quoted was too honeſt a Man to diſguiſe any Hints he had taken from practical Authors, and conceal their Names; otherwiſe one would be inclin'd to think, that *Alexander Trallian* had furniſh'd him with Part of the Doctrine he lays down, relative to the Cure of a Dyſentery. This Author inſiſts ſtrongly on the Excellencies of Milk, and recommends Bleeding in that Kind of Dyſentery, which he calls Rheumatical, to two Heminas. He very juſtly condemns the raſh and undiſtinguiſhing Practice of ſome, who immediately throw in Opiates; for theſe do but bind up the Humours for a time, affect the Head and Strength, and occaſion a more violent Return of the Flux afterwards. He takes notice, that in a true Dyſentery, where there is an Exulceration, Matter is often miſtaken for Slime: And I believe, ſays Dr. *Freind*, we often meet with Miſtakes, which are quite the reverſe, of Slime being taken for Matter.

Pliny recommends quenching hot Iron in Water for a Dyſentery. *Dioſcorides* quenches it in Wine too for the like Purpoſe.

Avenzoar gives an account of being cured of a Dyſentery by wearing an Emerald upon his Belly; and, in the like Caſe, he adviſes the giving it in Powder, to about ſix Grains.

Dr. *Barry*, in his Treatiſe of a Conſumption, gives a Caſe of a Perſon cured of a ſcorbutic Dyſentery, by taking no Nouriſhment for three Weeks, but the Whites of new-laid Eggs, diſſolved in the white Decoction prepared with Lime-water. By theſe Means, and the Uſe of Oil of ſweet Almonds, and Sperma Ceti, he was quickly cured, though before deſpair'd of.

Jo. Ger. Hen. Kramerus aſſures us, we may depend upon a very good Effect, in the Cure of a Dyſentery, from a Decoction of common Millet-ſeed, call'd St. *Ambroſe*'s Syrup.

According to *Heurnius*, in his Commentary on the Aphoriſms of *Hippocrates*, *L.* 4. *Aph.* 5. Patients who have a Leg, or any other Member, amputated, are ſometimes ſeized with a bloody Dyſentery. See ARTHRITIS, INTESTINA, and DIARRHOEA.

DYSEPULOTOS, δυσεπούλωτος, from δύς, importing Difficulty, and οὐλή, a Cicatrix. An Epithet for an Ulcer which is difficult to be heal'd. *Dyſepuloticus* is the ſame.

DYSEXANALOTOS, δυσεξαναλωτος, from δύς, importing Difficulty, and ἀναλίσκω, to conſume. An Epithet for any thing not eaſily conſumed, or digeſted. *Caſtellus.*

DYSEXODOS, δυσέξοδος, (from δύς, importing Difficulty, or Malignity, and ἔξοδος, an Egreſs, Paſſage, or going out) what is difficult to be forc'd out or remov'd. The Word, in this Senſe, occurs in *Lib.* 4. *Epid. Ægr.* 30. where it is ſpoken of lax Tumors affecting the Thighs in a *Leucophlegmatia.*

DYSIATOS, δυσίατος, from δύς, importing Difficulty, and ἰάομαι, to heal, or cure. Difficult of Cure.

DYSODES, δυσώδης, from δύς, importing bad, and ὄζω, to ſmell, of an ill Smell, fetid. By δυσώδης κοιλία, we are to underſtand, in *Hippocrates*, as *Foeſius* ſays, a fetid Diſorder of the ſmall Inteſtine; or, as he expreſſes it, 1 *Prorrhet.* 158. εἰλεὸν δυσώδη. *Dyſodes* is the Name of a Malagma for the Pleuriſy, and of an Acopon; the Compoſitions of which are deſcrib'd by *Galen*, *de C. M. P. G. Lib.* 7. *Cap.* 12, 13. and by *Paulus*, *Lib.* 7. *Cap.* 18, 19.

DYSONEIROS, δυσόνειρος, from δύς, importing bad, and ὄνειρον, a Dream. Producing troubleſome Dreams. *Dioſcorides*, *L.* 5. *C.* 7. informs us, that new Wine has this Effect.

DYSOREXIA, δυσορεξία, from δύς, importing bad, and ὄρεξις, Appetite. A bad or diminiſh'd Appetite.

DYSORGIA, δυσοργία, from δύς, importing Malignity, and ὀργὴ, Anger, Wrath, in *Hippocrates*, περὶ ἀρχ. ἰητρ. and περὶ χυμῶν, is implacable Anger or Reſentment.

DYSPEPSIA, δυσπεψία, from δύς, importing difficult, or bad, and πέπτω, to concoct. Difficulty of Digeſtion; or rather a deprav'd Digeſtion, when the Aliments in the Stomach, for want of a due Strength of the digeſtive Organs, follow their ſpontaneous Tendency, and contract an alcaline or acid Putrefaction. *Galen*, *de Sympt. Different. C.* 4.

DYSPHONIA, δυσφωνία, from δύς, importing difficult, and φωνὴ, the Voice. A Difficulty of Speech.

DYSPHOROS, δύσφορος, from δύς, importing difficultly, and φέρω, to bear, difficult to be borne, almoſt intolerable, is a Word applied by *Hippocrates* to various Subjects, with little Difference in the Signification, which imports the ſame as here given. Agreeable to this, *Heſychius* expounds δύσφορος by χαλεπὸς, vexatious, troubleſome.

DYSPNOEA, δύσπνοια, from δύς, importing Difficulty, and πνέω, to breathe.

Dyſpnœa, δύσπνοια, is defin'd by *Galen*, *Lib.* 1. περὶ δύσπ. βλάβη τις τῆς ἀναπνοῆς, "ſome Injury, or injurious Affection "of Reſpiration;" as the Name itſelf, he ſays, imports. *Hippocrates*, in many Places, uſes the Word δύσπνοον, (*Dyſpnoon*) in the ſame Senſe; as, for Inſtance, in *Coac.* where he ſays, τὸ ῥιγώδες καὶ τὸ δύσπνουν ἐν τοῖσι πόνοισι σημεῖα φλυκτίδια, "Shiverings, with a Difficulty of Breathing, under Pains, are "Prognoſtics of a Conſumption." Thus μακρόπνοι, and βραχύπνοι, are expounded in *Galen*, *Lib.* 3. περὶ δυσπν. by μακρόπνοια, and βραχύπνοια, "long Breathing, and ſhort Breathing." Δυσπνοικοὶ, (*Dyſpnœici*) in the Author of the *Definitiones Medicæ*, are ſuch as draw their Breath, as it were, through a ſtrait Paſſage; and *Galen*, *de C. M. S. L. Lib.* 7. *ad Finem*, ſays of them, they have the Bronchia of their Lungs ſtuffed with groſs and viſcous Humours.

Aſthma, ἆσθμα, in *Hippocrates*, is a quick and difficult Reſpiration, increaſed to a great Degree, as it happens to Perſons after ſwift Running, or violent Exerciſe, and that without a Fever. To this Purpoſe *Galen*, *Com. ad Aph.* 26. *Lib.* 3. ſays, that an Aſthma, which is the Name by which the *Greeks* call a quick Reſpiration, or ſuch as is incident to thoſe who run, or uſe any other violent Motion, happens in theſe Caſes, becauſe an Animal in Exerciſe wants much Reſpiration; but, when not cauſed by Exerciſe, it proceeds from a Straitneſs of the Cavities of the Lungs, which are ſtuffed with Defluxions from the ſuperior Parts. The ſame Author, *Com. ad Aph.* 46. *Lib.* 6. ſays, that there are many Sorts of *Dyſpnœa*; among which *Hippocrates* uſes to call by the Name of *Aſthma* that only, in which there is a quick and denſe Reſpiration; for though we now uſe ἀσθμαίνειν to expreſs ſuch a Reſpiration which is conſequent upon Running, and vehement Exerciſe, yet thoſe who lived next after *Hippocrates*, call'd a certain chronical Diſeaſe, ſome of them ſimply, Aſthma, others *Orthopnœa*; in which the Patients labour under a continual Difficulty of Reſpiration, or *Dyſpnœa*, without a Fever. Again, *Com.* 4. *in Lib.* 6. *Epid.* he writes, that when this Kind of *Dyſpnœa* is increaſed to a vehement Degree, it is called an *Aſthma* and *Orthopnœa*, being without a Fever, and cauſed by thick and viſcous Humours, obſtructing the Paſſage of the Breath, or ſome crude Tubercle in the Lungs: And, a little after, he ſays, that the Humour contained in the Tubercle being communicated to the *Aſpera Arteria*, the Shortneſs of Breath happened to be increaſed, and was then no longer call'd πυκνόπνοια, (*Pycnopœa*) ſhort or quick Breathing, but took the Name of *Aſthma*. *Paulus* alſo, *Lib.* 3. *Cap.* 29. gives the following Deſcription of Aſthmatics: They, ſays he, who, without a Fever, fetch their Breath ſhort, as when after ſwift Running, are, from that Symptom, call'd *Aſthmatics*; and the ſame Perſons, becauſe, out of Fear of Strangulation, they keep the whole Body of the Thorax in a ſtrait or erect Poſture, are call'd *Orthopneics* [from ὀρθὸς, ſtrait or direct, and πνέω, to breathe]. This Affection proceeds from a Stuffing of the Bronchia of the Lungs with groſs and viſcous Humours; but a *Dyſpnœa* is a common Symptom to this and many other Diſeaſes. This Deſcription *Paulus* has borrow'd from *Galen*, *de C. M. S. L.* who adds, that the Patients are obliged to raiſe the upper Parts of their Bed, on which they reſt their Thorax, for fear of Strangulation in their Sleep; for their Inſpiration, he ſays, is not ſufficient

to

to ſerve their Reſpiration, though their Thorax be dilated to the utmoſt; whence there appears to be ſome preternatural Conſtriction or Straitneſs within that Part, of which the Patients themſelves are plainly ſenſible. Thus *Galen.*

Orthopnœa, ὀρθόπνοια, from ὀρθὸς, ſtrait, or erect, and πνέω, to breathe, is breathing with the Neck in a ſtrait and erect Poſture; for the Patient, under this Diſorder, is affected with ſo great a Difficulty of Reſpiration, that he dares not lie down for fear of Suffocation, but is obliged to fetch his Breath with his Neck and Thorax in an erect Poſture. The Cauſe is a Straitneſs of the Lungs, and its Veſſels, occaſion'd by an Inflammation, or ſome Humour contained in the Cavities of the Lungs. *Galen, Com.* 2. *in Prorrhet.* ſays, "He, *(Hippocrates)* and all others, call, by the Name of *Orthopnœa*, that "Species of a *Dyſpnœa*, in which the Patients are ſuffocated "when lying down, and are hardly able to ſupport themſelves "with the Thorax erect, without ſomething at their Backs. "For the *Aſpera Arteria*, which has its Beginning at the "Larynx, and is diſtributed in the Lungs, is, together "with the Neck, dilated, by extending the Thorax in an "erect Poſture; and all its Branches, which diſperſe themſelves "over the Lungs, are at the ſame time dilated, and the in-"ternal Capacity of the Lungs enlarg'd. Hence it is, that "from a Peripneumony, and thoſe which are call'd aſthmatic "Affections, ariſes an *Orthopnœa*, as it does, for the ſame "Reaſon, in a very ſevere Quinſey, where the internal "Muſcles of the Larynx, being inflam'd, obſtruct the Paſſage "of Reſpiration; for this Diſorder alſo is exaſperated by a de-"cumbent Poſture, from an Increaſe of the Straitneſs of the "Parts." Again, *Com.* 4. *in Lib. de R. V. I. A.* explaining the dry *Orthopnœa* of *Hippocrates*, he ſays, "What he "*(Hippocrates)* calls a dry *Orthopnœa*, is a *Dyſpnœa*, which, "without Cough or Spitting, is ſo violent upon the Patient, "as not to ſuffer him to lie down without being ſuffocated." In *Lib.* 7. *Epid.* the Siſter of *Harpalides*, four or five Months gone with Child, is deſcrib'd as labouring under a dry Cough, Orthopnœa, Aſthma, and ſometimes a Suffocation, ſo that ſhe was always obliged to ſit up in her Bed, and to ſleep in that Poſture. She continued thus near two Months, and was then relieved by a Cough, in which ſhe expectorated great Quantities of mature, pituitous, and white Matter, and was at laſt delivered of a Female Child.

Dyſpnœa, in general, implies a Difficulty of Breathing, which, in a greater Degree, is call'd Aſthma; but, in an extreme Degree, it is call'd *Orthopnœa*.

A Difficulty of Breathing may be cauſed by every Diſtemper which can affect any Part of the Thorax, particularly the Heart, large Arteries, and Lungs; as an Eryſipelas, or Inflammation of the Lungs, crude Tubercles, Vomicas, Polypuſes, and many other Diſorders, which are taken notice of under their reſpective Articles. But our preſent Subject is, that Species of *Dyſpnœa*, which is uſually call'd an *Aſthma*, and, by the Vulgar, a *Phthiſic*.

CASE I.

The Son of Mr. *Haltzvvelt* became Aſthmatic, in conſequence of a Fall, which produced a Concuſſion of his Brain; and at laſt, an uncommon Load of Humours falling on his Lungs, he died.

Upon opening his Body, all the Parts of his Lungs were found ſtuff'd with phlegmatic and viſcid Humours. *Fabr. Hild. Cent.* 1. *Obſervat.* 2.

CASE II.

Mrs. *Rouquetre*, a Woman of ſixty Years of Age, very fat, corpulent, and accuſtom'd to a ſedentary Life, about fifteen Years ago, began to labour under a Difficulty of Breathing, which gradually increaſed to ſuch a Degree, that, when ſhe went up any Stairs, ſhe was obliged to ſtand ſtill, and recover her Breath, on every third or fourth Step. But, about the Beginning of *January* 1642. happening to take a Journey when the Winds were ſoutherly, and the Weather rainy, ſhe was ſuddenly ſeiz'd with a Defluxion of Humours, partly on her Lungs, and partly on her Jaws. By this means her Difficulty of Breathing was increaſed, and a Tumor appearing on her Right Cheek, her Jaws could not open farther than to allow her to ſip a little Broth. She had alſo, for ſeveral Years, been troubled, now-and-then, with an Eryſipelas of her Left Leg, which frequently uſed to exulcerate, and with which Symptom it had more remarkably appear'd, before ſhe was ſeiz'd with this Defluxion of Humours. Being call'd to her on the eighth Day of her Diſorder, I found her Pulſe unequal, intermitting at every third or fourth Stroke, and her Reſpiration carried on with the greateſt Difficulty. From theſe Symptoms, I ſuſpected that there muſt be ſome terrible Diſorder, not only in the Lungs, but alſo in the Heart itſelf, or in the Veſſels contiguous to it. And, indeed, this Prognoſtic was ſtill more confirm'd by the Ulcer of the Eryſipelas becoming ſuddenly dry, according to Aphoriſm 25. 6. Beſides, the Tumor of her Cheek diſappearing a few Days after, her Jaws nevertheleſs remained cloſed; and then, indeed, it appear'd, that their Conſtriction proceeded from a Convulſion of the Muſcles appointed for moving them. On the fifteenth Day of the Diſeaſe, pretty early in the Morning, her Right Eye was found ſhut, the other at the ſame time remaining open. This Symptom ow'd its Birth to a Palſey of the Eye-brow, and was the unlucky Omen of a more terrible Diſorder; for that ſame Afternoon ſhe was ſeiz'd with a ſlight Apoplexy; from which ſhe in ſome meaſure recover'd, in the Space of two Hours; but her Left Side became paralytic, and, her Strength gradually decreaſing, ſhe died three Days after. Through the whole Stages of the Diſeaſe, neither a Cough nor Stertor accompanied her Difficulty of Breathing, except on the Day before ſhe died.

Upon opening her Body, I found her Spleen ſo putrid, that, by a gentle Compreſſion, it would fall to Pieces. The Subſtance of her Lungs was of a livid Colour, moiſten'd with a watery Humour; and one of their Lobes, lying on the Left Side, was fill'd with putrid and purulent Phlegm. The Right Ventricle of her Heart appear'd, without its internal Membrane, ſo putrid alſo, and exulcerated, that its fleſhy Fibres, upon being touch'd with the Points of one's Fingers, fell to Pieces. Its Right Auricle appear'd preternaturally large, and was filled with a certain fleſhy Subſtance, which, being partly red, and partly blackiſh, reſembled concreted Blood, but could not be divided with one's Hands. I am of Opinion, that theſe two Diſorders of the Right Ventricle and Auricle were the Cauſes of the Inequality and Intermiſſion of her Pulſe, whilſt the Heart, endeavouring to throw off the uneaſy Load, was agitated with various Commotions. To this the Interruption or Interception of the natural Pulſe was owing. It is, on the other hand, ſufficiently plain, that her Difficulty of Breathing proceeded from the Infarction of her Lungs. *Riverius, Cent.* 2. *Obſ.* 77.

CASE III.

The illuſtrious Cardinal *Caetanus*, after the Cloſing up of an Iſſue in his Right Leg, was for four Months troubled with a Reſpiration preternaturally quick, frequent, and reſembling that of thoſe who are overheated by ſome violent Exerciſe; but his Inſpiration was attended with a greater Difficulty than his Expiration. His Thirſt was great, his Face high-colour'd, and his Nights paſſed without Sleep. What he ſpit up was in ſmall Quantity, and ſomewhat ſaltiſh. A ſlow Fever at the ſame time accompanied all theſe Symptoms; and, in three Months time, his Diſorder put an End to his Life.

Upon opening his Body, his Lungs were found full of Veſicles; which, when open'd, yielded a Water of a yelloviſh Colour. *Lælius a Fonte, Conſultat.*

CASE IV.

A Tubercle of the Lungs may be of two Kinds, one crude, and incapable of Suppuration, ſuch as the *Steatoma* or *Atheroma:* Tumors of this Kind, *Columbus* [*Lib.* 15.] ſays, he has often met with in diſſecting the Bodies of thoſe, who, during their Lives, had been afflicted with a Difficulty of Breathing. The other Kind tends to Suppuration, ſuch as that under which the Daughter of *Ageſis* labour'd, mention'd by *Hippocrates*, 4. 6. *Epid.* 4. which was, nevertheleſs, not accompanied with a Fever. Hence I infer, that Pus may be contained in the Lungs without any concomitant Fever. *H. Saxonia, Prælect. Pract. Part* 1. (26. §. 4.) I diſſected two, who were both afflicted with a Difficulty of Breathing on account of Tubercles, which were at firſt crude, but which afterwards came to Suppuration; the one, two, and the other three Months after the Beginning of the reſpective Diſorders. Both Patients ſpit up Blood, mix'd with a little Pus, and ſome ſmall Pieces of the Lungs. One of the Patients, before his Death, was afflicted with a pretty large Tumor of his Liver. Upon diſſecting both their Bodies, the Right Lobes of their Lungs were internally quite corrupted, and externally adherent to the Pleura. *Columbus apud Schenckium.*

A crude, viſcid, and conſiſtent Humour, congeſted and pent up into a crude Tubercle, and contain'd in a Cyſtis, may be form'd in the Subſtance of the Lungs; an Inſtance of which I met with in diſſecting the Body of a young Gentleman of Diſtinction. *Car. Piſo de Morbis a Ser. Sect.* 3. *Cap.* 4.

CASE V.

Mr. *Schottendorf* had for ſeveral Years been almoſt cloſe confin'd to his Bed, and, at ſtated Hours, had his Reſpiration almoſt entirely obſtructed. This Diſorder, ſcorning to yield to any Remedies whatever, at laſt put an End to his Life.

Upon opening his Body, I found his Peritonæum ſufficiently putrid, his Stomach almoſt empty, without any Chyle, or other humoral Matter, and, conſequently, little, and, as it were, ſhrivel'd up. His Inteſtines alſo were void of Fæces, and his Liver corrupted, eſpecially in that Part where it was cover'd

by the Ribs. The Left Side of his Spleen was disjoined from its Ligaments, as it were doubled, and every-where half-rotten. Upon laying open his Diaphragm, I found a very hard Mass, filled with a large Quantity of small Stones, adhering to the Substance of the Lungs. This Mass I extracted with my Hands. The Lobes of the Lungs adhered so firmly to their main Body, that they were become incapable of communicating any Motion to it. By his voracious and often repeated Eating of fat Fleshes, so much indurated Fat adhered to his Arteria Trachea and Pharynx, that he was not only often afflicted with an uncommon Difficulty of Breathing, but also became incapable of taking any Food for some Days before his Death; so that, being supported by Drink alone, I am inclined to think, Hunger would have soon put an End to his Days, tho' the Violence of his Disease had spared him. Besides, he assigned this as an external Cause for his Disorder, that, being on his Return from *Italy*, when he first fell sick, he had called an unskilful Surgeon, who, upon the very first Sight of him, boldly affirmed, that he laboured under a *Lues Venerea*, of which, by the way, he had never in his Life had the least Taint. This Surgeon prepared an Ointment of Quicksilver, which he had not been at Pains to extinguish sufficiently; and, using this by way of Unction, he, by the penetrating and resolving Efficacy of the Quicksilver, became daily worse and worse, till Death put an End to his Misery. I believe the Cause of this Disorder to be nothing else than the Quicksilver penetrating into the very Substance of the Lungs, in consequence of their loose and porous Texture. *Schenkius ex M. Joh. Fabr. Observat.*

There are great Reasons to believe, that this could not be effected by the mercurial Ointment. See MERCURIUS.

CASE VI.

M. *Lælius Lombard* of *Geneva*, a slow dull Man, of fifty Years of Age, died suddenly in the Year 1646. He was subject to an Asthma, a Disease hereditary to his Family. Upon going into a Wine-cellar during the Season of the Vintage, when the Must was fermenting, he was seized with so violent a Paroxysm, that he was scarce sooner laid in Bed, than he breathed out his last. Upon opening his Thorax, his Lungs appeared without any Stain, or vitiated Colour; only in Bulk they equalled those of an Ox.

We have Reason to believe, that the Nourishment of the Lungs is increased, as often as they, retaining their natural Consistence and Substance, yet grow to an enormous Bulk, and so fill the Cavity of the Breast, as rather to hinder Respiration altogether, than render it difficult; Instances of which I have more than once met with in dissecting dead Bodies. *Fr. Sylvius Praxeos, Lib. 1. Cap. 24. p. 12.*

CASE VII.

On the 11th of *May* 1676. I opened the Body of a young Man of twenty-two Years of Age, who, about eight Years before, contracted a Pleurisy, in consequence of his catching Cold after being overheated by running. Neglecting his Pleurisy, and not calling in Venesection to his Assistance, a terrible Asthma, accompanied with purulent and often bloody Expectoration, ensued. He had a violent Pain, resembling Gravel, in the Region of his Loins, and was always melancholy and dejected.

His Gall-bladder was very small, remarkably thick, and filled with a very black viscid Matter, which felt hard upon being touched. Its interior Crust was also thick, very black, and, as if it had been a special Coat, easily separable from the rest. His Liver was very large, and, beyond the Spleen, adhered pretty strongly to the Diaphragm, by means of a transverse Ligament reaching so far. It was very much covered with Tubercles, and every-where sufficiently scirrhous. Both Kidneys were entire; and the back Part of the Spleen was adherent to the Diaphragm. The Belly was distended with a clammy viscid Water, of a darkish Colour. In the Thorax, the Lungs adhered inseparably to the Ribs on both Sides, especially near the Vertebræ themselves. They were also almost corrupted as far as the lower Part of the Diaphragm. The Pericardium was filled and distended with above thirty Ounces of a very limpid Water, which was of a sweet Taste. The Pericardium being remov'd, the Heart, and its Right Auricle, appeared of an uncommon Size. Having tied all the other Vessels, we drew more than twenty Ounces of fluid Blood, tough Phlegm, and black Gore, from the Auricle. *G. Blasius Observ. Med.* 19.

CASE VIII.

In the Year 1646. at *Vallogne*, the Body of a Man of Fifty Years of Age, who had been wore away, and at last killed, by a severe Asthma, was opened; upon which the Lungs were found without Blood, their Parenchyma, and all their minute Passages, obstructed, filled, and, as it were, drenched in a thick viscid Phlegm, while, at the same time, there appeared many small Impostumes in the Parenchyma itself. On both Sides also the Lungs adhered so firmly to the Pleura, that a considerable Strength of the Hands was necessary to separate them. Their Colour was pale and blackish; so that they were quite destitute of Strength to throw the Matter off; and there was no Place for the Ventilation of the Heart, because the perceptible and pervious Passages of the Aspera Arteria and Arteria Venosa were plainly blocked up by the Abundance of the Matter; which Cause at last, by retaining the Sordes, overpowered and extinguished the vital Heat of the Heart.

Bad Diet, and the Viscera absolutely necessary for performing the Functions of Nature, being weakened by that means, were the Causes of so lamentable a Disorder; for the Stomach itself was become little, languid, and of a very slender Substance; the Omentum was plainly extenuated, and destitute of Fat; the Liver was pale and small; which Circumstances sufficiently shewed, that neither the first nor second Concoctions were duly carried on. *Otthe Heurnius, Histor.* 9.

CASE IX.

In the Year 1592. I opened a Woman big with Child, who had died apoplectic. In her Thorax I found her Lungs joined in some Places by strong nervous Filaments to the Ribs of the Right Side; and in both Sides they had assumed a preternatural Colour. *Petrus Pauvius, Observ. Anat.* 6.

CASE X.

An illustrious Prince, about sixty Years of Age, was, twice or thrice in a Year, afflicted with a Defluxion of thin Humours on his Breast, which brought on an Orthopnœa, and a Danger of Suffocation. Upon dissecting his Body, in his Thorax I found all the Lobes of his Lungs blackish, both internally and externally; they were also turgid with black Blood; their Substance was equable, but their Right Lobe adhered to the Pleura; and both Sinuses of the Heart contained a certain Substance. *Bonet. Lib. 2. Vol. 1. p. 514.*

CASE XI.

By the Dissection of Bodies we come to know, that, by the immoderate Use of Repellents, the Thorax is filled with a bloody Serum. An Instance of this occurred in the Year 1553. in a certain Merchant, who, before his Death, laboured under a terrible Difficulty of Breathing. He spit up little or nothing, and at last died. However, upon dissecting his Body, four *Pitcherfuls* of Serum were found in his Thorax.

I imagine, this had been occasioned by a Lamina or Plate of Lead, which he always wore on his Breast, on which there was a cancerous Tumor, and by the strong refrigerating and repellent Medicines he used even after it came to a Suppuration. It is certain, that the Blood had ousted back into the Breast, since the Tumor itself was very large, and became much less after the Use of these Medicines; and tho', before that, he had no Difficulty of Breathing, yet, from that very time, till the Day of his Death, he was afflicted with that Symptom. The Serum was bloody, that is, a little Blood appeared dissolved in it; nor was it such Serum as is found in the Peritonæum and Pericardium. *Rondeletius Meth. Cur. Morb. Lib. 2. Cap. 23.*

CASE XII.

A Shoemaker, of about thirty Years of Age, who died of a Dropsy, brought on by an Asthma, was, in the Year 1586, opened. Before his Belly began to swell, in the Region of the Back, on the Right Side, he had a fleshy Tumor, not receding from the natural Colour of the Skin; which when a Barber laid open with a Knife, nothing flowed from it for some Days, except Water; and the Wound was afterwards cured. But, when he was racked with a violent Cough, when his Belly and Feet began to swell, and a Difficulty of Breathing appeared, he took the Advice of some Physicians, and at last consulted myself. After he had used such things as were rather palliative, than effectual in promoting a real Cure, he began to recover at certain Intervals; but, immediately relapsing, he died.

Upon opening his Abdomen, four Brass Barbers Basons were filled with a Citron-coloured Water, which flowed from it. All the Viscera contained in the Abdomen were in a good Condition, except the Omentum. The Diaphragm was not pressed upwards by the Liver, but was remarkably depressed by the Matter lodged in the Thorax. Upon opening the Thorax, three Brass Basonfuls of purulent Matter flowed from the Right Side, on which the Lungs were converted into Pus, the Left remaining sound, and in a good State. Hence, that is, from the Ulcer of the Lungs, arose the Asthma, hence the Cough, and hence the Dropsy. *Caspar Bauhinus de Observat. propriis.*

CASE XIII

A certain Man, who laboured under an *Asthma* and Consumption, happening to die, his Lungs were suspected to be the principal Seat of his Disorder; but, upon opening his Body, nothing uncommon was found about them; only the Heart, which

which is indeed a ſurpriſing Circumſtance, was as large as a grown Perſon's Head, and had increaſed to ſuch an immenſe Bulk, that there was a *Conflux* and *Concourſe* of all the Blood and Spirits to it. *Ballonius Epid. & Ephem. L. 2. p.* 144.

CASE XIV.

Dr. *Walter Needham* informed me, that he knew a Butcher, who, having long laboured under a periodic *Aſthma*, which generally returned every Fortnight or three Weeks, at laſt died under an immediate Paroxyſm of it.

Upon opening the Body, all the Viſcera, and more eſpecially the Lungs, were found ſound; neither were there the leaſt Traces to be obſerved of an excrementitious Matter collected in the Bronchia, or of any Quantity of Blood having ſtagnated in the Veins. The only preternatural Phenomenon to be obſerv'd was, that the Gall-bladder contained ſeveral ſmall Stones; ſo that, if there was any other Diſorder, added he, it was either to be aſcribed to the nervous Syſtem, or to ſome other occult and unknown Cauſe, which could not be diſcovered by the Eyes. *Thom. Willis Pathol. Cap.* 12.

CASE XV.

Zecchius, Conſ. 18. informs us, that Cardinal *Palliot* laboured at once under an Aſthma, and a Heat and Difficulty of Urine; and that his Caſe had this Peculiarity in it, that when he was afflicted with the Heat and Difficulty of Urine, the Difficulty of breathing was perceptibly leſſened; and when the Strangury ceas'd, his Aſtma returned with redoubled Force. Concerning theſe Symptoms, I am of the following Opinion: The Aſthma proceeded from the thin Humours lodg'd in the whole Maſs of Blood; and theſe are oftener carried to the pulmonary Veins, from the Head, which, according to *Hippocrates*, contains more Blood, or more Veins, than the Lungs; for this Reaſon, no Cough precedes, but ſometimes a heavy Pain of the Head does. This Humour does not flow from the Head, through the Aſpera Arteria. This accounts for the Patient's not being troubled with a Cough. The Paroxyſm of the Aſthma was ſometimes put an End to, when the Strangury began; for this Reaſon, that the thick Humour is carried to the Kidney, whereas the thin is left in the Lungs. This is, likewiſe, the Reaſon why the Aſthma ceaſes, the Swelling of the Feet increaſing, as I have often ſeen, and the Diſcharge by Urine, as *D. Joh. Rhodius* affirms. *Schneiderus, Lib. 3. de Catarrh. C.* 6. See *Sennert. Lib.* 62. *Pract.* 45.

CASE XVI.

A certain Man, after having taken ſome Doſes of Mercurial Pills, in order to carry off ſome Venereal Buboes, was ſeized with a Difficulty of breathing, and a Fever, which cut him off in two Days time.

When his Body was opened, by Mr. *Gaute*, the King's Surgeon, there was found, in the Baſe of his Heart, a certain Excreſcence, as large as a Pigeon's Egg, and ſurrounded with many ſmaller ones, whoſe Surfaces were ſmooth and even, (for they were all formed by the Production of the proper Membrane of the Heart) had no fleſhy Fibres within, but only a ſoft Matter, in Colour and Conſiſtence not unlike the thick Dregs of Wine. This Matter was full of white, lucid, and metallic Corpuſcles, which, in every body's Opinion, were the Particles of the Mercury: The Probability of which is ſhewn by Mr. *Lemery*, and ſeveral other learned Men, in their medicinal and chemical Works. *D. Gaute in Zodiaco Med. Gallico, p.* 156.

CASE XVII.

In the Year 1649. I diſſected, in our Hoſpital, a Stone-cutter's Servant, who died of an Aſthma. In his Lungs I found a great Quantity of Stone-duſt, which he had drawn in, with the Air, in Inſpiration, and which had ſo ſtuffed up almoſt all their Veſſels, that in cutting the Lungs, which were very hard, my Knife ſeemed to paſs through a Heap of Sand. Now, ſince the Veſicles of the Lungs were filled with this Duſt, they could not poſſibly admit the inſpir'd Air, ſo that the Patient died aſthmatic.

In the following Year, in the ſame Hoſpital, I ſaw, and exhibited, two Caſes of the like Nature; that is, two Stone-cutters, cut off in the ſame manner, and their Lungs affording the ſame Appearances.

I alſo ſaw a Man, who died after having labour'd long under an Aſthma; and, as in his Life-time he had been accuſtomed to cleanſe and prepare ſuch Feathers as Beds are uſually ſtuff'd with, the Veſicles of his Lungs were full of the Down of theſe Feathers. *Bonet. Sepulchret. Anat.*

It is an old, but true Maxim, not only of Phyſicians, but alſo of the vulgar and illiterate Part of Mankind, that Life and Reſpiration are ſo inſeparably connected, as to go hand-in-hand. That Life, and all the ſeveral Functions ſubſervient to its Preſervation, are ſupported by that univerſal Circulation of the Blood from the Heart to all the Parts, and thence to the Heart again, is a Circumſtance abſolutely certain. But, at the ſame time, it is found equally true, that this Circulation, and conſequently Life, cannot ſubſiſt without that partial and leſs general Circulation of the Humours, which is performed thro' the Lungs, from the Right to the Left Ventricle of the Heart; ſince, when this latter ceaſes, Life, and all the Functions of the animal Œconomy, are forthwith at an End. Since, therefore, this Circulation of the Blood through the Lungs cannot be performed without a free Reſpiration, we may eaſily judge how much an eaſy and natural Breathing contributes to the Preſervation of Life, and how detrimental to it, a diſorderly, ſuppreſſed, or totally obſtructed Reſpiration muſt neceſſarily be. This Truth is ſufficiently evinced by thoſe Diſeaſes, which are accompanied with a Difficulty of breathing.

There are ſeveral very formidable Diſorders, which, among other direful Symptoms, are accompanied with a difficult and laborious Reſpiration. The Diſeaſes of this kind are principally ſuch as have their Seat fixed in the Lungs; a Pleuriſy, for Inſtance, a Peripneumony, a Cough, a Phthiſis, Scirruſes, Tubercles, and Impoſtumations of the Lungs. But, beſides theſe, there are many Cauſes, both within and without the Thorax, which, proving offenſive to Reſpiration, and the vital Circulation of the Humours, threaten the higheſt Danger, and produce that Diſorder which the *Greeks* called *Aſthma*; and which, in my Opinion, may be defined, a difficult and laborious Reſpiration, ariſing from various Cauſes, and accompanied with an intolerable Uneaſineſs and Straitneſs of the Præcordia, which, as it diſturbs the free Circulation of the Blood through the Lungs, muſt, of courſe, endanger a Suffocation.

As this Diſorder, in general, may ariſe from various Cauſes, ſo there are various Kinds of Aſthmas: Thus, for Inſtance, there is a gentle Dyſpnœa, or Difficulty of breathing, which is familiar to ſuch Perſons as are fat, corpulent, or full of Juices, eſpecially after any violent Motion or Exerciſe of the Body. This Species of the Diſorder depends upon a difficult Circulation of the Blood through the Lungs, and a preternatural Expanſion of the Veſſels, by which a ſufficient Ingreſs of the Air is prevented: But this Degree of the Diſeaſe is free from Danger, and of a tranſitory Nature. There is alſo a pituitous Aſthma, which, being accompanied with a moiſt Cough, and an Expectoration of viſcid Phlegm, racks the Patient both Day and Night, in whatever Poſture the Body happens to be: This Species of the Diſorder draws its Origin from a copious Congeſtion of viſcid Mucus in the Lungs; which blocks up the pulmonary Veſicles, and prevents the free Ingreſs and Regreſs of the Air. But our principal Intention, at preſent, is to conſider that Species of Aſthma, which ariſes from a ſpaſmodic Stricture of the Parts ſubſervient to Reſpiration, produced by various Cauſes both within and without the Thorax: This is what is commonly called a ſpaſmodico-flatulent, and a convulſive Aſthma.

This convulſive Aſthma is widely different from the convulſive Suffocation of hyſteric Patients, which only conſiſts in a ſpaſmodic Conſtriction of the upper Parts of the Fauces, as alſo of the Pharynx and Larynx, by contracting and leſſening the Cavity of which latter, it prevents the free Paſſage of the Air to the Lungs; whereas, in a convulſive Aſthma, the Paſſage through the Aſpera Arteria is ſufficiently free and pervious, and the Fault rather reſides in the Lungs themſelves; ſo that, ſometimes, only Inſpiration is difficult, while Expiration is duly and eaſily performed. We muſt, alſo, diſtinguiſh between a convulſive Aſthma, and a ſuffocative Catarrh; ſince this latter, which is accompanied with a Redneſs of the Countenance, and a Stertor, partakes, in ſome meaſure, of the Nature of a Palſy, and in a few Days comes to a Solution; whereas the former is entirely free from a Stertor, and belongs to the Claſs of Chronical Diſeaſes.

The Signs of an approaching Aſthma are, by *Aretæus, L. 1. Chronic. Morb. Cap.* 11. beautifully deſcribed in the following Words: "The Patient is ſeized with an Oppreſſion of the "Breaſt, a Liſtleſſneſs in his uſual Employment, or any other "Undertaking; in Running, or aſcending a riſing Ground, "his Breathing is difficult and laborious, he becomes hoarſe and "coughs, is afflicted with Flatulencies of the Præcordia, and "rack'd with uneaſy Eructations; he is ſubject to Watchings, "and in the Night-time very little, and almoſt imperceptibly, "hot; his Noſtrils, alſo, become too much contracted for a "free and eaſy Reſpiration. If the Diſorder is degenerating, "and becoming more formidable, the Cheeks become red, and "the Eyes prominent, like thoſe of ſtrangulated Perſons; he "ſnores whilſt awake, but much more when aſleep; his Voice "is indiſtinct, languid, and faint; he is fond of a free and "cold Air, and loves to walk in the open Fields, becauſe a "Houſe is a Scene too narrow and confin'd for his breathing "with the Freedom he wiſhes. He breathes in an erect "Poſture, and is eager to attract all the Air he poſſibly can: "For this Purpoſe, he opens his Mouth wide; and ſeems diſ-"concerted, becauſe it is too ſmall for his Purpoſe. His Face, "except the Cheeks, which are red, becomes pale; a Sweat "breaks

" breaks out about his Forehead and Neck, he is rack'd with " a ſharp and continual Cough, and expectorates a ſmall " Quantity of thin, cold, and, as it were, frothy Matter. " In Inſpiration his Neck becomes tumid, and there is a " Retraction of the Præcordia. His Pulſe is ſmall, frequent, " and depreſſed; his Legs, alſo, become ſmall and ſlender. If " theſe Symptoms ſhould happen to be increas'd, they ſome- " times ſuffocate the Patient, in the ſame manner an Epi- " lepſy does; but if they are alleviated and leſſen'd, the " Cough becomes leſs frequent, and returns at longer Intervals; " a large Quantity of ſanious and moiſt Spit is expectorated: " copious and aqueous Stools are diſcharg'd; the Urine, alſo, " is evacuated in large Quantities, though nothing, as yet, ſub- " ſides in it. His Voice becomes more clear and ſonorous; " his Sleeps longer, and ſufficient for the Support of Nature. " His Præcordia are relax'd, and render'd eaſy; and his Pain, " upon its Remiſſion, is ſometimes tranſlated to the Scapulæ; " he breathes at longer Intervals, and more eaſily, though with " a certain Roughneſs."

The more old and inveterate the Diſorder is, the more violent and terrible all theſe Symptoms are. Under this Diſtemper the Patient is generally coſtive, and the Urine diſcharged is thin and aqueous. Very frequently Tumors appear on the Feet, the Hands, the Face, and the Back; the Arms are ſeized with a preternatural Torpor, the Countenance becomes unſeemly, and mark'd with Spots of a leaden Colour. To theſe Symptoms is alſo joined a ſlight anomalous Fever, which is exaſperated towards the Evening. This Train of Symptoms is ſucceeded by a cacthetic Defedation of the Body, accompanied with œdematous Swellings of the Feet, a Dropſy of the Breaſt, or even an Aſcites, or Anaſarca. At laſt, one of the Sides, or, at leaſt, one of the Arms, becomes paralytic; or, which is remarkable, inſtead of this Symptom, an Amauroſis, which is a Palſy of the Eyes, happens, as was obſerv'd by *Gohlius*, in his Diſſertation *De Aſthmate convulſivo a Polypo Cordis*. Becauſe this Species of Aſthma for the moſt part terminates in a Suffocation, it is for that Reaſon called a Suffocative Aſthma.

Experience and accurate Obſervation ſufficiently inform us, that Perſons of a ſanguine Habit, and ſmall, but numerous Veſſels, as alſo thoſe who are corpulent, plethoric, or what we call *narrow-cheſted*, are moſt generally ſubject to Aſthmas, after any violent Commotion either of Body or Mind, eſpecially in the Spring and Autumn. Perſons of this kind are ſtill more expoſed to the Shocks of this Misfortune, if they either labour under an immoderate Flux, or a total Suppreſſion of the Menſes, or hæmorrhoidal Diſcharges; or neglect their accuſtomed Evacuations of Blood, whether by Scarification, or Veneſection. They are alſo ſubject to the ſame Diſorder, if they are hypochondriacal, or if the Stomach and Inteſtines, in conſequence of a diſturbed and irregular periſtaltic Motion, abound with Flatulencies, or are rack'd with Spaſms: And they are ſtill more infallibly expos'd to this direful Train of Calamities, if the Excretions of the peccant and acrid Serum, by whatever Emunctories, are either totally ſuppreſſed, or carried on in a faint and languid manner.

Upon the anatomical Diſſection of Subjects who have fallen a Sacrifice to this Diſeaſe, we generally find Fluctuations of Water in the Thorax, accompanied with polypoſe Concretions of the Heart. Inſtances of this nature are given by *Carolus Piſo, de Morbis ex Colluvie ſeroſa*; by *Scultetus, in Append. Obſ.* 31. and in the *Act. Medic. Berolin. Dec.* 2. *Vol.* 7. In ſome Subjects there is only found an Extravaſation of Serum in the Thorax, without any polypoſe Concretions in the Heart; an Inſtance of which Kind we find recorded in the *Act. Medic. Berolin. Dec.* 2. *Vol.* 8. in which Caſe the Aorta was alſo found offified. In other Subjects the Lungs are found ſtuff'd with a black ſtagnating and extravaſated Blood; an Inſtance of which occurs in *Willis*'s *Pharm. Rational. Sect.* 7. *Cap.* 3. Sometimes the Lungs and Bronchia remaining ſound and entire, there are only polypoſe Concretions found in the Heart; Inſtances of which are to be met with in *Pezoldus*, *Obſervat.* 58. and in the *Ephemerides Naturæ curioſ. Dec.* 3. *An.* 2. *Obſervat.* 185. and in *Dec.* 1. *An.* 4. *Obſervat.* 11.

But, that we may be able more diſtinctly to comprehend the Manner in which an Aſthma is produced or generated, it is neceſſary to premiſe ſome things with reſpect to Reſpiration. In order, therefore, to a free and natural Reſpiration, it is abſolutely requiſite, that the Lungs, which conſiſt of numberleſs Blood-veſſels, both of the arterial and venous kind, as alſo of membranaceous Ducts and Veſicles, ſhould be ſufficiently expanded and dilated by the Air, that ſubtle, elaſtic, and ethereal Fluid, when the Cavity of the Thorax is enlarg'd by the Elevation of the Ribs. By means of this Expanſion, the Blood is more freely and quickly convey'd through the venous and arterial Ramifications of the Lungs, which were before much complicated and compreſs'd, to the Left Ventricle of the Heart, becauſe the Preſſure, made upon the Blood-veſſels by the Veſſels diſtended with Air, facilitates the Motion of the Fluids through them. But ſince the Air, within the Lungs, which is impregnated with humid Vapours, and deprived of its Elaſticity, cannot make an Exit for itſelf; and ſince, in its room, freſh expanſive Air ought to ſucceed; it is abſolutely neceſſary, that the Thorax ſhould, in ſome meaſure, be contracted, and have its Cavity rendered leſs. This alternate Dilatation and Contraction of the Thorax, the Expanſion and Collapſing of the Lungs, the ſufficient Ingreſs and Egreſs of the Air, together with a due and equable Motion of the Heart, produce a free and natural Reſpiration; which is highly neceſſary to the Preſervation of Health and Life. But when any Cauſes occur, which either obſtruct the Ingreſs and Egreſs of the Air from the Lungs, diſturb the dilatatory and contractile Motion of the Muſcles of the Thorax, Abdomen, or Diaphragm, or diſorder the due Syſtole and Diaſtole of the Heart; forthwith an Aſthma, the Generation of which we have been accounting for, is produc'd.

Taking the above-enumerated Circumſtances for ſo many Data, it will be no difficult Taſk to render the Ætiology of an Aſthma ſufficiently obvious and eaſy: And, becauſe there may be various Cauſes of this Diſorder, we ſhall firſt conſider that which ariſes from ſome Fault or Imperfection of the Blood: We obſerve, then, that ſevere and violent Aſthmas are produc'd by a Redundance of Blood and Humours, by their preternatural Thickneſs, or their Congeſtion in the Præcordia; for, when the Maſs of Blood and Humours is too copiouſly and impetuouſly convey'd to the Right Ventricle of the Heart, it muſt, of courſe, be alſo more copiouſly carried to the Ramifications of the pulmonary Veſſels; by which means, the elaſtic Force of the inſpir'd Air is, in conſequence of the ſtrong Reſiſtance of the Blood, conſiderably impair'd. The Blood, therefore, which is not briſkly enough propel'd thro' the pulmonary Vein, ſtagnates in its ſmall Ramifications; and the freſh Supplies of Blood, convey'd by the continual Pulſation of the Heart, diſtend and dilate the Ramifications of the Veſſels: Hence ariſe a Difficulty of Breathing, great Uneaſineſs, a Tremor and Palpitation of the Heart, together with an unequal, ſmall, quick, and frequent Pulſe. This Aſthma ariſing from a Redundance of Blood, ought, alſo, to be diſtinguiſhed by the Epithet Spaſmodic, becauſe the ſtagnant Blood not only preternaturally diſtends the Veſſels, and ſmall Ramifications of the Nerves, but alſo compreſſes the membranous Veſicles. Now, 'tis to be eſtabliſh'd as an infallible Maxim, that a preternatural Expanſion of the nervous Coats, by a large Quantity of Blood ſtagnating in them, lays a Foundation for a ſpaſmodic Conſtriction; and, *vice verſa*, this Conſtriction contributes very much to the Stagnation and Congeſtion of the Humours: This ſeems to be confirmed by thoſe Patients, whoſe Lungs, after Death, have been found ſtuff'd with a black, ſtagnant, and extravaſated Blood. *Willis*, in his *Pharm. Rational. Sect.* 7. *Cap.* 3. furniſhes us with an Inſtance of this, in a Man belonging to the Prieſthood, an Order more expoſed to this Misfortune than others, in conſequence of the Congeſtion of Humours to their Lungs, occaſion'd by their frequent Declamations in Public.

This Species of Aſthma is very common in hypochondriac Patients; becauſe in them the vital Humours, which are generally pretty thick, are, in conſequence of the Stricture of the inferior Parts, forc'd in too large Quantities to the Præcordia: In Patients of this Claſs, this Diſorder is almoſt always complicated with Flatulences of the Stomach, and Diſtentions of the *Primæ Viæ*, by which the primary Diſeaſe is render'd worſe; for ſince the Diaphragm touches immediately upon the Stomach, when the latter is diſtended with Flatulences, the former muſt, of courſe, be forthwith proportionably affected, and its free Motion prevented: Hence, alſo, the due Expanſion of the Lungs is obſtructed. Beſides, it frequently happens, that the Diaphragm, which is a nervous Membrane, is ſpaſmodically contracted; by which means, the Œſophagus, which perforates it, is ſo contracted, that a free Paſſage cannot be afforded to the Vapours ſtruggling for an Eruption: Hence the Uneaſineſs of the Præcordia is ſurpriſingly increas'd; and the Flatulences, being afterwards, in ſome meaſure, ſet at Liberty, diſcharge themſelves in loud and copious Eructations, which proportionably alleviate the Diſeaſe.

That Species of Aſthma which ſtrictly deſerves the Name of Convulſive, and which frequently occurs in Practice, is, without the Concurrence of any perceptible material Cauſe, produc'd by a ſpaſmodic Conſtriction of the Parts ſubſervient to Reſpiration, eſpecially of the Membranes ſurrounding the pulmonary Veſſels; for, when the nervous Coats of the Diaphragm, the membranous Parts of the intercoſtal Muſcles, and the delicate Membranes which every-where incloſe the pulmonary Veſicles, are ſpaſmodically conſtricted, the Cavity of the Thorax is, by that means, leſſen'd, the Expanſion of the Lungs check'd, the due Ingreſs of the Air into the pulmonary Veſicles prevented, and the Paſſage of the Blood thro' the Lungs, together with its Circulation from one Ventricle of the Heart to the other, ſurpriſingly retarded: Now, ſince the contracted Parts of the Breaſt receive their Nerves from the vertebral and dorſal Pairs, which alſo ſend off Ramifications to the Arms,

'tis

'tis ſufficiently obvious, why the whole Breaſt and Arms ſhould be oppreſs'd and tenſe, the Scapulæ, Back, and Sternum, afflicted with Pain, and the Arms affected with a Torpor, and, at laſt, a Palſy; becauſe the Stricture prevents a due Influx of the nervous Fluid.

Theſe ſpaſmodic Conſtrictions are excited by an acrid, ſubtile, cauſtic, and, often, virulent Matter, lodg'd about the nervous Parts of the Præcordia. This peccant Matter is, originally, generated by the Repulſion of Sweats, eſpecially in ſcorbutic Patients; as alſo, by the inſufficient Evacuation, or prepoſterous Repreſſion of exanthematous Diſorders, of Efflorescences, of all Kinds of Excretions of the acrid Lymph and Serum, or of Defluxions of Matter on the Joints. Thus we are taught, by daily Experience, that an Aſthma is produc'd by an Eryſipelas, the Small-pox, and, eſpecially, the Meaſles; the purple Fever, as alſo ſcorbutic Spots, and Puſtules of every Kind; when the peccant Matter is either not ſufficiently forc'd to the Surface of the Body, or injudiciouſly repel'd, by the prepoſterous Uſe of Aſtringents. This Diſorder, alſo, ariſes from the Itch, the Tinea, or Achors of the Head, and the Cruſta Lactea, when prepoſterouſly dried up by oleous and pinguious Subſtances, or Linen-cloths impregnated with Sulphur. An Aſthma may alſo ariſe, from a Repreſſion of the fetid Sweat of the Feet, or a ſudden and univerſal Suppreſſion of Tranſpiration; as alſo, from chronical Ulcers, or Fontanels unſeaſonably and injudiciouſly heal'd: Thus I have ſeen an Inſtance of a convulſive Aſthma, ariſing from the drying up of a ſerpiginous Ulcer in the Scrotum: An Aſthma may, in like manner, be produc'd by a Gout, or any arthritic Diſorder, retiring to the more noble Parts, partly in conſequence of a Defect of Strength, and partly in conſequence of prepoſterous and ill-choſen Meaſures.

To this Claſs of Diſorders belongs that dry ſpaſmodic Aſthma, which, by means of metallic, ſaturnine, ſulphureous, poiſonous, and arſenical Exhalations, as, alſo, by thoſe of foſſile Coals and *Aqua-fortis*, is principally incident to thoſe who work in Metals, ſuch as Miners, and ſome Kinds of Smiths. In the *Acta Medica Berolinenſ. Dec.* 1. *Vol.* 6. we have an Inſtance of a Smith, who, by attracting the metalline Particles, in ſtriking Braſs with a Hammer, fell into a convulſive Aſthma; for theſe noxious and virulent Exhalations, when drawn in by Inſpiration, fix on the nervous Membranes of the pulmonary Veſicles; and, by conſtricting them, prevent the free and perfect Acceſs of the Air into them, and therefore threaten this terrible Diſorder.

The ſpaſmodic Stricture of the Diaphragm alone, without any Fault or Imperfection of the Lungs, is ſufficient to diſturb the Work of Reſpiration, and induce a ſudden Suffocation. I have ſtill freſh in my Memory, two memorable, but mournful, Inſtances of this Kind, in which the Patients, tho' before ſound in every reſpect, by being ſtruck on the Pit of the Stomach, and the Region to which the Diaphragm is annexed, ſuddenly died of a Suffocation: Upon laying open their Bodies, nothing amiſs appear'd, except a Stricture of the Diaphragm, and a gentle Sugillation of its tendinous Part. Nor is it leſs effectually confirm'd by Experience, that Wounds inflicted by Puncture in the Centre of the Diaphragm, have produc'd an inſtantaneous Suffocation; not to mention the intolerable Difficulty of Breathing, which is perceiv'd in conſequence of an Inflammation of the Diaphragm, which is a nervous Subſtance: Nor is it hard to aſſign a Reaſon for this, ſince the conſtricted Diaphragm retains a convex Figure, which in Inſpiration ought to be plain: Now, on this account, it ſo contracts the Cavity of the Thorax, that the Lungs cannot be ſufficiently expanded.

Nor are we to forget that ſpaſmodic Aſthma, which, in cachectic Patients draws its Origin from œdematous Swellings of the Feet, repel'd by any means, and is accompanied with a violent Oppreſſion and Uneaſineſs of the Breaſt. This Diſorder is to be accounted for, almoſt in the ſame manner with that Aſthma, which ariſes from a Redundance of Blood; for, when a Stricture is brought upon the Feet, that thick and vapid Serum ſtagnating in them is forc'd upwards, abſorb'd by the Blood-veſſels, and convey'd to the Præcordia; where being, with the reſt of the Maſs of Humours, carried from the Right Ventricle of the Heart, into the pulmonary Artery, and its Ramifications, it ſo fills theſe, that, by compreſſing the pulmonary Veſicles, it reſiſts the entering Air, and prevents a ſufficient Ingreſs of it for propelling the Blood thro' the Veins: This Blood, therefore, which is impregnated with a viſcid Serum, ſtagnates in the ſmall arterial Ramifications, diſtends them in a violent manner, and, by that means, induces the higheſt Uneaſineſs, a Difficulty of Breathing, and, ſometimes, a ſudden Suffocation. This laſt Misfortune almoſt infallibly happens, if œdematous Swellings of the Feet are repel'd in thoſe Patients, in whoſe Hearts there are polypoſe Concretions. I have obſerv'd, that in Patients of this Kind, when ſeiz'd with intermittent Fevers, if the Swelling of the Feet has ſuddenly diſappear'd, under the cold Paroxyſm; theſe Fevers have brought on an intolerable Difficulty of Breathing, and, always, at the third cold Fit, a ſudden Suffocation.

There is another Species of Aſthma, which ſtill better deſerves the Name of Suffocative, and ariſes from polypoſe Concretions form'd about the Ventricles of the Heart. This Diſorder frequently terminates in a ſudden, Suffocation; and upon laying open the Bodies of thoſe who have died of it, nothing preternatural is diſcover'd, except the polypoſe Concretions themſelves. Obſervations confirming this are found in *Riverius, Centur.* 1. *Obſ.* 82. *Tulpius, Lib.* 1. *Cap.* 27. *Penzold. Obſervat.* 58. and in the *Ephemerides, Nat. curioſ. Dec.* 3. *An.* 2. *Obſ.* 185. For ſince the polypoſe Concretions, eſpecially about the Left Auricle of the Heart, block up the Paſſage of the Blood about to return from the Lungs, this Blood is accumulated in the pulmonary Veſſels, by diſtending which, it hinders the free Acceſs of the Air; and, unleſs the polypoſe Concretion is remov'd, terminates in a total Stagnation, and fatal Suffocation.

A Dropſy of the Breaſt, tho' generally the deplorable Effect of a convulſive Aſthma, yet, when ariſing from this, or any other Cauſe, ſuch as an Inflammation of the Lungs, or an external Injury, lays a Foundation for a violent ſuffocative Aſthma. This Dropſy of the Breaſt may be known, from the following Diagnoſtics: Œdematous Tumors appear, not only in the Feet, but the Hands, the Swelling of which Parts is by the ingenious *Baglivi* acknowledged as the pathognomic Sign of this Diſorder: For, ſays he, in his *Prax. Med. Lib.* 1. 11. "Thoſe who labour under a Dropſy of the Breaſt, are affected "with a Swelling of the Hands, and, ſometimes, of the Arms "themſelves, as far up as the Elbows." In thoſe afflicted with a Fluctuation or Dropſy of the Breaſt, we alſo obſerve, eſpecially when they incline their Bodies to one Side, a Tremor of the Heart, a Torpor and Palſy of the Arms, a dry Cough, ſometimes accompanied with the Expectoration of a pellucid Serum, and an anomalous Fever. When this Diſorder is complicated with a Polypus of the Heart, which it generally is, the Patient is ſeiz'd with Palpitations of the Heart, and his Pulſe is of the intermitting Kind.

A Dropſy of the Breaſt is an Extravaſation of Lymph and Serum in its Cavity, and is produc'd in the following manner: That the external Coat of the Lungs is copiouſly furniſh'd with lymphatic Veſſels, is beautifully ſhewn by the celebrated *Nuck*, in his *Adenogr. curioſ.* Theſe Veſſels, as well as the other Lymphatics, found in many Parts of the Breaſt, carry back their Contents to the thoracic Duct, in order to be convey'd thence thro' the Subclavian Vein, and the Vena Cava, to the Right Ventricle of the Heart. When, therefore, the Paſſage of this Lymph is ſo obſtructed, that it cannot reach the thoracic Duct, the lymphatic Veſſels are too much ſtuff'd, and at laſt, being diſtended beyond their due Sphere of Elaſticity, they are ruptur'd, and diſcharge their Contents into the Cavity of the Breaſt. Since, therefore, ſpaſmodic Strictures of the Parts ſubſervient to Reſpiration, and eſpecially of the Lungs, which produce a convulſive Aſthma, check and retard the Conveyance of the Lymph to the thoracic Duct, 'tis no difficult Matter to conceive in what manner they may at laſt produce a Dropſy of the Breaſt. On the other hand, this Collection of Waters in the Breaſt, by filling the whole Cavity of the Thorax, and preſſing upon the Diaphragm, leaves no Space for the Lungs to expand themſelves in; and therefore, by preventing the free Ingreſs of the Air and Blood into them, and hindering the Circulation of the latter thro' them, induces a ſuffocative Aſthma, ſo call'd, becauſe it puts an End to the miſerable Patient's Life by a Suffocation. This extravaſated Water, in the mean time, not only colliquates the Lungs which float in it, but, in Proceſs of Time becoming acrid, alſo corrodes, and almoſt conſumes them with Putrefaction, as *Harderus* has obſerv'd, in *Lib.* 1. *Obſ.* 51. As for the Dropſy of the *Pericardium*, it may not only be produc'd, in the ſame manner, from the lymphatic Veſſels ſurrounding the Surface of the Heart, but is alſo increas'd by the Secretion of the Serum from its Auricles, when they are ſtuff'd with ſtagnating Blood.

Nor are we to overlook that Species of Dropſy in the Breaſt, the Waters of which are included in Hydatides, as in Bags, and which, for the moſt part, is found to have its Seat within the Subſtance of the Lungs. In practical Authors many Inſtances occur of theſe Hydatides, not only in the Lungs, but alſo in the Pleura, the Diaphragm, and the external Surface of the Heart. For Caſes of this Nature, ſee *Otto Heurnius, Obſ.* 18. *Bartholine, Cent.* 2. *Obſ.* 61. *Acta Hafnienſ. Vol.* 3. *Obſ.* 76. and the *Ephemerides Nat. Curioſ. Cent.* 3. & 4. *Obſ.* 115. Theſe Hydatides ſeem to be generated in the Lungs themſelves, by the lymphatic Veſſels contain'd in their Subſtance being ruptur'd, and diſcharging their Contents into their ſmall Cells and Veſicles; and 'tis highly probable, that, in conſequence of a Rupture of theſe Veſſels, the Serum may be extravaſated into the Subſtance of the Lungs, and induce a ſudden Suffocation. From this Circumſtance we alſo

alſo account for that limpid Matter, which is ſometimes expectorated in certain Kinds of Coughs.

If any accidental Cauſes can concur to the Production of a convulſive Aſthma, certainly external Cold, that formidable Enemy to the nervous Syſtem, is none of the leaſt conſiderable of this Kind. Hence, in the Winter Seaſon, and when the Winds blow from the northerly Quarters, this Diſorder becomes more violent, and is alſo increas'd by drinking cold Liquors. I have, in a particular manner, obſerv'd that thoſe Perſons who do not carefully cover their Breaſts, but fooliſhly expoſe them to the Cold, eſpecially in the Night-time, are often ſubject to this Misfortune.

From what has been ſaid, we underſtand the various Manners in which both convulſive and ſuffocative Aſthmas are generated and increaſed. We ſhall, therefore, now conſider the Prognoſtics of theſe Diſorders. When the Misfortune is recent, and only depends upon the ſpaſmodic Conſtriction of the Precordia, ſome Hopes of the Patient's Recovery are left; eſpecially if the arthritic and gouty Defluxions, Ulcers, and exanthematous Eruptions are drawn back to their proper Places. A Diſcharge of Blood either from the Uterus, or the hæmorrhoidal Veins, happening to thoſe Patients who are ſeiz'd with an Aſthma, and hypochondrial Complaints, in conſequence of a Suppreſſion of theſe Evacuations, alleviates the Diſorder; and, if it is recent, produces a perfect Cure: But if it ſhould happen to be inveterate, or treated with prepoſterous and improper Medicines, it degenerates into a Dropſy of the Breaſt, Obſtructions and Infarctions of the Viſcera of the lower Belly, œdematous Swellings of the Feet, a Cachexy, and, at laſt, an univerſal Dropſy: For 'tis certain, that the Vena Cava, which conveys the blood from the lower Belly to the Heart, paſſes thro' the tendinous Centre of the Diaphragm: Nor is it leſs certain, that the free Motion of the Diaphragm aſſiſts and promotes the Circulation of the Blood thro' the Liver, which is naturally languid. When, therefore, the free Aſcent of the Blood thro' the Vena Cava is hinder'd, its Circulation thro' the Liver muſt, of courſe, become more ſlow. Hence the Humours, eſpecially in thoſe Parts of the Body which are more remote from the Heart, ſuch as the Feet, ſtagnate, and depoſit a ſerous Subſtance, which is the Cauſe of the œdematous Swellings. Afterwards the Humours move with Difficulty thro' the Viſcera of the lower Belly, and ſtagnating in them, produce Infarctions, Scirrhuſes, Cachexies, and Dropſies. Experience alſo, as well as the Obſervations of the ingenious *Lower* teach us, that when the Vena Cava is tied near the Diaphragm, a Dropſy is forthwith produced. In general, we muſt obſerve, that all convulſive Aſthmas either produce a ſpeedy Death, and ſudden Suffocation, eſpecially in Caſes where there are polypoſe Concretions of the Heart; or they are protracted for a conſiderable time, and induce a Dropſy, which proves mortal, if the Patient is ſeiz'd with a ſlow Fever, has an unequal and intermitting Pulſe, is affected with the Palſy of the Arms, a continual Palpitation of the Heart, a preternaturally ſmall Diſcharge of the Urine, and a Syncope: When theſe Symptoms appear, we may be pretty certain the Death of the Patient is not far off. Some aſthmatic Patients are cut off by a ſupervening Inflammation of the Lungs; and the more violent this Species of the Diſorder is, the more languid alſo is the Pulſe. When old Perſons are ſeiz'd with an Aſthma, the Diſorder generally accompanies them to the Grave; and that Species of Aſthma which ariſes from a Diſlocation of the Vertebræ, admits of no Cure, till theſe are reduc'd. The longer, the more frequent and violent the Paroxyſms of an Aſthma are, the greater Danger of a Suffocation is.

The CURE.

In an Aſthma, the moſt important Intentions of Cure are theſe following: Firſt, to ſooth and alleviate the ſpaſmodic Strictures of the Breaſt, and Parts ſubſervient to Reſpiration: Secondly, to derive Humours to the exterior and inferior Parts of the Body, and to procure a due and equable Circulation of them: And, thirdly, to remove the ſeveral Cauſes which ſupport the Diſorder, by Medicines adapted to their reſpective Natures. As the two firſt of theſe Intentions are principally to be anſwer'd immediately under the Paroxyſms, ſo the laſt is to be carried on in the Intervals between them.

Becauſe under the immediate Shock of the Paroxyſm the Patient is generally coſtive, and the Humours convey'd to the ſuperior Parts along with the Flatulences, no Medicines afford a more inſtantaneous Relief, than emollient and carminative Clyſters, injected twice or thrice, as the State and Condition of the Patient ſhall require. Theſe Clyſters are to be prepar'd of the Flowers of Elder, Melilot, Mullein, Piony, white Lilies, and common Chamomile, the Four carminative Seeds, and Oil of Chamomile by Infuſion, together with the Addition of a Dram or two of common Salt, or Sal Gemmæ, by way of Stimulus. Excellent Effects are alſo produced by Frictions of the Feet, which are almoſt always cold, as alſo by Immerſions of them into moderately warm Water. When the Præcordia are rack'd with violent Spaſms, we may, for removing this Symptom, with ſingular Advantage, apply to them warm Fomentations, or Bladders fill'd with warm Milk. Theſe Spaſms are alſo, ſometimes, ſucceſsfully allay'd by nervine Liniments, which I generally prepare in the following manner:

> Take of the *Aqua Anhaltina*, two Ounces; of the Spirit of Sal Ammoniac, of Earth-worms, of the Eſſence of Saffron, and of Caſtor, each two Drams; of the Oil of Nutmeg, or Mace, one Dram: Make into a Liniment, to be apply'd to the Neck, the Scapulæ, the Muſcles of the Thorax, and the Spine of the Back.

With reſpect to internal Medicines, the beſt and moſt powerful are Antiſpaſmodics, in Conjunction with mild Diaphoretics, which, by diſcuſſing the peccant Matter, and relaxing the ſpaſmodic Strictures, produce the moſt happy Effects. Of this Kind are, Mixtures of the analeptic Waters, prepar'd of the Flowers of the Lime, Piony, Primroſes, Lilies of the Valley, *Egyptian* Thorn, and Meadow-ſweet; the *Pulvis Marchionis*, native Cinnabar, the *Spiritus Nitri dulcis*, or the anodyne mineral Liquor, the *Mixtura Simplex*, and the Syrup of wild Poppies: Theſe Mixtures are to be frequently exhibited; or they may be given alternately, with proper Doſes of the anodyne Liquor, in Conjunction with the *Spiritus Bezoardicus Buſſii*, or ſuccinated Hartſhorn. Beſides, the Patient's Body is, as much as poſſible, to be kept moderately warm; nor is it proper and expedient to attempt any thing more under the immediate Attacks of the Paroxyſms.

During the Intervals of the Paroxyſm, our principal Intentions ought to be, to diſcuſs the Humours ſtagnating in the Breaſt, to reſtore their free and equable Circulation, and, at the ſame time, to remove the material and immediate Cauſes of the Diſorder. When, therefore, an Aſthma is brought on by too large a Congeſtion of the Blood in the Thorax; after checking and allaying its Ebullition, by correcting Powders and Mixtures, we are to leſſen its Quantity: This Intention is excellently anſwer'd by Veneſections in the Feet, at proper and ſtated times, eſpecially in Patients accuſtom'd to the Uſe of Wine. Scarifications may alſo, now-and-then, be uſed, in Patients habituated to them. In aſthmatic Patients, labouring under a Suppreſſion of the hemorrhoidal Diſcharge, Leeches, applied to the Veins of the Anus, are productive of very happy Effects. Mild and gentle Laxatives, for eliminating the Sordes of the *Primæ Viæ*, and promoting the Circulation of the Blood thro' the Abdomen and the *Vena Porta*, proper Exerciſe, a ſlender Regimen, and light Liquors, drank in large Quantities, are alſo to be recommended in Caſes of this Nature: And, if hypochondriacal and flatulent Symptoms appear, with ſo much the happier Succeſs are gentle Laxatives and Clyſters exhibited, in Conjunction with the Uſe of the *Elixir Viſcerale*, and a proper Regimen: But particularly in Patients, labouring under a Suppreſſion either of the Menſes, or the hæmorrhoidal Diſcharge, nothing is more beneficial than the warm *mineral Waters*, to be us'd both internally and externally; or the *Selteran Acidulæ*, which are to be drank warm'd, with an Admixture of Milk. Theſe Meaſures are, alſo, to be taken in the Cure of that Aſthma, which draws its Origin from a Polypus of the Heart.

When an Aſthma draws its Origin from the Retroceſſion or Repulſion of an arthritic, gouty, ſcabious, purpuraceous, or ulcerous Humour; that is, from the Tranſlation of an acrid, peccant, and cauſtic Serum to the nervous Parts of the Breaſt, nothing is more ſafe and expedient, than by mild and gentle Diaphoretics, which promote a free Perſpiration, to drive out the peccant Humour to the Surface of the Body, or force it back to the Parts whence it was repel'd. This Intention is excellently and ſpeedily anſwer'd by the anodyne Liquor, mix'd with the *Spiritus Bezoardicus Buſſii*; or by the bezoardic Powders, compos'd of diaphoretic Antimony, Nitre, the *Pulvis Marchionis*, prepar'd Amber, and a ſmall Quantity of Camphire. This Medicine is moſt properly and commodiouſly us'd in the Morning, drinking after it ſome Cups of an Infuſion, prepar'd, after the manner of Tea, of the Herbs Germander, and Paul's-betony; the Flowers of Elder and the Lime; the Seeds of Fennel, and the *Aniſum Stellatum* (ſee ZINGI); after which, a gentle Sweat is to be promoted. In Caſes where Scabs or Ulcers are either repel'd, or too ſoon heal'd, Preparations of Sulphur are of ſingular Service, ſince they are highly efficacious in repelling the Sordes to the Surface of the Body; for, as, in theſe Diſorders, Preparations of mineral Sulphur, externally apply'd, are highly pernicious; ſo, on the contrary, when internally exhibited, by corroborating the Tone of the Parts, they contribute not a little to the Diſſipation and Perſpiration of the heterogeneous Matter: Nor, in Caſes of this Nature, are we to neglect the Uſe of gentle Laxatives, and mild Diuretics, ſuch as the Tincture of Tartar, and ſome others of a like Nature; ſince, by theſe the groſs

groſs Sordes of the *Primæ Viæ*, and other Parts, are carried off by Urine. Waſhing the Feet is, alſo, of ſingular Service, by inviting the arthritic and gouty Matter to them.

When an Aſthma ariſes from the Repulſion of œdematous Swellings of the Feet, either by violent Diſorders of Mind, ſudden Frights, exceſſive Cold, or a febrile Paroxyſm, 'tis then no eaſy Taſk to diſcuſs the Congeſtion of viſcid Serum in the Breaſt, and recal it to the external Parts of the Body. In Caſes of this Nature, I have ſeen the following diaphoretic Powder exhibited with ſignal Succeſs:

Take of the Ceruſs of Antimony, and calcin'd Hartſhorn, each one Dram; of the *Cinnabaris Medicinalis*, two Scruples; and of the corrected Sulphur of Antimony, four Grains: Reduce all into a fine Powder; of which I generally give two Scruples for a Doſe, ordering the Patient a Draught of ſome proper Infuſion after it.

Beſides, the Feet are to be kept warm, and carefully ſubjected to Frictions, in order to relax their Spaſms, and expel the Cold. Clyſters are, alſo, to be injected, and Laxatives, tho' of the moſt mild and gentle Kind, preſcrib'd.

In a dry Aſthma, ariſing from external Cauſes drying the Bronchia and pulmonary Veſicles, ſuch as the Steams of Lead, an Atmſophere impregnated with the Exhalations of Quick Lime, or the Smoak of foſſile Coal, the ſeveral Intentions of Cure are moſt effectually anſwer'd by thoſe Medicines, which moiſten the Parts, correct the Acrimony of the Humours, and relax the Fibres; ſuch as Milk, Cream, Oil of ſweet Almonds, Emulſions, Sperma Ceti, and the Fats of Animals, us'd both internally and externally.

When ſulphureous or arſenical Steams, or the Effluvia of *Aqua fortis*, or Spirit of Vitriol, are received into the Lungs, (as it frequently happens to Miners, and ſuch as are much engaged in chymical Preparations of theſe Bodies) moſt violent aſthmatic Diſorders and Peripneumonies are thence produced; In this Caſe, the Vapour of putrid Urine, with the Salt of Tartar diſſolv'd in it, and immediately received into the Lungs, is the moſt effectual Pectoral; the acid, corroding Particles irritating the Lungs, being thereby corrected, and changed into an innocent, inactive, neutral Salt. *Barry, of a Conſumption.*

In thoſe Aſthmas, where a Dropſy of the Breaſt is already form'd, the Cure is highly dubious and uncertain: In ſuch Caſes, the only Method of Relief ſeems to be a *Paracenteſis*, or Tapping of the Thorax; an Operation, highly extol'd by ſome, particularly the celebrated *Carolus Piſo*, *Scultetus*, in *Obſ.* 31. and *Sylvius*, in his *Oper. Medic. Cap.* 50. Nor is there any Neceſſity for our declining this Operation, ſince, when perform'd by a ſkilful Hand, it is entirely free from Danger: But 'tis by ſome diſputed, whether it always affords a certain and infallible Relief. *Hippocrates*, in his ſecond Book *de Morbis*, judiciouſly adviſes, that this Operation ſhould be perform'd, before the Diſorder has made any conſiderable Progreſs, or injur'd any of the Viſcera: And, indeed, when the Viſcera happen to be injur'd, or exulcerated, I would not adviſe this Operation to be raſhly ventur'd upon; but ſo long as theſe remain in a ſound and natural State, it promiſes very conſiderable Relief. Beſides, we muſt, in Conjunction with theſe means already mentioned, uſe mild Diuretics and Laxatives, eſpecially ſuch as are ſaid to operate gradually, and without promoting a too ſenſible Evacuation; and theſe Meaſures are to be taken in the Beginning of the Diſeaſe, when 'tis, as yet, free from every Degree of febrile Exacerbation.

Before we quit this Subject, we think it expedient to ſubjoin thoſe Remedies, which *Celſus*, in the fourth Chapter of his fourth Book, recommends in a Difficulty of Breathing: "Veneſection, ſays he, unleſs contra-indicated by ſome important Circumſtance, affords Relief. Nor is this, of itſelf, ſufficient; for warm Goat's-milk is to be exhibited every Morning; and, if the Patient is not feveriſh, his Belly is to be render'd ſoluble. Extenuated Patients, when beginning to breathe more freely, are, ſometimes, to be pretty briſkly purg'd, and, ſometimes, only to have their Bodies render'd gently ſoluble. The Head is to be laid high in Bed; the Thorax is to be reliev'd with warm Fomentations and Cataplaſms, either of the moiſt or dry Kind: Beſides theſe Meaſures, the Patient is to uſe Sorbitions, and mild Aliments, ſometimes ſmall Wine, and ſometimes an Emetic: Thoſe Medicines which provoke Urine are, alſo, beneficial; but nothing is more ſo, than walking ſlowly till the Patient is moderately weary, and uſing frequent Frictions, eſpecially of the inferior Parts, either in the Sun, or before a Fire, both by one's ſelf, and by the Aſſiſtance of others, till an Eruption of Sweat is produc'd."

Cautions and Admonitions to be obſerv'd in Practice.

Acrid Purgatives, ſuch as Jalap, Gamboge, Coloquintida, Elaterium, and Spurge, as alſo draſtic Emetics, eſpecially thoſe prepar'd of Antimony, are, in this Diſorder, to be avoided with the utmoſt Care, ſince they more effectually diſpoſe the nervous Syſtem to Spaſms: But in that Species of cachectic Aſthma, where the Breaſt is full of ſerous and viſcid Humours, I generally, with great Succeſs, exhibit ſmall Quantities of emetic Tartar, in Conjunction with an Infuſion of Manna, in order to reſtore ſuch a Degree of Strength to the weaken'd Lungs, as may enable them to reſiſt the ſtagnant Juices. In Caſes of this Nature, well-corrected Sulphur of Antimony is, alſo, highly beneficial: Squills, in like manner, cautiouſly exhibited, are, in this Diſorder highly extol'd, as productive of the happieſt Effects, both by their inciding and reſolvent Virtues. See an Account of the *Kermes Mineral*, under the Article ANTIMONIUM.

It is a common, but a monſtrous and pernicious Piece of Practice, to attempt the Removal of thoſe œdematous Swellings, which frequently accompany an Aſthma, by means of draſtic Purgatives; ſince nothing elſe can be expected from ſuch a Method, but that the Patient ſhould fall a more early Victim, than he would have otherwiſe done. Repelling Plaiſters, and ſuch as dry up and conſolidate Ulcers of the Legs, are alſo highly injurious in aſthmatic Caſes. Nor are the Laconic Baths, with Spirit of Wine, always to be us'd with Safety; becauſe they dry the Body too much, and repel the Tumors. But we may at once, with more Safety and Benefit, uſe dry Fomentations, and diſcutient Bags; exhibiting, at the ſame time, internally, Diaphoretics mix'd with Antiſpaſmodics. Diuretics may alſo be ſafely and advantageouſly us'd, and pretty acrid Clyſters injected.

Veneſection ought never to be inſtituted during the Paroxyſm of an Aſthma, ſince, by that means, the Diſorder becomes worſe, and more obſtinate; nor in the Intervals of the Paroxyſms will it be of any Advantage, except in that Species of Aſthma which ariſes either from a Redundance, or preternatural Thickneſs, of the Blood, in Conjunction with a Polypus of the Heart; or from a Suppreſſion of accuſtomed Evacuations of Blood: In which Caſes, Veneſection about the Equinoxes, with a prophylactic Intention, is highly expedient. But 'tis to be obſerv'd, that a Clyſter, in order to diſpel the Flatulencies, and render the Body ſoluble, is always, with great Advantage, injected before Veneſection.

Hot mineral Waters, eſpecially in the Beginning of the Diſeaſe, as alſo the *Acidulæ*, which ought to be uſed warm, are of ſingular Advantage, both for the Prevention and Cure of this Diſorder; eſpecially when ariſing from a ſcorbutic Cacochymy, an Infarction of the Viſcera, or a Suppreſſion of critical Evacuations of Blood. On the contrary, when the Diſeaſe is become inveterate, when polypoſe Concretions are already form'd in the Heart, or when a Dropſy of the Breaſt is brought on, the Drinking of theſe accelerates the Death of the Patient, as I have found in various Inſtances; for, in Patients of this Kind, we find at once a ſurpriſing Relaxation of the Solids, and Obſtructions of the Viſcera; for which Reaſon, theſe mineral Waters cannot paſs duly through the Emunctories, but, ſtagnating in different Places, not only increaſe the extravaſated Serum in the Breaſt, but alſo produce new Tumors or Swellings in various Parts.

Greater Dependence is juſtly to be had on the external Uſe of hot Baths, eſpecially of ſuch as are not of an aſtringent, calcareous, and chalybeate Quality, but rather of thoſe whoſe Waters are ſubtile, light, and impregnated with a certain alcaline Salt. In Caſes of this Nature, I have ſeen very happy Effects produc'd by the Waters of *Toeplitz* and *Piperen*, ſince, by their relaxing and emollient Virtues, they ſurpriſingly ſoften and ſolace the rigid Fibres, and, at the ſame time, render Perſpiration more free and copious. But in Caſes where polypoſe Concretions, or extravaſated Waters, are ſuſpected, theſe are by no means to be uſed. It is alſo to be obſerv'd, that Baths are of far more Efficacy for the Prevention, than for the Cure, of Aſthmas.

In a cachectic State, accompany'd with an Aſthma, Diuretics are found to be highly beneficial: Thus *Johannes Rhodius*, in *Lib.* 3. *Obſervat.* 27. aſſures us, that an Aſthma of this Kind was cur'd in twenty-four Hours, by an Evacuation of thirty-ſeven Pints of Urine. With reſpect to Diuretics, *Baglivi*, in his Obſervations, has the following Words: "I have often obſerv'd, that in Diſeaſes of the Breaſt, Nature herſelf indicates the Propriety of conveying the peccant Matter to the urinary Paſſages; for 'tis obvious, that there is a ſenſible and manifeſt Conſent between the Legs, the Pudenda, and the Breaſt. But Diuretics, prepar'd of lixivial and acid Salts, are not ſafe in Diſeaſes of the Breaſt, becauſe they excite Coughs, and exaſperate the Diſorder." On the contrary, Powder of Millepedes, Preparations of Turpentine, moderately ſpirituous, but ſufficiently alcaliz'd, Eſſence of Amber, Balſam of the Sulphur of Antimony, Decoctions of the aperient Roots, and *Fernelius's Syrup of Marſhmallows*, powerfully provoke Urine, whilſt, at the ſame time, they are not in the leaſt injurious to the tender Membranes of the Lungs.

In ſpaſmodic Aſthmas, accompany'd with Cardialgias, as alſo in thoſe ariſing from Strictures of the Diaphragm, I have often obſerv'd, that demulcent and anodyne Liniments, pre-

par'd of the recent Fats of Animals, the Fat of a Capon ſubtiliz'd by the Heat of the Sun, and the *Emplaſtrum Barbetianum*, enrich'd with Soap and Camphire, are far more effectual than hot and ſpirituous Subſtances.

In the Prevention, as well as in the Cure, of an Aſthma, the Force and Efficacy of other Medicines is excellently aſſiſted by the Air; which, the more pure, fine, and ſerene it is, the greater Relief it affords the Patient. Every one knows, that this Diſorder is remarkably increas'd only by a Change of the Weather. The Antients, in this, as well as in other Diſeaſes, accounted the Air a Circumſtance of the laſt Moment and Importance. Thus *Cœlius Aurelianus*, *Chronic. L.* 3. *C.* 1. informs us, "That in caſe of Stricture, 'tis expedient the "Patients ſhould be lodg'd in a Place moderately light and "warm; that they ſhould uſe Abſtinence till the third Day, "and be kept in a State of Reſt both with reſpect to Body "and Mind; applying, at the ſame time, to the Neck and "Thorax, fine ſoft Wool, ſoak'd in ſweet warm Oil."

In order to corroborate the nervous Parts of the Breaſt, and prevent Aſthmas, beſides the drinking cold, but pure and light Water, nothing is more beneficial than the Country Air, which *Baglivi* recommends in the following Words: "In "inveterate Aſthmas, whether of the humoral or convulſive "Kind, I order the Patient to retire to the Country Air, and "to frequent Fields under Tillage. He ought, therefore, to "follow the Labourer, walk in the Furrow, and draw in "the nitrous, ſaline, and ſulphureous Exhalations, ariſing "from the freſh-turn'd Glebes of Earth. The Tone of the "Lungs, weaken'd by a long-protracted Diſeaſe, is, by "the nitrous and ſaline Subſtance of the central Heat of "the Earth, corroborated, ſtrengthen'd, and reſtor'd; by "which means the Circulation of the Blood is freely carried on "through the minute Veſſels of the Lungs, and the Diſeaſe "remov'd."

Both in the Relief and Cure of an Aſthma, it is a Circumſtance of great Moment, what Kind of Liquor the Patient drinks. All Ales, and eſpecially that prepar'd of Wheat, are in this Caſe to be condemn'd. As rich and generous Wine creates an Ebullition of the Blood, it muſt of courſe increaſe the Congeſtion of the Humours, the Oppreſſion of the Breaſt, and the Difficulty of Breathing; eſpecially in Patients of a plethoric Habit. As Wine of an aqueous Nature, ſuch as that produc'd on the Banks of the *Moſelle* and *Neckar*, when recent, is ill calculated for corroborating the Fibres of the Stomach, and, conſequently, for promoting Digeſtion; ſo it produces Flatulences, eſpecially in hypochondriacal Patients. In aſthmatic Caſes, the moſt proper Liquor I have hitherto found, is old *Rheniſh* Wine, mix'd with three or four Parts of pure Spring-water, or of the *Selteran* Waters. Beſides, Infuſions, by way of Tea, prepar'd of Hyſſop, Paul's-betony, Garden Crowfoot, Ground-ivy, Liquorice-root, the Tragus [*Sea-grape*], and the Flowers of the Daiſy, are highly beneficial in all Aſthmas, from whatever Cauſe they may ariſe.

Such Subſtances as are too ſweet, or prepar'd with Sugar or Honey, are in every Species of Aſthma, but more eſpecially thoſe of the ſerous and hypochondriacal Kind, to be carefully abſtain'd from; ſince, by injuring the Tone of the Stomach, they deſtroy Digeſtion, and, by that means, lay a Foundation for the Generation of Flatulences. *Frederic Hoffman.*

Other Authors mention ſome Things omitted by *Hoffman* in the preceding Treatiſe, and differ widely from him in many Circumſtances, relative to the Method of Cure. Thus, in that Species of Aſthma which is call'd *Idiopathic*, and which is a difficult Reſpiration, ariſing either from ſome Imperfection of the Lungs, or ſomething of a noxious and peccant Quality contain'd in them, the celebrated *Pitcairn* orders the following Meaſures to be taken.

If the Aſthma is highly dangerous, that is, if the Difficulty of Breathing is ſo great, that the Patient runs a Riſque of being ſuffocated before Purgatives can be exhibited, and produce the deſign'd Effects, a Vein is always to be open'd; becauſe Veneſection never fails to leſſen the Paroxyſm, relieve the Patient, and afford a due Time for providing and exhibiting other Remedies. If a ſudden Rarefaction of the Blood, or a Plethora, under which Word I comprehend a Suppreſſion of any accuſtom'd Evacuation of Blood, ſhould either produce or accompany an Aſthma of this Kind, 'tis abſolutely neceſſary the Patient ſhould be blooded; ſince, in this Caſe, Veneſection removes the Diſorder.

In all Caſes where this Diſorder is neither produc'd nor accompany'd by a Plethora, a Vomit muſt always be exhibited at the Beginning; ſince, by the Concuſſion of the Body, it derives the peccant Matter from the Lungs; as it does in a ſenſible Manner from the Glands of the Eyes, the Noſtrils, and Fauces. Nor is a Vomit to be only once exhibited, but frequently repeated, till the deſign'd Effect is produc'd.

Though, on account of my long Experience of the Virtues of antimonial Preparations, I prefer them to all other Emetics; yet, in this Caſe, I recommend between a Dram, and half an Ounce, or a whole Ounce, of Tobacco-leaves, boil'd in ſix Ounces of ſpring-water, till the Liquor is reduc'd to four. This Liquor, when expreſs'd, ſtrain'd, and edulcorated with Sugar, is a highly beneficial Vomit. Half of the Decoction may be taken at firſt; after which, the Patient is to wait till he vomits; but, if it ſhould not produce this Effect, he is to take the other Half, drinking, at the ſame time, either warm Water, ſmall Beer, or Beer Poſſet-drink.

If after the Vomit, or even when that Circumſtance has been neglected, the Strength of the Patient ſhould be found low and impair'd, a Purgative of the Juice of common Orrice-root, or that of the Dwarf-elder, is to be exhibited in the Interval of the Paroxyſms; or the following Pills, with a proper Addition of *Mercurius Dulcis*, may, with great Advantage, be us'd:

Take of Gum-ammoniac, Diagrydium, and Reſin of Jalap, each half a Scruple; of the volatile Salt of Amber, five Grains; and of Elixir Proprietatis, a Quantity ſufficient for forming a Maſs of Pills to be taken for one Doſe.

Once every Day, on which the Patient is not purg'd, or at leaſt when the Courſe of Purging is at an End, we muſt exhibit alternately the Juice or Infuſion of twenty-five or thirty live Millepedes in four Ounces of *Spaniſh* or *Rheniſh* Wine, or one Scruple of Gum Ammoniac, diſſolv'd in two Ounces of warm Penyroyal-water.

But to theſe I prefer half a Dram of Sperma-ceti, exhibited in warm Wine or Ale; for this Medicine is of ſo great Efficacy in preventing the Paroxyſm, that, next to Veneſection, it deſerves the higheſt Encomiums; and, in weak Conſtitutions, is even to be prefer'd to it. Next to this, I eſteem the expreſs'd Juice, or an Infuſion of Millepedes; then Gum Ammoniac, diſſolv'd in *Aqua Vitæ*, or any ſpirituous Water: The next in Efficacy are, the Flowers of Benzoin, any volatile Salt, either diſſolv'd or dry, and the Powder of Millepedes. All theſe Medicines are proper during the Paroxyſm.

Great Advantage is alſo perceiv'd from a Decoction of the Wood and Bark of Guaiacum and Saſſafras, or of the Root of the greater Burdock, in Spring-water. Nor is any Medicine more effectual than Ale, impregnated with Millepedes; ten or more of which, taken alive, and gently bruiſed, and bound up in a Cloth, are to be allow'd for each Pint of fermenting Ale. This Liquor is to be uſed as the Patient's ordinary Drink; or let a ſufficient Quantity of the following Tincture be exhibited:

Take of *Spaniſh* Wine, one Pint; of the Flowers of Sulphur, two Drams; and of the volatile Salts of Hartſhorn and Amber, each two Scruples: Let them ſtand in Digeſtion for four Days. This was the Secret of the celebrated *Willis*.

Sir *John Floyer* was afflicted with an Aſthma from the ſeventeenth Year of his Age to the Time of his Death, which happen'd when he was conſiderably above fourſcore. As he had read more than moſt Gentlemen of his Profeſſion, his own Diſorder, and others which he attended, afforded him infinite Opportunities of comparing the Phænomena of this Diſeaſe, with what he found in Authors; and, as he has taken notice of many Circumſtances relative to Practice, I ſhould adviſe the Reader to conſult his Book on an Aſthma, which is too long to be inſerted in this Place.

DYSRACHITIS, δυσραχίτις. The Name of a Plaiſter deſcrib'd in *Galen*'s Treatiſe *de Comp. Medic. per Genera*, *Lib.* 5. *Cap.* 3. and recommended for Fiſtulas and callous Sinuſes.

DYSTHANATOS, δυσθάνατος· from δύς, importing Difficulty; and θάνατος, Death. This Adjective is apply'd to any thing which either induces or prognoſticates a laborious and painful Death; or it is apply'd to a Perſon who dies a lingering or painful Death.

DYSTHERAPEUTOS, δυσθεράπευτος· from δύς, importing Difficulty; and θεραπεύω, to heal. Difficult to heal.

DYSTHESIA, δυσθεσία· from δυσθέω, to be uneaſy; Moroſeneſs, or Impatience, under Diſtempers.

DYSTHRAUSTOS, δύσθραυστος· from δύς, importing Difficulty; and θραύω, to break; not eaſily broken.

DYSTHYMIA, from δύς, importing Uneaſineſs; and θυμός, the Mind; Anxiety, Deſpondence, or Dejection of Mind.

DYSTOCHIA, from δύς, importing Difficulty; and τίκτω, to bring forth Young; difficult Labour, or Child-birth. See PARTUS.

DYSTŒCHIASIS, δυστοιχίασις· from δύς, importing bad; and στοῖχος, Order; an irregular Diſpoſition of the Hairs in the Eye-lids. *Caſtellus* from *Foreſtus*.

DYSTROS, δύστρος· The *Macedonian* Name for the Month of *March*. It occurs in *Aetius*, *Tetrabib.* 1. *Serm.* 3. *C.* 164.

DYSURIA, δυσουρία· from δύς, importing painful; and οὖρον, Urine: It implies a rendering of the Urine with a Senſation of Heat

Heat and Pain: It is diſtinguiſhed from a Strangury, as, in the laſt, the Urine is voided by only a Drop, as it were, at a time, but, however, with Pain; and from an Iſchury, as in this Diſorder there is an almoſt total Suppreſſion of Urine. A Dyſury conſtantly attends a virulent *Gonorrhœa*, accompanies many other Diſtempers, as a Symptom; and is frequently excited by very acrimonious Medicines, and the external Application of Cantharides. In a Dyſury, emollient and mucilaginous Medicines, as Gum Arabic diſſolv'd in Barley-water, Emulſions, and Decoctions, with an Addition of Nitre, copious Draughts of diluting Fluids, and Camphire, are uſually preſcrib'd.

See the Article CALCULUS; where the various Cauſes of Dyſuries are more fully treated of.

E.

E. The antient *Greeks*, as we are told by *Galen*, *Com.* 3. *in* 6. *Epid. T.* 40. had but one Character, which was H, to expreſs their *Epſilon* and *Eta*, or *e* ſhort, and *e* long: He makes the ſame Obſervation on the O, *Omicron*, and Ω, *Omega*, which were formerly, he ſays, expreſs'd alſo by one Character. And this Multiplication of Letters, he obſerves, has been the Occaſion of Multitudes of Errors in Tranſcribers, by making Permutations of the Letters, contrary to the Senſe of Authors.

For the Signification of E in the chymical Alphabet, ſee ALPHABETUM.

EBEL. The Seed of Sage, or of Juniper. *Rulandus.*

EBENUS ÆTHIOPICA, Offic. *Palma Haira*, Park. Theat. 1667. *Palma Americana ſpinoſa*, C. B. Pin. 507. Raii Hiſt. 2. 1363. Pluk. Almag. 277. Phytog. 103. *Palma tota ſpinoſa major, fructu pruniformi*, Cat. Jam. 177. Sloan. Hiſt. 2. 119. *Palma Braſilienſis ſexea Airi*, Piſ. (ed. 1658.) 129. *Palma Partoricenſis, ſpinoſiſſima, vinifera*, Hort. Beaum. 32. *Palma facie Haira*, J. B. 1. 393. *Palma Americana Haira ſive Ayri*, Jonſ. Dendr. 144. THE MACOW OR EBONY-TREE.

It grows in *America*: Its Wood, which is black, and of a very denſe and ſolid Subſtance, is us'd. *Plukenet*, deſcribing the Tree, ſays, that its Wood is like black Marble, and ſinks in Water like Iron.

There are two Species of Ebony in Uſe among Mechanics; but whether either of them be the true and genuine Ebony of the Antients, remains a Controverſy. *Dioſcorides* deſcribes two Species: "The firſt, he ſays, is brought from *Ethiopia*, "is black, and has no Veins interſpers'd; is ſmooth like po- "liſh'd Horn: When broken, appears of a denſe and cloſe "Subſtance; and has a pungent Taſte, with an Aſtringency. "The other Sort comes from *India*, is interſpers'd with white "and yellow Lines, and ſpotted; but the firſt Species is the "beſt." *Pliny*, in his Deſcription of it, ſays, "It was a "rare Tree, and grew in the Country between *Siene*, the "Limit of the Empire in *Egypt*, and *Meroe* in *Ethiopia*, "which produced no other Trees, but thoſe of the Palm- "kind. *Fabianus* ſays that it will not flame, but will, how- "ever, burn; during which, it emits a pleaſant Smell. There "are two Species: The rare Ebony, which is the beſt, grows "to a Tree, whoſe Trunk is without Joints; the Wood "black and ſhining, and very pleaſant to the Sight, in its "native Beauty; the other Species is a Shrub, reſembling the "Cytiſus, and grows in all Parts of *India*."

Ebenus Offic. C. B. Pin. 448. J. B. 1. 394. Jonſ. Dendr. 423. Raii Hiſtor. 2. 1805. *Ebenum ſive Lignum Indicum*, Camel. Syll. 64. EBONY.

I take this Tree, ſays *Dale*, with *Camellus*, to be the true *Indian* Ebony of the Antients: It is a bacciferous or Berry-bearing Tree, with Leaves of the Size of thoſe of the Walnut-tree. *Camellus* makes ſeven Species of Ebony, the firſt of which is the *Ebenus Æthiopica*, laſt deſcribed under that Title.

The Part in Uſe is the Heart, or medullary Subſtance, of the Wood, which is black, and extremely hard. Ebony, by all the Antients, was accounted good for the Eyes. The Powder of it, ſays *Pliny*, is reported to be a Specific for the Eyes; and the Wood, triturated with Paſſum, to cure Dimneſs of Sight. *Zacutus Luſit.* ſays it is of Service in flatulent Convulſions. Ebony, as *Dioſcorides* ſays, has an exterſive Virtue in cleanſing the Pupil of the Eye, from whatever darkens the Sight; and is good for inveterate Rheums and Puſtules in the Eyes: If it be uſed inſtead of a Stone in Triturations for preparing of Collyria, theſe Medicines will have the better Effect. An excellent Ingredient in Collyria is prepar'd of the Duſt or Shavings of Ebony, macerated a Day and a Night in *Chian* Wine, and then carefully triturated: Some, after Trituration, paſs it through a Sierce, and ſo uſe it; and ſome again put Water inſtead of Wine. They burn it, alſo, in a crude, or unbak'd, earthen Pot, till it be reduced to Coals, and waſh it in the manner of burnt Lead: Thus prepared, it is effectual in dry and ſcurfy Ophthalmies. *Dioſcorides, Lib.* 1. *Cap.* 129.

Another Species of the Ebony is the

Alcea arbor Populnea fronde, tota argentea, quinque capſularis, ſeu Ebenus, viridis ex Inſula S. Helenæ, ubi ab Anglis illic degentibus, BLACK-WOOD AND EBONY, *i. e. Lignum Nigrum, & Ebenus nominatur*, Raii Hiſt. 3. 520.

Mr. *Ray* was of Opinion, that this is the genuine Ebony of the *Indians*. It is diſputed, at preſent, what was the Ebony of the Antients; ſome taking it for a Species of Palm-tree, others of Guaiacum, others of Cytiſus: But there are two Species of Wood found in the Shops of Joiners, and other Mechanics; one imported from the *Eaſt Indies*, as *Helbigius* obſerves, which is that here meant; the other is of a ſiliquous or Pod-bearing Tree of *America*, as we are informed by that very learned Botaniſt Sir *Hans Sloane*; which being of no Uſe in Medicine, we ſhall ſay no more concerning it. *Dale.*

EBISCUS. A Name for the ALTHÆA, which ſee. *Blancard.*

EBRIECATUM. A Term us'd by *Paracelſus*, to expreſs the partial Loſs or Depravation of Reaſon, as it happens during Drunkenneſs.

Ebriecatum Cæleſte, in the ſame Author, ſeems to import ſuch a divine Enthuſiaſm, or Inſpiration, as the *Sibyls* among the Antients boaſted of, and, among the Moderns, the *French* Prophets, and many other religious Sects. *Paracelſus* himſelf, as it ſhould ſeem, pretended to be under ſome ſuch Influence. But it is paying Heaven a very indifferent Compliment, to attribute unintelligible Nonſenſe, ſuch as a Perſon utters when drunk or mad, to divine Inſpiration.

EBRIETAS, Drunkenneſs.

Among the Aphoriſms of *Hippocrates*, there is one, 5 *Aph.* 5. which reſpects Ebriety, and is thus expreſs'd: "If a drunken "Perſon loſe his Voice on a ſudden, he dies in Convulſions, "unleſs a Fever ſeizes him, or his Voice returns at the going "off of the drunken Fit." Here *Galen* obſerves, "that it "is uſual with *Hippocrates* to call thoſe who labour under a "*Carus*, by the Name of *Κωφοι*, "mute, or depriv'd of "Voice." But a *Carus*, *Galen* ſays, is a ſudden Inſenſibility and Immobility of the whole Body; which Diſpoſition "is, by *Hippocrates*, uſually denominated from one of its "moſt remarkable Symptoms. He names no particular Time "for the Solution of the drunken Diſorder, becauſe none can "be aſſign'd, ſince all are not circumſcribed by the ſame "Meaſure: Some recover their Senſes the next Day, others "the Night following, and ſome not till the third Day, in "proportion to the Quantity and Strength of the Wine "(*Liquor*), and the Nature of the Perſon who drinks it; for "as the ſame Meats require different Times for Digeſtion in "different Bodies, ſo it is with Drink. We ought, there- "fore, to be perfectly acquainted with the Nature of the "Perſon, or obſerve the Time when he comes to himſelf; "and if, at that Term, he is free from a Fever, and has not "recover'd his Speech, he will die in Convulſions."

Though Sleep, ſays *Proſper Alpinus*, in Drunkenneſs, as ſome are of Opinion, can neither be abſolutely approv'd, nor condemn'd, yet we have known ſeveral drunken Perſons, who, after continuing a Day and a Night in a profound Sleep, never more revived. *Proſper Alpinus de Præſag. Vit. & Mort.*

See ALCOHOL.

EBRON,

EBRON, Paradiſe, in the Phraſe of *Paracelſus*; that is, the Place inhabited by our firſt Parents.

EBSEMECH. *Langius*, in his *Harmonia Chymica*, uſes this Word to expreſs Quickſilver, ſublim'd from *Cambar*, perhaps meaning *Cinnabar*.

EBULLITIO, Ebullition. This is, properly, a violent Degree of Boiling, till the Liquor bubbles. But the Chymiſts apply it, analogically, to the Bubbling of any Fluid during Effervescence or Fermentation.

EBULUS. A Name for the *Sambucus Humilis*, Dwarf Elder. See SAMBUCUS.

EBUR, Ivory. See ELEPHAS.

ECAPATLI. A Name for the *Senna Orientalis*; *fruticoſa*; *Saphera dicta*.

ECBOLICA, from ἐκβάλλω, to caſt out. Forcing Medicines, which forward Delivery; or Medicines which cauſe Abortion.

ECBRASMATA, ἐκβεβρασμένα· from ἐκβράσσω, to caſt out, as the Sea does the Wreck of a Ship; or from βράζω, to be very hot. Fiery Puſtules breaking out on the Surface of the Body. *Galen. Paulus Ægineta. Virgil* calls theſe *Ardentes Papulæ*, *Georg.* 3. *V.* 564. and repreſents them as the Effects of wearing Cloths made of the Wool of Sheep, that dy'd of a Murrain he there deſcribes.

ECBYRSOMATA, ἐκβυρσώματα· from βύρσα, a Skin. Eminences or Protuberances of the Bones at the Joints, which appear thro' the Skin. *Galen.*

ECCATHARTICA, from καθαίρω, to purge. According to *Gorræus*, Eccathartics are Remedies, which, apply'd to the Skin, open the Pores: But, in general, they are underſtood to be Deobſtruents; but ſometimes imply expectorating Medicines; and, at others, ſimply, Purgatives.

ECCHYLOMA, ἐκχύλωμα· from χυλὸς, Juice. An Extract. *Ecchyloſis* implies Extraction, or the making an Extract.

ECCHYMATA, ἐκχύματα· from ἐκχύω, to pour out. The ſame as ECBRASMATA.

ECCHYMOSIS, or ECCHYMOMA, ἐκχύμωσις, or ἐκχύμωμα· from ἐκχύω, to pour out; or, perhaps, from ἐκ, without; and χυμὸς, Juice, or Humour. A Diſorder of the ſuperficial Parts of the Body, which happens, when by a Contuſion the capillary Veſſels are broken, and their contain'd Fluids extravaſated; which, ſtagnating, change the natural Colour of the Part, to brown, livid, or black. The Ætiology of an *Ecchymoſis*, and its Diſtinction from a Sugillation, is ſpecify'd under the Article CONTUSA, which ſee.

ECCLISIS, ἔκκλισις· from ἐκκλίνω, to bend, or turn aſide. In *Hippocrates*, *Lib. de Articulis*, it imports a Receſſion of a Bone from its proper Situation; that is, A Luxation.

ECCOPE, ἐκκοπὴ· from κόπτω, to cut; *Exciſion*, or Cutting out; properly of a Bone in a fractur'd Skull. *Galen.*

ECCOPEUS, ἐκκοπεὺς· of the ſame Derivation with the preceding Word. A chirurgical Inſtrument us'd by the Antients for the ſame Purpoſes, as the modern Surgeons employ a Lenticular, or Raſpatory. It was a Knife for cutting out Bones, particularly of the Head; and for raſping or ſcraping down morbid Eminences.

ECCOPROTICA; from κόπρος, Dung. Mild Cathartics, whoſe Operation extends no farther than the inteſtinal Tube, and whoſe Contents only they evacuate.

ECCRINOLOGICA; from ἐκκρίνω, to ſecrete, or ſeparate: That Part of Medicine which relates to the Doctrine of Excretions, or the Diſcharge of Excrements out of the Body.

ECCRISIS, ἔκκρισις. An Excretion of excrementitious or morbid Matter, by any of the Emunctories, as it happens in a perfect *Criſis*. The Matter, thus excreted, is, alſo, ſometimes call'd by that Name.

ECDORA, ἐκδορά· from δέρω, to excoriate; Excoriation in general; and, particularly, of the Urethra, in *P. Ammannus*.

ECDORIOS, ἐκδόριος· of the ſame Derivation as the preceding Word. An Epithet for cauſtic or eſcharotic Medicines, which have the Power of excoriating the Parts, to which they are apply'd.

ECHECOLLON, ἐχέκολλον· from κόλλα, Glue. A glutinous, tenacious, and adheſive Topic, or external Medicine.

ECHEL. The Sun. *Laurentius Ventura*, *de Ratione conficiendi Lap. Philoſoph.*

ECHELION, ἐχέλιον. The Name of a certain Plant. The Word occurs in *Nicolaus Myrepſus*, *Sect.* 8. *C.* 56. But it is not known what Plant he means, unleſs it be, as *Fuchſius* conjectures, the *Echium*.

ECHINEIS, ἐχινηὶς. The Fiſh call'd REMORA, or Sea-Lampry. See REMORA.

ECHETROSIS, ἐχέτρωσις. The Name by which *Hippocrates* calls the white Bryony, in his Treatiſe *de Natura Muliebri*, and in the firſt Book *de Morbis Mulierum*.

ECHIDNA, ἔχιδνα. The Viper. See VIPERA.

ECHINIDES, ἐχινίδες in *Hippocrates*, ſeem to be a ſmall Kind of Sea-hedghogs; of which he makes frequent Uſe in his Treatiſes on the Nature and Diſeaſes of Women; or elſe Sea-thiſtles, call'd by him (*Lib.* περὶ γυναικ. φυσ.) τελχῖνες περὶ ἐφθαλάσσιοι; and much us'd in Purgations of the Womb. The ſame in *Athenæus* are called ἐχῖνοι, and ἐχινόδοντες, from their being thick-ſet with Prickles, like the *Echinus*, or Hedghog. This Water-thiſtle is of a cold and aſtringent Quality, and, therefore, effectual in Inflammations and Defluxions, *Galen. Lib.* 8. *Simpl. Med.* The ἐχῖνος is, alſo, an Herb, *Lib.* 6. *Med. Simpl.* called, alſo, ἐχινος· and, by the *Latins*, *Ocymum aquaticum*; whoſe Fruit is a Repellent, and a Drier, and, conſequently, accommodated to Defluxions. The Body of the Sea, as well as the Land Echinus, is of an extenſive and digeſtive Quality. *Cornarius*, for ἐχινίδες, in *Hippocrates*, reads κνίδες, and expounds it of the Fruit of the Lentiſk-tree. *Calvus* renders it, *Quernos erinaceos*, "Oaken Hedghogs;" perhaps becauſe ἐχῖνοι, in *Heſychius*, are ſaid to be δρυῶν οἱ κύπελλοι, "the Cups of Acorns." So in *Lib.* περὶ γυναικ. φυσ. for ἐχῖνοι *Cornarius* read κῖνοι, "(the Leaves) of the Lentiſk-"tree:" ἐχῖνος in *Heſychius*, is alſo the Fruit of the Plane-tree, and a Kind of Pomegranate: ἐχῖνος, alſo, in *Hippocrates* ſignifies a great wide-mouth'd Pot. There are ſeveral other Significations of the Word in Grammarians, which would be ſuperfluous in this Place.

ECHINATE SEEDS; of *Echinus*, a Hedghog; ſuch Seeds of Plants as are prickly and rough.

ECHINOMELOCACTOS. A Name for the *Melocactos Indiæ Occidentalis*; and for the *Melocactos*; *Americana*; *minor*.

ECHINOPHTHALMIA; from ἐχῖνος, a Hedghog; and ὀφθαλμία, an Inflammation of the Eye. An Inflammation of thoſe Parts of the Eye-lids, which are beſet with Hairs.

ECHINOPHORA.

The Characters are;

The Calyx conſiſts of one quinquefid ſtellated Leaf, including the Pedicle of the Umbella: The Fruit conſiſts of one echinated or prickly Capſula, containing one long Seed.

Boerhaave mentions but one Species of this Plant; which is,

Echinophora; Paſtinacæ folio. *T.* 656. *Paſtinaca*, *Echinophora*, *Apula*, *& ſcandix*. Col. 1. 101. *Paſtinaca*, *ſylveſtris*, *anguſtifolia*, *fructu echinato*. C. B. P. 151. ECHINOPHORA WITH A PARSNIP-LEAF.

Boerh. Ind. alt. Vol. 1. *p.* 64.

I don't find any medicinal Virtues attributed to this Plant.

ECHINOPODA *Cretenſibus*. J. B. *Echinopoda frutex Creticus*. Park. *Geniſta-ſpartium ſpinoſum Aphyllon alterum*, *tribus aculeis ſemper junctis*, *floribus luteis*, C. B. *An Scorpius ſecundus*, Cluſii?

This ſmall thorny Buſh grows up with many thorny green Sprigs and Branches, ſet cloſe together, having always three Prickles, or Thorns, growing together; and is ſeldom ſeen to have any Leaves there, becauſe they fall away ſo quickly (*Alpinus* ſaith it never beareth any). The Flowers hereof grow at the Tops of the Branches in great Plenty, (but *Alpinus* denies it, and ſays, it bears but very few) are yellow, whereof the Bees never taſte, ſtanding in whitiſh-green Huſks, a little hoary all over, and theſe are ſucceeded by ſmall Pods, with very ſmall Seeds in them. This is very tender to keep, not enduring any cold Place, Summer or Winter.

It not only grows in *Crete*, but in the Iſland of *Chios*, and all over *Greece*.

ECHINOPUS.

The Characters are;

It has the Appearance of a Thiſtle; the Leaves grow in alternate Order: The Floſcules conſiſt of one ſmall fiſtulous Leaf, divided into five Segments, which are rolled outwards; theſe grow on the Top of the Ovary, within its downy Crown; and are collected into one ſpherical, echinated, or prickly Head, without a common Calyx, or Crown, to ſurround them. The Ovary ariſes out of a Calyx, conſiſting of many ſmall ſcaly Leaves, and is of a cylindrical Form, adorned with a downy Crown. All theſe Parts being cloſely and denſely compacted, adhere to an Axis, ſo as to form one ſpherical Head.

Boerhaave takes notice of five different Species of this Plant:

1. Echinopus; major, *J. B.* 3. 69. *Tourn. Inſt.* 463. *Boerh. Ind. A.* 135. *Crocodilion*, Offic. *Echinopus*, Chab. 351. *Scabioſa Cardui folio*, *Sphærocephala elatior*, Herm. Cat. 539. *Carduus globoſus*, Ger. 990. Emac. 1151. *Carduus Sphærocephalus latifolius vulgaris*, C. B. 381. Raii Hiſt. 1. 383. Hiſt. Oxon. 3. 163. *Carduus Sphærocephalus ſive globoſus major*, Park. Parad. 332. GLOBE-THISTLE.

This Plant is cultivated in Gardens, and flowers in Summer. The Parts us'd in Medicine are the Root and Seed. The Root, drank, excites a copious Hæmorrhage at the Noſe, and is given with good Succeſs in Diſorders of the Spleen. The Seeds provoke Urine. *Dioſcorides*.

Crocodilion

Crocodilion is deſcrib'd by *Dioſcorides* "as having the Ap- "pearance of the black Chamæleon, to grow in Woods, to "have a long, ſmooth, and ſomewhat broad Root, and an "acrimonious Smell, like *Naſturtium*." But what is the Plant here meant, though there be ſeveral in Botanic Writers call'd by that Name, is not eaſy to determine. Some will have it to be the *Carline Thiſtle*, others *Eryngo*; who are both confuted by *Matthiolus*, whoſe Reaſons are here omitted for the ſake of Brevity. *Andreas Lucana*, the Authors of the *Adverſaria*, and *Lobel*, in his *Obſervations*, give the Name of *Crocodilion* to the Plant here exhibited; to whoſe Authority, ſays *Dale*, at preſent, I ſubmit my Opinion, becauſe it ſeems beſt to agree with the Deſcription above given. *Dale*.

2. Echinopus; major; humilior; floribus albidis, *Flor.* 2. 57. *Carduus, Sphærocephalus, latifolius, vulgaris, flore albo*, C. B. P. 381. Var. GREATER DWARF GLOBE-THISTLE, WITH WHITISH FLOWERS.

3. Echinopus; major; flore candido, ſtaminibus in medio cœruleis, *T.* 463. *Carduus, Sphærocephalus, latifolius, vulgaris, flore ſtaminibus in medio cœruleis*, C. B. P. 381. Var.

4. Echinopus; folio acanthi aculeati tenuiter laciniato; flore albo, *Boerh. Ind. A.* 135. *Spina alba*, Offic. *Spina alba quibuſdam capite echinato*, J. B. 3. 71. *Acantha Caucas ſive Spina alba*, Chab. 351. *Carduus globoſus acutus*, Ger. Emac. 1151. *Carduus Sphærocephalus acutus minor*, Park. 977. *Carduus Sphærocephalus capitulo longis ſpinis armato*, C. B. 382. Hiſt. Oxon. 3. 163. Raii Hiſt. 1. 383. *Echinopus Creticus capite magno aculeato*, T. Coroll. 34. *Scabioſa acanthoides conglobato capite longis ſpinis munito*, Pluk. Almag. 333. PRICKLY GLOBE-THISTLE. *Dale*.

This Plant is cultivated with us in the Gardens of the Curious, and flowers in Summer. The Root and Seed are uſed in Medicine; the Root is effectual in the Cœliac Paſſion, provokes Urine, and in a Decoction cures the Tooth-ach; the Seeds help Convulſions in Infants, and the Bites of Serpents. *Dioſcorides*.

The *Spina alba* of *Dioſcorides* is deſcrib'd "to have the "Leaf of the white Chamæleon, but narrower and whiter, "and ſomewhat rough and prickly, a Stalk above two Cubits "high, and as big as a Man's Thumb, or bigger, whitiſh, and "hollow, bearing on its Top a prickly Head, like that of the "*Echinus marinus*, but leſs, and of an oblong Figure. The "Flowers are purple, and the Seed like that of the *Cnicus*, "only rounder."

This Plant is alſo controverted, and has exerciſed the Wits of ſome learned Men, and divided them into Parties. *Anguillarius*, and others, aſſert it to be the ſame we have here ſpecify'd, whoſe Opinion ſeems moſt probable, as agreeing beſt with the Deſcription; for which Reaſon we have beſtow'd that Name upon it. *Dale*.

5. Echinopus; minor; annuus; capite magno, *T.* 463. *Carduus, Sphærocephalus, annuus minor*, M. H. R. B. *Scabioſa, Cardui folio annua*, Par. Bat. *Carduus, Sphærocephalus, annuus, Luſitanicus, tenuiter laciniatus*, M. H. 3. 164. *a*. LESSER ANNUAL GLOBE-THISTLE, WITH A LARGE HEAD. *Boerh. Ind. alt. Plant. Vol.* 1.

The *Hiſtoria Plantarum*, attributed to *Boerhaave*, remarks, that theſe Plants are taken little Notice of in Medicine, but are balſamic and glutinous.

ECHINUS is the prickly Head or Cover of the Seed or Top of any Plant; ſo call'd from its Likeneſs to a Hedghog.

Echinus, Offic. Jonſ. Exang. 39. Aldrov. de Exang. 403. Bellon. de Aquat. 384. Charlt. Exer. 62. *Echinus marinus*, Liſt. Hiſt. A. A. 169. Mer. Pin. 192. *Echinus major*, Geſn. Aquat. 350. *Echinus Ovarius*, Riolan. 1. 578. *Echinus Ovarius rotularis dictus, ſubflaveſcens, viginti ſtriis, quarum decem e papillis, & aliæ decem e tranſverſis lineolis conflatæ ſunt, interſtitia ſtriarum, punctulis minimis occupantibus*, Lang. Hiſt. Lap. 124. Tab. 35. *Echinus Cidaris milliaris baſi pulvinata; rarioribus & minoribus eminentiis*, Klein. Echinod. 17. Tab. 2. C. D. *Echinus Ovarius ſecundus*, Mort. North. 231. Tab. 10. Fig. 3. *Echinus Ovarius*, Plot. Hiſt. Oxon. 107. Tab. 5. n. 5. Liſt. Hiſt. A. A. 222. Tab. 7. n. 23. *Echinus ex alterâ parte planus, ex alterâ ſubſphæricus purpuraſcens, aculeorum veſtigiis parum eminentibus*, Ejuſd. App. 27. THE SEA HEDGHOG.

It is taken in the main Sea: As to its Virtues, it is friendly and beneficial to the Stomach and Belly, and provokes Urine. The crude Shell, toaſted, is a good Ingredient in Medicines for abſterging the Pſora; and the Aſhes of it, burnt, cleanſe foul Ulcers, and repreſs proud Fleſh. *Dale* from *Dioſcorides*. See Echinides.

Echinus Ovarius, Plot. Hiſt. Oxon. 126. Tab. 5. Fig. 4. Mort. Woodw. Attempt. Tom. 1. P. 11. n. 178. North. 232. Tab. 10. Fig. 5. *Echinometra circinata papillis maximis*, Breyn. Sched. 55. Tab. 1. The Part in Uſe is the Glandule or Spike, call'd the *Jews-ſtone* of the Shops. See farther of it, with its Virtues, under Judaicus Lapis.

Echinus Terrestris. See Erinaceus.

ECHIS, ἔχις. The Male Viper.

ECHIUM.

The Characters are,

The Calyx is very large, and divided into five long ſlender Segments. The Flower is monopetalous, cylindrical at the Bottom, Funnel-ſhap'd, and inflected; the upper Part extends above the other, in ſuch a manner, as to form a bifid Galea, and a trifid Lip or Beard; it is furniſh'd with five Stamina, which are inflected, and in a manner corniculated; the Seeds are like a Viper's Head.

Boerhaave mentions eleven Species of this Plant; which are,

1. Echium vulgare, *C. B. Pin.* 254. *Raii Hiſt.* 1. 498. *Synop.* 3. 277. *J. B.* 3. 586. *Hiſt. Oxon.* 3. 440. *Tourn. Inſt.* 135. *Boerh. Ind. A.* 194. *Ger. Emac.* 802. *Park. Theat.* 414. *Rupp. Flor. Jen.* 176. *Mer. Pin.* 34. *Buxb.* 100. *Chom.* 100. *Phyt. Brit.* 36. *Echium*, Offic. Chab. 517. Rivin. Irr. M. Dill. Cat. Giſſ. 96. VIPERS BUGLOSS.

The lower Leaves of Vipers Bugloſs are pretty long and large, broadeſt at the End, ſomewhat round-pointed, hairy and rough, almoſt to Pricklineſs; the Stalk grows to be about a Foot high, or more, round, rough, and prickly, having many ſmaller, narrower, and ſharp-pointed Leaves, growing alternately without Foot-ſtalks. The Flowers grow in Spikes, curl'd inward, like a Scorpion's Tail, and opening gradually; they are large and gaping at the Mouth, the upper Lip being much longer than the lower, of a blue Colour, with ſeveral red Stamina, ſtanding in hairy Calyces, in which grow four rough Seeds, in Shape like Vipers Heads. The Root is thick and brown, not much branch'd, but growing deep in the Earth.

The Leaves are us'd, being eſteem'd to be good for the Biting of Vipers, and other venomous Creatures. *Dioſcorides* ſays, that, if it be held in the Hand, no venomous Creature will come near the Perſon to ſting him for that Day. *Miller's Bot. Off.*

I find nothing related with Certainty concerning the Virtues of this Plant. *Wittenbergius* preſcribes half a Dram of the Powder of the dry'd Root, to be taken in Wine or Beer, for the Epilepſy, and unnatural Heats. *Ray* from *J. Bauhine*. *Dioſcorides* ſays, that it cures Pains in the Loins.

2. Echium; Creticum; latifolium; rubrum, *C. B. P.* 254. *M. H.* 3. 441. BROAD-LEAV'D CANDIA VIPERS BUGLOSS, WITH A RED FLOWER.

3. Echium; Creticum; anguſtifolium; rubrum, *C. B. P.* 254. *M. H.* 3. 441. NARROW-LEAV'D CANDIA VIPERS BUGLOSS, WITH A RED FLOWER.

4. Echium; ſylveſtre; hirſutum; maculatum, *C. B. P.* 254. *M. H.* 3. 440.

5. Echium; majus; & aſperius; flore dilute purpureo, *Bot. Monſp. M. H.* 3. 440. GREAT ROUGH VIPERS BUGLOSS, WITH A FLOWER OF A PALE PURPLE COLOUR.

9. Echium; procumbens; annuum; floſculis atro-rubentibus, *M. H. Blæſ.*

7. Echium, Ægyptiacum; ferox; flore albo, *Boerh. Ind. a.* 194. *Lycopſis*, Offic. Chab. 516. *Lycopſis Ægyptiaca*, C. B. Pin. 255. Park. Theat. 518. Raii Hiſt. 1. 499. *Lycopſis Dioſcoridis quibuſdam*, J. B. 3. 584. *Lycopſis Dioſcoridis & Rauwelfii*, Hiſt. Lugd. App. 28. *Echium Orientale longioribus floribus*, Hiſt. Oxon. 3. 441. *Echium latiſſimo folio, Lycopſis dictum, flore dilutè purpuraſcente*, Herm. Hort. Lugd. Bat. 225. WALL BUGLOSS.

It grows about *Aleppo*, and the Root is uſed in Medicine; which, as *Dioſcorides* ſays, made into a Cataplaſm with Oil, is a Cure for Wounds; and, with *Polenta*, cures an Eryſipelas; triturated, and uſed by way of Unction with Oil, it provokes Sweat.

There is a great Controverſy among Botaniſts about the *Lycopſis*; ſome aſcribing that Name to one Plant, others to another. *Matthiolus, Lacuna, Dalechampius*, and *Caſtor Durantes*, will have it to be the *Cynogloſſum*; and we are told by *Matthiolus*, that *Ruellius* and *Fuchſius* were of the ſame Opinion. But *Ruellius*, upon comparing the Deſcriptions of both Plants, aſſures us, that the *Lycopſis* cannot be the *Cynogloſſum*, as many Herbariſts of his Time would have it to be. *Cordius* takes the *Echium vulgare*; *Dodonæus*, (in the *French* Edition) the *Bugloſſum majus*; *Lonicerus*, the *Bugloſſum ſylveſtre*, to be the true *Lycopſis* of *Dioſcorides*. For my part, I

am of a different Opinion from all the above-mention'd Authors; and am more inclin'd to think the Plant diſcover'd by *Rauwolfius* to be the genuine *Lycopſis* of *Dioſcorides*, than any of the preceding, or that which is exhibited by *C. Bauhine*, under that Name. *Dale.*

8. Echium; majus; & aſperius; flore albo, *C. B. P.* 254. *M. H.* 3. 440. GREAT ROUGH VIPERS BUGLOSS, WITH A WHITE FLOWER.

9. Echium; folio ampliſſimo; Luſitanicum, *T.* 135. PORTUGAL VIPERS BUGLOSS, WITH A LARGE LEAF.

10. Echium; foliis anguſtis & villoſis, *T.* 136. *Anchuſa, anguſtis, villoſis, foliis*, Bocc. Muſ. 2. 84. T. 78. VIPERS BUGLOSS, WITH NARROW HAIRY LEAVES.

11. Echium; annuum; folio Lithoſpermi arvenſis; flore cæruleo, parvo, *Micheli. Boerh. Ind. alt. Plant. Vol.* 1. *p.* 194.

Echium Fuchſii, ſive Borrago ſylveſtris. A Name for the BUGLOSSUM SYLVESTRE.

Echium, ſcorpioides, arvenſe. A Name for the *Heliotropium*; *minus*; *anguſtifolium*; *arvenſe*; *ſeu hirſutum.*

Echium, ſcorpioides, paluſtre. A Name for the *Heliotropium*; *minus*; *anguſtifolium*; *paluſtre*; *ſeu glabrum.*

ECHOS, ἦχος. A Sound. In *Hippocrates*, this frequently imports what the *Latins* call *Tinnitus Aurium*; and the *Engliſh*, a Ringing of the Ears; a Symptom very frequent in acute Diſtempers.

ECLAMPSIS, ἔκλαμψις, from λάμπω, to ſhine, is a Splendor, Brightneſs, or Effulgence, in 6. *Epid. Sect.* 1. *Aph.* 4. τῶν παίων ἐκλάμψιες ἅμα ἤβῃ, ἐσιν ὅτι μεταβολὰς ἰσχυσι καὶ ἄλλας. "The Flaſhes of Light, or Scintillations, [a Symptom "of the Epilepſy, and put by *Hippocrates*, as he is generally "underſtood, for the Diſeaſe itſelf] of Children, undergo "Mutations, in ſome Subjects, at the Age of Puberty, and "at other Times." The Word ἐκλάμψιες is by all refer'd to the Epilepſy; and they underſtand by it, the Change which Children undergo at the Age of Puberty, when Nature ſhines forth, and ſparkles with freſh Luſtre, and diſplays itſelf to more Advantage, both with reſpect to Strength and Underſtanding. This ſeems to be the Senſe in which the Author of the *Medicus* underſtood this Sentence, when he ſays, that "the Epilepſy in Children is cured by Nature, ἐκλάμψασα, "*ſhining forth*, and exerting itſelf at the Age of Puberty, "when the natural Heat, by drying up the Cauſes, puts an "End to the Diſeaſe by a Criſis." But, moſt probably, the Word ἐκλάμψιες was intended to ſignify thoſe reſplendent Flaſhes and Sparklings which ſtrike the Eyes of epileptic Patients, and are call'd by *Cælius Aurelianus*, *Tard. Paſſ. Lib.* 1. *Cap.* 4. *Scintillarum Micæ, & circuli ignei*, "Scintillations, "and fiery Circles." Thus, *Lib.* 7. *Epid. Hippocrates*, deſcribing the Caſe of *Phænix*, affected with epileptical Symptoms, ſays, that from his Right Eye, τὰ πολλὰ ὥσπερ ἀςεροπὴν ἐκλάμπων ἐφόρει, "Coruſcations, like Flaſhes of Lightning, fre"quently ſeem'd to dart forth." The Verb ἐκλάμπω is uſed, *Lib.* 1. *Epid. Sect.* 3. to expreſs the higheſt Degree of a Fever, juſt before and at the Criſis, when it is thoroughly kindled, and ſhines forth and ſparkles in all its Splendor, or exerts itſelf with its utmoſt Violence. In the ſame Senſe we read, *Lib. de priſca Med.* ὀξύταος ὁ πυρετὸς ἐκλάμπει, "a "moſt acute Fever ſhines forth like a Flame, or ſhews itſelf in "its utmoſt Fury."

ECLECTICA MEDICINA, from ἐκλέγω, to elect. Certain Phyſicians among the Antients, of whom *Archigenes* was one, ſelected from all the other Sects, what appear'd to them the beſt, and moſt rational; hence they were call'd *Eclectics*, and their Medicine was denominated *Eclectic Medicine.* See the PREFACE, *Page* lix. and the Article ARCHIGENES.

ECLECTOS, ἐκλειπτὸς, from λείχω, to lick. A certain Form, in which pectoral Medicines are frequently directed. A Lambitive, Linctus, or *Lohoch.* See LINCTUS.

ECLEGMA is of the ſame Derivation as *Ecleictos*, and imports the ſame Thing. See LINCTUS.

ECLYSIS, ἔκλυσις, from ἐκλύομαι, to be looſen'd, extremely weaken'd or enfeebled, is a general Faintneſs and Feebleneſs of all the Parts of the Body. Thus, 7. *Aph.* 8. ἀι μετ' ἐκλύσιος ἀφωνίαι, is a Loſs of the Voice, attended with an utter Decay of Strength; but ἔκλυσις κοιλίης, *Coac.* is a Looſening of the Belly by a free and copious Diſcharge by Stool.

ECMAGMA, ἔκμαγμα, in *Galen*'s *Exegeſis*, is explain'd a kneaded or work'd Maſs, or the Crocomagma. The Word occurs, *Lib.* περὶ ἀρθρων.

ECNEPHIAS, ἐκνεφίας, of ἐκ, from, and νέφος, a Cloud, is a ſtormy Wind breaking out of a Cloud; ἐκνεφίας ὄμβρος, in *Galen*'s *Exegeſis*, is a Shower in Sun-ſhine; in *Heſychius*, a Shower breaking out of the Clouds; and ἐκνεφίας πυρετὸς, according to *Galen*, is a Fever, which is at once both humid and igneous, as the Sun breaking out of a Cloud, which has alſo the Epithet of *Ecnephias.*

ECNYPE, ἐκνύπη, in *Galen*'s *Exegeſis*, is expounded by ἐξυπλωμένη, explicated, expanded.

ECPEPIESMENOS, ἐκπεπιεσμένος, from ἐκπιέζω, to depreſs, or preſs outwards. An Epithet for Ulcers with protuberating Lips. *Hippocrates, Lib. de Fract.*

ECPHRACTICA, from ἐκ, and φράσσω, to obſtruct. Deobſtruent Medicines.

ECPHRAXIS, ἔκφραξις, of the ſame Derivation as the preceding Word. An Opening of the Pores.

ECPHYAS, ἔκφυας, from ἐκ, and φύω, to produce. An Appendix, or Excreſcence. The *Appendicula Vermiformis* is thus call'd by ſome Writers.

ECPHYSESIS, ἐκφύσησις, from ἐκ, and φυσάω, to breathe. A quick Exſpiration or Expulſion of the Air out of the Lungs.

ECPHYSIS, ἔκφυσις, of the ſame Derivation as ECPHYAS. A Proceſs, Apophyſis, or Appendix. It is alſo a Name for the Duodenum, in *Galen, de Uſu Part. L.* 5. *C.* 3.

ECPIESMA, ἔκπιεσμα, from ἐκ, and πιέζω, to preſs. A Sort of Fracture of the *Cranium*, when the Bones are much ſhatter'd, and, preſſing inwardly, affect the Membranes of the Brain.

Ecpieſma alſo ſignifies the Maſs remaining after the Juices of Vegetables have been preſs'd out; and, in this Senſe, it is the ſame as *Magma.* It ſometimes farther imports the Juice preſs'd out. In the former Senſe *Dioſcorides* uſes it, *L.* 4. *C.* 160. ſpeaking of *Balanus Myrepſica.*

ECPIESMOS, ἔκπιεσμὸς, of the ſame Derivation as the preceding Word, implies, in general, Expreſſion, or Preſſing out. But a Diſorder of the Eye is call'd *Ecpieſmos*, which conſiſts in a very great Prominence of the entire Globe, thruſt, as it were, almoſt out of the Orbit, by a great Flux of Humours, or Inflammation.

ECPLEROMA, ἔκπλήρωμα, from πληρόω, to fill, in *Hippocrates*'s *Mochlicus*, and *Lib.* περὶ ἄρθρων, are ſmall hard Balls of Leather, or any other Subſtance, adapted to fill up the Cavities of the Arm-pits, while, by Help of the Heels, placed againſt the Balls, and repreſſing the ſame, the luxated *Os Humeri* is reduced into its Place. The Operation is deſcrib'd at large in the before-mention'd Book *de Artic.*

ECPLEXIS, ἔκπληξις, from ἐκπλήσσω, to terrify or aſtoniſh, in 7 *Aph.* 14. is a Stupor, or Stupefaction, deſcrib'd by *Galen*, in his Comment on that Aphoriſm, to be when the Patient lies without Motion, with his Eyes open, like one in a Trance, and neither ſays nor does any thing. Ἔκπληξις, in the *Definitiones Medicæ*, is a Tranſport of Mind (διανοίας ἔκστασις) proceeding from ſome ſudden Perturbation.

ECPNEUMATOSIS, from ἐκ, and πνεῦμα, Breath. The ſame as ECPNOE.

ECPNOE, ἔκπνοὴ, from ἐκ, and πνέω, to breathe. Exſpiration. That Part of Reſpiration in which the Air is expel'd out of the Lungs.

ECPTOMA, ἔκπτωμα, from ἐκπίπτω, to fall out. A Luxation or Diſlocation of a Bone. It alſo implies a Falling off, ſpeaking of corrupted Parts; the Excluſion of the Secundines after the Birth of a Child; a Falling down of the Womb; and a Deſcent of the Omentum, or Inteſtine into the Scrotum.

ECPTOSIS, ἔκπτωσις, the ſame as ECPTOMA.

ECPYCTICA, from πυκάζω, to condenſe. Condenſing or incraſſating Medicines.

ECPYEMA, or ECPYESIS, ἐκπύημα, or ἐκπύησις, from πύον, Pus, or Matter. A Collection of Matter, Vomica, or ſuppurated Abſceſs.

ECREGMA, ἔκρηγμα, from ἐκ, off, and ῥήγνυμι, to break. A Part, Piece, or Segment. Ἐκρήγματα περὶ ὀσφῦν, *Lib.* 7. *Epid.* ſeem to mean Eruptions about the Loins.

ECREXIS, ἔκρηξις, from ῥήγνυμι, to break. A Rupture. It is uſed by *Hippocrates* to expreſs a Rupture or Laceration of the Womb.

ECRYTHMOS, ἔκρυθμος, from ῥυθμὸς, Harmony or Metre. Irregular, diſorderly. It is apply'd to the Pulſe.

ECROE, ἔκροὴ, from ἐκρέω, to flow out. An Efflux, or the Courſe by which any Humour, which requires Purging, is evacuated. Thus ἐκρόαι, *Lib.* 2. *Epid.* are the Ducts, Paſſages, and Sluices, appointed by Nature, for diſcharging the Humours, and eliminating the morbific Matter. In another Place of the ſame Book, *Hippocrates* uſes the Word ἐκλόγισι in the ſame Senſe.

ECRUSIS, ἔκρυσις, of the ſame Derivation as ECROE, in *Hippocrates, Lib.* περὶ ἑπταμήνου, is an Efflux of the Semen not mature enough to be call'd an Abortion, as having not receiv'd the Conformation of a Fœtus. "In theſe Days, [the firſt "and ſeventh] he ſays, happen Multitudes of Abortions; but "ſuch as theſe are call'd *Ecruſis*, ἐκρύσεις, Effluxes, and not "Abortions." *Ariſtotle* alſo, in his Hiſtory of Animals, *Lib.* 7. *Cap.* 3. tells us, that Miſcarriages, under ſeven Days, are call'd ἐκρύσεις, *Effluxes*; above theſe, and under forty Days, they are call'd ἐκλέωσμοὶ, Abortions.

ECSARCOMA, ἐκσάρκωμα, from σὰρξ, Fleſh. A fleſhy Excreſcence.

ECSTASIS, ἔκστασις, from ἐξίσταμαι, to be out of one's Senſes. It imports, in *Hippocrates*, a Loſs of the Senſes, or Delirium.

ECSTRO-

ECSTROPHIUS, ἐκστρόφιος, from ἐκστρέφω, to invert or turn out. An Epithet for any Medicine, which makes the blind or latent Piles appear externally, that proper Applications may be made to them.

ECTASIS, ἔκτασις, from τείνω, to extend. An Extenſion of the Skin, the Reverſe to Corrugation or Wrinkling.

ECTEXIS, ἔκτηξις, from τήκω, to liquefy or conſume. A Colliquation of the Solids, or Emaciation.

ECTHELYNSIS, ἐκθήλυνσις, from ἐκθηλύνω, to render effeminate. Softneſs or Emaſculation. It is applied to the Skin and Fleſh, when lax and ſoft; or to the Legs, when in the ſame State; or to Bandages, when not ſufficiently tight.

ECTHLIMMA, ἔκθλιμμα, from ἐκθλίβω, to daſh or preſs out or againſt. In *Hippocrates de Fract.* it implies Exulcerations on the Surface of the Skin, made by Colliſion or Compreſſion.

ECTHLIPSIS, ἔκθλιψις, of the ſame Derivation as ECTHLIMMA. Eliſion or Expreſſion. Ἔκθλιψις ἔξω σφοδρὴ ὀμμάτων, *in Coac.* 218. "a vehement Expreſſion of the Eyes "outward," oppoſed to κοιλότης, "Hollowneſs;" and is accounted, as well as that, a bad Sign. In the ſame Sentence occurs λαμπεδόνος ἔκθλιψις, "an Expreſſion or Eliſion of a "Splendor," ſpoken of the ſame ſwelled and prominent Eyes, when they dart forth reſplendent Rays and Coruſcations of Light hither and thither, like Eyes which are continually rolling. This is alſo condemned as a bad Symptom. Some Copies for ἔκθλιψις read ἔκλαμψις· which, tho' it be frequently ſpoken of reſplendent Eyes, has not the Force and Significancy of ἔκθλιψις in this Place.

ECTHYMA, ἔκθυμα, from ἐκθύω, to break out. A Puſtle, or cutaneous Eruption.

ECTILLOTICA, from ἐκτίλλω, to pull out. Medicines which conſume callous Tubercles and Corns; or which aſſiſt in pulling off ſuperfluous Hairs from any Part. *Blancard.*

ECTOME, ἐκτομή, from ἐκ, out, and τέμνω, to cut. Exciſion.

ECTOMIAS, ἐκτομίας, or ἔκτομας. A caſtrated Animal.

ECTOMON, ἔκτομον. Black Hellebore. *Galen.*

ECTRAPELOGASTROS, ἐκτραπελόγαστρος, from ἐκτράπελος, indecent, filthy, and γάστηρ, the Belly. An Epithet for a Perſon, whoſe Belly is of an unnatural and enormous Size.

ECTREPSIS, ἔκτρεψις, from ἐκτρέπω, to divert, or turn aſide, in *Hippoc.* κατ' ἰητρ. is an Inclination or Converſion to one Side, as *Galen* explains it in his *Comment.* This Word ἔκτρεψις is ſubſtituted by *Foeſius*, and *C. Hoffman*, for ἔκτειψις, which is read in all the Copies, becauſe, ſay they, it is plain from the Context in the fore-mentioned Place, that the Thing intended by the Word is a Change in the Poſture of the Body for its more convenient Treatment, by an Inclination of it to one Side; which is moſt fitly expreſſed by this Term ECTREPSIS.

ECTRIMMA, ἔκτειμμα, from ἐκτείβω, of τείβω, to rub, is an Attrition or Galling. In *Hippocrates, Lib. de Fract.* ἐκτείμματα are Exulcerations of the Skin about the Os Sacrum, contracted by long lying in one Poſture under a Fracture of the Thigh.

ECTRIPSIS, ἔκτριψις, of the ſame Original as the preceding, is expounded by *Galen*, in his *Exegeſis*, by τὴν ἐς τὰ σπλάγχνα ὅσαν παρέλλαξιν, "a Permutation, [a Change of "State] with reſpect to the Viſcera." But *Foeſius* thinks we ſhould read ἔκτριψις, and, inſtead of *Galen*'s Expoſition above-quoted, ἐς τὰ πλάγια παράλλαξιν, "a Permutation of Sides, "or ſhifting from one Side to another." See ECTREPSIS.

ECTROPE, ἐκτροπή, from ἐκτρέπω, to divert, pervert, or invert, is any Duct, Paſſage, or Drain, by which the Humours are diverted and drawn off. Thus, *Lib.* 2. *Epid. Sect.* 1. ἀποστάσιες, &c. "an Apoſtaſis is made by the Veins, Bones, "Nerves, or Skin, ἢ ἐκτροπίων ἑτέρων, or by other Ways "or Paſſages." See ECROE. *Ectrope*, in *Paulus, Lib.* 3. *Cap.* 22. is an Affection of the lower Eyelid, the ſame as ECTROPIUM, which ſee.

ECTROPIUM.

When the Eyelids are ſo inverted or retracted, that their interior red Skin becomes prominent, and the Eye cannot be ſufficiently covered by them, the Diſorder is, by the *Greeks*, called *Ectropium*, from the Word ἐκτρέπω, to invert. Hence it may properly enough be called an Inverſion, or an Everſion, of the Eyelids. When this Misfortune happens in the ſuperior Eyelid, in conſequence of its Reſemblance to a Hare's Eyes, it is by the *Greeks* called *Lagopthalmus*, or Hare's Eye. But ſome, juſtly enough, diſtinguiſh between the *Ectropium* and the *Lagopthalmus*, the latter of which is, when the ſuperior Eyelid is not inverted, but only, like a Hare's Eye, retracted by any Cauſe, in ſuch a manner, that it cannot ſufficiently cover the Eye. The like Misfortune is alſo frequently obſerved in the inferior Eyelid, without any Degree of Inverſion, though few have mentioned this Symptom. Hence it may juſtly be eſteemed a Species of *Ectropium*. Sometimes this Diſorder appears ſingle, and by itſelf, whilſt at other times 'tis complicated with Inflammations of the Eyes, Sarcomas, that Species of Diſorder called Encanthis, or an encyſted Tumor. When the *Ectropium* or *Lagopthalmus* appear ſingle, and by themſelves, they generally ariſe either from bad Cicatrices form'd after fortuitous Wounds, the Extirpation of Tubercles, an Exulceration or Burning of the Eyelids, or from ſuch a preternatural Increaſe of the internal Fleſh, after ſevere and frequent Inflammations, as is ſufficient to invert the Eyelid; various melancholy Inſtances of which I myſelf, ſays *Heiſter*, have ſeen. Theſe Diſorders may alſo be produced by too ſtrong aſtringent ophthalmic Medicines, which powerfully conſtrict and condenſe the Skin.

The Cure of theſe Diſorders is often pretty difficult, and conſiſts principally in a ſufficient Reduction of the conſtricted or retracted Skin of the Eyelid. If, therefore, the Diſeaſe is not inveterate, the Cure may be attempted by moiſtening and emollient Medicines. The Cicatrix and adjacent Skin are alſo to be ſoftened and enlarged by proper Meaſures. For this Reaſon it is highly expedient, when this Diſorder begins, carefully to foment the Eyelids and Cicatrices, either with the Steam of warm Milk, or Water, or with the Oil of ſweet Almonds, or of Olives, Mucilage of Quince-ſeeds, Hares Suet, Ointment of Marſhmallows, or any other emollient Ointment or Plaiſter. At the ſame time, if the ſuperior Eyelid is affected, it is often to be drawn downwards; whereas, if the inferior is in the like Condition, it is to be drawn upwards. It is alſo proper, eſpecially in the Night-time, to apply Plaiſters and Compreſſes, drawing the Eyelids together; which Practice is to be carefully continued, till they are reduced to their natural State and Condition. But, if theſe Meaſures ſhould prove ineffectual, we are to have recourſe to manual Operation, which ſometimes produces happy Effects, tho', at other times, the Diſorder is abſolutely incurable, in conſequence of the violent Contraction of the Skin.

The moſt commodious Method of performing the Operation is, at a ſmall Diſtance from the Eyelaſhes, to make an Inciſion in Form of a Creſcent, whoſe Horns, in the ſuperior Eyelid, are to be made downwards, and in the inferior upwards; as in *Tab.* 36. *Fig.* 26. *Lett.* A A: So that, by means of the Inciſion, the Skin may be ſufficiently lengthened. When the Eyelid wants little of its natural Largeneſs, one Inciſion is ſometimes ſufficient for a due Relaxation of the Skin, as in *Fig.* 26. But, when it deviates very much from its due Dimenſions, two or three of theſe Inciſions muſt be made parallel, and at a very ſmall Diſtance from each other. Then, ſtretching the Skin ſufficiently, the gaping Wounds are to be filled with ſmall Portions of dry Lint, which muſt be ſecured with a proper Compreſs and Bandage. At the ſubſequent Dreſſings, the Lint muſt be immerſed in ſome proper vulnerary Ointment. By this means a freſh Coalition of the Skin is not only prevented, but alſo new Fleſh is raiſed from the Bottom of the Wound, which gradually fills the Chaſm of the Skin, and conſequently extends and enlarges it. That the Cure may be the more ſpeedily performed, 'tis expedient, by narrow Slips of ſome proper Plaiſter, to draw the ſuperior Eyelid downwards, and the inferior upwards. Theſe Meaſures muſt be perſiſted in, till the Wounds are filled with new Fleſh, and the Eyelid, by that means, ſufficiently enlarged.

If an Inverſion, eſpecially of the inferior Eyelid, ſhould happen, in conſequence of a violent Inflammation producing fungous and luxuriant Fleſh internally, the moſt proper Method of Cure is, by well-choſen Medicines, to allay the Inflammation, and then cautiouſly to conſume and extirpate the luxuriant Fleſh by the *Lapis Infernalis:* But, in this Attempt, the Eye is to be carefully defended; for, when the Cauſes of the Diſorder are removed, it muſt, of courſe, ceaſe, and the Eyelid be reſtored to its natural State. When this Misfortune ariſes from an *Encanthis*, an *Hyperſarcoſis*, a *Sarcoma*, or Excreſcence of Fleſh, as in *Fig.* 27. 28. and 29. theſe are to be removed in the manner directed under their reſpective Articles.

When the Eyelids are immenſely diſtorted and contracted, or when the Diſorder has remained from the Patient's Birth, ſcarce any Meaſures of Relief can prove effectual. Sometimes this Misfortune is produced without any Cicatrice in the inferior Eyelid, eſpecially in old Perſons, by a Debility or relaxed State of the orbicular Muſcle. In this Caſe, the Operation is of no manner of Uſe, and greater Benefit is to be expected from Liquors, Spirits, Balſams, and Ointments, of a corroborating and ſtrengthening Nature. But of the longer ſtanding the Diſorder is, the more it is Proof, both againſt the Operation, and the Influence of Medicines; for the Eyelids, in this Caſe, gradually habituate themſelves to Diſtortion, and ſo loſe their natural Figure, that they can never be reſtored to their former State and Condition. *Keckius*, in the Year 1733. publiſhed a learned Diſſertation on the *Ectropium*, to which the Curious may have recourſe for their Satisfaction. *Heiſter. Chirurg.*

Galen, in the *Definit. Med.* makes *Ectropium* an Everſion of the Eyelids in general. But, according to *Paulus Ægineta*, *L.* 6. *C.* 12. the *Ectropium* is peculiar to the inferior Eyelid; whereas the ſame Diſorder in the ſuperior he calls *Lagophthalmus.*

ECTROSIS, ἔκτρωσις, from ἐκτιτρώσκω, to miſcarry. A Miſcarriage.

ECTROTICA,

ECTROTICA, of the ſame Derivation as the preceding Word. Medicines which cauſe Abortion, or a Miſcarriage.

ECTYLOTICA. A Word coin'd by *Horſtius*, from τύλος, a Callus, to expreſs Remedies appropriated to conſume Calloſities.

ECZEMA, from ζέω, to boil, or be very hot. A Puſtule which is hot and painful. *Eczeſma* is the ſame, and is eſteemed the better Reading by *Fuchſius*, in his Notes on *Nicolaus Myrepſus*, *Sect.* 10. *C.* 64.

EDELPHUS, in the Jargon of *Paracelſus*, imports a Perſon who makes Prognoſtics from the Nature of the Elements.

EDENTULUS. Without Teeth.

EDERA QUINQUEFOLIA. A Name for the *Vitis*; *quinquefolia*, *Canadenſis ſcandens*.

EDERA TRIFOLIA. A Name for the *Toxicodendron*; *triphyllum*; *glabrum*.

EDES, EDETZ, *Aurum Elimpius*, that is, as *Caſtellus* expounds it, Amber. *Rulandus*.

EDESSENUM *Pelarium*. The Name of a Collyrium in *Aetius*, *Tetr.* 2. *Serm.* 3. *Cap.* 101. reckoned among the *Collyria Monohemera*, or ſuch as cure in one Day, [ſee MONOEMEROS] and called, among others, *Pelarium*, from its feculent Compoſition. [See PELARION]. It is ſuppoſed to have its Epithet *Edeſſenum* from the City *Edeſſa*, where it was probably invented, or much uſed. It is prepar'd in the following manner:

> Take of Gum Tragacanth, Gum Arabic, Acacia, Amylum, Sarcocolla, each two Drams; Opium, four Drams; Ceruſs, eight Drams; Cadmia, ſixteen Drams: Make them into a Compoſition with Water.

EDIC, EDICH, or EDIR. Iron. *Rulandus*.

EDULCORATIO. Sweetening with Sugar or Honey. But, in Chymiſtry, it imports the rendering Preparations ſweet, that is, mild, by depriving them of their Acrimony. This is generally done by repeated Affuſions of Water.

EFFERVESCENTIA. Efferveſcence ſtrictly ſignifies a ſlight Degree of Ebullition in Liquors expoſed to a due Degree of Heat. But it is applied by the Chymiſts to that Ebullition, which is excited when two Subſtances of different Natures, an Alcali, for Example, and an Acid, are mixed together. If the Efferveſcence produces a Heat in the Subſtances ſo mixed, it is called a hot Efferveſcence; but, if no Heat is excited, it is a cold Efferveſcence. It is, by former Writers in Chymiſtry, confounded with Fermentation. But *Boerhaave* has very judiciouſly limited the Signification of Fermentation to that inteſtine Motion of Vegetable Juices, which produces a vinous Liquor, or Vinegar; and calls all other Ebullitions, produced by the Mixture of Bodies, Efferveſcences.

EFFIDES. Ceruſs. *Rulandus*.

EFFILA. Freckles. *Rulandus*.

EFFLORATIO. The ſame as EXANTHEMA, which ſee.

EFFLORESCENTIA. The ſame as EXANTHEMA.

EFFLUVIA. Minute Particles which exhale from Bodies. Thus the Particles perpetually flowing from odoriferous Bodies, and which affect the Organs ſubſervient to the Smell, are call'd *Effluvia*. Thus, alſo, the minute Particles, which are conveyed through the Skin in Tranſpiration, are called *Effluvia*. By theſe Effluvia from morbid Bodies, Contagion is propagated.

EFFRACTURA. A Species of Fracture of the *Cranium*, when the Bone is broken, and much depreſſed, by a violent Blow. *Paré*.

EGELO. A Name for the *Cytiſus*; *Alpinus*; *anguſtifolius*; *flore racemoſo*, *pendulo*, *longiori*.

EGESTIO. Excretion, generally uſed relative to Evacuations by Stool.

EGOITAS. A Term coin'd by *Helmont*, to expreſs the Light of the Underſtanding, by which we contemplate, or reflect internally.

EJACULANTIA, or EJACULATORIA VASA, are the Veſſels which receive the ſeminal Matter elaborated in the Teſticles, and convey it to the Penis. Theſe are the *Epididymis*, the *Vaſa Deferentia*, the *Veſiculæ Seminales*, and *Proſtatæ*.

EIDECHTHES, εἰδέχθης, from εἶδος, Shape or Aſpect, and ἔχθος, Hatred or Enmity, is apply'd to whatever has an odious or deformed Aſpect, as it is expounded by *Heſychius*. In *Hippocrates*, *Lib.* 2. περὶ γυναικ. it is an Epithet for a putrefy'd Egg, and for Things of an abominable Smell, in Oppoſition to εὐώδεα, "Things of a grateful Odour."

EIDOS, εἶδος, a Form, a Kind, is uſed, by *Hippocrates*, in various Senſes. *Galen*, 2 *Com. Lib. de Nat. Hum.* expounds τὰ εἴδη, by τὰς τῦ σώματος φύσεις, "the Natures of Body," conſiſting of a Mixture of the four Qualities. In the Additions to the ſame Book, we are taught, "that a Phyſician ought to "hold himſelf provided for all Diſeaſes, Natures [εἴδεσι], Sea"ſons, and Ages." He uſes the Word in the ſame Senſe, for Nature, Form, or Conſtitution, in ſeveral other Places of that Treatiſe; and, 2 *Epid. Sect.* 2. expreſſes the ſame by ἰδέα. In *Lib. de ſalubri Vict.* τὰ εἴδη are explained, in *Galen*, by ἀι τῦ σώματος ἕξεις καὶ ἰδέαι, "the Habits and Forms of Body." Thus again, *Lib.* 2. *Prorrhet.* τὰ εἴδεα τῶν ἀνθρώπων, are the particular Nature, Habit, or Conſtitution of every Perſon, tho' even acquir'd by Cuſtom, and Length of Time; which ſort of Habit is called by *Galen* ἕξις, (*Scheſis*). Εἶδος alſo ſignifies the ſame as *Res*, "Thing"; or Ingredients in a Mixture, as (*Lib.* 2. περὶ γυναικ.) ὄξος σὺν τοῖς εἴδεσι ἢ οἶνον, (mix) "Vinegar, or Wine with theſe Things;" that is, with Juniper-berries, Sage, and other Ingredients. *Galen*, *Com.* 1. & 2. *in Lib.* καὶ ἀήρ, explains εἴδη, as ſignifying "Kinds." And by τὰ εἴδεα τῶν πυρετῶν, 3 *Epid.* we are to underſtand the different Kinds or Species of Fevers.

EJECTIO, in Medicine, implies much the ſame as EXCRETIO.

EILAMIDES, εἰλαμίδες, from εἰλέω, to involve. The Meninges, or Membranes of the Brain, the *Pia Mater*, and DURA MATER.

EILEMA, εἴλημα, from εἰλέω, to form Convolutions. In *Hippocrates*, *Lib. de Flatibus*, this Word imports painful Circumvolutions of the Inteſtines, occaſioned by Flatulences. It alſo, ſometimes, imports an *Involucrum*, or Covering.

EILEON, εἰλεόν, from εἰλέω, to wind. A Name of the Inteſtine, call'd the *Ileum*, according to *Gorræus*; but I don't recollect, that this Word occurs in any *Greek* Author.

EILEOS, εἴλεος, from εἰλέω, to form Convolutions. The Iliac Paſſion. See ILIACA PASSIO.

EILETHERES, εἰληθηρὲς, from ἥλιος, the Sun, and θέρω, to heat. Heated by the Sun. *Hippocrates*, *de Morbis*, *Lib.* 2.

EIRION, εἰρίον, Wool. See *Lana*.

EIROS, εἶρος. This was explained by ſome, according to *Erotian*, the Circumſcription of a ſcirrhous Tumor of the Spleen; and, by others, a bad Affection of the whole Body. But *Erotian* diſapproves of both theſe Explications, and ſays it imports a Species of Fever in *Hippocrates*: The Word, however, does not occur in the Works of *Hippocrates*, now extant.

EISBOLE, εἰσβολὴ, from εἰς, into, and βάλλω, to caſt. It ſignifies, ſtrictly, an Injection: But is uſed to expreſs the Acceſs or Attack of a Diſtemper, or of a particular Paroxyſm. It alſo, ſometimes, implies an Irruption.

EISPNOE, εἰσπνοὴ, from εἰς, in, and πνέω, to breathe. Inſpiration.

ELA-CALLI. The Name of a Shrub which grows in ſandy Soils, in ſome Parts of the *Eaſt-Indies*, about twice as high as a Man. The Bark of its Root triturated, and drank in Water in which Rice has been boil'd or waſh'd, is recommended againſt the Dropſy, and is ſaid to be a very mild Medicine; which Mr. *Ray* juſtly wonders at, ſince the Plant is full of an acrid and cauſtic Milk; which, however, when exhibited with Butter in which it has been boil'd, proves a mild and gentle Purgative. The Leaves, heated at the Fire, provoke Urine; and the Steam or Vapour of a Decoction of them contributes to alleviate and remove Pains in any Part of the Body: The Juice, expreſs'd from the Leaves either warm'd or a little toaſted, cures Pains of the Ears, if put into them. It alſo removes Specks of the Eyes, if dropt into them; and contributes to the Cure of Swellings in the Pudenda, if the Body is waſh'd with it. *Raii Hiſt. Plant.*

ELÆAGNUS CORDI. A Name for the GALE; *Frutex Odoratus Septemtrionalium*, which ſee. But, according to *Miller*, the *Elæagnus* is a Name of the *Oleaſter*, Wild Olive.

ELÆOMELI, ἐλαιόμελι, from ἔλαιον, Oil, and μέλι, Honey.

In *Palmyra*, a Country of *Syria*, the *Elæomeli*, which is an Oil thicker than Honey, and of a ſweet Taſte, flows from the Trunk of a Tree. Two Cyathi of this Oil, drank with one Hemina of Water, evacuate crude and bilious Humours by Stool. But the Patients who uſe this Medicine, are ſeiz'd with a Torpor, and Privation of Strength; there is, however, no Neceſſity for being terrified at theſe Symptoms. In this Situation, they are to be carefully rous'd, and not allow'd to fall into a deep or profound Sleep.

This Oil is alſo prepar'd of the Fat of the oleaginous Buds of the Tree; and, of this Kind, that is beſt which is old, thick, pinguious, and not turbid. It is of a heating Nature, and, if apply'd by way of Ointment to the Eyes, contributes to the Cure of Dimneſs of Sight. It alſo contributes to the Cure of the Leproſy, and Pains of the Nerves. *Dioſcor. L.* 1. *C.* 37.

Hermolaus Barbarus, in his Commentaries on the firſt Book of *Dioſcorides*, thinks, that the ἐλαιόμελι is the ſame with the Manna, mentioned in Scripture; and only differs from it in this, that the ἐλαιόμελι is uſed in Medicine; whereas the Manna might be eaten for common Food.

ELÆON, ἔλαιον, Oil. See OLEUM.

ELÆOSACCHARUM, from ἔλαιον, Oil, and σάκχαρ, Sugar. A Term in Pharmacy, importing, a Mixture of diſtil'd Oils with Sugar.

After

After the Chemiſts had ſhewn Phyſicians, that the Spirit reſiding in eſſential Oils contained, in a ſmall Volume, all the particular Virtues of the Plant; Phyſicians prudently reflected, that they had hence an excellent Inſtrument in their Art; but that the unctuous Tenacity of the Oil ſtill prevented its being uſed with Safety; becauſe theſe Oils being extremely ſharp, and, by their Tenacity, remaining fixed to one Part, occaſioned Inflammations. Hence they began to think of a Method of rendering theſe Oils miſcible with Water, and uniformly conveying their entire Virtues to the Places intended; and this they found might be effected by the Means of Sugar.

Grind, therefore, an Ounce of dry Loaf-ſugar to an impalpable Powder, in a Glaſs Mortar, with a Glaſs Peſtle; and, by degrees, add thereto a Dram of any eſſential Oil, or half a Dram, if the Oil be very tenacious; and continue rubbing them together, till all the Oil is perfectly mix'd, and drank into the Sugar. The Oil, in this Operation, uſually diffuſes a Fragrancy to a great Diſtance; the Operation, therefore, ſhould be perform'd quick, and the Mortar be covered with a Cloth, ſurrounding the Peſtle. If a little freſh White of an Egg be added in the Grinding, and mix'd in with the Sugar and Oil, the Oil thus becomes more eaſily miſcible; but the Mixture will not thus keep ſo long, without turning rancid. And thus Sugar, which is a very pure Soap, or a true eſſential oily Salt, divides the glutinous Tenacity of the Oil, interpoſes itſelf betwixt the Principles thereof, unites them cloſely with itſelf, and makes an extemporaneous Soap; which may thus be commodiouſly diluted with Water, for medicinal Uſes: For though this Mixture is not ſo perfect as in an actual Soap, or true eſſential Salt, yet it ſuffices for Uſe; nor is there Reaſon to apprehend any Inconvenience from the Sugar, in this Preparation; for Sugar is unjuſtly ſaid to be unwholſome, as there are no Proofs extant thereof. On the contrary, it is a wonderful Salt, that perfectly mixes with Water, and ferments therewith into Wine: And yet, what is exceedingly ſurpriſing, it appears oleaginous, and perfectly inflammable in the Fire; whence it is known to conſiſt of Oil and Salt.

If theſe Elæoſacchara be well prepared, dried, and put into clean Glaſſes, exactly cloſed with Glaſs Stoppers, they may long be preſerved perfect; and, in this manner, very effectual Medicines might be commodiouſly carried from Place to Place; and, upon occaſion, be directly uſed on a Journey, by adding a little of the Elæoſaccharum to a Glaſs of Wine. An Elæoſaccharum might, alſo, be made, by grinding an eſſential Oil with a fix'd alcaline Salt; by which means, alſo, a kind of Soap is obtained: But Alcalis thus deſtroy the grateful Properties of the eſſential Oils, and change their natural Taſtes and Odours. Such Elæoſacchara, alſo, would preſently reſolve in the Air, and thence be eaſily ſpoil'd. By the former Method, therefore, Phyſicians may prepare an excellent Medicine, rich in Virtues: For if the Elæoſaccharum of Mint be diſſolv'd in diſtil'd Mint-water, then ſtrengthened with the Addition of the Spirit of Mint, and the Mixture ſweetened with the Syrup of the ſame Plant, the whole Virtues of Mint may thus be obtained.

REMARKS.

Hence appears the ſaponaceous Property of Sugar, which fits it for breaking and dividing the Bodies of Oils, as if they were in a manner fermented with Sugar; and, at the ſame time, it does not diminiſh, but rather improves, the particular Virtue of theſe Oils: Whence the Antients, who were unacquainted with Sugar, mixed Oils with Honey, for the like Purpoſes. And hence we learn the Virtue of Sugar in the Body; where, being diluted with the natural Juices, it affords a ſaponaceous Lixivium, which, by the Force of Circulation, diſſolves unctuous and viſcous Subſtances: Whence it does not generate, but diſſolves Phlegm; nor does it increaſe the Bile, nor turn into it, but opens, thins, and divides it; though, by diſſolving the Oils too much, it may occaſion Leanneſs; as, by attenuating too much, it produces a Weakneſs and Relaxation of the Parts, and is, therefore, often found prejudicial in the Rickets, and the Scurvy. In the mean time, this Production of Nature and Art is, as we above obſerved, very ſingular and extraordinary; for it entirely diſſolves in Water, melts in Fire, ſhoots like a perfect Salt into perfect Cryſtals, is manifeſtly fix'd, and, if diſtil'd in cloſe Veſſels, affords an acid penetrating Spirit: In an open Fire it becomes wholly inflammable; it is fermentable, and thus convertible into ſtrong Wine, which will afford Alcohol; and, laſtly, it may be converted into ſharp Vinegar. If it be call'd a Salt, we may aſk how it comes to be inflammable in the Fire? if an Oil, how it comes to cryſtallize? if an eſſential Salt, how it comes to ferment? So that, perhaps, in all Nature there is no other Body found, in which all theſe Properties conſpire. *Boerhaave's Chemiſtry.*

ELAMBICATIO. A Method of analyſing mineral Waters, to inveſtigate their Virtues. *Caſtellus* from *Fallopius.*

ELANULA. Alum, as hard as Iron.

ELAPHICON. A Name for the ELAPHOBOSCUM, in *Oribaſius, Medic. Lib.* 1.

ELAPHOBOSCUM, from ἔλαφος, a Stag, and βόσκω, to feed. A Name for the *Siſarum Germanorum.*

ELAPHOS, ἔλαφος. The Stag. See CERVUS.

ELAPHOSCORODON. The ſame as OPHIOSCORODON.

ELAPS, ἔλαψ. The Name of a Serpent, mentioned by *Aetius, Tetrab.* 4. *Serm.* 1. *Cap.* 32. the Bite of which induces ſomething like the Iliac Paſſion. It is cur'd, he ſays, by the uſual Remedies for theſe venomous Bites, and principally by thoſe which eaſe Gripings, and provoke Urine.

ELAQUIR. Red Vitriol. *Rulandus.*

ELAS MARIS. Burnt Lead. *Johnſon.*

ELASIS, ἔλασις, from ἐλαύνω, to impel, or repel. See ELASTICITAS.

ELASMA, ἔλασμα, from ἐλαύνω, to impel. A Lamina, or Plate, of any Kind. But it is uſed to expreſs a Clyſter-pipe.

ELASTICITAS. Elaſticity. A Word much in Uſe among the modern Philoſophers, coin'd from ἐλαύνω, to impel, or repel. It imports that Power or Property in natural Bodies, by which they reſtore themſelves ſpontaneouſly to the Figure and Dimenſions, which they had loſt by the Action of ſome other Body applied to them. Thus a Spring, or a Bow, when bent, reſtore themſelves, by their Elaſticity, to the Form they obtain'd before any external Force was applied to them. And thus the Arteries, after being diſtended by the Impulſe of the Blood, contract, and reſtore themſelves, by their Elaſticity, to the ſame Form and Dimenſions they had before thus diſtended. Whoever is more inclined to inquire into the Cauſes of Elaſticity, than to cure Diſeaſes, may find a great deal upon this Subject, in the Writings of the *Carteſian* and *Newtonian* Philoſophers; in which, however, they will find very little Satisfaction, without a ſufficient Share of philoſophical Enthuſiaſm. See STRICTURA, and LAXITAS.

ELATE, ἐλάτη. The Fir. See ABIES.

ELATER. The ſame as ELASTICITAS.

ELATERION, ἐλατήριον, from ἐλαύνω, to exagitate. This imports, in general, any purging Medicine; and particularly, thoſe which operate with Violence. Hence the Name was transferred to the wild Cucumber, and the Preparations thereof. In the Writings of *Hippocrates*, Elaterium is frequently mention'd as an external Application of a digeſtive and detergent Nature. Its internal Uſe is, however, in all Probability, recommended, when the τὰ ἐλατήρια, or agitating Medicines, are mention'd. In the fifth Section of the ſixth Book of his Epidemics, for purging Children, he preſcribes the Milk of a Goat, or Woman, who hath eaten Elaterium or wild Cucumber. Where the Word Elaterium ſeems to imply white Hellebore, which the Goats eat.

The Characters of the Elaterium, or wild Cucumber, are,

The Leaves and Branches are without Tendrils; the Fruit prickly, and burſts, and flies abroad with a great elaſtic Force; the Juice is violent in Operation. *Boerhaave Ind. alt. Part.* 2. *p.* 77.

Elaterium Officinarum; Cucumis; ſylveſtris; aſininus dictus. *Boerh. Ind. A.* 2. 77. *Cucumis agreſtis*, Offic. *Cucumis agreſtis, ſive aſininus.* Park. Inſt. 104. Elem. Bot. 87. Hiſt. Oxon. 2. 33. *Cucumis Elaterium Rivini.* Rupp. Flor. Jen. 41. *Guaverva-oba, ſive Cucumis aſininus.* Piſ. 264. WILD CUCUMBER.

This Plant has ſeveral rough Stalks, which creep upon the Ground, whoſe Leaves are ſet on long hairy Foot-ſtalks; they are pretty large, greeniſh above, and hoary underneath, ſomewhat triangular, and indented about the Edges, rough and hairy. The Flowers grow on the Rudiment of the Fruit, being much ſmaller than the Flowers of the Garden Cucumbers, of one ſingle pale-yellow Leaf, cut into five Parts. The Fruit is as big as a large Olive, cover'd all over with harmleſs Prickles, and full of a pulpy Juice, containing ſeveral brown oval Seeds, which, when ripe, upon handling, or gently preſſing, will ſquirt forth at the End with great Violence. It is ſown in Gardens, flowering in *July*, and the Fruit is ripe in *September.*

This is a very ſtrong purging Plant, the Fæcula of whoſe expreſs'd Juice is the Elaterium of the Shops, and is one of the ſtrongeſt Cathartics we have, carrying off ſerous watery Humours, both upwards and downwards, with great Violence; whereby it is of ſingular Uſe in the Dropſy, when the Bowels are not decay'd. It likewiſe forcibly brings down the Catamenia, and even deſtroys the Fœtus in the Womb, and is therefore only fit to be adminiſtred by a ſkilful Hand. *Miller's Bot. Off. Dioſcorides* and *Aetius.*

As for the Antiquity of Elaterium, *Theophraſtus* informs us, that he ſaw ſome of it two hundred Years old, in the Cuſtody of a Phyſician of indiſputable Veracity; and that its Virtues were, as yet, entire: So that the Elaterium muſt have been

been known long before the Days of *Hippocrates*, ſince *Theophraſtus Ereſius* flouriſhed very ſoon after him.

Dioſcorides, in the 155th Chapter of his 4th Book, gives us the following Directions for preparing Elaterium: "Chuſe "ſuch Cucumbers as, when touch'd, burſt, as it were, and "diſcharge their contain'd Juices. Theſe are to be kept for "a Night, and, next Day, put into a wide Sieve, laid over "the Mouth of a Veſſel. Then, with a Knife, whoſe Edge "is turned upwards, divide the Cucumbers, one by one, and "expreſs the Juice, through the Sieve, into the Veſſel plac'd "under it; then ſqueeze the fleſhy Part of the Cucumbers, "adhering to the Sieve, that it may be alſo paſs'd through it. "Pour this expreſs'd Juice into another Bowl, or Baſon. "The Parings, or Shreds, are to be laid in the Sieve, waſh'd "with pure Water, expreſs'd, and thrown away. The Juice, "receiv'd into the Baſon, is to be agitated and mix'd; after "which it is to be cover'd with Linen Cloth, and expos'd "to the Sun. But, when it coagulates, the Water floating "above it, together with the frothy Concretions on its Sur-"face, are to be pour'd off; and this is to be done ſo long "as any Water appears. After this Water, if any ſhould "remain, is diligently pour'd off, Drop by Drop, the Sedi-"ment itſelf is to be triturated in a Mortar, and reduced to "ſmall Cakes. Some, in order more expeditiouſly to expreſs "a large Quantity of Juice from the Elaterium, ſift Aſhes "upon the Ground; then, making a ſmall Hollow in the "Middle, they cover it with a threefold Linen Cloth, into "which they pour the Elaterium, with its Moiſture; and, "when this latter is drain'd off, they make up the former, "when dry, into Cakes, in the manner already directed. "Others, in order to waſh this Maſs, uſe Sea-water, mix'd "with freſh Water; while others, in the laſt Waſhing, uſe "Mulſum. That Elaterium is counted beſt, which is white, "moderately moiſt, ſmooth, bitter to the Taſte, and eaſily "kindled upon the Application of a lighted Candle to it. "But that which is porraceous, rough, of a turbid Appear-"ance, heavy, and full of recrementitious Parts, is bad. "Some, in order to procure a due Degree of Smoothneſs and "Whiteneſs to the Elaterium, mix Amylum with it. "It retains its purgative Quality for ten Years after it is "made. The largeſt Doſe is an Obolus [about twelve Grains], "and the ſmalleſt a Semi-obolus [or ſix Grains], and to "Children two Areola [or four Grains]; for larger Doſes of "it are dangerous. This Medicine evacuates Bile and Phlegm, "both by Vomit and Stool. Thoſe who labour under a Dif-"ficulty of Breathing, receive great Advantages from the "Evacuations made by this Medicine. If the Intention is "to evacuate by Stool, adding a double Quantity of Salt, "and as much Muſtard as is ſufficient to colour the Maſs, "form Pills of the Bulk of a bitter Vetch; after the Exhi-"bition of which, let the Patient drink a Glaſs of warm "Water. But if the Intention is to evacuate by Vomit, "the Elaterium is to be diluted in Water, in which a Feather "is to be immers'd, and the Parts lying under the Tongue are "carefully to be anointed with it: But if the Patient is "difficult to vomit, the Elaterium may be diſſolv'd in Oil, or "the Ointment of Orris; but he is not to be ſuffered to ſleep. "If too ſtrong and violent Evacuations by Stool ſhould be pro-"duced by this Medicine, we muſt frequently exhibit to the "Patient Wine mix'd with Oil; for the Patients are free from "this Symptom, when Vomitings are brought on. When, "on the contrary, too frequent Vomitings are excited by "the Elaterium, cold Water, Polenta [ἄλφιτον], and Oxy-"crate, Apples, and Subſtances capable of ſtrengthening the "Stomach, are to be exhibited. Elaterium, us'd by way of "Peſſary, provokes the Menſes, and kills the Fœtus. When "injected into the Noſtrils, with Milk, it removes the Epi-"lepſy, and long-continued Pains of the Head. In Quinſeys "it is ſucceſsfully us'd, as an Ointment, in Conjunction with "old Oil, Honey, or the Gall of a Bull. A Dram of the "Root of Garden Cucumber, reduced to Powder, and exhi-"bited in Hydromel, excites Vomiting. But if the Patient, "after Supper, deſires to vomit gently, and without Uneaſi-"neſs, two Oboli [or twenty-four Grains] will prove a ſuffi-"cient Doſe."

Elaterium is one of the moſt violent and draſtic Hydragogues of any in the Materia Medica. It is a Species of wild Cucumber, differing principally from thoſe of the Garden Kind by the Smallneſs of its Fruit, being no larger than a *Spaniſh* Olive, which it reſembles pretty much in Figure. When it is ripe, it falls from its Stalk, upon the gentleſt Touch, or the ſlighteſt Gale of Wind; and throws its Seeds, with Violence, a conſiderable Way round it. It is called Elaterium; but this Name is now principally given to an Extract which the Antients prepared from it.

In order to render the Preparations of this Plant more mild and gentle, Mr. *Boulduc* has been at incredible Pains; and, in the Courſe of his Experiments, found, that this Plant has ſcarcely any ſulphureous Principles; becauſe Brandy and Spirit of Wine hardly act upon it at all, and becauſe the Principles they draw from it are only Salts, diſſolv'd and carried off, not by the Sulphur of theſe Menſtruums, but by the Phlegm they always retain. The wild Cucumber, then, contains only ſaline Parts, in which its Virtues conſiſt: And, as it is a ſtrong Purgative, we may, from this Circumſtance conclude, that Salts are as properly Purgatives as Sulphurs, though this Quality is not ſo generally aſcrib'd to the former as to the latter.

Mr. *Boulduc* was convinced, that Juices obtained by Expreſſion have leſs Virtue than Decoctions and Infuſions. In the former of theſe Proceſſes, we leave, as uſeleſs, a Maſs, which is not, in reality, ſo; and which contains Principles of the Plant, the Union of which with the others would be neceſſary, either to correct or augment their Qualities. By the latter of theſe Proceſſes, that is, Decoction or Infuſion, every Principle is equally drawn out; and even though the compound Subſtance ſhould be peccant with reſpect to Strength and Acrimony, the Principles united and mix'd, drawn from it, are ſuch as were moſt eaſily diſengag'd, and, at the ſame time, moſt mild and gentle.

After trying an incredible Number of Experiments, ſometimes on all, and ſometimes only on ſome of the Parts of this Plant, Mr. *Boulduc*, at laſt, fell upon a Method of preparing, from the dry Root, a ſimple Decoction, or Extract, preferable to what can be obtained from all the other Parts, and which he has found, from Experience, to be a very mild, and, at the ſame time, a very powerful Hydragogue. The Doſe is from twenty-four to thirty Grains, in Conjunction with a few Grains of Mechoacan or Rhubarb, and Salt of Wormwood, incorporated with Extract of Juniper.

As the Cucumbers, produced by this Plant, do not ripen all at once, they muſt be gathered immediately before the preciſe Moment of their perfect Maturity, becauſe ſoon after they would fall, and ſpread their Seeds, which would render them uſeleſs. Mr. *Boulduc* thinks, that the Method of preparing the Elaterium us'd among the Antients was highly difficult; and poſitively affirms, that it was loſt a long time ago. This Art he has attempted to recover, and, by preſerving every thing that was eſſential and important in it, has found the means of preparing an Elaterium, not only as good, but apparently better than that of the Antients; ſince ſix Grains of it purge very well, and without Violence. It muſt be exhibited in Conjunction with ſome Powder of Rhubarb, and ſome alcaline Salt.

But the moſt ſimple Elaterium is that which he made, when he imagin'd, that moſt of the good vegetable Remedies come, as it were, prepar'd from the Hands of Nature. Accordingly he dried the wild Cucumber very well, and reduc'd it, together with its Seeds, to a Powder, which he found a very good Hydragogue. *Hiſt. de l'Acad. Royale, An.* 1719. p. 54.

The Root, and inſpiſſated Juice, of the *Cucumis ſylveſtris* or *aſininus*, are the principal, if not the only Parts of the Plant us'd in Medicine. This Juice, prepared in a certain Manner, is call'd Elaterium, of which there are two Kinds mentioned by the Antients; that, for Inſtance, of *Theophraſtus*, which is green, and, in all Probability, made of the inner Subſtance of the Pulp of the Fruit; and that of *Dioſcorides*, made only of the thin and wateriſh Parts, which is white, and which, for that Reaſon, is accounted beſt by him and *Meſue*. The Green is not half ſo ſtrong in promoting Evacuations, either by Vomit, or Stool, as the White, of which one Grain, diſſolved in any Liquor, operates very powerfully on People of weak Conſtitutions. This Medicine powerfully eliminates aqueous and viſcid Humours collected about the Joints. The Juice of the Root produces the ſame Effect, and is, therefore, properly uſed in Clyſters, or laid as a Plaiſter, or Poultice, to the Parts affected, in ſciatic Pains. This Juice, alſo, when boil'd with Wormwood, in Water and Oil, cures inveterate Megrims, if the Temples are frequently bath'd with it, and ſome of the Leaves and Roots beaten together, and applied to them as a Poultice. When this Juice of the Root is injected into the Noſtrils with Milk, it is ſaid to produce the ſame Effect. When mix'd with Goats Dung, and applied, by way of Plaiſter, to any hard Tumors or Swellings, it is ſaid powerfully to reſolve them. According to *Meſue*, the Juice, not only of the Fruit, but alſo of the Root, or a Decoction of either, if drank, affords Relief in the Dropſy, the Jaundice, and all Obſtructions of the Liver and Spleen. *Dioſcorides*, for the Cure of a Dropſy, orders half a Pound of the Roots to be bruis'd, and put into three quarters of a Pint of ſtrong Wine, three Ounces of which are to be exhibited for three or four Days, till the Dropſy is remov'd, which it carries off without creating any Uneaſineſs to the Stomach. According to *Caſtor Durantes*, a few Grains of Elaterium, mix'd with Conſerve of Roſes, will produce the ſame Effect. The Powder of the Root, mix'd with Honey, removes the Marks of Sugillation. The Root boil'd, or ſteep'd, in Vinegar, cures the Morphew, and removes Specks and Freckles. The Powder of the dry'd Root, according to *Dioſcorides*, cleanſes the Skin of the Face from all Scurf, and the unſeemly Remains of Scars. The Juice of the Leaves, dropt into the Ears, removes Pains, Noiſe, and Deafneſs. A Decoction of the Root removes Tooth-achs, if the Teeth are waſh'd with it. The

Powder

Powder of the Root, mix'd with Honey, deterges, incarns, and cicatrizes old Ulcers and Sores. In the Shops, the Root of the wild Cucumber is generally us'd as a Succedaneum, for that of the Coloquintida or Bitter Apple; ſince the latter is not ſo eaſily obtain'd as the former.

The preſent Method of preparing Elaterium is thus given by *Lemery*. Elaterium is, properly, the Juice of the wild Cucumber, as ſoon as it is extracted from it; but, as it is uncapable of being preſerv'd, for any conſiderable time, in this State, it is, therefore, to be prepar'd in the following manner:

Bruiſe ripe wild Cucumbers, in a Stone or Marble Mortar. Let them digeſt cold, for four or five Hours: Then heat them, and ſqueeze their Juice through a Linen Cloth. This Juice is to be put into a glaſs or earthen Veſſel, and the Moiſture evaporated, till what remains aſſumes the Conſiſtence of an Extract, or becomes capable of being form'd into Pills; And this is what they call Elaterium. Some ſuffer this Juice to continue in a State of Reſt for ſome time, and ſeparate from it the Fæces, which they dry in the Sun, and which they call Elaterium. Others throw away the Fæces, and evaporate the depurated Juice, to the Conſiſtence of an Extract: But I am of Opinion, that the Qualities of the wild Cucumber are more effectually obtain'd without this Depuration.

Elaterium powerfully evacuates, by Stool, thick Phlegm, melancholy and ſerous Humours. It is uſed in Apoplexies, Lethargies, Dropſies, and hypochondriac Melancholy. The Doſe is from three Grains to half a Scruple. The Cucumbers, when bruis'd, are left in Digeſtion ſome Hours, that their viſcid Parts being rarefied, the Juice may be more eaſily extracted from them.

Mr. *Soame* relates, from *Reuſner's Obſervations*, publiſh'd by *Velſchius*, that an Empiric us'd to give two Pills, of the Size of Chiches, compos'd of wheaten Meal, and the Juice of the wild Cucumber, to Patients labouring under a Dropſy, which was ſucceeded by a plentiful Purgation of Water. After this, with a Lotion for the Legs, made of a Decoction of the Stalks, he drew the Matter downwards, and then exhibited another like Doſe of his Pills; and, by this means perform'd very many Cures. *Raii Hiſt. Plant. p.* 648.

In exhibiting Elaterium, great Caution ſhould be us'd with reſpect to the Doſe; for half a Scruple is too much; ſeldom more is exhibited at once than five Grains.

ELATINE MAS. A Name for the *Linaria*; *hirſuto folio, ſubrotundo*; *flore ex herbido flaveſcente.*

ELATINE FŒMINA. A Name for the *Linaria*; *hirſuto folio, acuminato, in Baſi auriculato*; *flore luteo minimo.*

ELATINUM OLEUM, ἐλάτινον ἔλαιον. The Name of an Oil deſcrib'd by *Dioſcorides*, *Lib.* 7. *Cap.* 54.

ELECTIO. Election. This is, by ſome Writers, made a Part of Pharmacy, which conſiſts in a Knowledge of the various Simples which compoſe the Materia Medica; and directs the Choice of Drugs, diſtinguiſhing the good from the bad. For an Account of the Doctrine of Elective Purges, ſee CATHARTICA.

ELECTRODES, ἠλεκτρώδης, from ἤλεκτρον, Amber. An Epithet for Stools which ſhine like Amber, in *Hippocrates*, *Epid.* 4.

ELECTRUM, ἤλεκτρον. Amber. See AMBRA.

ELECTUARIUM. An Electuary. A Form in which both officinal and extemporaneous Medicines are frequently made. It may be conſidered as a Number of Boles united together; but is made ſomewhat ſofter, by an Addition of a due Proportion of Preſerves or Syrups. When the Conſiſtence is very ſoft, it is call'd ſometimes by the Name of Opiata. The Rules laid down for the Compoſition of a Bolus, may be juſtly applied to an Electuary.

The principal Conſiderations in preſcribing officinal Electuaries are, that ſuch Things only be put together, as will not, by any oppoſite Qualities, deſtroy one another, or loſe their natural Properties, by lying long in this manner; and, likewiſe, that the Whole be of a Conſiſtence that will hold Ingredients of different Gravities in equal Mixture. Thus, in all Electuaries where the teſtaceous Powders are ordered, or any thing of an alcaline Nature, no Acids, or any thing that will turn acid, ought to be mix'd, becauſe they will ferment; their Weight, likewiſe, requires a thicker Conſiſtence than can be well given by a Syrup, to hold them in Suſpenſion; and, for offending in both theſe reſpects, the College have now expung'd the *Confectio de Hyacintho*, which conſiſted chiefly of teſtaceous and heavy Ingredients, and was made up with Syrup of Lemons. Things which are moſt liable to grow worſe in this Form, chiefly affect the aſtringent Compoſitions; becauſe that Roughneſs, or Aſperity, in which their Aſtringency conſiſts, by long lying in Moiſture, grows ſofter, and, conſequently, leſs efficacious in any ſuch Intentions. This Change is very manifeſt, in comparing old Diaſcordium, or Conſerve of red Roſes, with new.

Extemporaneous Electuaries differ, principally, from the officinal, in that the latter are confin'd to ſuch things as will, for a long time, keep together; whereas the former may be ventured upon with Materials, which will not long remain without Change, provided they agree in Intention; as Conſerves, with the teſtaceous Powders, Preparations of Steel, and the like, will continue together long enough for preſent Uſe, but will not lie many Days without fermenting and ſpoiling.

Yet, in the Preſcription of extemporaneous Electuaries, there is ſome Care requiſite, even for their convenient keeping a few Days fit for taking: Thus, if the lighter Species be made into an Electuary with Syrups only, it will, in a Day's time, grow too dry for taking, without freſh Moiſture; which Inconvenience is often experienced with the Bark; and the Neceſſity of having enough of it in a tolerable Doſe, is the only Excuſe for ſo ordering it; for a ſufficient Quantity of any Conſerve, to preſerve a Conſiſtence, which is the only way in this Caſe, would increaſe a Doſe of the Bark, in Electuary, to an unreaſonable Bulk. The teſtaceous and heavier Powders, likewiſe, make an Electuary very diſagreeable, without the Interpoſition of ſome Conſerves: So that a Conſerve ſeems a neceſſary Ingredient in this Form, only as a Vehicle to other Things; and the Conſiſtence requiſite in theſe Caſes is, that a Doſe may be taken up with the Point of a Knife, or any ſuch thing, and not to be too hard to ſwallow without Trouble.

But, next to a due Conſiſtence, a very material Circumſtance in an Electuary is, that it be uniformly ſmooth, and as ſightly as poſſible; for the Manner of taking it makes an Error in either of theſe reſpects very offenſive. As Conſerves, therefore, are, generally, in themſelves, coarſe enough to be knotty in the Mouth, and ſubject to grow more ſo, by candying in keeping; whenever they are ordered in an Electuary, they ſhould previouſly be pulp'd through a Sieve, with a ſufficient Quantity of ſome Syrup, ſuitable to the Intention: If any thing ſhould be, likewiſe, added, which, by beating or rubbing on a Tile, cannot eaſily be rendered thus ſmooth, as Sperma Ceti, or the like, it may be thus drove through a Sieve with the Conſerve, and the Species, or any dry Subſtances, put in afterwards. In regard to Colour, alſo, which is no ſlight Circumſtance as to the taking of a Medicine, a good deal may be contrived to Advantage without Prejudice to its Efficacies. On this Account the Æthiops, or crude Antimony, if poſſible, ſhould be kept out of this Form, becauſe they give ſuch an unſightly Black; and, for this Reaſon likewiſe, moſt Preparations of Steel make very unſightly Electuaries. But beſides avoiding, as much as poſſible, thoſe things which give ill Colours; others, which have not this Inconvenience, may yet be improved by ſuitable Mixture: Thus the Cinnabar, which of itſelf is an agreeable Red, loſes its Beauty in any of the brown or green Conſerves; but is improved by that of Roſes or Hips, and eſpecially if they be a little acidulated with Spirit of Sulphur. The Conſerve of Roſes is, likewiſe, ſo much improved in its Colour with every Acid, that, whenever it comes into an Electuary, it ſhould be thus managed, unleſs the Intention abſolutely forbids it, which can hardly be in any Inſtance, ſo as to make it hurtful.

There are ſome other Circumſtances, likewiſe, in the Preſcription of an Electuary, worth Conſideration, and, particularly, with relation to the Efficacies of ſome things: Thus the ſtronger Cathartics ought not to be truſted in this Form; becauſe the Manner of taking does not ſufficiently aſcertain the Doſe: And the ſame Objection, likewiſe, holds againſt Opiates. The moſt powerful Alexipharmics, alſo, which are commonly given in acute Caſes, are not conveniently thus truſted; ſo that an Electuary is hardly ever met with in a Fever. The Dearneſs of ſome things may be a farther Bar to this, as the Prices uſual for an Electuary will by no means anſwer them: Thus Bezoar, or the Gaſcon's Powder, would make a reaſonable Demand look like Extortion, which is what common Prudence would avoid.

The Quantity of an extemporaneous Electuary ſhould ſeldom exceed three Ounces; and thereabout will an Ounce and half of Conſerve, two Drams of the common Powders, with a ſufficient Quantity of Syrup, amount to; though Cinnabar, and ſome of the heavier things, will not take up ſo much. And if this Rule, as to Quantity, be not obſerv'd by the Preſcriber, but more be ordered, it is a common thing for the Compounder to do it for him by proportioning the Materials ſuitable thereto; as by making up half, or a third, of what is directed.

ELECTUARIUM AMARUM: *The Bitter Electuary.*

Take of Epithymum, half an Ounce; of Angelica-roots, three Drams; of Gentian, Zedoary and Acorus, of each two Drams; of Cinnamon, one Dram and a half; of Cloves, Mace, Nutmegs, and Saffron, of each one Dram; of Aloes, ſix Ounces; and with the Syrups of Citron and Orange-peels, and Sugar, each a ſufficient Quantity, make them into an Electuary.

ELECTUARIUM DE BACCIS LAURI:

Electuary of Bay-berries.

Take of the Leaves of dried Rue, ten Drams; of the Seeds of Biſhops-weed, Cumin, Lovage, Origany, Caraway, wild

wild Carrot, and Parſley, of black and long Pepper, of wild Mint, Calamus Aromaticus, Bay-berries, and Caſtor, each two Drams; of Sagapenum, half an Ounce; of Opopanax, three Drams; of clarified Honey, one Pound and an half: Powder all theſe Ingredients that require it, and make the Whole into an Electuary, by adding the Gums at laſt, after they are well diſſolv'd in White-wine.

This Electuary is much commended for the Uniformity and Efficacy of all its Ingredients, either in the Intentions of a Carminative or Hyſteric, which Purpoſes are advantageouſly enough aimed at by the ſame things in many Inſtances; as there is ſomewhat in them peculiarly aſſiſting to each other. The Gums, as in all Compoſitions of this Make, are to be diſſolv'd in as little White-wine as will ſerve to ſtrain them; and then they are to be mix'd with Honey juſt warm'd; after which the reſt are to be ſifted in, when powder'd. This is very conveniently preſcrib'd, from half a Dram to a Dram, in a Bolus, for any extemporaneous Occaſion, and cannot well be mended by any Additions.

ELECTUARIUM CARYOCOSTINUM. See CARYOCOSTINUM.

ELECTUARIUM DIASPERMATON: *An Electuary of Seeds.*

Take of the greater and leſſer Four cold Seeds, of the Seeds of Aſparagus, Pimpernel, Baſil, Parſley, and Winter-cherries, of each two Drams; of Gromwell, and Juice of Liquorice, each three Drams; of Cinnamon and Mace, each one Dram; of white Sugar diſſolv'd in Water, eight times as much as the Whole: And make into an Electuary. S. A.

ELECTUARIUM EX ELLEBORO:
An Electuary of Hellebore.

Take of the Roots of white Hellebore ſliced, one Pound; of Spring-water, ſix Quarts: Macerate them together for three Days, then boil to the Conſumption of half; ſqueeze out the Liquor by a ſtrong Expreſſion; and to it add three Pounds of Honey, and boil up to a due Conſiſtence.

This Electuary is but the ſame as the *Mel Helleboratum*, which was more proper, it being by no means to be called an Electuary, but only a thick Syrup. Its Doſe is from half an Ounce to an Ounce and an half, or two Ounces.

ELECTUARIUM LENITIVUM: *Lenitive Electuary.*

Take of ſton'd Raiſins, freſh Polypody of the Oak, and the beſt Sena, each two Ounces; of Mercury, one Handful and an half; of Figs, Number twenty; of Maiden-hair, Violet-leaves, and cleans'd Barley, each one Handful; of Damaſk-prunes and Tamarinds, each ſix Drams; of Liquorice, half an Ounce: Boil them together, S. A. in ten Pints of Water, to the Conſumption of a third Part, and ſqueeze out the Liquor by a ſtrong Expreſſion; and in Part of it, while warm, diſſolve the Pulps of Caſſia, Tamarinds, new Prunes, and of Sugar of Violets, each ſix Ounces: In the other Part of the ſtrain'd Liquor melt two Pounds of the fineſt Sugar; and, laſtly, add one Ounce and an half of Sena-leaves in Powder, and of Coriander-ſeeds, powdered, one Ounce to every Pound of the Electuary, ſo that it may be brought into a due Conſiſtence for that Form. S. A.

We ſhall, ſays *Quincy*, offer an Alteration of this Compoſition, which any one may make uſe of at Pleaſure. Take Polypody of the Oak, and French Barley, of each four Ounces; Mercury, and Maiden-hair, of each two Handfuls; Liquorice-root, four Ounces: Boil theſe in a ſufficient Quantity of Water, to two Pounds, or thereabouts; to which add two Pounds of red Sugar, and ſtrain them through a Flannel together hot: Then to this Syrup put the Pulps of Tamarinds, Caſſia, and Prunes, of each ſix Ounces; Powder of Sena, half a Pound; of Aniſe-ſeeds, one Ounce; or, in its room, becauſe the Seeds are difficult to powder fine, of the Oil, one Dram, or ſixty Drops. Great Care muſt be taken, that the Pulps do not burn, or run into Knots, which is to be prevented by having the Fire ſlow, and ſtirring it well during Evaporation to a due Conſiſtence: And when it is high enough, let it be almoſt cold, before the Powders are ſifted in, becauſe they will then mix the ſmoother. Few boil this Medicine up high enough, which makes it fret and ferment, and ſour in hot Weather; and then it gripes, and operates much rougher than is intended: It ought therefore, to be of ſuch a Conſiſtence as will not ſtir by the greateſt Heat, but keep its Form. This gently relaxes the Belly, and, in coſtive Habits, where ſuch things are often wanted, it may rather be taken at any time, to the Quantity of a Nutmeg, than as a Cathartic; but when it is ſo given, the Doſe is from two Drams to one Ounce. A due Conſiſtence gives about one Dram of Sena, in Powder, to every ſix Drams of the Medicine.

ELECTUARIUM PECTORALE: *The Pectoral Electuary.*

Take of the Juice of Liquorice, and of ſweet Almonds, of each half an Ounce; of Pine-leaves, one Ounce; of Hyſſop, Maiden-hair, Florentine Orris, Nettle-ſeeds, and round Birthwort, each one Dram and an half: Seeds of Creſſes and Elecampane-root, of each half a Dram; of Honey, fourteen Ounces: And make into an Electuary.

It is deſign'd for Diſtempers of the Breaſt, to ſoften, cool, and heal the Lungs; but the common Practice hath no Regard to it.

ELECTUARIUM E SASSAFRAS: *Electuary of Saſſafras.*

Take of the beſt-ſcented Saſſafras, two Ounces: of Spring-water, one Quart; boil to the Conſumption of a third Part, adding, towards the latter End, of broken Cinnamon, half an Ounce: When the Liquor is ſtrain'd, boil it again, with one Pound of the fineſt Sugar, to the Conſiſtence of a thick Syrup: And ſtir into it, of the Powder of Saſſafras, one Ounce; of Cinnamon, one Dram; and of Nutmegs, half a Scruple; ſo that it may be made into an Electuary. S. A.

It is a very grateful Medicine to take, and good in all Caſes where Abſorbents and Sweeteners are ordered. Its Doſe is from half a Dram to two Drams, two or three times in a Day.

ELECTUARIUM E SUCCO ROSARUM:
Electuary of the Juice of Roſes.

Take of Sugar, and the Juice of Damaſk-roſes, each one Pound four Ounces; of the three Kinds of Sanders, of each half an Ounce; of Maſtich, three Drams; of Diagrydium, twelve Drams. Let the Sanders be reduced to a Powder, and mix'd with the Diagrydium and Maſtich, after they have been ſeparately powder'd; and then mix'd with the Juice of Roſes and Sugar, boil'd up into a Syrup, while it is warm, ſo as to make them all together into an Electuary.

This is, originally, a Preſcription of *Nicolaus Myrepſus*, and receiv'd by the Auguſtan and College Diſpenſatories exactly alike; but in the new one are rejected Spodium and Camphire, both which were in before, but of no Service to the Medicine.

Medicines in this Form abound in Pharmaceutical Writers. The Curious may conſult *Lemery*'s *Pharmacopée Univerſelle*.

Proſper Alpinus gives a very extraordinary Account of the Effects of an *Indian* Electuary, much in Uſe among the *Egyptians*, call'd *Bernavi*.

The Electuary of *Bernavi* is prepared in thoſe Parts of the *Indies* which lie neareſt to *Egypt*; and though the *Egyptians* receive it thence in large Quantities, they are entirely ignorant of the Ingredients of which it is compos'd; and yet it is a Medicine of uncommon Virtue and Efficacy; for they who take an Ounce of it, firſt become chearful, talk much, ſing Love-ſongs, laugh heartily, and are guilty of ſeveral other Inſtances of Mirth and Foolery. This Turn of Mind continues for about an Hour, after which they become fierce and wrathful; but they do not remain in this State for any conſiderable Time; for they become ſad, melancholy, and dejected to ſuch a degree, that they continually lament and bewail their Fate, till, at laſt, being ſeiz'd with a deep Sleep, they eliminate the offending Matter, and awake in their former State of Health. *Proſper Alpinus de Medicina Ægyptiorum.*

ELELISPHACOS, ἐλελίσφακος. Sage. See SALVIA.

ELEMENTA. The Elements or Principles of which all Bodies are compounded, and into which they are again reſolvable. Philoſophers have not yet agreed what theſe Elements are; neither have they ſaid any thing relative to them, which has not been ſhewn by the Favourers of other Sects, to be falſe and abſurd. As I do not apprehend, that a Diſquiſition on the Elements of Bodies would convey any conſiderable Knowledge relative to the Cure of Diſeaſes, I ſhall enter no farther into this Subject.

ELEMENTATUS. An Adjective us'd by *Paracelſus*, importing exceſſive, either with reſpect to Heat or Cold.

ELEMI GUMMI. The Tree, which produces this Gum, is thus diſtinguiſh'd:

Arbor Braſilienſibus gummi Elemi ſimile fundens, foliis pinnatis, floſculis verticillatis, fructu Olivæ figura & magnitudine, Raii Hiſt. 2. 1546. *Icicariba & illius Reſina Icica*, Piſon. (ed. 1648.) 59. *Icicariba & illius Gummi Icica ſive Elemi*, Ejuſd. (ed. 1658.) 122. *Icicariba Braſilienſibus, cujus Reſina dicitur Icica*, Mareg. 98. *Elemnifera Curaſſavica Arbor*, Parad. Bat. Prod. 332. Pluk. Phytog. 173. *Prunus Javanica Atriplicis foliis Gommelini Kakouſa Javanis*, Ejuſd. 218. Hort.

Beaum.

Beaum. 35. *Prunifera Fago ſimilis Arbor Gummi Elemi fundens, figurâ & magnitudine Olivæ ex Inſula Barbadenſi*, Pluk. Almag. 306. *Arbor ex Surinama, ſive Americana, Myrti Laureæ foliis, Elemi Reſinam fundens*, Breyn. Prod. 2. 19. Ind. Med. 47. *Elemi Gummi*, Ejuſd. *Kækuria, Myrobalanus Zeylanica, ex qua Gummi Elemi*, Herm. Muſ. Zeyl. 48. *Kækuriaghaka*, Ejuſd. 52. *Gummi Elemi Officinarum*, C. B. Pin. 504. *Gummi Elemi*, Park. Theat. 1586. Raii Hiſt. 2. 1847. *Elemi*, Mont. Exot. 11. *Elemi Reſina*, J. B. 1. 535. THE GUM ELEMI-TREE.

This is a ſoftiſh, reſinous, eaſily inflammable Gum, of a pale yelloviſh white Colour, of a pleaſant agreeable Smell, eſpecially when melted. It comes to us from the *Spaniſh Weſt Indies* in long roundiſh Cakes, wrapt up in Flags or Leaves.

This Gum is ſeldom given inwardly, but is of great Service outwardly, being uſed frequently in all Kinds of Wounds, but eſpecially thoſe of the Head and Nerves, being mollifying, ripening, and eaſing Pain.

There is an Ointment in the Shops, called *Unguentum e Gummi Elemi*, and, ſometimes, *Linimentum Arcæi*; which takes its Name from this Gum. *Miller's Bot. Off.*

It heats, mollifies, digeſts, reſolves, ripens, eaſes Pain, is ſerviceable in Affections of the Head and Nerves, and Wounds of the ſame; and, in particular, is a Specific for Wounds of the Cranium: It is good for Contuſions of the Joints, and provokes Urine and the Menſes. *Dale* from *Schroder*.

There is contain'd in it an eſſential Salt, invelop'd in a great Quantity of Oil, with a little Phlegm and Earth; it is only uſed externally in Ointments and Plaiſters. *Lemery des Drogues*. See BALSAMUM.

UNGUENTUM E GUMMI ELEMI, *ſive* LINIMENTUM ARCÆI:

Ointment of GUM ELEMI, *or* ARCÆUS's LINIMENT.

Take of Gum Elemi, Turpentine of Fir, of each one Ounce and a half; of old and depurated Mutton-ſuet, two Ounces: Mix them, and make an Ointment. S. A.

This moſt commonly goes by the Name of *Linimentum Arcæi*, from *Arcæus*, its Inventor; who, in a Treatiſe, *de recta Vulnerum Curatione*, *Lib.* 1. *Cap.* 4. greatly extols this Balſam, as he calls it, particularly in Wounds of the Head; and our Surgeons ſay it digeſts and incarnates much better than the Baſilicon, which is apt to foul a Wound, and generate fungous Fleſh.

ELENGI. The Name of a tall Tree, which grows in *Malabar*; from the Flowers of which, the Inhabitants diſtil a fragrant Water, which is ſaid to be ſerviceable in Melancholy and Fevers.

ELEOSELINUM; from ἕλος, a Fen; and σέλινον, Parſley. A Name for the APIUM, Smallage.

ELEPHANTIASIS, or ELEPHAS; ἐλεφαντίασις, or ἐλέφας. A Species of Leproſy. It is ſo call'd, becauſe it affects the Legs in ſuch a manner, as to make them appear like thoſe of an Elephant. See LEPRA.

ELEPHANTINUM EMPLASTRUM. A Plaiſter deſcrib'd in *Oribaſius*'s *Synopſis*, *L.* 3. There is one, alſo, under this Title, deſcrib'd by *Celſus*, *L.* 5. *C.* 19. *Sect.* 24. which is very different from that of *Oribaſius*.

ELEPHANTOPUS; of ἐλέφας, an Elephant; and πούς, a Foot; Elephant's Foot; a Plant ſo called by Monſieur *Vaillant*; becauſe, he ſays, the Under-leaves of the firſt Sort ſomewhat reſemble an Elephant's Foot.

The Characters are;

It hath a diſcous Flower, compoſed of ſeveral Florets, which are hermaphrodite, contained in one Flower-cup, which is cut into ſeveral Segments, almoſt to the Bottom; the Bottom of the Calyx is flat, and filled with Ovaries, which are beſet on the Top with Hairs: The Diſks are jointed upon a common Placenta, and form a Sort of Sheaf, garniſhed with a Foliage.

The Species are;

1. *Elephantopus Conyzæ folio.* Vaill. Mem. Acad. Scien. 1719. ELEPHANT'S FOOT WITH A FLEABANE LEAF.

2. *Elephantopus folio ſinuato.* Vaill. Mem. Acad. Scien. 1719. ELEPHANT'S FOOT WITH A SINUATED LEAF.

3. *Elephantopus Helenii folio, flore purpuraſcente.* ELEPHANT'S FOOT WITH AN ELECAMPANE-LEAF, AND PURPLISH FLOWERS.

ELEPHAS. This Word has many Significations. In Zoology it imports the

Elephas Offic. Schrod. 5. 285. Schw. de Quad. 87. Raii Synop. A. 131. Aldrov. de Quad. 17. Geſn. de Quad. 376. Charlt. Exer. 4. THE ELEPHANT.

The two large Teeth in the ſuperior Jaw are the Parts of the Elephant principally us'd in Medicine, as well as Mechanics.

It is called *Ebur* Offic. Mont. Exot. 5. Ind. Med. 47. IVORY.

Ivory is a Refrigerant and Drier; is moderately aſtringent, inciding, and a Strengthener of the Viſcera: It ſtops uterine Hæmorrhages, affords Relief in the Jaundice, expels Worms, is good for inveterate Obſtructions; cures Pains and Weakneſs of the Stomach, and the Epilepſy; preſerves from Melancholy; and reſiſts Poiſons and Putrefaction. *Dale* from *Schroder*.

Much the ſame Virtues are aſcrib'd to Ivory as to Hartſhorn. See CERVUS. See, alſo, the Article ALIMENTA, for a farther Account of Ivory.

Elephas, in Chymiſtry ſignifies *Aqua-fortis*. *Rulandus*.

In Botany, it imports a Plant call'd by *C. Bauhine*, *Scordio affinis Elephas ob Florem*; and, by *Parkinſon*, *Scordio affinis Elephas Columnæ*.

ELEPODATUM. Filed. *Rulandus*.

ELERSNA. The ſame as MOLYBDÆNA. *Rulandus*.

ELESMATIS. Burnt Lead. *Rulandus*.

ELETTARI. A Name for the CARDAMOMUM MINUS. *Boerhaave*.

ELEVATIO, Elevation. Chymical Sublimation is, ſometimes, thus call'd: And a Tumor is frequently call'd an Elevation of the Part affected.

ELEVATORIUM. An Elevator. A chirurgical Inſtrument, of which there are many Sorts, that are deſcrib'd under the Articles of the Operations where they are us'd.

ELICHRYSON. The ſame as *Helichryſon*, which ſee.

ELIDRION, imports Maſtich, or Mercury, or Rhaphontic, or a metallic Maſs, of three Parts, one of Silver, one of Braſs, and one of Gold. *Rulandus*.

ELIGII MORBUS. A Fiſtula. *Johannes Anglicus*.

ELIGMA. A Linctus. *Nicolaus Myrepſus*, *Sect.* 13.

ELIXIR. *Lemery* derives this Word from ἑλκω, to draw, or extract; becauſe in making Elixirs, the pureſt Part of the Ingredients is extracted by the Menſtruum; or from ἐλίξω, to help; becauſe of the Aſſiſtance receiv'd from Medicines of this Kind, in the Cure of Diſeaſes. Theſe Derivations, however, ſeem to be very remote from the true one, which is *Arabic*: *Al-ecſir*, or *Al-ekſir*, is Chymiſtry: Hence *Elixir*, a Medicine prepar'd by the chymical Art, is appropriated, by way of Eminence, to a Tincture extracted by a proper Menſtruum, from many efficacious Ingredients; for the Difference betwixt a Tincture, and *Elixir*, ſeems to conſiſt in this, that a Tincture is drawn from one Ingredient, ſometimes with an Addition of another to open it, and diſpoſe it to yield to the Menſtruum; whereas an *Elixir* is a Tincture extracted from many Ingredients, at one and the ſame time: Add, that an Elixir is not ſo clear, but of a ſomewhat thicker Conſiſtence than a Tincture. *Lemery* informs us, that an *Elixir* is, ſometimes, call'd an *Enchiloma*.

There are a very great Number of Elixirs deſcrib'd by chymical Writers, and in the Diſpenſatories, of which I ſhall ſpecify thoſe which follow.

ELIXIR PROPRIETATIS, *with diſtilled Vinegar.*

Take choice Aloes, Saffron, and Myrrh, of each half an Ounce; cut and bruiſe them, put them into a tall Bolthead; pour twenty times their own Weight of the ſtrongeſt Vinegar thereon; let them ſimmer in a gentle Sand-heat for twelve Hours: Now ſuffer the Whole to reſt, that the Fæces may ſubſide; and gently ſtrain off the pure Liquor, thro' a Linen Cloth. Put half the Quantity of diſtilled Vinegar to the Remainder; boil, and proceed as before, and throw away the Fæces: Mix the two Tinctures together, and diſtil, with a gentle Fire, till the Whole is thicken'd to a Third: Keep the Vinegar which comes over for the ſame Uſe; and what remains behind, is the *Elixir Proprietatis*, made with diſtil'd Vinegar.

REMARKS.

Thus we obtain an acid, aromatic Medicine, of great Uſe in the Practice of Phyſic; for, when externally applied, it cleanſes and heals putrid, ſinuous, and fiſtulous old Ulcers, defends the Parts from Putrefaction, and preſerves them by a true embalming Virtue: It alſo heals Ulcers, and cures Gangrenes in the Lips, Tongue, Palate, and Jaws. It has the ſame Effects in the firſt Paſſages, when uſed internally, as often as putrefied Matter, corrupted Bile, concreted Phlegm, Worms, and numberleſs Diſtempers proceeding from theſe four Cauſes, are lodged and ſeated therein. Again, it has nearly the ſame Effects in the Blood and Viſcera, as may eaſily appear, from knowing the Virtues of the three Ingredients, when diſſolved in a ſubtile Vinegar. It is to be taken in a Morning, upon an empty Stomach, at leaſt twelve Hours after Eating: It is given from a Dram to two

of three for a Doſe, in ſweet Wine, Mead, or the like, walking after it, or having the Belly gently rubbed. If taken in a larger Doſe, and with a ſomewhat cooler Regimen, it always purges; if in a leſs Doſe, and often repeated, it cleanſes the Blood, by ſecreting thick Urine; and generally performs both theſe Operations ſucceſſively: But, if taken plentifully, while the Patient is in Bed, and the Body well covered, it acts as an excellent Sudorific; and, afterwards, uſually purges, and proves diuretic; and thus becomes every way uſeful. Hence I conceive, that this is the beſt acid *Elixir Proprietatis*, good in numerous Caſes, and, at the ſame time, ſafe. *Paracelſus* declared, that an Elixir made of Aloes, Saffron, and Myrrh, would prove a vivifying and preſerving Balſam, able to continue Health and long Life to the utmoſt poſſible Limits: And hence he calls it, by a lofty Title, the Elixir of Propriety to Man: But conceal'd the Preparation; in which *Helmont* aſſerts the Alcaheſt is required. *Crollius* formerly uſed the Oil of Sulphur made by the Bell, as a Menſtruum in this Caſe, upon conſidering, according to the Doctrine of *Paracelſus*, that an hungry Acid was proper in ſtomachic Remedies; but when this is uſed, the Aloes and Myrrh are ſcorched, and acquire a ſtony Hardneſs, ſo as not afterwards readily to diſſolve in Alcohol: For this Uſe they require, that the ſtrong Acid of the Sulphur ſhould be diluted: Hence, I conjectured, that a mild, oily, vegetable Acid, would prove a commodious and proper Solvent, in this Caſe, for medicinal Uſes; and, upon adding an equal Quantity of Alcohol to the Elixir prepared in this manner, it becomes more balſamic, mild, and effectual. It, in every reſpect, reſembles the *Pilulæ Ruffi*, and may be ſucceſsfully uſed in their ſtead.

ELIXIR PROPRIETATIS, *with a diſtil'd Water.*

Reduce equal Quantities of Aloes, Saffron, and Myrrh, to Powder; put it into a tall chymical Glaſs; add twenty times their Weight of diſtil'd Scurvygraſs-water; and proceed as above directed.

REMARKS.

This Elixir, tho' excellent, has this Inconvenience, that, when long kept, it grows mothery; but it has extraordinary Virtue in the Body, like thoſe deſcribed above, excepting that it wants the Acid. It is an excellent Purge, and, inſtead of Scurvygraſs-water: Any other aromatic Water may be employed.

ELIXIR PROPRIETATIS, *with a fixed Alcali.*

Take the ſame Species as above, put them into a Bolt-head, and pour as much Oil of Tartar *per Deliquium* to them, as will make them into a moderately thin Paſte, which is to be digeſted in a gentle Sand-heat, of an hundred Degrees: The longer the Digeſtion is continued, the better; the Veſſel being ſtopped: And thus, in time, the Alcali will intimately diſſolve the Aloes and Myrrh for this Purpoſe. When the Matter is thus prepared, let it be treated with any diſtilled aromatic Water, as above deſcribed; and thus there will be obtained an alcalized *Elixir Proprietatis*, with a diſtil'd Water. Or elſe, to the Species prepared as above, add twenty times their Weight of pure Alcohol, and boil them for twelve Hours: When cold, carefully pour off the upper Liquor from the Fæces; add more Alcohol to the Remains, and proceed as before, till all the Virtue be drawn out; then thicken the Tinctures together by gentle Diſtillation, till the Liquor acquires the Conſiſtence of Oil of Almonds; and keep it under the Title of *Elixir Proprietatis, with Alcali and Alcohol:* The Virtues of which Preparation cannot be ſufficiently recommended: Or, if, inſtead of Alcohol, common Spirit be uſed, a thicker, and no leſs noble Elixir will be obtained. In this Preparation I have ſometimes uſed, inſtead of Alcohol or Spirit, the ſimple or compound Spirit diſtil'd from Aromatics; as, the ſimple aromatic Spirit of Lavender-flowers, the ſimple aromatic Spirit from the dry Leaves of Mint, and the ſimple aromatic Spirit from the green Leaves of Roſemary, and, ſometimes, with a compound Spirit; and the Elixir, ſo prepared, has proved excellent.

REMARKS.

Theſe Elixirs are of frequent and excellent Uſe in all Diſtempers proceeding from auſtere, aqueous, cold, phlegmatic, and ſcirrhous Cauſes, or Obſtructions without Inflammations; they purge generally by all the Emunctories of the Body; and are, at the ſame time, grateful to the Nerves and Spirits. They excellently forward the Birth, promote the Menſes, bring down Milk, kill Worms, and ſupply the Defect of the Bile; whence Practitioners cannot be without

them. They act by means of the Alcali, the diſſolved Ingredients, the Spirit, and the Waters, employed in various ways.

ELIXIR PROPRIETATIS, *with tartariſated Tartar.*

To the ſame Ingredients, reduced to Powder, pour thrice their Weight of the Liquor of tartariſated Tartar; digeſt them in a cloſe Veſſel, for three Days, in an Heat of an hundred and fifty Degrees; and thus the Ingredients will be entirely diſſolv'd into an uniform pappy Maſs, much better than by Vinegar, Water, or alcaline Liquor: Then pour on twenty times the Quantity of Alcohol, in reſpect of the Ingredients, and boil them, gently, for twelve Hours: Let all cool, and ſtand at Reſt; then decant the clear Liquor, and treat the reſt with more Alcohol, as before, till nearly the Whole be diſſolved; for little Fæces will here be left. Inſpiſſate all the Elixirs, with a gentle Fire, to the Thickneſs of Oil; preſerve the Alcohol for the ſame Uſe; and thus will be obtained the *Elixir Proprietatis*, with tartariſated Tartar and Alcohol.

REMARKS.

This Elixir, being prepared with a compound, and wonderfully opening Salt, has greater Virtues than the foregoing; ſo that it is admirable in old inveterate Obſtructions, which it powerfully reſolves, without offending by any acid or alcaline Property; for theſe compound Salts, along with what they reſolve, generally paſs quick through the Veſſels of the Body.

ELIXIR PROPRIETATIS, *with regenerated Tartar.*

Put the above-mention'd Species into a tall Glaſs, and pour thereto thrice their Weight of the Liquor of regenerated Tartar; digeſt for three Days, and the Aloes and Myrrh will be thus almoſt entirely diſſolved, and the Saffron thoroughly open'd; then add twenty times the Weight of pure Alcohol, with reſpect to the Powder, boil them gently for twelve Hours; and, in other reſpects, proceed as before: There will remain a few Fæces, which may be thrown away. Inſpiſſate the Elixir to an half; reſerve the Alcohol for the like Uſe: The Elixir will be, and always continue, thick and turbid.

REMARKS.

In this laſt Preparation, the Ingredients are almoſt wholly diſſolved, ſo as to become uniform and potable; whence I have found this Elixir to have an incomparable opening and diſſolving Virtue, in moſt chronical Diſeaſes; where it mightily liquefies the Concretions in the Veſſels, agreeably ſtimulates the nervous Syſtem, ſo as to throw off the Matter thus diſſolved, and prevents Putrefaction, which, in theſe Caſes, is ſo frequent and deſtructive. Hence it relieves the Viſcera, reſtores their Action, impaired by an obſtructing Matter, reſolves the Tumors, and thus cures numerous Diſtempers, ſcarce otherwiſe curable: Whence I have been almoſt inclined to eſteem this Elixir, as the Elixir of *Paracelſus* and *Helmont*.

In all theſe Proceſſes we have an Example of the chymical Solution and Preparation of the ſame thing, by various Solvents; and learn by what means theſe Solutions have different Virtues, according to the Difference of the Menſtruum; and that theſe Elixirs ought to be prepared with different Menſtruums, for daily Uſe, according to the Intention of the Phyſician: So, likewiſe, they act differently, according as they are determined by the Preſcriber: Thus, if taken with *Venice* Treacle, they prove ſudorific; if along with a Cathartic, they purge; and, if along with Whey, or mineral Waters, they prove diuretic, provided the Patient walks abroad in the cool Air. They all of them preſerve the Bodies of Animals from Putrefaction, if ſuſpended therein, except that prepared with Water: They are all of them excellent in caſe of carious Bones, except thoſe prepared with Acids; and hence they ſhould always be ready at hand for Practice, as being almoſt general Medicines; and no Wonder, ſince Saffron is a true Exciter of the animal Spirits; Aloes, an excellent and innocent Purgative; and Myrrh, the higheſt Antiſeptic; but, in thoſe Diſtempers, where the Blood is too much broke, in large Bleedings, or the Hæmorrhoids, or where the Humours are in too violent a Motion, they are by no means proper, but pernicious.

Boerhaave's Chymiſtry, Vol. 3. *Proceſſ.* 81. *&c.*

The *London* Diſpenſatory directs two Proceſſes for preparing the *Elixir Proprietatis*, both different from the preceding. The firſt is call'd, ſimply,

Elixir Proprietatis.

Take of choice Myrrh, of the beſt Aloes, and of Saffron, of each three Ounces; when they are powder'd, pour upon them a Quart of rectify'd Spirit of Wine: Digeſt them four Days, to an Extraction of the Tincture, which pour off: To the Remainder, pour on more Spirit of Wine; digeſt, and pour off as before; and, afterwards, draw away ſome of the Spirit by Diſtillation: It is made acid, by an Addition of the Spirit of Sulphur; any Quantity, at Diſcretion.

This may be given from ten to thirty Drops to Children; and to grown Perſons, from twenty to ſixty Drops, or more.

It is particularly good in pale, wan Complexions; and will, itſelf, frequently cure the Green-ſickneſs; but in hot, florid Conſtitutions, it does not ſo well agree, eſpecially in thoſe ſubject to the Gravel. It is accounted very good to deſtroy Worms in Children; and, certainly, there is nothing better to keep the Bowels clear of thoſe ſlimy and viſcid Humours, the Effects of Indigeſtion, which breed them, than this Medicine, if long and frequently taken, as twice or thrice a Day, for three or four Weeks together.

The other is under the Title of

Elixir Proprietatis Helmontii.

Take of red Tartar, and Nitre, each twelve Ounces: Let them be powdered, and, by degrees, put into an hot Crucible; let then the calcined Matter be poured into a Glaſs Mortar, whereupon pour two Pints of White-wine, and make a Lixivium: In this Lixivium, put Aloes and Saffron, each one Ounce and an half, ſo as to make a Tincture.

Take of Sal Armoniac, eight Ounces; diſſolve it in twenty Ounces of Spring-water; and, when ſtrained, evaporate it to a Dryneſs: Of this Salt take one Ounce; of White-wine, one Pint; and make a Lixivium, in which diſſolve one Ounce and an half of Myrrh, ſo as to make a Tincture. Mix all theſe Tinctures together in a Veſſel, well ſtopped, ſo as to make them into an Elixir.

Elixir Vitrioli: *Elixir of Vitriol.*

Take Cinnamon, Ginger, and Cloves, of each three Drams; Calamus aromaticus, one Ounce; Galingal, an Ounce and an half; Sage and Mint dry'd, of each half an Ounce; Cubebs, and Nutmegs, of each two Ounces; Wood of Aloes, and Citron-peel, of each one Dram: Powder them together, and add to them white Sugar-candy, three Ounces; Spirit of Wine, three half Pints; and Oil of Vitriol, one Pound: Digeſt them together for twenty Days; and then pour off the Liquor, and filtre it for Uſe.

This is now tranſplanted into the College Diſpenſatory; where it is aſcribed to *Mynſicht* for its Author. The Spirit had better be digeſted upon the Ingredient ſome time by itſelf, becauſe the Oil of Vitriol gives a Thickneſs to it, and diſables it from taking out the Virtues of the Spices; and, when it is put in, it muſt be done very gradually, becauſe it will otherwiſe cauſe ſo ſudden an Heat, as to endanger burſting the Veſſel. Many have got a way of putting in *Jamaica* Pepper, for all the Spices; but it is not ſo juſt to vary from the Receipt, when there is no Reaſon for it but Cheapneſs, and the Medicine thereby becomes the worſe; which it certainly does in this Inſtance, becauſe that is a more oily Spice than thoſe here order'd, and therefore cannot make ſo good a Stomachic. This Medicine is greatly come into Practice of late, and very deſervedly; for it mightily ſtrengthens the Stomach, and will do good Service, ſometimes, where Bitters avail nothing, eſpecially in Relaxations from Debauches and Over-feeding. This very well imitates the Virtues of the celebrated Bark, and is properly given in all Intentions, where that is found to ſucceed; ſo that, by its Help, Intermittents, and many Diſorders from too lax a State of the Solids, may be remov'd, with a much leſs Quantity of the Bark than they might otherwiſe require. It has an Influence, alſo, over many Diſtempers of the Head to Advantage, and preſerves againſt Epilepſies, Apoplexies, Palſies, and rheumy Defluxions. It may be given from ten, to thirty or forty Drops, in any ſuitable Vehicle, once, twice, or thrice a Day; obſerving to take it when the Stomach is moſt empty, as in the Morning faſting, a little before Dinner, and in the Afternoon. This is the very Medicine which Mr. *Fuller*, Author of the *Medicina Gymnaſtica*, gives an Account of, in his Appendix, to have been order'd to him by a Phyſician; and by the ſole Help of which he was recover'd from a moſt deplorable Decay of Conſtitution, particularly of the Stomach, and continual Reachings to vomit for ſome time; tho', from a Return afterwards into the ſame Irregularities, which was, driving away hypochondriac Complaints by ſpirituous Liquors, he relapſed, and died.

Elixir Salutis.

Take of Sena-leaves, cleared of their Stalks, four Ounces; of Guaiacum-chips, of dry'd Elecampane-root, of the Seed of Aniſe, Caraway, Coriander, and of Liquorice-root, of each two Ounces; of Raiſins ſton'd, eight Ounces; of *French* Brandy, three Quarts: Steep them together cold for four Days, and then ſtrain out the Spirit for Uſe.

This is in *Shipton's Additamenta*, where he ſays, that ſome, likewiſe, add Salt of Tartar, Rhubarb, Scammony, and Jalap, in order to make it operate more briſkly; for, as here directed, the purgative Ingredient, which is the Sena only, bears ſo ſmall a Proportion to the Quantity of Spirit, in a Doſe ſufficient for a Purge, that it is too ſtrong for moſt Perſons, who have not been accuſtomed to ſpirituous Liquor: It, therefore, is now to be deemed rather a Carminative than a Cathartic; and, in ſome colic Pains it gives great Relief: The Doſe is, one or two Spoonfuls at a Night, and three or four in the Morning.

Daffy's Elixir is ſaid to be little more than this.

Whereas I have frequently, in my Quotations from *Frederic Hoffman*, mention'd his *Elixir Balſamicum*, *Balſamum Vitæ*, and *Balſamum Liquidum Spirituoſum*, by which I apprehend he means the ſame Medicine; it will be proper in this Place, to communicate ſo much as is known of its Preparation.

Elixir Balsamicum Hoffmanni.

This Preparation is found under the Title of *Balſamum Vitæ Haffmanni*, in the *Straſburg* and *Ratiſbon* Diſpenſatories; and is taken, with a little Variation, from the Author's Notes on *Poterius*; where the following Directions are given for its Preparation:

Take of the freſh-diſtil'd Oils of Lavender, Marjoram, Cloves, Cubebs, Cardamoms, and Citron, each one Scruple; of the diſtil'd Oil of Mace, two Scruples; of the Oil of Cinnamon, twenty-four Drops; of the Oils of Rue, and white Amber, each half a Scruple: Let theſe Oils be mix'd together, and ſtand for ſome Weeks.

When, therefore, we want the extemporaneous Balſam of Life, let ten Drops of theſe Oils be pour'd into an Ounce of highly rectify'd Spirit of Wine. And if we intend, that it ſhould be render'd more grateful, half a Scruple of Ambergriſe may be previouſly diſſolv'd in the Oils. But this Balſam will ſtill be impregnated with higher and richer balſamic Qualities, if to one Ounce of it we add half a Dram of Peruvian Balſam; by which it is render'd good againſt Apoplexies, and is of ſingular Uſe both internally and externally. Internally it may be given from ten to twenty Drops in Weakneſſes, colic Pains, Faintings, and Lowneſs of Spirits; and, externally, it may be applied to the Noſe, the Wriſts, the Nape of the Neck, and the Crown of the Head; in all Weakneſſes of the Head, as alſo in ſpaſmodic and lethargic Diſorders.

But, according to *Schulzius*, in his *Prælectiones*, this is not the Deſcription of that liquid ſpirituous Balſam which the Author has for many Years prepar'd in his own Houſe; for, ſays he, I am abſolutely certain, that no one has got the Preparation from himſelf. However, the Circumſtance of the moſt Importance conſiſts in the Purity of the diſtil'd Oils, and their not having chang'd or loſt the fine and ſubtile Nature of their æthereal Particles by Length of Time; for which Reaſon, he not only diſtils a great many vegetable Oils himſelf, but alſo ſubjects ſuch as are a Year old to a new Diſtillation; that, by depoſiting their recrementitious Parts, they may recover their due and natural Fineneſs; for he imagines, that the finer theſe Oils are, the more readily they paſs through the Emunctories, and are, conſequently, fitter and better accommodated to internal Uſe. With reſpect to the various Uſes of this Elixir, whether internal or external, the Author is very full in ſeveral Parts of his Works. The Doſe is from ten to fifteen, or twenty Drops. See the Article Balsamum.

ELIXIS, ἐλιξις, from λείχω, to lick. An Eclegma, or Linctus.

ELIXIVIATIO, Elixiviation; that is, the Operation by which a fix'd Salt is extracted from the Aſhes of Vegetables, by an Affuſion of Water.

ELIZ, or ELZIMAR, or ELZ. Flos Æris. *Johnſon.* See Æs.

ELLEBORINE. See Helleborine.

ELLEBORITES. See Helleborites.

ELLEBORUS. See Helleborus.

ELLOBOS, ἔλλοβον. An Epithet for ſuch Seeds or Fruits as are contain'd in Pods or Lobes.

ELLYCHNIOTOS, ἐλλυχνιωτὸς, from ἐλλύχνιον, the Wick of a Lamp or Candle. A Sort of Lint us'd by the antient Surgeons, thus call'd, either becauſe it was made up in the Form of a Wick of a Lamp; or, rather, becauſe it was made of the ſame Materials.

ELLYCHNION, ἐλλύχνιον· from λύχνος, a Lamp; the Wick of a Lamp, or Candle.

The *Ellychnium* of the Antients was a certain Kind of Matter, which ſerv'd them for a Wick to their Lamps or Candles. This appears from *Galen*, who, *Lib.* 14. *M. M.* directs the Uſe of *Ellychnium*, eſpecially the ſofteſt, ſuch as that of *Tarſus*, inſtead of a Sponge; but of what particular Stuff or Materials this *Ellychnium* of *Tarſus* was compoſed, we have no Information: For, tho' *Pliny* mentions ſome *Ellychnia*, ſuch as that compoſed of the Fruit of the *Ricinus*, which he commends for its extraordinary Clearneſs, and that made of the *Papyrus*, and another prepared of the *Phlomis*, which Plant is therefore called *Lychnitis*, and, by ſome *Tryallis*, having thick fat Leaves, very well adapted for the Purpoſe; and, laſtly, that compoſed of a kind of Sulphur; yet, he no-where ſays a Word of the *Ellychnium Tarſenſe*: The only one who mentions it is *Galen*, who, *Lib.* 13. *M. M.* ſhewing the Method of bringing Ulcers to a Cicatrix, ſpeaks of this *Ellychnium*; and, *Lib.* 14. *ibid.* teaching a Way to cure an œdematous Swelling, he adviſes to uſe a Sponge dipt in Oxycrate; and, for want thereof, an *Ellychnium* of *Tarſus*. *Cornarius*, *Comment. in* 3. κατ. τοπ. endeavours to prove it a kind of terreſtrial Fungus, which is accommodated to ſerve inſtead of Wicks for Lamps or Candles, and, alſo, uſed inſtead of Spunges, eſpecially when they are new: But the learned *Mercurialis*, *Var. Lect. Lib. Cap.* 17. explains it of a Kind of Wood, called by the *Greeks* ξύλον (*Xylon*), that is, Cotton.

ELMINTHES, or HELMINTHES, ἕλμινθες. Worms.

ELOANX, or ELOME. The ſame as AURIPIGMENTUM.

ELODES, or HELODES. An Epithet for a Species of Fever, attended with profuſe Sweats, ſomething like the SUDOR ANGLICUS.

ELOGIUM. This Word is us'd by *Paré*, in the ſame Senſe as *Renunciatio*; which is, the Judgment or Report of a Phyſician, relative to the State of the Sick.

ELOME. See ELOANX.

ELONGATIO. An imperfect Luxation; when the Ligaments of a Joint are ſtrain'd, and the Limb lengthen'd, without being perfectly out of Joint.

ELOPITINUM. Vitriol. *Rulandus.*

ELOS *Maris*. Burnt Lead. *Rulandus.*

ELOXOCHITL. The Name of an *Indian* Tree, mention'd by *Ray*, under the Article *Banana*, without aſcribing any medicinal Virtues to it.

ELPIS. The Scoriæ of Silver. *Rulandus.*

ELTZ. See ELIZ.

ELUTRIATIO. The pouring a Liquor out of one Veſſel into another, in order to ſeparate the ſubſiding Matter from the clear and fluid Part.

ELUVIES, in *Pechlinus*, imports the Humour diſcharg'd in a *Fluor Albus*.

ELUXATIO. The ſame as LUXATIO.

ELYMAGROSTIS. A Name for the *Gramen*; *Panicum*; *Panicula ſimplici*. See PANICUM.

ELYMOS. A Name for the PANICUM. *Blancard.*

ELYTHROIDES. The *Tunica Vaginalis* of the Teſticles.

ELYTRON, ἔλυτρον· from ἑλύω, to involve, or cover. An Involucrum, Covering, Vagina, or Sheath of any Kind. *Hippocrates* calls the Membranes which involves the ſpinal Marrow, ἕλυτρα.

ELZIMAR. See ELIZ.

EMANSIO. *Ettmuller* thinks *Emanſio Menſium*, would be a more proper Term than *Suppreſſio Menſium*, to expreſs a Cohibition of the Menſes. This Obſervation appears very trifling.

EMBAMMA, ἔμβαμμα· from βάπτω, to immerge, or dip. A Sauce, or Pickle, to dip Victuals in, as it is eaten. Muſtard is a Sort of *Embamma*.

EMBAPHION, ἐμβάφιον. An *Acetabulum*, or Cruet, for holding *Embammas*. In *Hippocrates*, it ſometimes imports a Meaſure, the ſame as *Acetabulum*.

EMBASIS, ἔμβασις· from ἐν, in, and βαίνω, to go. A bathing Tub, or Veſſel, fill'd with warm Water.

EMBATE, ἐμβάτη. This Word is in *Hippocrates*, *de Morbis internis*. It is explained a leathern Garment. But ſome take it to ſignify the ſame as EMBASIS.

EMBOLE, ἐμβολή· from ἐμβάλλω, to put in. The Reduction or Setting of a diſlocated Bone.

EMBORISMA. A barbarous Word, importing an *Aneuriſm*.

EMBOTUM. A Funnel, for conveying Fumes into any Orifice of the Body.

EMBREGMA, EMBROCHE, ἔμβρεγμα, ἐμβροχή· from ἐμβρέχω, to irrigate, or moiſten; an Embrocation. It is an external Kind of Remedy, which conſiſts in an Irrigation of the Part affected, with ſome proper Liquor, by means of a Woollen or Linen Cloth, or a Spunge dipt in the ſame. Its Uſe is either to attenuate and diſlodge ſomething obſtructed underneath the Skin, to eaſe Pain, or to irritate the Part into more Warmth, and a quicker Senſe of Feeling.

EMBROCATIO. The ſame as the preceding Word; which ſee.

EMBRONTETOS, ἐμβρόντητος· from βροντὴ, Thunder; is, properly, one Thunder-ſtruck; but is, from a Similitude of Effects, apply'd to a Perſon ſeiz'd with the Apoplexy.

EMBRYO, EMBRYON, ἔμβρυον· (from ἐν, in, and βρύω, to pullulate, or bud forth; παρὰ τὸ ἔσω βρύειν, ἢ ἐντὸς τῆς γαστρὸς αὔξεσθαι, "because it pullulates in the internal "Parts, and grows within the Womb") in the Senſe of *Hippocrates*, is the Child, or Fœtus, in the Womb, as appears from 5 *Aph.* 31. 48. 60. and other Places of his Works. *Galen*, *de Symptom. Cauſ. Lib.* 1. *Cap.* 7. ſays, that the Fœtus, under two Months old, is not call'd in *Greek*, *Embryon*, but κύημα, *Cyema*, "a Conception." *Marcellus*, in *Fœtura Hominis* obſerves, that the *Embryo* is what the pregnant Woman carries in the Womb, and is called by that Name as long as ſhe carries it. *Dioſcorides* uſes the Word in the ſame Senſe in many Places. This Term *Embryon* is apply'd by *Homer*, and frequently by *Ariſtotle*, to the Fœtus of Brutes; and, by *Theophraſtus*, to the Seeds of Plants; in which he is follow'd by modern Authors.

EMBRYONATUM *Sulphur*. The Chymiſts, particularly *Gerard Domneus*, diſtinguiſh Sulphur into three Kinds: The firſt is the univerſal Sulphur, or Reſin of the Earth, not united with any thing; by which they ſeem to mean, the univerſal Acid. The ſecond is, the *Sulphur Embryonatum*; that is, the ſame Sulphur, united to Minerals and Metals. The third is the ſame Sulphur, ſeparated from Metals and Minerals by Art.

EMBRYOTHLASTES, ἐμβρυοθλάστης· from ἔμβρυον, a Fœtus; and θλάω, to break. An Inſtrument contriv'd for breaking the Bones, for the more ready Extraction of the Fœtus, in difficult Labours. *Hippocrates* calls it πίεσσον.

EMBRYOTOMIA; from ἔμβρυον, a Fœtus, and τέμνω, to cut. An Exſection of the Child out of the Womb. It differs from the *Cæſarean* Section in this, that in the laſt the Child is taken out entire, by an Inciſion made in the Abdomen of the Mother; whereas, in this, the Child is cut into Pieces whilſt in the Womb, for the more eaſy Extraction, without injuring the Mother.

EMBRYULCUS, ἐμβρυουλκός· from ἔμβρυον, a Fœtus, and ἕλκω, to draw. A Hook, for the Extraction of a Child in a difficult Labour. It is alſo call'd ἑλκυστήρ. See *Tab.* 54. *Fig.* 16. 17. 18. 19. 20. and 21.

EMBULA. A Pipe. *Rulandus.*

EMBULARCHI *Suffumigium*. A Suffumigation deſcrib'd in *Aetius*, *Tetrabib.* 4. *Serm.* 4. *C.* 122.

EMBYAYEMBO. The Name of a Plant, which grows in *Braſil*. *Raii Hiſt. Plant.*

EMERICUS. Emery. See SMYRIS.

EMERUS.

The Characters are;

It has the Leaves and Appearance of the *Colutea*; and bears a ſlender Pod, full of cylindrical Seeds.

Boerhaave mentions two Species of this Plant; which are,

1. Emerus *Cæſalp.* 117. *Colutea, ſcorpioïdes, major & elatior, fruteſcens.* M. H. 2. 122. SCORPION SENA.

2. Emerus; minor. *Tourn. Inſt.* 650. *Elem. Bot.* 510. *Boerh. Ind. A.* 2. 49. *Emerus*, Offic. *Colutea humilis*, Park. Theat. 227. *Colutea Scorpioïdes humilis*, Ger. 1117. Emac. 1300. Raii Hiſt. 1. 924. J. B. 1. 382. Chab. 81. *Colutea Scorpioïdes humilior & minor*, Hiſt. Oxon. 2. 122. *Colutea ſiliquoſa minor*, C. B. Pin. 397. *Colutea ſiliquoſa ſeu Scorpioïdes minor*, Jonſ. Dendr. 378. *Coronilla montana*, Rivin. Irr. Tetr. Rupp. Flor. Jen. 216. Buxb. 85. LESSER SCORPION SENA.

This Plant grows in hilly Places, and flowers in *June*. The Leaves are uſed; but *Boerhaave* is unacquainted with any medicinal Virtues belonging to them. *Ruppius* writes, that the common People ſubſtitute the Leaves, inſtead of thoſe of Sena; and *Buxbaums* tells us, that the old Women, who pretend to Medicine, call it SENES BLATTER, and uſe it inſtead of Sena-leaves. *Dale.*

EMESIA, and EMESMA, ἐμεσία, ἔμεσις, and ἔμεσμα· from ἐμέω, to vomit. The ſame as EMETOS, which ſee.

EMETICA, from ἐμέω, to vomit. Emetics, or Medicines which induce Vomiting.

Hippocrates, as a powerful Preſervative againſt Diſeaſes, ordered Emetics, which were to be exhibited once or twice a Month, during the Winter and Spring. The moſt ſimple of theſe Emetics conſiſted only of a Decoction of Hyſſop, with the Addition of a ſmall Quantity of Salt and Vinegar. This Preparation was to be taken, faſting, by thoſe who were in good Plight

Plight of Body; whereas thoſe who were lean and extenuated, were to uſe it after Dinner or Supper.

We learn from *Diodorus Siculus*, that the Practice of the antient *Egyptian* Phyſicians conſiſted pretty much in provoking to vomit, together with Clyſters and Abſtinence.

Aſclepiades, notwithſtanding his Averſion to Purges, yet ventur'd to vomit his Patients ſometimes, particularly after Supper. *Plutarch*, however, appears to have been a very great Enemy to Emetics, as well as Cathartics, if we may judge of his Sentiments by his Writings.

Among the ſeveral Medicines of the evacuating Kind, Emetics, or ſuch as excite Vomiting, are none of the leaſt conſiderable. Theſe are either mild and gentle, or of a more ſtrong and draſtic Nature. Among the former, we may juſtly reckon common Water render'd tepid, with the Addition of a little Salt and Honey, or expreſs'd Oil, or Fat, or made into a Decoction with the Seeds or Bark of Horſe-radiſh, or the Seeds of Dill; or the Waters of warm Mineral Springs, drank in large Quantities at a time.

Among thoſe of the more violent and draſtic Kind, the Vegetable Kingdom ſupplies us with theſe following: The Leaves and Root of Aſarabacca, white Hellebore, the Juice of the middle Bark of the Elder-tree, Gamboge, Ipecacuanha, and all the draſtic Purgatives exhibited in too large Quantities; among Metals and Minerals, all Preparations of Copper, ſuch as white *Cyprian* Vitriol, the Gilla of *Paracelſus* and *Angelus Sala*, prepared of the *Caput Mortuum* of the Oil of Goſlar Vitriol, which partakes of the Nature of Copper; the Cryſtals of Verdegriſe; the Emetico-diaphoretic Salt of *Moebius*, prepar'd of equal Quantities of Goſlar Vitriol and Nitre; as alſo ſuch Subſtances as receive their emetic Qualities from the reguline Part of Antimony they contain, ſuch as emetic Tartar, Glaſs of Antimony, and the *Aqua Benedicta* of *Rulandus*, prepar'd of it; the *Mercurius Vitæ*, eſpecially when prepar'd of rectified Butter of Antimony, by Precipitation with common Water, or Oil of *Tartar per Deliquium*; the *Pulvis Monckii*, prepar'd of two Parts of the chalybeated Regulus of Antimony, and one of Nitre; the Golden Sulphur of Antimony corrected, and the *Panacea Glauberiana*, or *Conordingiana*, if five or ſix Grains of them are exhibited.

The milder Emetics, and ſuch as are pretty much of a dietetic Nature, were principally uſed by *Galen*, and the Antients, ſince they are ſafe, and generally, by their Quantity, ſtimulate the Stomach to vomit, eſpecially when it is weak, and diſpos'd to throw up its Contents, which may be diſcover'd by a Nauſea, Eructations, Bitterneſs of the Mouth, and the uneaſy State of the Patient. But theſe do not act beyond the Limits of the Stomach, from which they very advantageouſly evacuate crude, phlegmatic, and bilious Humours, produced by improper Aliments, or a bad Digeſtion.

The more ſtrong and draſtic Emetics, when exhibited in a ſmall Doſe, by their fine, cauſtic, ſalino-ſulphureous Acrimony, act, not only on the nervous Coat of the Stomach and Inteſtines, by ſpaſmodically conſtricting them; but, if exhibited in a ſomewhat larger Doſe, they penetrate beyond the Stomach, into the highly nervous biliary Ducts, into the Glands of the Inteſtines, Meſentery, and Pancreas, as alſo into the Liver, and expel their contain'd Humours from theſe Parts. Sometimes, alſo, they affect the whole nervous Syſtem, and prove highly injurious to the Conſtitution.

Practical Corollaries.

The Antients, as an Emetic of the moſt draſtic Kind, us'd white Hellebore, as *Celſus*, in the 13th Chapter of his ſecond Book, informs us; and that in Epilepſies, Madneſs, and other terrible Diſorders, when not accompanied with a Fever. But he juſtly adviſes, that the Body ſhould be duly moiſten'd, before this Medicine is uſed. But in our Times, as we have more ſafe Emetics, we juſtly abſtain from this draſtic Medicine, and make Choice of ſuch of the above-mention'd, as are more friendly to Nature, and the nervous Syſtem, and may be exhibited with leſs Danger: Among which we may juſtly give the Preference to that *American* Root Ipecacuanha, half a Dram, or more, of which may be exhibited for a Doſe. This Root, beſides its ſaline, ſubtile, and acrid Principle, alſo contains one of a balſamic and corroborating Quality, and has this peculiar Advantage attending it, that it ſoon produces its Effects; for which Reaſon it is very properly uſed where Delays might be attended with bad Conſequences. And becauſe, in Vomiting, the periſtaltic Motion of the Stomach, and by Conſent that of the Inteſtines, is inverted, if the Vomiting is very intenſe in a Diarrhœa, or Dyſentery, the Flux is by that means check'd and ſtopt for ſome time. Hence *Celſus*, in the third Chapter of his firſt Book, juſtly affirms, that Vomits ſtop Fluxes, and render the Body ſoluble, when coſtive. The moſt commodious Succedaneum for Ipecacuanha is Aſarabacca, the Root and Leaves of which are poſſeſs'd, not only of a ſubtile, acrid, volatile, and cauſtic Principle, which in Boiling eaſily exhales, but alſo of a corroborating and balſamic Quality, and afford ſingular Relief in inveterate Fevers of the tertian and quartan Kind, as alſo in Dropſies, and the Jaundice. Among antimonial Preparations, we give the Preference to emetic Tartar, prepar'd of the *Crocus Metallorum*, and not of Glaſs of Antimony, which is as ſtrong again. Three or four Grains of this Tartar, either alone, or in a ſmaller Doſe with Ipecacuanha, prove an excellent Vomit. And if the Intention is to purge and vomit at one and the ſame time, two or three Grains of emetic Tartar may be added to a Decoction of Manna. With the ſame Intention we may uſe five or ſix Grains of the *Panacea Glauberiana*, exhibited with one Scruple of Cream of Tartar; and in a pituitous Aſthma, this End is ſometimes very commodiouſly anſwered by two or three Ounces of Oxymel of Squills. But as for the emetic Preparations of Copper, which, by their conſtrictive Quality, long exagitate the nervous Coats of the Stomach, and other Parts; as alſo the reguline Powders of Antimony, the Pulvis Monckii, the Glaſs of Antimony, and the Mercurius Vitæ, whoſe Effects cannot be depended on, ſince they act either too ſtrongly, or too weakly, according to the State and Diſpoſition of the Humours in the Stomach, we ought carefully to abſtain from them, and may be very well without them in the Materia Medica.

Draſtic Emetics are ſometimes not only uſeful, but abſolutely neceſſary for expelling Poiſons, eſpecially of the narcotic Kind; as alſo the infectious Particles which exhale from Patients labouring under contagious Diſorders, and which, deſcending to the Stomach, there mix with the Juices, and, unleſs ſoon carry'd off, are convey'd into the Maſs of Blood. In like manner, draſtic Emetics are neceſſary for evacuating the corrupted and peccant Humours ariſing from the Commixture of heterogeneous Aliments, the Bile, and fermenting ſalival Humours, which, ſtagnating in the Stomach and Inteſtines, eſpecially the Duodenum, become corrupted by their Continuance there, and frequently give Riſe to Fevers of the ſlow, the quotidian, and the quartan Kind; as alſo to chronical Coughs, to violent Diſorders of the Head, Melancholy, a Hemicrania, and ſometimes to an Epilepſy, or Apoplexy.

In Diſeaſes ariſing from a thick Bile form'd, as it were, into a viſcid Coagulum, and obſtructing the biliary Ducts, ſuch as the black and yellow Jaundice, a Cachexy, and ſome others, Emetics are ſometimes uſed with Succeſs, when other Medicines prove ineffectual; ſince they attenuate the bilious Sordes, which are the Cauſes of theſe Diſorders.

In Anaſarcas, Leucophlegmatias, œdematous Swellings of the Parts, and a curable Aſcites, Emetics, exhibited in a pretty large Doſe, frequently carry off by Stool, but rarely by Vomit, the aqueous Serum from the Liver, and the Ducts and Glands of the Inteſtines, Meſentery, and Pancreas.

In all feveriſh Paroxyſms, Inflammations of the Stomach, or Caſes where it is affected with Spaſms, as, for Inſtance, in Cordialgias, violent Anger, hyſteric and hypochondriac Spaſms, and where there is a Diſpoſition to a Spitting of Blood, or an immoderate Diſcharge either by the Menſes, or hæmorrhoidal Veins, as alſo in all Diſeaſes ariſing from a Congeſtion of Humours to the Head, ſuch as Apoplexies, Palſies, Vertigoes, violent Head-achs, a Loſs of Hearing or Sight, Vomits are never to be uſed; nor are they to be exhibited to plethoric Patients, till the Plethora is removed by Veneſection, nor to thoſe whoſe Inteſtines are ſtuff'd with Fæces, till theſe are previouſly evacuated, and purged off.

'Tis proper, in order to make Emetics work more eaſily, to exhibit them always in a liquid Form, or in a ſufficient Quantity of ſome moiſtening, relaxing, and pinguious Vehicle; for Vomiting not only requires a powerful Conſtriction of the Pylorus, and Bottom of the Stomach, but alſo a Relaxation of the ſuperior Orifice of the Œſophagus.

During the Operation of Emetics, and after it is over, the Patient is carefully to guard againſt Cold, to abſtain from cold Liquors, from the Sallies of Paſſion, from hot and ſtimulating Medicines, from acrid and ſalt Aliments, and rather to uſe ſuch as are of a demulcent Nature, afford laudable Juices, and are of eaſy Digeſtion. It is of ſingular Uſe to drink a few Ounces of Aſſes Milk, if it can be had, about four Hours after the Operation of the Vomit is over. *Frederic. Hoffman. Medic. Rational. Syſtemat.*

Sydenham lays it down as a Rule, that, whenever a Vomit and Bleeding are neceſſary, Bleeding ſhould always precede the Exhibition of an Emetic. The principal Vomit recommended by the laſt-quoted Author was the emetic Wine; and I much queſtion whether we have improv'd his Method, by ſubſtituting Ipecacuanha in its ſtead, eſpecially in Fevers, febrile Diſorders, and the Small-pox. At leaſt, our Ipecacuanha does not ſucceed ſo well with us, as his emetic Wine is repreſented to have done with him. If we conſider with due Attention what has been ſaid under the Article *Duodenum*, the Reaſons for this Difference will be pretty obvious.

Alexander Trallian recommends Vomits above all Things in Tertians, and much more in Quartans, taken before the Fit; and of the latter he has cur'd the moſt inveterate by this Remedy alone. This is a Practice, which, *Freind* obſerves, is mention'd, tho' little inſiſted upon, by the reſt of the Antients; but

conſonant to Reaſon, and of great Advantage, not only in theſe, but in many other Caſes.

Dr. *Harris*, in his Diſſertations, informs us, that antimonial Vomits are ſafe in the Heat of the Summer, but are very dangerous in the Cold of the Winter. The ſame Author, alſo, tells us, that white Vitriol is an excellent, mild, and ſafe Emetic, in a Doſe of four Scruples. He alſo informs us, that, where Carduus and Aſarabacca are thought too mild, Fox-glove, in Decoction, will anſwer the moſt violent Intentions, as an Emetic.

Dr. *Cheyne*, in all his Works, recommends Vomits as the moſt effectual Means of Relief in nervous Caſes.

There is, or at leaſt was very lately, a Man in *Cheſhire*, commonly call'd the Vomiting, or Straw-hat Doctor, who render'd himſelf famous for exhibiting a particular Sort of Emetic, which he kept as a Secret. This Vomit has the Reputation of operating very ſoon, with great Eaſe, and good Effect.

I am inform'd, that his Vomit is the following Water; and my Authority for this is very good:

Take of the Leaves and Flowers of the common Meadow Crow-foot. Let them be diſtil'd in a common Alembic, in the ſame manner as common Simple Waters, as long as any Pungency remains in the Liquor. The diſtil'd Water is very hot and pungent, and requires lowering with common Water, till it may be drank. The Method of taking it is, to fill the Stomach firſt with about a Quart of warm Water; then give an Ounce of the Liquor, which in a few Minutes brings up the Water without any Violence. This is to be repeated, till the Patient has vomited ſufficiently.

Common Salt is us'd to check the Operation of Emetics; which it will certainly do, and make them run off by Stool. Violent Vomitings are, alſo, ſtopt by copious Draughts of warm diluting Fluids; by mild Oils; by Opiates, Aromatics; by grateful Acids, and corroborating Medicines, either taken internally, or apply'd externally to the Region of the Stomach.

EMETOCATHARTICUM. A Medicine which both vomits and purges.

EMETOLOGIA. From ἔμετος, a Vomit, and λόγος, Diſcourſe. That Part of Medicine which treats of Emetics.

EMETOS, ἔμετος, from ἐμέω, to vomit. A Diſcharge of the Contents of the Stomach by Vomit. See VOMITUS.

EMEU, or EME, Cluſ. EMEU, vulgo *Caſoaris*. The Name of a very large Bird of the Oſtrich-kind, call'd *Caſoar*, which is found in the *Molucca* Iſlands. The Fat of this is the only Part recommended in Medicine; which is ſaid to be emollient, reſolvent, nervous, and digeſtive.

EMIAI, ἐμίαι. *Galen* ſays, that this is an *Attic* Word, importing Vomitings.

EMINENTIA. Any Protuberance, or preternatural Tumor, is thus called.

EMISSARIUM, in Medicine, is any Orifice of the Body, either natural or morbid, out of which any thing is emitted.

EMMENAGOGA, ἐμμηναγωγὰ, from ἐμμήνια, the menſtrual Diſcharges; and ἄγω, to draw, lead, or force. Emmenagogues, or Medicines which promote the menſtrual Flux; tho' *Frederic Hoffman* ſeems to include, under this Name, thoſe Remedies which cauſe a Diſcharge of Blood from the hæmorrhoidal Veins.

Among thoſe which beſt and moſt commodiouſly anſwer this Intention, we may juſtly reckon the Roots of Birthwort, Zedoary, and the Five aperient Roots; the Herbs Mugwort, Calamint, Feverfew, Peny-royal, Baum, Savin, Polium Montanum, Rue, Marjoram, Roſemary, Wall-flowers, Saffron, Bay-berries, Juniper-berries; the Gums Bdellium, Myrrh, Galbanum, Opopanax, Sagapenum, and Amber: Among purgative Subſtances, Aloes, Rhubarb, and Bryony; as alſo Aromatics, and animal Salts; Caſtor, and chalybeate Preparations, which excel all others of the mineral and chymical Kind.

The more theſe Excretions are ſubſervient to Life and Health, the more it were to be wiſh'd, with *Hippocrates*, that we had certain and efficacious Medicines for regulating them, and by that means preventing and curing ſeveral very terrible Diſorders. But as theſe Excretions are principally the Work of Nature, and in Women appear, return, and end, at certain Periods; but are neither incident to all Men, nor ſo periodical as the Menſes; and as a certain Redundance of Blood, together with a certain State of the Veſſels of the Anus and Uterus, diſpoſed to a ſpontaneous Evacuation, are requiſite, in order to theſe Diſcharges; and as theſe Evacuations may be obſtructed, or totally deſtroy'd, by various Cauſes; it muſt of courſe be a difficult Taſk to fall upon effectual Means of reſtoring theſe Evacuations when ſtopt, or enlarging them when impaired; neither of which Ends can ever be obtain'd without knowing the Cauſe from which the Misfortune proceeds.

But, ſuppoſing that there is a Redundance of Blood, the principal Cauſe of this Evacuation; ſuppoſing, alſo, that the Veſſels of the Uterus and Anus are ſo diſpos'd, that they may be diſtended by a large Quantity of Blood flowing to them, and be capable of diſcharging this Blood; yet, if the Excretions are not duly carried on, either on account of Obſtructions, or ſpaſmodic Conſtrictions of the ſmall lateral Veſſels of the Arteries; in conſequence of which, the Blood does not circulate naturally; or on account of a Diminution of the ſpirituous Principle of the Blood, and the elaſtic contractile Force of the Heart and Arteries; then the above-enumerated Medicines afford the deſired Relief: For the capillary Veſſels are excellently open'd, and Obſtructions remov'd, by the Five aperient Roots, Birthwort, Rhubarb, Bryony, and Wall-flowers, eſpecially if exhibited by way of Decoction with ſome ſaline Stimulus, ſuch as Borax. This Intention is alſo excellently anſwered by the Gums exhibited with Aloes, and other Purgatives, in the Form of Pills. The ſmall and capillary Ducts, when ſpaſmodically conſtricted, or preternaturally contracted, are excellently relax'd and open'd by Mugwort, which is of a demulcent Nature, as alſo by Yarrow, Saffron, and Caſtor. In order to reſtore the ſpirituous Principle of the Blood, ſtrengthen the Solids, and confirm the Tone of the Fibres and Veſſels, ſuch Corroboratives are to be uſed, as operate by their fine volatile and oleous Salt; among which we may reckon all Aromatics, Myrrh, the Berries of the Bay and Juniper-trees, Roſemary, Peny-royal, Baum, Savory, Savin, Wall-flowers, Calamint, Amber, Filings of Steel, chalybeate Tinctures, and volatile oleous Salts.

When the Evacuation is impair'd, or render'd ſlow, by a Redundance of Blood, which too powerfully reſiſts the Elaſticity of the Veſſels, the Emmenagogues already mention'd, eſpecially thoſe of the hotter Kind, are by no means to be exhibited; for by theſe the Blood is thrown into violent Commotions, and a Train of formidable Symptoms are frequently brought on. In this Caſe, therefore, Veneſection in the Feet is to be recommended, ſince, by means of that alone, theſe ſalutary and critical Evacuations are often happily reſtored.

Nor are the Emmenagogues already enumerated proper, in Caſes where there is a Deficiency of Blood, and laudable Juices, as in Perſons recovering from the Shock of a Diſeaſe, thoſe whoſe Primæ Viæ are ſtuffed with viſcid Sordes, or thoſe the villous Coats of whoſe Stomachs are lin'd with a viſcid Mucus, and by that means Digeſtion and Chylification unduly carry'd on. In Caſes of this Nature, the principal Intention of the Phyſician ought to be, not only the Regeneration of a good and laudable Blood by nutritive gelatinous Subſtances, and Broths, eaſily convertible into Blood and Juices; but alſo, if neceſſary, the Reſtitution of the Digeſtion and Elaboration of the Chyle by Emetics, gentle Purgatives of a ſaline aperient Nature, and bitter Stomachics.

Theſe Evacuations are frequently ſtopt by Obſtructions and Infarctions of the vaſcular Subſtance of the Anus in Men, and the internal Part of the Uterus and Vagina in Women; in conſequence of which they admit no Blood, however ſtrongly propel'd to them. In theſe Caſes forcing Medicines are not only ſuperfluous, but pernicious, unleſs the indurated and infarcted Veſſels are previouſly relax'd and ſoften'd by proper Medicines. And this Intention can neither be more ſpeedily nor efficaciouſly anſwered, than by Baths, or Fomentations, or Vapour-baths, ſo contriv'd, that a Veſſel, full of warm Water, impregnated with Mugwort, Peny-royal, and Chamomile-flowers, may be placed under the Abdomen in ſuch a manner, that the Steam may aſcend and penetrate into the Uterus, and adjacent Parts. This is to be done in a warm Room, with the Patient's Body well cover'd; and, in order to keep the Water warm, red-hot Flints are now-and-then to be put into it. Frictions of the Legs and Thighs with warm Cloths, eſpecially after Bathing with ſweet Water, alſo contribute very much to the Production of this Effect.

But in thoſe Diſorders ariſing from a Suppreſſion, a Defect, or Irregularity of the Menſes, or hæmorrhoidal Diſcharge, nothing is more certain, ſafe and effectual, than a prudent Uſe of mineral Waters, eſpecially the mild *Caroline* Springs for internal, and thoſe of *Toeplitz* for external Uſe, ſince by theſe all the Intentions of Cure are excellently anſwered; for, by drinking the former of theſe Waters, the viſcid Humours are attenuated and evacuated, and the Obſtructions of the capillary Veſſels remov'd, whilſt by bathing in the *Toeplitz* Waters, which are highly light, and deſtitute of a conſtricting earthy Principle, the Stricture of the Parts is remov'd, and the Veſſels ſo enlarg'd, as readily to admit the Blood, and again diſcharge it.

As in Medicine 'tis a difficult Taſk to keep the menſtrual Diſcharges in a due and natural Order, ſo 'tis ſtill more difficult to manage the hæmorrhoidal, when a large Quantity of Blood attempts its Diſcharge by the Veins of the Anus, but does not find them diſpos'd for its Evacuation; but the Diſcharges of this Kind, are, among all other Subſtances, moſt powerfully promoted by Pills prepared of Aloes, which by their highly ſubtile, reſinous, and ſulphureous Particles, not only excite a violent Orgaſm in the whole Maſs of Blood and Humours, but alſo by ſtimulating the Coats of the Colon and Rectum, by their tenacious, viſcid, and reſinous Parts, excite a greater Afflux

of

of Blood to these Parts: Yet when the Blood, after it has arrived here, cannot make its Way through the Vessels, it partly protrudes them, like so many Tubercles, accompanied with Pain; and partly, stagnating between the nervous Coats of the Intestines, and pressing them, produces violent Inflations, Spasms, and other terrible Disorders of the Abdomen. *Frederic Hoffman.*

EMMENIA, ἐμμήνια, from μὴν, a Month. The menstrual Discharges.

EMMOTOS, ἔμμοτος, from μοτὸς, Lint. In *Hippocrates*, it is an Epithet for Persons, Parts of the Body, or Disorders, which require the Introduction of Lint for their Cure.

EMODIA. A barbarous Word, importing a Stupor of the Teeth.

EMOLLIENTIA. Emollient or softening Remedies. See ALTERANTIA.

EMOTIO. This Word is us'd with respect to the Mind, and then imports a Delirium; or relative to some Bone, and then implies Luxation.

EMPASMA, ἔμπασμα, from πάσσω, to sprinkle upon. The same as CATAPASMA, or DIAPASMA. See CATAPASMA.

EMPEIRIA, ἐμπειρία, from πεῖρω, to try. Experience.

EMPEROS, ἔμπηρος, the same as πηρὸς, mutilated.

EMPETRUM.

The Characters are,

It has the Leaves and Appearance of *Heath*; the Flower is Male, has no Petals, and consists of Stamina; the Fruit, which grows in a different Part of the Plant, is like a Berry, and full of hard stony Seeds.

Boerhaave mentions two Species of this Plant; which are,

1. Empetrum; montanum; fructu nigro, T. 579. *Erica, baccifera, procumbens nigra*, C. B. P. 486. *Erica, baccifera, Matthioli*, J. B. 1. 526. Lugd. 188. *Erica, Coris folio*, 11. Clus. H. 45. BLACK-BERRY'D HEATH, CROW-BERRIES, OR CRAKE-BERRIES.

2. Empetrum; Lusitanicum; fructu albo, T. 579. *Erica, erecta, baccis candidis*, C. B. P. 486. *Erica, baccifera, Lusitanica*, T. B. 1. 528. *Erica, Coris folio*, 10. Clus. H. 45. *Erica*, 7. Clus. Lugd. 190. H. *Boerh. Ind. alt. Plant. Vol. 2. p.* 173.

Besides the two foregoing Species of *Empetrum*, *Dale* mentions a third:

Empetrum, Offic. *Thymelæa foliis Kali lanuginosis, salsis*, C. B. Pin. 463. Tourn. Inst. 594. Elem. Bot. 467, Raii Hist. 2. 589. Jons. Dendr. 236. *Sanamunda secunda Clusii*, Ger. Emac. 1595. J. B. 1. 594. Chab. 48. *Sanamunda altera Clusii*, Park. Theat. 203. SEA-HEATH SPURGE. *Dale.*

It grows spontaneously on the Sea-coasts of *Andalusia*, and flowers in *February*. The Root is in Use; a Dram of which, taken in a Decoction of Chiches, is a potent Cathartic. About *Gibraltar* it is call'd *Burhalaga*, and used only for heating of Ovens. *Raii Hist. Plant.*

EMPHRACTICA, ἐμφρακτικὰ, from φράσσω, to obstruct. Obstructing Topics, such as, when applied to the Body, adhere, and stop the Pores.

EMPHRAGMA, ἔμφραγμα, of the same Derivation as the preceding Word. An Impediment, or Obstruction. Thus some Parts of a Child, presenting in an unnatural Posture, are said, by *Hippocrates*, to be an *Emphragma*, that is, to obstruct the Birth, in his Treatise, *de Septimestri Partu.*

EMPHRAXIS, ἔμφραξις, of the same Derivation as EMPHRACTICA. An Obstruction.

EMPHYSEMA, ἐμφύσημα, from φυσάω, to inflate. Any flatulent Tumor. It is generally taken for a soft Tumor, arising from Air, contain'd in the Cells of the *Membrana Cellulosa.*

See that Part of the Article CAPUT, which treats of Wounds of the Head. See also CELLULOSA MEMBRANA.

In *Hippocrates* it imports an Inflation of the Belly; and sometimes a Tumor in general.

It is surprising to what a Degree the cellular Membrane will be inflated by the Air retain'd and rarefy'd in its Cells. To this Purpose, Mr. *Mery* gives a very remarkable History in the Memoirs of the *Royal Academy of Sciences* for 1713. which the Curious may consult.

EMPIRICA SECTA. The Empiric Sect. See the PREFACE.

Empiricus is deriv'd from πεῖρω, to experience.

EMPLASTICA, ἐμπλαστικὰ, from ἐμπλάσσω, to obstruct, or spread upon. The same as EMPHRACTICA.

EMPLASTRUM, ἔμπλασις, of the same Derivation as the preceding Word. A Plaister.

No Part of the Apparatus for Dressing is of more Importance than Plaisters; the Nature of which is so well known, that it would be ridiculous to attempt a Definition of them. There are various, and almost innumerable Kinds of Plaisters; the most considerable of which, together with their Composition and Preparation, are found in the several Dispensatories; but especially in the *Pharmacopœia Augustana*, the *London Dispensatory*, that of *Brandenburg*, and *Lemery*'s *Pharmacopée Universelle*. Most of these Plaisters are spread upon Linen Cloth, Leather, or Silk, according to the different Conditions of Wounds, and the various States of Patients. When Plaisters are to be applied to hairy Parts of the Body, those Parts are previously to be shav'd, that the Plaister may adhere more firmly, and be removed more easily, and with less Pain to the Patient. But that they may be still more commodiously apply'd, their Form is to be adapted to that of the particular Part, for whose Relief they are intended. Thus some Plaisters ought to be round, others square, others triangular, others oval or elliptical, others in the form of a Crescent, others shap'd like the Letter T, and others in the Form of a *Maltese* Cross, as in *Tab.* 23. *Fig.* 1, 2, 3, 4, 5, 6, 7, 8. Others have either one or both of their Sides slit, according to the Intention proposed, as in *Fig.* 9. and 10. To these we may add that kind of Plaister, which being perforated in the Middle, is destin'd for Fractures, accompanied with adjacent Wounds; that, by this means, the Wounds may be commodiously cleansed and dressed without removing the Plaister, as in *Fig.* 11. 11. 11. However various the Forms of Plaisters may be, as is obvious from what has been said, yet such as are either square or round, are most generally used; since there are few Parts of the human Body to which these may not be commodiously apply'd, especially if their Edges are slit with a Pair of Scissars.

The Bulk, as well as the Figure, of Plaisters, is various; for their Largeness ought always to correspond to the Wound, or Part affected. As for the Use of Plaisters, it is found to be very various and extensive; for they not only serve to retain Balsams, Ointments, Lint, Tents, and other Applications, to Wounds, but also contribute very effectually to *generate* Pus, to digest and maturate Tumors, to conglutinate and cure Wounds, to unite fractur'd Bones, to heal Burns, to alleviate Pains, and to corroborate such Parts of the Body as are weak and infirm.

It is to be remark'd, that the best way of giving a Plaister a good Consistence, is a Prejudice to many Intentions; and that is done with Litharge, or Minium, and Oil; for when these are boiled, so as to incorporate, they make a Body very suitable for this Form; but then they are opposite in Virtues to the warmer Gums, which are frequently mix'd with them. The other Ways, therefore, of giving a Consistence to this Form, either with Wax, Resin, or Pitch, may be preferable as to Intention or Efficacy; but these also have their Inconveniences in other respects; for those Plaisters which take in much Wax, are difficult to spread; because, when warm, they are not glutinous enough to stick well. Resin likewise is troublesome to spread, and, where it abounds, sticks too much; and Pitch of any kind, especially when join'd with Turpentine, though made into an hard Consistence, yet will not hold its Form in Rolls, but run flat, as is commonly observ'd in the *Emplastrum Cephalicum*, and *Adhæsivum*; for which Reason they are frequently confin'd in Bladders.

In the Prescription of extemporaneous Plaisters, the greatest Regard is to be had to that particular Consistence which the Part can most conveniently bear, whereupon the Application is to be made. Thus Plaisters to the Breast and Stomach, especially in the Intentions of Emollients or Discutients, should be yielding and soft, as in the officinal *Emplastrum Stomachicum magistrale*; but to the Loins, or any of the Limbs, where warm Discutients and Strengtheners are to be applied, an higher, and more adhesive Consistence is to be sought for. The emollient Plaisters likewise should be laid on thick, and frequently repeated, if the Symptoms continue; because their better Parts are soon spent. Discutients also, applied to hard Tumors, require Repetition; but the Strengtheners, which are on purpose contrived of a strong adhesive Consistence, are permitted to lie on, till they grow dry, and come off spontaneously. In some flatulent Tumors, where a Plaister alone does not prevail, they are at Intervals taken off, and discutient Fomentations or Lotions made use of; such as are composed of Bitters, Carminatives, and take in lixivial Salts, or alcaline Spirits.

There are a great Number of Plaisters describ'd in the Dispensatories above-quoted. Those in the *London Dispensatory* are the following:

EMPLASTRUM ADHÆSIVUM: *The sticking Plaister.*

Take of the simple Diachylon, and Diachalcitis, of each one Pound; of Burgundy Pitch, six Ounces; of Turpentine, one Ounce; of Gum Sarcocolla, four Ounces: Make into a Plaister. *S. A.*

The College have taken this from *Bates*, with some little Variations in the Quantities. The Pitch, and Gum Sarcocolla, must be very carefully strained, or else the Plaister will be almost useless. There are, indeed, many Compositions of this kind in Practice amongst our Surgeons, who vary them at their own Discretion; and most of them omit the Sarcocolla, as giving more Trouble to make it smooth, than its Qualities are judg'd to deserve.

EMPLASTRUM

EMPLASTRUM EX AMMONIACO. See AMMONIACUM.

EMPLASTRUM E BACCIS LAURI: *Plaiſter of Bay-berries.*

Take of Bay-berries, having their Huſks clear'd off, two Ounces; of Frankincenſe, Maſtich, and Myrrh, of each half a Dram; of Cypreſs, Coſtus, yellow Wax, Turpentine, and Oil of Bays, each one Ounce; of deſpumated Honey, juſt made warm, four Ounces. Powder together the Cypreſs, Coſtus, and Bay-berries, to be mixed with the Honey: Let the Frankincenſe, Maſtich, and Myrrh, be ſeparately reduced, and mixed with the Honey; and then add the Oil of Bays, the Turpentine, and Wax, all melted together, ſo as to make a Plaiſter. *S. A.*

EMPLASTRUM DE BETONICA. See BETONICA.

EMPLASTRUM CÆSARIS: *Cæſar's Plaiſter.*

Take of red Roſes, one Ounce and a Half; of Biſtort-root, of Cypreſs-nuts, of all the Sanders, of Mint, and Coriander-ſeeds, of each three Drams; of Maſtich, half an Ounce; of Hypocyſtis, Acacia, Dragon's Blood, ſealed Earth, true Bole, and red Coral, of each two Drams; of Turpentine, waſh'd in Plantain-water, four Ounces; of Oil of Roſes, three Ounces; of white Wax, twelve Ounces; of Reſin of the Pine-tree, ten Ounces; of Pitch, ſix Ounces; of the Juices of Plantain, Houſleek, and Orpine, of each one Ounce. Let the Wax, Reſin, and Pitch, be melted together; then add the Turpentine and Oil, the Hypocyſtis and Acacia, diſſolved in the ſaid Juices; and, laſtly, the Powders, ſo that the Whole may be made into a Plaiſter. *S. A.*

EMPLASTRUM CEPHALICUM: *Cephalic Plaiſter.*

Take of tranſparent Reſin, two Ounces; of black Pitch, one Ounce; of Labdanum, Turpentine, Bean and bitter Vetch-flowers, and Pigeons-dung, of each half an Ounce; of Myrrh, and Maſtich, of each one Dram and an half; of Gum, Juniper, and Nutmegs, of each two Drams. Let the Myrrh and Labdanum be diſſolved in a warm Mortar; and, with an Addition of the reſt of the Ingredients, make into a Plaiſter. *S. A.* If it be deſired ſtronger, add the Powders of Euphorbium, Pellitory, and black Pepper, of each two Scruples.

This is much uſed in common Preſcription, to apply to the Feet, as well as the Head.

EMPLASTRUM E CICUTA CUM AMMONIACO. See CICUTA.

EMPLASTRUM E CYMINO. See CUMINUM.

EMPLASTRUM DIACHALCITEOS: *Compound Plaiſter of Chalcitis.*

Take of old unſalted Hogs-lard, cleanſed from its Membranes, two Pounds; of old Oil of Olives, of the Litharge of Gold, powder'd and ſifted, of each three Pounds; of white Vitriol, calcin'd and powder'd, four Ounces. Let the Litharge, Lard, and Oil, be boiled together, over a gentle Fire, with a little Plantain-water, and continually ſtir'd with a Spatula, to the Conſiſtence of an Emplaſter; and when this is taken off the Fire, ſtir in the Vitriol, ſo as to make it into a Maſs. *S. A.*

EMPLASTRUM DIASULPHURIS. See DIASULPHURIS.

EMPLASTRUM EPISPASTICUM PRIMUM: *The firſt Bliſtering-plaiſter.*

Take of the ſimple Melilot-plaiſter, one Pound and a half; of Cantharides, in fine Powder, twelve Ounces; of the Seeds of Biſhops-weed, one Ounce and a half; of Vinegar, half a Pint; and make into a Plaiſter. *S. A.*

EMPLASTRUM EPISPASTICUM SECUNDUM: *The ſecond Bliſtering-plaiſter.*

Take of Burgundy Pitch, twelve Ounces; of Venice Turpentine, four Ounces; of the Powder of Cantharides, ſix Ounces: Mix, and make them into a Plaiſter. *S. A.*

EMPLASTRUM GRISEUM DE LAPIDE CALAMINARIS: *The Calamine-plaiſter.*

Take of prepar'd Calamine, one Ounce; of Litharge, two Ounces; of Ceruſs, half an Ounce; of Tutty, one Dram; of Turpentine, ſix Drams; of white Wax, one Ounce and an half; of Sheep's-ſuet, two Ounces; of Frankincenſe, five Drams; of Maſtich, three Drams; of Myrrh, two Drams; of Camphire, half a Dram. Let the Turpentine, Wax, and Suet, be all melted together; then put in the Frankincenſe, Maſtich, and Myrrh, in Powder; and after they are very well mix'd, add the Calamine, Litharge, Ceruſs, and Tutty, alſo in fine Powder. Laſtly, before they are quite cold, put in the Camphire, diſſolv'd in a little Spirit of Wine; and make all into a Plaiſter.

This is recommended for a great Healer of Ulcers.

EMPLASTRUM AD HERNIAM: *Plaiſter againſt Ruptures.*

Take of Galls, Cypreſs-nuts, Pomegranate-peel, Balauſtines, Acacia, the Seeds of Plantain, Fleawort, and Creſſes, Acorn-cups, roaſted Beans, long and round Birthwort and Myrtles, of each half an Ounce. Let all theſe be powder'd and macerated four Days in Vinegar of Roſes, and afterwards dried: Then take of the greater and leſſer Comfrey; of Horſe-tail, Woad, Ceterach, Roots of Oſmund-royal, and Fern, of each one Ounce; of Frankincenſe, Myrrh, and Maſtich, of each two Ounces; of Armenian Bole, waſhed in Vinegar; of prepar'd Calamine, Litharge of Gold, and Dragon's-blood, of each three Ounces; of Pitch, two Pounds; of Turpentine, a ſufficient Quantity to make the Whole into an Emplaſter. *S. A.*

This is not only intended for what is ſignified by its Title, but for the ſtrengthening any weak Part.

EMPLASTRUM DE MASTICHE: *The Maſtich-plaiſter.*

Take of Maſtich, two Ounces; of Armenian Bole, waſh'd in red Wine, one Ounce and an half; of red Roſes, ſix Drams; the Raſpings of Ivory, and Myrtle-berries, of each half an Ounce; of Turpentine, Colophony, Tacamahaca, and Labdanum, of each two Ounces; of yellow Wax, half a Pound; of the Oil of Myrtles, four Ounces. Let thoſe Things be powder'd apart, which require it; then melt the Wax in the Oil, and to them, when taken off the Fire, add the Turpentine; afterwards mix the Bole, Roſes, and Ivory, in Powder, and laſt of all the Maſtich; then briſkly ſtir them about in a warm Mortar, ſo as to bring them to a Plaiſter. *S. A.*

EMPLASTRUM DE MELILOTO SIMPLEX: *Simple Melilot-plaiſter.*

Take of freſh Reſin, eight Pounds; of yellow Wax, four Pounds; of Sheep's-ſuet, two Pounds: After theſe are melted together, put in five Pounds of green Melilot, cut ſmall; and make into a Plaiſter. *S. A.*

This is but a modern Contrivance, and is now greatly in Uſe, principally for dreſſing Bliſters.

EMPLASTRUM MERCURIALE: *The Mercurial Plaiſter.*

Take of Quickſilver, which hath been ſtrained through Leather, eight Ounces; of liquid Storax, one Ounce and an half; of Venice Turpentine, one Ounce. Let the Whole be work'd together in a Mortar, to an entire Incorporation of the Mercury: Then take of the Diachalcitis-plaiſter, one Pound; of Gum Ammoniac, half a Pound. Melt them, and put them into a Mortar, and work them about until cold, and become a Plaiſter.

EMPLASTRUM DE MINIO: *Red-lead Plaiſter.*

Take of Red-lead, nine Ounces; of the Oil of red Roſes, one Pound and an half; of White-wine Vinegar, ſix Ounces; and boil them to a perfect Conſiſtence of a Plaiſter.

EMPLASTRUM E MUCILAGINIBUS. See DIACHYLON COMPOSITUM.

EMPLASTRUM NIGRUM: *The Black Plaiſter.*

Take of white Ceruſs, one Pound; of Linſeed Oil, two Pounds; and boil them to a ſufficient Conſiſtence, ſtirring all the while with a Spatula.

EMPLASTRUM A NOSTRATIBUS FLOS UNGUENTORUM DICTUM: *A Plaiſter call'd, in our Country, The Flower of Ointments.*

Take of common Reſin, Reſin of the Pine-tree, yellow Wax, Sheep's-ſuet, of each half a Pound; of Olibanum, four Ounces; of Turpentine, two Ounces and an half; of Myrrh and Maſtich, of each one Ounce; of Camphire, two Drams; of White-wine, half a Pound: Boil them together into a Plaiſter.

It is pretty much in Uſe amongſt our Surgeons for a warm Suppurative.

EMPLASTRUM OPODELDOC: *Opodeldoc-plaiſter.*

Take of Bdellium, Ammoniacum, Galbanum, Sagapenum, and Opopanax, of each two Ounces: Melt theſe together, and add to them half a Pound of *Strasburgh* Turpentine, four Ounces of Oil of Bays, two Ounces of Amber; and ſtir them together, over a gentle Fire. Take of Litharge, one Pound; Calamine, one Pound and an half; of Oil of Olives, two Pounds; of Linſeed-oil, one Pound: Boil theſe likewiſe over a gentle Fire, ſtirring all the while with a Spatula; and when theſe are all mixed, add of yellow Wax, and Colophony, of each one Pound; and, after theſe are melted and mixed with the preceding, boil again, and ſtir, until all are incorporated: Then gradually put in of the aſtringent Saffron of Mars, Loadſtone, red

Colcothar,

Colcothar, Olibanum, Myrrh, Amber, Maſtich, Sarcocolla, Dragon's-blood, and Camphire, of each one Ounce; of round Birthwort-root, two Ounces; and let them ſtand over the Fire, till the Whole hath obtained a due Conſiſtence.

This Compoſition hath been greatly extol'd heretofore, and particularly by *Paracelſus*, who frequently mentions It in is chirurgical Writings.

EMPLASTRUM OXYCROCEUM. See CROCUS.

EMPLASTRUM DE SAPONE: *Soap-plaiſter.*

Take of common Oil, two Pounds; of red Lead, one Pound. Let them be put upon a Fire, and briſkly ſtirred about a good while, until they are very well mixed; then take the Mixture off the Fire, and before it is quite cold, ſtir in of Venice Soap, cut into Slices, half a Pound; and make into a Plaiſter. *S. A.*

This is much in Eſteem amongſt ſome Perſons; principally, for diſcuſſing gouty Tumours, and the Juices ſtagnating after Strains.

EMPLASTRUM STICTICUM: *Stictic Plaiſter.*

Take of the Oil of Olives, ſix Ounces; of yellow Wax, one Ounce and an half; of ground Litharge, four Ounces and an half; of Gum Ammoniacum, and Bdellium, of each half an Ounce; of Galbanum, ſix Ounces; of Opopanax, Oil of Bays, Calamine, both the Birthworts, Myrrh, and Frankincenſe, of each two Drams; and of fine Turpentine, one Ounce: Let the Oil and Litharge be boil'd and incorporated together, ſtirring with a Spatula, till it ceaſes to ſtick to the Fingers: Then, removing it off the Fire, melt in it the Wax; next, the Turpentine mix'd with the Gums; and, laſt of all, the Powders: When all is cold, put in the Frankincenſe, and Oil of Bays, ſo as to make the Whole into a Plaiſter. *S. A.*

EMPLASTRUM STOMACHICUM MAGISTRALE:

The Magiſterial Stomach-plaiſter.

Take of Mint, Wormwood, Stœchas, and Bays, of each one Dram; of Marjoram, red Roſes, and yellow Sanders, of each two Drams; of Calamus aromaticus, Aloeswood, Flowers of Lavender, Nutmegs, Cubebs, Galangal, long Pepper, and Mace, of each one Dram; of Maſtich, three Drams; of Cloves, two Drams and an half; of the Oils of Mint, one Ounce and an half; of Nard, one Ounce; of Spike, one Dram; of Reſin, and Wax, of each four Ounces; of Labdanum, three Ounces; of ſtrain'd Storax, half an Ounce: Make into a Plaiſter. *S. A.*

This is now much in Eſteem to ſtrengthen the Stomach, inſomuch that there are hardly any Shops without it.

EMPLASTRUM TONSORIS.

Take of hard Pitch, two Pounds; of Wax, one Pound; of Reſin of the Pine-tree, half a Pound; of Fenugreek-flower, and the Powder of black Chameleon, and Bryony-root, of each four Ounces; of Cumin-ſeeds finely powder'd, two Ounces: Make into a Plaiſter. *S. A.*

Lemery deſcribes a great Number of Plaiſters in his *Pharmacopée Univerſelle*. Of theſe I ſhall only deſcribe the *Emplaſtrum Abbatis de Grace*, and the *Emplaſtrum Andreæ a Cruce*, which I have frequently mention'd.

EMPLASTRUM ABBATIS DE GRACE.

Take of the Oil of Roſes, ſixteen Ounces; of the depurated Juice of pale Roſes, and prepar'd Litharge of Gold, each nine Ounces, and of prepar'd *Venetian* Ceruſs, two Ounces: Boil to the Conſiſtence of a Plaiſter, and then add four Ounces of yellow Wax.

The Litharge, the Ceruſs, the Oil of Roſes, and the depurated Juice of pale Roſes, muſt be boil'd together in the ſame Veſſel, continually ſtirring them with a wooden Spatula, till they aſſume the Conſiſtence of a Plaiſter. Then cut the Wax ſmall, and let it melt along with them. When the Mixture is almoſt cold, it is to be made up in Rolls.

This Plaiſter is proper for drying Wounds and Ulcers, and is frequently us'd, by way of Plaiſter, in applying potential Cauteries.

EMPLASTRUM ANDREÆ A CRUCE.

Take of Roſin, two Pounds; Gum Elemi, four Ounces; Venice Turpentine, and Oil of Bays, of each two Ounces: Make them into a Plaiſter, according to Art.

Theſe Drugs muſt be all melted together, and paſſed through a Linen Cloth to ſeparate the Fæces; and by this means we ſhall have a Plaiſter fit to be reſerved for Uſe.

It is ſerviceable in Wounds of the Breaſt, and other Parts; it cleanſes, conglutinates, and conſolidates; it is good for Contuſions, Fractures, and Diſlocations.

This Plaiſter muſt be kept in a Pot; for, if it be form'd into Rolls, it runs. *Lemery, Pharmacopée Univerſelle.*

EMPLATTOMENA, ἐμπλαττόμενα. The ſame as EMPLASTICA.

EMPNEUMATOSIS, ἐμπνευμάτωσις, from ἐμπνέω, to blow into, or inflate. An Inflation of the Stomach, according to the Author of the *Definitiones Med.* But it is applied to other Parts, as the Womb, by *Paulus Ægineta, in Lib.* 3. *Cap.* 70.

EMPRION, ἔμπριον, from πρίω, to ſaw. Serrated, or ſaw-like. A Sort of Pulſe mentioned by *Galen.* In this the Artery is diſtended in one Part more than in another, and feels indented, or like a Saw. It is ſaid to attend all inconſiderable Inflammations.

EMPROSTHOTONOS, ἐμπροσθότονος, from ἔμπροσθεν, forwards, and τείνω, to bend. A Species of Convulſion of the Muſcles of the Neck. According to *Celſus, Lib.* 4. *Cap.* 3. an *Emproſthotonos* is a convulſive Stiffneſs of the Neck, when the Chin is immoveably fix'd on the Breaſt: An *Opiſthotonos*, when the Head is bent backwards, in ſuch a Manner as that the Head reſts on the Scapulæ: And a *Tetanus*, when the Head is upright and immoveable.

EMPSYCHOSIS, ἐμψύχωσις, from ψυχὴ, the Soul. The Union of the Soul with the Body: Animation.

EMPTYSIS, ἔμπτυσις, from πτύω, to ſpit out. *Aretæus, Acut. Lib.* 2. *Cap.* 2. limits the Signification of this Word to a Diſcharge of Blood by Spitting, when it comes only from the Mouth, Fauces, and Parts adjacent.

EMPYEMA, ἔμπυημα or ἐμπύησις, from ἐν, within, and πύον, Pus or Matter.

Aretæus, Lib. 1. *de Cauſ. & Sign. Morb. Chron. Cap.* 9. ſays, "that they who are affected with purulent Abſceſſes in "the Cavities of the Body, whether within the Thorax, or "below the Diaphragm, if the Pus be diſcharged upwards, are "called ἔμπυοι, *Empyi*; if downwards, ἀποπυϊάσεις, *Apoſtematiæ.*" And, *ibid. Cap.* 8. he tells us, that "If there "be a Suppuration of the Thorax, or Ribs, and the Pus be diſcharged through the Lungs, it is called ἔμπυον."

"Thoſe who have a Collection of Pus, ſays *Galen, Com.* 3. *in Prognoſt. Text.* 60. "whether it be all within the Body, "or contain'd in ſome Part affected with an Inflammation, "either before or after an Eruption, we call ἔμπυοι, *Empyi* "(afflicted with a Purulency or Suppuration)." But our Phyſicians beſtow that Name principally on thoſe who are affected with a Suppuration in the Thorax and Lungs. In this Caſe, the Pus, after an Eruption, is contained between the Thorax and the Lungs; and, unleſs it be ſpeedily expectorated, the Patient dies of a Conſumption, with a ſlow Fever, which is always exaſperated in the Night. The Antients called a Collection of Pus, in any Part of the Body, *Empyema*; and ſuppurating Medicines, were, for that Reaſon, by ſome call'd *Empyemata*, by others, *Diapyemata*. Some will have thoſe who are affected with a Collection of Pus in any one of the Viſcera, to be called *Empyi*; others, as we ſaid, will allow that Name to none but thoſe who have a Settlement of Pus between the Thorax and the Lungs; for the Diſeaſe is form'd in a Place affected with an Inflammation, and of an Effuſion of Pus within the Thorax, from the inflam'd Part. Pus is generated whenever the Matter of an Inflammation is not reſolved, and carried off, but there ſettling, is, by Heat, concocted and converted into Pus. *Hippocrates*, 7 *Aph.* 38. thus expreſſes it; "Defluxions "on the Thorax [τὴν ἄνω κοιλίην] come to a Suppuration in "twenty Days." And, more clearly, 5 *Aph.* 8. where he ſays, that "In thoſe who labour under a Pleuriſy, if the pec-"cant Matter be not diſcharg'd in fourteen Days, it turns to "a Suppuration." For pleuritic Pains, if not remov'd, either by Expectoration, or Purging, or Bleeding, or Diet, or other Medicines, excite a Suppuration, or ſuffocate the Patient. This is well expreſs'd by *Galen, in Prognoſt. Com.* 2. *T.* 55. "All Pains, he ſays, affecting the Thorax, at the Seat of the "Lungs, which will not yield to Medicines, if nothing elſe "afflicts the Patient, and no other deſtructive Symptom ap-"pears, give Reaſon to expect a Suppuration." The Inflammation, then, being ſuppurated, and its Humours converted into Pus, unleſs this be diſcharged by ſpitting, there enſues a Rupture of the Impoſtume, and an Effuſion of the Pus into the Cavity of the Thorax and Lungs, under which Circumcuuſtance the Patients are truly and properly *Empyi*. By this Pus they are either ſuffocated, or freed from it by a free Expectoration in the Term of forty Days, as we are taught by *Hippocrates*, 5 *Aph.* 15. "Whoever, ſays he, become *Empyetic* "from a Pleuriſy, if cleans'd in forty Days from the Time of "the Rupture, recover; otherwiſe they fall into a Conſum-"ption." On which *Galen*, commenting, ſays, "Unleſs "the Pus be all diſcharged, by Expectoration, in that Term of "Days, it putrifies, and in that Quality corrodes the Lungs, "and induces a Conſumption:" Which is an Extenuation of

the whole Body, becauſe of the incurable Ulcers of the Lungs, and a Leanneſs, in Conjunction with a ſlow Fever; which Affection the *Greeks*, and eſpecially the *Athenians*, as *Galen*, *Com.* 7. *Aph.* 16. informs us, properly call'd φθόη, *Phthoe*, and *Hippocrates*, φθίσις, *Phthiſis*. When this Diſeaſe is come to its Extremity, the Caſe is deſperate, the Hair falls off, the Belly ſuffers under a Flux, from mere Imbecillity of the Faculty, as *Galen* expreſſes it, and the Spit is retain'd; for, however extenuated, the Patients live, as long as they are able to clear their Lungs by coughing and ſpitting; but by the Matter, which ſhould be expectorated, remaining within, the Paſſages of Reſpiration are obſtructed, and the Sick, by that means, ſuffocated.

In order to prognoſticate with more Clearneſs and Certainty from an Empyema, or to predict the Fate of *Empyi*, or thoſe who are affected with Pus from the Rupture of an Impoſtumation in the Thorax, we are to inquire, firſt, whether the Suppuration proceeds from a Pleuriſy, Peripneumony, or Quinſey; ſecondly, what are the Signs by which we diſtinguiſh them; thirdly, we are to inform ourſelves when the Rupture happens; and, laſtly, we are to treat of thoſe who recover, as well as thoſe who die, and the fatal Signs attending their Diſorder.

When we are to expect an Empyema, we are taught by *Hippocrates*, in the following Words, *Prognoſtic.* "Whatever Pain "affects theſe Parts [*the Region of the Thorax*], and cannot "be removed, either by Expectoration, or Purging, or Bleeding, or Medicines, or a Regimen of Diet, muſt be expected "to produce a Suppuration." But as *Hippocrates*, 2 *Aph.* 47. has told us, "that Pains and Fevers are more incident at a "time when Pus is generating, than after it is generated, "they muſt of Neceſſity be increas'd, as Matters tend to the "Suppuration." The ſame Author, in the Book before-quoted, gives us a Direction to "compute the Beginning of "an Empyema from the Day in which the Patient was taken "with a Fever or Rigor, and, inſtead of a Pain, complain'd "of a Weight in the Place which was before affected with "Pain; for thus it happens about the Beginning of a Suppuration; and from this time you are to expect a Rupture of "the Suppuration, at the End of the before-mentioned "Terms." *Galen*, in his Comment on this Place, ſays, that the Signs of a Suppuration are a Weight inſtead of a Pain, a Rigor, or Shivering, and a remarkable Exacerbation of the Fever. Beſides a Senſe of Weight, *Hippocrates* reckons a Heat in the Sides, or in one of them, if the Suppuration be only in one Side, as a Symptom; for thus he proceeds, *ibid.* "If the "Suppuration be only in one Side, it will be proper to cauſe "the Patient to turn, and to examine him, whether he has a "Pain in one Side, and whether it be hotter than the other; "and, when he lies on his ſound Side, it is fit to aſk him, "whether he has a Senſe of a Weight preſſing upon him; "for, if ſo, the Suppuration lies in the Side, which ever it be, "where the Pain is felt." A Suppuration, then, is diſcover'd by theſe Signs, which are, as we ſaid, a Rigor or Shivering; which is excited, as *Galen* ſuppoſes, from the Acrimony of the Pus infeſting the inflam'd Parts, an Increaſe of the Fever, and a Senſe of a Weight in the Sides, or in one of them, if the Collection of Pus be only in one Side: I add to theſe Signs the Senſe of a Heat in the Sides, or one Side, if the Pus be only collected in that Side. If this Increaſe and Collection of Pus, concocted by Nature, after its Eruption, happens to be expectorated by coughing, the *Empyi* recover; but if the Pus can no way be diſcharged, through Want of Strength, the Patient is either ſuffocated, or dies of a Conſumption. Hence we are told by *Hippocrates*, in the *Prognoſtics*, that "The "Diſeaſe is more fatal to old Perſons than young;" becauſe, as *Galen* ſays, "Old-age is infirm, and great Strength of "Nature is requir'd for Diſcharges by coughing and ſpitting; "and none can recover without a very copious Expectoration "of Pus, by means of a Cough." *Galen*, *de Loc. affect. Lib.* 5. *Cap.* 3. tells us of *Empyi*, or Perſons affected with a Collection of Pus within the Thorax, who have expectorated, or ſpit out, the Quantity of fifteen Heminæ, or half Pints, of Pus, and recover'd. Thoſe, therefore, who ſpit plentifully, eſcape; which is the Import of what *Hippocrates* ſays, 5 *Aph.* 15. "They who become *Empyi*, after a Pleuriſy, if cleans'd "by Expectoration in forty Days from the time of the Rupture "of the Abſceſs, are freed from the Diſeaſe." When Expectoration cannot be effected, the Patient is ſometimes ſuffocated through the groſs and viſcous Quality of the Pus, and the Denſeneſs, or cloſe Contexture, of the Membrane ſurrounding the Lungs, and the Weakneſs of the Faculty, which is known by a Reſpiration, in which the whole Thorax is elevated, and yet nothing is expectorated. *Galen*, *de Loc. affect. Lib.* 4. *Cap.* 7. tells us, "that they who are *Empyi*, on account of a "Collection of Pus between the Thorax and Lungs, and "elevate the whole Thorax in Reſpiration, do the ſame thro' "Weakneſs, and Inability to diſcharge the Pus." If the Patient eſcapes Suppuration, he dies of a Conſumption, as *Galen* obſerves, waſting away under a ſlow Fever, the Heat conſtantly increaſing more or leſs in the Night, and the retain'd Pus putrifying within, and corroding and ulcerating the Lungs.

The Signs of a Conſumption ſucceeding an Empyema are thus expreſs'd by *Hippocrates*, *Prognoſt.* "Firſt, the Fever "never leaves the Patient, but is more moderate in the Day-"time, and exaſperated at Night, with copious Sweats, a "Cough, and much Deſire to expectorate, but to little Pur-"poſe. Theſe Symptoms are attended with Hollowneſs of the "Eyes, Redneſs of the Cheeks, and Crookedneſs of the Nails "of the Fingers; there is, alſo, a Senſe of Heat of the Fingers, "and eſpecially at the Tops; the Feet ſwell, the Appetite is "loſt, and there is an Eruption of Puſtules about the Body." *Galen*, commenting on this Deſcription, ſays, that the Fever never ceaſes, becauſe the ſolid Parts of the Body are heated; for which Reaſon, alſo, the Fever keeps one conſtant Tenor, retaining a Heat like Chalk or Lime-ſtone, gentle to the Touch; and this Heat, which is the proper Diagnoſtic of a hectic Fever, is increas'd after Eating and Drinking, in like manner as it is in Chalk upon Affuſion of Water; and the Fleſh becomes much hotter to the Touch. The continual Sweating is owing to the Weakneſs of the Patient, and the Diſſipation of the diſtributed Aliment. The Patient has an Inclination to cough, and ſtrives to expectorate, but diſcharges nothing worth Conſideration, on account of the Groſſneſs and Viſcidity of the Pus, the Denſity of the Membrane incloſing the Lungs, and the Weakneſs of the Faculty. Hollowneſs of the Eyes, which is a Symptom common to all long Fevers, is from Drineſs, and Redneſs of the Cheeks from the Heat of the Lungs and the Cough; both which heat the Face, and the whole Head, becauſe the Vapours, which ariſe from the Defluxion oppreſſing the Lungs, aſcend thither in great Redundance. The Nails are crooked, becauſe the Fleſh, which ſhould ſupport them on each Side, is conſum'd. The Fingers, as in all hectic Fevers, are remarkably hot, and appear to be ſo at the Inſide of the Tops, as being more carnous, and abounding with Humour. At length the Feet ſwell, the Extinction of the natural Heat commencing in thoſe Parts which are fartheſt diſtant from its Original. The Appetite is loſt, that, as well as all other Faculties, being under a Decay; and there is an Eruption of Puſtules from an Effuſion of corroding Ichor upon the Skin: Thus far *Galen*. Theſe, then, are the Signs of a Conſumption from an Empyema, under which the Patients live as long as they can ſpit, and diſcharge the Pus. 7 *Aph.* 16. One thing worthy of Remark, in relation to the Spitting, and which is obſerv'd by *Galen*, in the third of the *Epidemics*, in deſperate Conſumptions, is, that no Sign of Concoction appears. The Spitting, at laſt, is ſuppreſs'd, and a Looſeneſs ſucceeds, with a Swelling of the Feet, and other Symptoms; which convinces the Patients themſelves, that their Caſe is deſperate. In the firſt place, then, the peccant Humour, which is the Cauſe of the Pleuriſy, or Peripneumony, being not diſcharg'd, putrefies, and is changed into Pus; then breaks, and is expectorated by coughing. But this Collection of Pus, in the Thorax and the Lungs, makes its Eruption in a determinate Time, which is generally twenty Days, and ſometimes ſooner or later. The prognoſtic Signs of an Eruption are deſcrib'd by *Hippocrates*, *Lib. Prognoſt.* in the following Manner: "Whether an Em-"pyema will break ſooner, or later, may be thus known: "If there be Pain at the Beginning, and the Difficulty of "Breathing, with the Cough and Spitting, continue, the Eru-"ption may be expected on the twentieth Day, or ſooner; "but if the Pain be gentle, and all the other Symptoms mode-"rate in proportion, the Eruption may be longer delay'd: "However, a Pain, Difficulty of breathing, and Spitting, muſt "precede an Eruption of the Pus." Hence *Galen* infers, that the Prognoſtics of a Rupture of the Impoſtume are a Pain, Difficulty of Breathing, Cough, and Spitting, which, if they are continual and violent, prognoſticate a ſpeedy Eruption; if otherwiſe, a ſlower. However, as the Body incloſing the Pus is corroded by its Acrimony, there muſt of neceſſity be a Pain, Cough, and Spitting, becauſe ſome of the thinner Part of the Sanies penetrates through the involving Subſtance; and a Difficulty of Breathing is unavoidable, both on account of the bad State of the whole Body, and more eſpecially of the Pain. The Reaſon or Cauſe of the Eruption is referred to the motive Force of Nature, the Quantity of Pus, or its deprav'd Quality, irritating the expulſive Faculty to an Expectoration. The Rupture happens before due Time, or before the Pus is concocted, either by means of ſome pure Bile, which, not being thoroughly mix'd with the Matter, nor reduced to a moderate and natural Temperament, corrodes the Bag containing the Pus, or from the Redundance or Virulence of the Pus, or both of them together, irritating the expulſive Faculty. This is a ſymtomatical Eruption, and ſuch as is condemn'd; but, when the Pus is duly and perfectly concocted, the Eruption is, from the Diſpoſition of Nature, critical and laudable, and the Pus appears white, pure, equal, and ſmooth; whereas, in the premature and ſymptomatical Eruption, the Pus is crude, of a Mixture of Colours, and fetid, or yellow, and mix'd with Plenty of Bile. The

Author of the *Coac. Præſag.* 392. ſpeaking of this latter Eruption, ſays, "They who expectorate purulent and bilious "Matter, whether ſeparately, or mix'd together, generally die "on the fourteenth Day."

Theſe things being premiſed, we are now to conſider what may be predicted from an Empyema: And, firſt, with reſpect to a Recovery: We are taught to prognoſticate the Recovery of a Patient, labouring under an Empyema, by the following Signs, mention'd by *Hippocrates* in his Book of *Prognoſtics*: "Among good Signs, he ſays, may be reckon'd, for the "Patient to ſupport the Diſtemper with Eaſe, to breathe "freely, to be free from Pains, to expectorate with Facility, "for his Body to appear of an equal Warmth and Softneſs in "every Part; that he has no Thirſt; that his Urine, Stools, "Sleep, and Sweat, are all laudable, and ſuch as were before "requir'd [*in this Book*]: If all theſe Symptoms concur, the "Patient, we may be aſſur'd, will not die." And, a little after, he ſays, "They have moſt Reaſon to expect a Recovery, "whom the Fever leaves the ſame Day after the Eruption, "whoſe Appetite ſpeedily returns, and Thirſt ceaſes; when the "Stools are ſmall in Quantity, and conſiſtent; and when the "Pus is white, ſmooth, of one Colour, and free from Phlegm, "and expectorated without much Difficulty, or violent Cough-"ing. Under all theſe Requiſites, the Patient is moſt happily "and ſpeedily reliev'd; but, if the Caſe be leſs favourable, "they are ſureſt to recover, whoſe Symptoms moſt reſemble "thoſe before deſcrib'd."

The Signs prognoſticating Death, under an Empyema, are principally theſe, as enumerated by *Hippocrates*, in the ſame Book of his *Prognoſtics*; and are directly contrary to the former: As, "When the Patient ſupports himſelf with Difficulty "under the Diſeaſe; when Reſpiration is great and full; when "the Pain is continual; Expectoration is perform'd with much "Labour and Coughing; there is a great Thirſt; the Fever "affects one Part of the Body more than another; the Belly "and Sides are in a vehement Heat; but the Forehead, Hands, "and Feet, are cold; and the Urine, Stools, Sleep, and Sweats, "are all bad, or contrary to thoſe in the former Caſe; if any "of theſe Symptoms appear under Expectoration, the Patient "will die before the Term of fourteen Days; or the ninth, "or eleventh Day." And again, a little after: "They die [*of an Empyema*], "if the Fever does not leave them, or returns "after it had ſeem'd to have left them; if there be a Loſs of "Appetite, with a Looſeneſs; or if the Pus they expectorate "be greeniſh and livid, or pituitous and frothy; under all "theſe Symptoms Death is inevitable." Whatever is expectorated by Spitting, but gives no Relief to the Patient, is condemn'd, *Coac.* 390. The Wife of blind *Meander*, *Lib.* 4. *Epid.* 7. 4. immediately expectorated greeniſh and purulent Matter on the ſixth Day, and died about the twentieth Day. The Son of *Amphiphrades*, 7 *Epid. T.* 4. expectorated a greeniſh Sort of Matter, and died on the twenty-eighth Day. *Hermoptolemus*, *ibid. T.* 16. on the fifteenth Day of his Illneſs, expectorated a paliſh Matter, and died the next Day. And, to conclude, *Hippocrates*, 7 *Aph.* 44. aſſures us, "that *Empyi*, "or thoſe who labour under an Empyema, if, after cauteriz-"ing, the Pus flows pure and white, recover; but if it be "ſomewhat bloody, dirty, and fetid, they die."

From comparing the Paſſages above-quoted, with modern Authors, and his own Practice, *Boerhaave* ſeems to have collected the following Particulars relative to an Empyema, which he lays down by way of Aphoriſm.

When Matter or Pus is collected in the Cavity of the Breaſt, betwixt the Lungs and the Pleura, the Diſorder is called an Empyema.

This is properly enough an Empyema; but the Matter may happen, alſo, to be collected in the Duplicatures of the Mediaſtinum.

The Diſorder above-mentioned ſuppoſes a previous purulent Abſceſs within the Breaſt; which, breaking, diſcharges its Contents into the Cavity of the Thorax.

Theſe Abſceſſes are ſeated, firſt, in the Lungs; and are caus'd either by Inflammations, Ruptures of the Veſſels, or conſiderable Obſtructions by Subſtances not eaſily reſolvable.

Secondly, in the Pleura, ariſing either from an Inflammation, a ſlight Wound heal'd too precipitately externally, a Contuſion, or Rupture of this Membrane.

Thirdly, in the Diaphragm; when an unreſolv'd Inflammation of this Part ſuppurates, and breaks on that Side next the Breaſt.

Fourthly, in the Mediaſtinum; when that Part is, in like manner, inflam'd.

Fifthly, In the Pericardium, after an Inflammation thereof.

An Empyema may be prognoſticated from an Inflammation of any of the Parts above-mentioned, which has not been reſolv'd by means of Coction, Revulſion, a Criſis, or Medicines; but which terminates with a Shivering, a Fever which increaſes in the Evening, a wandering Heat, a Senſe of Weight on the Part, a Difficulty of Breathing, Loſs of Appetite, and Thirſt.

An Empyema is known to be form'd, firſt, from a Duration of ſuch a Diſorder, as is mentioned above, for twenty Days, without a due Expurgation by Expectoration.

Secondly, by the Diſcontinuance of the Signs of an Abſceſs in any of the before-mention'd Parts.

Thirdly, from a new Pain, together with a Difficulty of Breathing, and Diſcharge of Saliva, which ſoon after ceaſe.

Fourthly, from a dry Cough, a Weight on the Diaphragm, an Impoſſibility of lying on one of the Sides, a Noiſe made by the fluctuating Pus or Matter upon Motion, a ſlow Fever, Redneſs of the Cheeks, Hollowneſs of the Eyes, Heat at the Extremities of the Fingers, Incurvation of the Nails, and Tumor of the Abdomen.

The Conſequences of the Rupture of an Abſceſs or Vomica, ſo as to form an Empyema, are, firſt, a continual Accumulation of Pus or Matter from the Ulcer, not yet heal'd, nor deterg'd.

Secondly, a continual Agitation, a Degeneracy, Fetidneſs, Putrefaction, and Attenuation of the Pus or Matter, thus confin'd in a warm and moiſt Place.

Thirdly, a difficult Elevation of the Diaphragm, and Extenſion of the Lungs: Hence Reſpiration is render'd ſhort, difficult, and not eaſily perform'd, unleſs in an erect Poſture; Danger of Suffocation when the Patient lies down, which, however, it is not poſſible for him to do on the unaffected Side; a perpetual dry Cough, and Anxiety.

Fourthly, a Maceration, Corroſion, and conſequent tabid State of the Lungs, Pleura, Diaphragm, Mediaſtinum, Pericardium, and of the Heart itſelf; a hectic Fever, attended with a ſmall and quick Pulſe; Redneſs of the Cheeks; perpetual Thirſt; utter Loſs of Appetite; extreme Weakneſs and Faintings.

Fifthly, hence an Unfitneſs of all the Fluids for Nutrition, Circulation, Secretion, and Excretion; whence a Conſumption and Atrophy, a Reſolution of the Fibres, a Putrefaction of the Liquids, and their Diſcharge through the corroded Lungs; or a ſanious and fatal Diarrhœa, with nocturnal Sweats after Sleep, Puſtules on the Face, Incurvation of the Nails, a ſhining Yellowneſs of the Skin, and an Hippocratic Countenance.

The Cure of this Diſorder is to be varied according to the different Cauſes and States thereof. For, firſt, when it is known, that there is an Abſceſs of the Lungs, Pleura, Diaphragm, Mediaſtinum, or Pericardium, for the Signs of which ſee PERIPNEUMONIA and PLEURITIS, all Endeavours are to be us'd to break it as ſoon as is poſſible, and to determine it towards the external Parts. This is to be done by the actual Cautery, the Knife, and by Medicines, or proper Motion. By Medicines, I ſuppoſe, *Boerhaave* means, ſuppurating Topics, applied externally to the Parts; for, if the Pleura is affected, theſe may invite a Tumor outwards; from whence the Matter may be diſcharged by Inciſion or Burning. When it is known, that the Abſceſs is broken, the Matter diſcharg'd muſt immediately be brought away, either by the Mouth, provided Nature ſhews the Way, by exciting a conſiderable Expectoration; or by the urinary Paſſages, if there are Signs of the Excretion of Pus in the Urine; or by the Operation for the Empyema, which is to be perform'd, by a proper Inſtrument, on the Side affected, betwixt the fifth and ſixth, or fourth and fifth Ribs, reckoning from the loweſt Rib. The Pus is there to be evacuated gently, and by degrees; the Ulcer is to be deterged by Injections of ſoft and mild Decoctions, with an Addition of Honey; and, after that, the Wonnd is to be heal'd.

If the Pus or Matter diſcharg'd appears white, ſoft, uniform, void of Smell, and communicating no Colour to the Probe upon Contact; if the Patient is free from Fever, Thirſt, and a Diarrhœa; if he eats and digeſts tolerably well, and is, in other reſpects, in a pretty good State of Health; and if the Acceſs of Air to the Cavity of the Thorax is, by all poſſible means, prevented; there are Hopes of his Recovery.

If, on the contrary, the Pus is brown, ichorous, mix'd with ſmall Fibres, or Blood, fetid, tinges the Probe applied to it, and burſts out all at once, there is the utmoſt Danger of Death, or a Conſumption.

If the Mediaſtinum is corroded and perforated, upon opening the Thorax, a ſudden Suffocation frequently enſues.

If the Empyema is of long Standing, if the Patient is extremely weakened, if the Hairs begin to fall off, if a colliquative Diarrhœa is already begun, and there is a great Extenuation of the Body; this Operation, generally, accelerates the Death of the Perſon on whom it is perform'd.

The Operation for the EMPYEMA.

The Operation for the Removal of Pus, or Matter, extravaſated in the Cavity of the Thorax, is called *Paracenteſis*; which is alſo perform'd in the Abdomen, and Scrotum, for evacuating Pus, Water, Blood, or any other foreign and preternatural Subſtance. But the *Paracenteſis*, or Perforation of the Breaſt between the Ribs, becomes neceſſary,

First,

Firſt, not only in the *Empyema*, ſtrictly ſo call'd; but, alſo, ſecondly, when any Quantity of Blood is diſcharg'd internally from a Wound of the Thorax, thro' which it cannot be extracted, but induces various formidable Symptoms: But, in this Caſe, the Operation is, by the *French*, improperly call'd the Operation for the *Empyema*; ſince Pus is abſolutely requiſite to conſtitute an Empyema; for which Reaſon it is, more properly call'd a ſimple *Paracenteſis*, or Perforation of the Breaſt.

Thirdly, this Operation becomes neceſſary, when the Waters in a Dropſy of the Breaſt are to be evacuated. When, therefore, the Diſeaſe itſelf, and its ſeveral Symptoms, ſuch as a Difficulty of Breathing, and a Senſe of unuſual Weight and Fluctuation in the Breaſt, indicate a foreign and preternatural Humour lodg'd within, we are to have recourſe to the Operation, ſince the noxious and peccant Matter can ſcarcely, if at all, be evacuated by any other means: But, before the Operation is attempted, 'tis to be carefully conſider'd, whether the Patient, in the Situation he is in, can receive any Relief from it. When, therefore, the Strength is much impair'd and exhauſted, this Operation is, generally, highly dangerous; for the Patient, for the moſt part, either dies under it, or ſoon after. His Fate is alſo the ſame, if, in conſequence of the inveterate Nature of the Diſeaſe, the internal Parts are corroded and corrupted; or if the Patient labours under a Fever, a Flux, an intolerable Difficulty of Breathing, frequent Faintings, or cold Sweats; for all theſe Symptoms pronounce the Diſeaſe deſperate, and almoſt always prognoſticate a ſpeedy Death. In theſe Caſes the Operation, inſtead of being attended with Succeſs, procures Infamy and Diſgrace to the Surgeon, ſince he is generally charg'd with having kill'd a Patient, who, in reality, fell the genuine Victim to his own Diſorder. But when none of theſe Symptoms appear, when the Patient is yet ſufficiently ſtrong, and the Diſeaſe recent, the Operation is frequently attended with due Succeſs, becauſe the Breaſt may be perforated without any Danger, provided the Surgeon is ſufficiently cautious, ſince there is no Neceſſity for making an Inciſion in any Part beſides the Skin, Fat, Muſcles, and Pleura.

But before the Operation is attempted, we muſt carefully advert to two Circumſtances:

Firſt, in what Side of the Breaſt the noxious Matter is lodg'd: For, when the ſound and unaffected Side is perforated, the Operation is to no Purpoſe.

Secondly, what particular Part of the Breaſt ought to be perforated. But, in order the more infallibly to diſcover in what Side of the Breaſt the noxious Matter is lodg'd, we are diligently to conſider, firſt, in what Side the Patient before felt Inflammation and Pains. Secondly, in what particular Part the Patient perceives a Senſe of Weight, and a certain Kind of Fluctuation. Thirdly, on what Side the Patient lies moſt commodiouſly; for in it the Matter is generally lodg'd; ſince he cannot lie, without great Uneaſineſs, on the ſound Side. Fourthly, a certain Swelling, accompanied with a violent and intenſe Heat, generally diſcovers the affected Side. When we are thus ſatisfied with reſpect to the affected Side, if it ſhould happen to be the Left, the Operation is moſt commodiouſly perform'd between the ſecond and third; and, if the Right, between the third and fourth ſpurious Ribs, counting from the loweſt, about an Hand, or five Fingers-breadth, or, in large-ſiz'd Patients, ſix Fingers-breadth from the Spine of the Back, and lower Angle of the Scapula; for, if the Perforation was made higher, the malignant Matter, collected in the lower Part of the Cavity of the Thorax, could not be commodiouſly diſcharg'd. *Boerhaave*, in *Aphor. N.* 303. treating of Wounds of the Thorax, orders the Perforation to be made between the ſecond and third of the inferior true Ribs; but all good Surgeons diſſent from him, becauſe that Place is by far too high. The ſame Author, however, *Aphor.* 1191. ſpeaking of an Empyema, directs the Operation to be perform'd betwixt the fifth and ſixth, or fourth and fifth Ribs, reckoning from the loweſt Rib. On the contrary, if the Perforation ſhould be made lower than the Part we have directed, we are in Danger of wounding the Diaphragm, eſpecially on the Right Side, where the Liver is connected to it.

In like manner, when the Perforation is made nearer the Spine of the Back, the Operation is far more tedious and doubtful, ſince the thick Muſcles muſt not only be pierc'd, but ſince there is alſo the greateſt Danger of wounding the intercoſtal Arteries and Veins, or other large Veſſels, which, in this Part, are not inſerted in the Sulci, or Furrows, of the Ribs; ſo that the Part directed by us is at once more commodious and ſafe for having the Perforation made in it, than any others.

This Part is to be mark'd with Ink; and the Patient reclining his Body a little, the Surgeon, and an Aſſiſtant, are, with their Fingers, to raiſe the Skin; after which an Inciſion, about three Fingers-breadth in Length, is to be made in the Part mark'd, that the Fleſh may afterwards be perforated with the greater Eaſe. Surgeons make this Perforation in two different manners; for they either thruſt a ſharp and triangular Inſtrument included in a Tube, by the *French* call'd *Trocar*, and repreſented in *Tab.* 45. *Fig.* 1. ſo far into the Fleſh, till its Extremity is perceived to have penetrated into the Cavity of the Breaſt: Then they extract the Inſtrument, repreſented by *Fig.* 2. and evacuate the noxious Matter by the Pipe left in the Wound, and repreſented by *Fig.* 3. This Evacuation is to be continued as long as the Patient's Strength will bear it; for when we perceive a fainting Fit approaching, or find a large Quantity of the noxious Matter diſcharg'd, removing this Pipe, we introduce into the Perforation, another ſhorter Pipe, made either of Lead, as in *Tab.* 23. *Fig.* Q; or of Silver, and flexible, as in *Tab.* 26. *Fig.* 9. Theſe are carefully to be ſecur'd by Strings tied about the Breaſt, and by Plaiſters over the Pipe: A thick Compreſs is to be apply'd, and ſecur'd by a particular Species of Bandage, by Surgeons call'd *Mantile cum Scapulari*, the Scapulary and Napkin. Sometimes the Skin, Fleſh, and Pleura, are all perforated at one time by the Trocar; but as the Lungs, which frequently adhere to the Pleura, may poſſibly be injur'd by this Method, the more ſkilful and judicious Surgeons uſe the following Method. Having cautiouſly made an Inciſion, of about three Fingers-breadth in Length, in the Skin and Fat, they afterwards make a tranſverſe Inciſion into the Fleſh and Pleura, between the two Ribs above-mention'd, with the Knife G or H, in *Tab.* 22. after which they introduce the Pipe already mention'd, and evacuate the noxious and peccant Matter: But in making this Inciſion, we muſt take care, that the Body of the Patient be, in ſome meaſure, inclin'd forwards; ſince, by this means, the Interſtice between the Ribs is render'd larger, and, conſequently, more Space allow'd for the Inciſion; which when made ſufficiently large, the Finger is to be introduc'd into it, and the Lungs, if adhering to any of the adjacent Parts, are to be ſeparated, that the noxious Humours may be the more eaſily evacuated. Tho' this laſt Method of performing the Operation requires more Diligence in the Surgeon, and more Reſignation in the Patient, yet 'tis, for ſeveral Reaſons, preferable to the other; for, beſides that the Lungs, if we perceive them to adhere, may in this Caſe be thruſt back, either with the Finger, or a Probe, and, by that means, ſecured from Injury, the bloody or purulent Matter is capable of being far more effectually evacuated, in conſequence of the Largeneſs of the Inciſion. According to Mr. *Petit*, we ought abſolutely to abſtain from Pipes and Tents, on account of the Diſadvantages attending them; and rather introduce into the Inciſion a Piece of ſoft Linen Cloth, made up in form of a Tail, by which means the Wound is not only kept open, but alſo the peccant Matter continually and commodiouſly diſcharg'd: Over the Linen Cloth introduc'd into the Wound, we are to lay a Portion of Lint, with a Thread fix'd to it, and over this, more Linen; all which muſt be ſecur'd with a Plaiſter, and a tight Bandage.

On the ſubſequent Days, the Wound is to be dreſs'd once, twice, or thrice, according to the Uneaſineſs of the Patient; and, when as much of the noxious Matter is evacuated as the Patient's Strength can bear, we muſt twice or thrice, at every Dreſſing, inject ſome cleanſing Liquor warm, which is again to be carefully evacuated: What is generally, and, at the ſame time, moſt efficaciouſly, us'd for this Purpoſe, is a warm Decoction of ſome vulnerary Herb, ſuch as Paul's Betony, Scabious, or *Saracens* Conſound, mix'd with Honey of Roſes, and Oil of Myrrh, and, unleſs the Patient is afflicted with a Cough, with a little of the Eſſence of Myrrh, or the pectoral Balſam of *Wurtzius*: *Garengeot* highly recommends, for this Purpoſe, a Decoction of the *Perſicaria*; and, if the Diſorder ariſes from a Pleuriſy or Peripneumony, a Decoction of Marſh-mallows; But common Spirit of Wine, impregnated with the Sulphur of Antimony, is equally efficacious, both in cleanſing and healing the Wound: Others recommend Lime-water, mix'd with Honey of Roſes, as the moſt proper Liquor for this Purpoſe. After theſe Meaſures have been taken for ſome time, we are carefully to obſerve, whether the injected Liquor returns pure and free from any Remains of the peccant Matter; for then we may conclude, that the Cavity of the Breaſt is ſufficiently purg'd; after which, the Piece of Linen Cloth, or Pipe, is to be extracted, and the Wound conglutinated, like other Wounds of the Breaſt: But that the Liquors injected may be again diſcharg'd more effectually, the Patient muſt be ordered to recline his Body on the Part where the Wound is made, and breathe ſtrongly. In the Cure, we are, above all things, to take care, that proper internal Medicines, eſpecially vulnerary Decoctions and Balſams, together with a due Regimen, be not neglected.

We muſt alſo obſerve, that the corrupted Matter generated by the Inflammation, does not always fall down to the inferior Part of the Breaſt, but rather penetrates thro' the Fleſh, and forms a Tumor and Abſceſs on the external Parts of the Breaſt. When this happens, we are not to make the Inciſion in the poſterior Part of the Thorax, as already directed, but immediately on the Part affected, and appearing externally tumid, whether anterior or poſterior. Sometimes this Diſorder is ſo

violent; that the Matter diffuſes an highly fetid Smell, and corrodes the Ribs; and if the vitiated Parts of theſe cannot be removed, the Diſorder is generally incurable.

When under the Sternum, and between the Membranes of the Mediaſtinum, any Abſceſs is form'd by a Fall, a Blow, or a Fracture of the Sternum, the peccant Matter can ſcarcely be evacuated by any other means than a Perforation of the Sternum. When, therefore, an Abſceſs of this Kind is ſuſpected by ſkilful Phyſicians and Surgeons, tho' both the Nature of the Diſorder, and Experience, convince us of the Difficulty of determining certainly in this Caſe, the Operation is to be perform'd in the following manner: The Patient muſt be laid on his Back, and a crucial Inciſion made in the lower Part of the Sternum, where the Abſceſs ſometimes diſcovers itſelf by a ſmall Hole; then drawing aſide the Lips of the Wound, the Sternum is to be perforated in the ſame manner with the Head, when trepan'd. When the Perforation is made, the Patient is to lie on his Breaſt, for the more commodious Diſcharge of the corrupted Matter. When the Abſceſs is ſufficiently cleans'd, eſpecially with the Injections already recommended, the Wound is to be dreſs'd, and conglutinated, almoſt in the ſame manner with Wounds of the Head, made by the Trepan. Some are of Opinion, that this Perforation of the Sternum is not ſo dangerous as that of the Cranium, becauſe the noble and important Parts of the one may be more readily injur'd than thoſe of the other: Yet 'tis not to be deny'd, that the Signs by which a Collection of Matter under the Sternum is diſcover'd, are highly dubious and uncertain. *Columbus*, however, and *Caſpar Hoffman* inform us, that if Humours are preternaturally collected in this Cavity of the Mediaſtinum, they may be ſafely evacuated, by perforating the Sternum. *Dionis* alſo tells us, that he ſaw this Operation perform'd, but that the Patient died ſoon after: Great Caution is, therefore, neceſſary in an Attempt of this Kind. *Petit* recommends the Perforation of the Sternum, when, after a Fracture of it, however reduc'd, a Pain remains under it, longer than might be reaſonably expected; for, ſays he, this is a Sign, that an Abſceſs ſtill is conceal'd under it. In his Treatiſe on the Bones he affirms, that the Sternum is ſometimes perforated by the Pus lodg'd under it, and which is, in ſome meaſure, diſcharged from it: But, becauſe the Ulcer can neither be ſufficiently deterg'd, nor the Pus effectually diſcharg'd, by ſuch a ſmall Perforation, he orders it to be enlarg'd by a Perforator, and the Wound cleans'd in the manner already directed. *Heiſter. Chirurgia.*

With reſpect to the Operation above-deſcrib'd, *Heiſter*, we ſee, and the beſt Authors extant, approve it; amongſt whom is *Boerhaave*, who, in *Aphoriſm* 303. directs it, when a conſiderable Quantity of Blood is extravaſated in the Thorax, by a Wound; in *Aphoriſm* 1191. when Pus is lodg'd in the Cavity of the Breaſt, and can neither be brought away by Expectoration, nor diſcharg'd by the urinary Paſſages; and, in a Dropſy of the Breaſt, *Aphoriſm* 1219. I find, however, that Mr. *Sharp*, in his Treatiſe of the Operations of Surgery, ſpeaks of this Operation as ſuperfluous, or even prejudicial, for the Evacuation of Blood, or Pus, diſcharg'd into the Cavity of the Thorax. "The Fluids," he ſays, "deſcribed as neceſ-
"ſary to be voided by this Operation, are Blood, Matter, and
"Water; but I am inclin'd to think, that upon Inquiry,
"either into the Reaſon or Succeſs of practiſing in all theſe
"Inſtances, we ſhall be induced to diſcard it as uſeleſs and
"pernicious in the two firſt, and confine its Advantages wholly
"to the laſt.

"When Blood is the Fluid ſuppos'd to require Evacuation
"by this Method, 'tis always extravaſated through ſome
"Wound of the Veſſels of the Lungs or Thorax, and, being
"diſcharged in great Quantities on the Diaphragm, is ſaid to
"oppreſs Reſpiration, till let out by ſome convenient Perfo-
"ration, made in the moſt depending Part of that Cavity,
"which is the only Kind of Perforation into the Thorax,
"diſtinguiſh'd by the Name of the Operation for the Em-
"pyema: But, if the Blood-veſſels wounded are very large,
"the Opening at the Bottom of the Thorax can be by no
"means adviſable, whilſt the Hæmorrhage continues, ſince it
"will be a Drain for a dangerous Effuſion of Blood, which,
"perhaps, would otherwiſe be choak'd up, and ſtopt, for
"want of a ready Iſſue.

"I know there are ſome Surgeons who admit of this Rea-
"ſoning, yet ſtill judge it neceſſary to perform the Operation,
"when the Hæmorrhage is ſtopt: But ſince, in Wounds of
"the Lungs, we ſee the Blood not only for the moſt part
"finds ſome Vent by the external Wound, if left open, but
"is conſtantly ſpit up by the Trachea, had we no other Proofs
"of this abſorbent Power in the Lungs, we might from hence
"be perſuaded of the Probability of its being more ſafely car-
"ried off ſo, than by any artificial Opening we can poſſibly
"contrive in the Thorax.

"Or if it be thought, that the extravaſated Blood, being
"coagulated in the Thorax, cannot be taken up by the Veſ-
"ſels of the Lungs, yet, even in this Caſe, the Operation
"uſually practis'd will not anſwer the Purpoſe; for, beſides
"that the Lungs frequently adhere to the Pleura, in the Place
"of Inciſion, which would abſolutely prevent any Advantage
"from it, the Depth and Narrowneſs of the Orifice, and its
"Height above the Diaphragm, on which the congeal'd Blood
"is ſuppos'd to lie, will make the Succeſs, at beſt, very
"precarious.

"If, then, the Attempt to diſcharge the Blood, by this
"Operation, be not eligible, when we know of its Extrava-
"ſation, it will be ſtill leſs ſo, in Caſes that are doubtful;
"nor will the Uſe of Tents and Injections for that Purpoſe
"be adviſeable.

"If I have ſhewn the Impropriety of the Operation for the
"Empyema, in relation to Wounds of the Thorax; its Un-
"fitneſs, alſo, in thoſe Caſes where Matter is ſuppos'd to lie
"looſe in the Thorax, will as readily appear; for, if we mean
"by it to give Iſſue to an Abſceſs of the Lungs, it will be
"needleſs; ſince an Abſceſs of the Lungs, when they do not
"adhere, and ulcerate outwards through the Ribs, will, almoſt
"always, be diſcharged by the Trachea; which is ſo gene-
"rally true, that, upon opening ſeveral, who have loſt a great
"Part of their Lungs by Impoſtumation, I do not remember
"to have found any looſe Matter in their Thorax: And it is
"notorious, that many conſumptive People die of the Diſ-
"charge they ſpit up from their Lungs: From whence it may
"be infer'd, that the Operation is not, with any good Pro-
"ſpect, to be undertaken on this Account: There poſſibly
"may have been ſome few Impoſtumations, form'd between
"the Mediaſtinum and Lungs, which have been diſcharged
"into the Cavity; but here, if the Matter is in a ſmall Quan-
"tity, the Lungs will take it up; and if in a large one, the
"Evacuation will do but little Service: Beſides, theſe Inſtances
"are but very few, and the Symptoms of an oppreſs'd Dia-
"phragm, from that Cauſe, but very doubtful; ſo that I
"think the Operation is not adviſeable, upon ſuch a Pre-
"ſumption. Generally ſpeaking, in any Inflammation of the
"Pleura, or Lungs, an Adheſion of both enſues; in conſe-
"quence of which, Nature finds a Diſcharge outwardly, it
"being moſt frequent for Abſceſſes of the Pleura, and inter-
"coſtal Muſcles, and not uncommon, even for Abſceſſes of
"the Lungs, to break externally. In caſe of an Adheſion, no
"farther Operation is requir'd, than opening the Tumor, when
"ſuppurated, with a Lancet; and if the Diſcharge is ſo great as
"to forbid the healing the external Ulcer, it may be kept open
"with an hollow Tent; by which manner of Treatment many
"have liv'd, a long time, with a running Fiſtula."

I would not conclude the laſt-quoted Author to be wrong, with reſpect to the diſcarding this Operation, upon the Authority above-mentioned, or any other; but would chuſe to conſult Reaſon and Succeſs, to which he himſelf appeals, upon this Occaſion: But I ſhall here confine myſelf to the Propriety of the Operation, when Pus is diſcharg'd into the Cavity of the Breaſt, and forms what is properly call'd an *Empyema*.

When, therefore, we are certain, from the Signs of a preceding Inflammation, Suppuration, and Rupture of an Abſceſs, in any Part within the Cavity of the Breaſt, that a large Quantity of Matter is there lodg'd, and, at the ſame time, no conſiderable Expectoration, nor any Appearance of a Diſcharge of Matter enſues, the Patient, unleſs reliev'd, muſt neceſſarily die tabid: But if a violent and ſudden Diſcharge of Matter is made by the *Aſpera Arteria*, the Patient periſhes by Suffocation, as we learn from *Hippocrates*, and Experience. Now in the firſt of theſe Caſes, and when the other is to be apprehended, I think it highly reaſonable to try an Operation, which is not very hazardous, rather than ſuffer the miſerable Patient to periſh without any Proſpect of Relief; eſpecially as the Caſes annex'd to this Article ſhew, that large Quantities of Matter are ſometimes contain'd in the Cavity of the Thorax, which may by a Perforation be let out.

As to the Succeſs of this Operation, many Hiſtories occur, in medicinal Writers, much in its Favour; and I have myſelf been a Witneſs, more than once, of the ſudden Recovery of Patients by means thereof, who, in all human Probability, muſt otherwiſe have periſh'd; and I have heard of many more, both from Phyſicians who have directed it, and Surgeons who have perform'd it. Among others, the following Caſe is remarkable, and comes up to my preſent Purpoſe.

Robert Kidwell, a Gardener, at this time, in *Lambeth-marſh*, near the End of the new Bridge, was ſome Years ago, being, at that time, about Eighteen, ſeiz'd with a violent Pleuriſy, in conſequence of Bathing in cold Water, immediately after working very hard: He was blooded copiouſly ſeveral times, and other Meaſures were taken, in order to reſolve the Inflammation; but to no Purpoſe; for it was ſucceeded by Shiverings, and all the Signs of the Formation of Matter; and afterwards, by the Signs of a Rupture of the Abſceſs, and a Diſcharge of Pus into the Cavity of the Breaſt. Mr. *Weſtbrook*, a Gentleman well diſtinguiſh'd by his Abilities in his Profeſſion, at this time viſited him, and found him labouring for Breath; his Breaſt ſeem'd much diſtended; his Face was pale,

ſhining, and œdematous; and he was ſo weak, as not to be able to lift up his Hands, which hung down by his Sides, much ſwell'd, utterly uſeleſs. Mr. *Weſtbrook* judg'd, that as he could not poſſibly live many Hours in this Condition, the only way to ſave his Life, was to perform the Operation. He accordingly made a Perforation into the Thorax with an Inciſion-knife, about two or three Fingers-breadth directly below the Left Breaſt, which Place he thought the moſt prominent. An exceſſively fetid Pus immediately burſt out with ſuch Violence, that it flew all over the By-ſtanders, and wetted a large Sheet; beſides which, more than a Pint was collected in a Porringer. The ſame Quantity, that is, more than a Pint, was diſcharged at every Dreſſing for ſeven or eight Days. During the Courſe of the Cure, the Orifice, by ſome Accident, clos'd ſo much, as to make it neceſſary to dilate it; which was accordingly done, and a very conſiderable Diſcharge of Pus follow'd. In three Days the Patient was able to walk up and down Stairs; in about eight Weeks the Orifice was clos'd, and perfectly heal'd; and, a very little time afterwards, he was ſtrong enough to beat two Men, with whom he had a Quarrel. It is remarkable, that his Cure was ſucceeded by an Abſceſs, and conſequent Fiſtula, in the Anus, of which he was cured; and is at this time a very hearty and ſtrong Man.

Observation I.

Carolus Piſo ſays, that though, according to *Hippocrates*, a Pleuriſy does not tend to a Suppuration before the fourteenth Day, yet he has in the Courſe of his own Practice known this happen, not only in young Perſons, but alſo in thoſe arrived at the Years of Maturity, in ſeven, or even in four Days; the Suppuration in the mean time palpably diſcovering itſelf by a Shivering, and ſubſequent Fever, ſeizing the Patient on theſe Days, and recurring every Day following. Thus, in a certain young Gentleman of Diſtinction, a Shivering and Fever appearing on the fourth Day, and recurring on the fifth, ſixth, and ſeventh Days, prognoſticated a Suppuration.

The laying open this Patient's Body, before the ſecond Week of the Diſorder was expired, ſufficiently demonſtrated, that a perfect Suppuration had happen'd before the Time ſpecified by *Hippocrates*, ſince his whole Thorax was found ſtuffed with Pus. Beſides, I remember, ſays he, to have ſeen Pus in the Thorax of a certain Clergyman, who died on the ninth Day of a Pleuriſy, becauſe he had been ſo ill-adviſ'd, as to uſe Purgatives, neglecting at the ſame time Veneſection, till the ſixth Day of his Diſorder, when I was call'd. *Carolus Piſo, de Morbis ab Illuvie Seroſa.*

Observation II.

Upon diſſecting the Body of a Patient, in whom an internal Suppuration had happen'd, I found the Left Lobe of the Lungs entirely wanting, and the Left Cavity of the Thorax filled with purulent Water; notwithſtanding which, the Patient, during the two Months he had been afflicted with this Diſorder, laboured under no Difficulty of Breathing, and had only a gentle Cough, without any Expectoration of the morbific Matter. *Dom. Panarolus Ponti, C.* 1. *Obſervat.* 46.

Observation III.

In a certain Perſon, on whom the Operation for the Empyema was perform'd, the Lungs appeared ſufficiently ſound and firm; but a Matter diſcharged from an internal Abſceſs of his Side, into the Cavity of his Thorax, ſo compreſs'd the Diaphragm, that he could hardly breathe. The Surgeon, without the Uſe of any Cauſtic, introduced his Knife between the ſixth and ſeventh Ribs; after which, putting a Pipe into the Orifice, a bloody Ichor was firſt diſcharged, and at different times taken away in moderate Quantities. For three Days this Matter was evacuated without any fetid or noiſome Smell; but afterwards, every time the Perforation was opened, a highly fetid Smell was diffuſed, till by Decoctions of Myrrh and bitter Herbs, prepared with Water and Wine, and frequently injected every Day, the morbific Matter and Sordes, producing this Smell, were totally attenuated, and waſh'd away. After this the Diſcharge entirely ceaſing, and the Perforation being conſolidated, the Patient remain'd in a perfect State of Health.

Upon laying open the Body of a Patient, who would not ſubmit to the Operation for the Empyema, I found that a certain Quantity of Pus, diſcharged from an Abſceſs in the Pleura, and intercoſtal Muſcles, had ſphacelated the Part affected, and the contiguous Portion of the Lungs; after which, corroding the Diaphragm, ſo as to make a Perforation in its Right Side, it had fallen down upon the abdominal Viſcera, and not only diſcoloured, but corroded their external Coats. Then the purulent Matter, corroding and perforating the Inteſtinum Rectum, was at laſt diſcharged with the Excrements. As this Patient was naturally robuſt, and had an Averſion to all Kinds of Medicines, he ſupported his Diſorder for two Months, during which he laboured under a ſlight Fever, Thirſt, Reſtleſſneſs, an uneaſy Senſation at the Stomach, frequent Vomitings, and a Privation of Sleep.

Upon opening the Body of another, who died of an Empyema, I did not find ſuch a large Collection of purulent Matter; but there was a purulent Ulcer in the Pleura, which continually diſcharged Pus in large Quantities into the Cavity of the Thorax, and contaminated the Lungs, which were in a manner immers'd in it. This Patient during his Diſorder was afflicted with a kind of ſlow Fever reſembling a Hectic. *Willis Pharm. Rat.*

Observation IV.

A certain Man, about thirty Years old, when drinking Wine, was ſo fooliſh, as, by way of Oſtentation, to break and chew the Glaſſes; but at laſt a Fray happening between him and ſome of his Companions, he was ſoundly beat and kick'd. Upon this he was not only ſeiz'd with an Aſthma, accompanied with a pungent Pain of his Side, but alſo diſcharged large Quantities of Blood, both by Vomit and Stool. Various Methods were taken for his Relief, but to no Purpoſe; for as the purulent Matter contained in the Cavity of his Thorax could not be evacuated by Expectoration, and as he abſolutely declin'd the Operation for the *Empyema*, he at laſt fell a Sacrifice to his Obſtinacy.

After his Death we carefully opened his Abdomen, and took an accurate Survey of his Stomach, Inteſtines, Liver, Spleen, Kidneys, Meſentery, Omentum, and Bladder; in which we found no Marks of any Injury, much leſs any Traces of chew'd Glaſs in his Stomach and Inteſtines; the Circumſtance to which his Antagoniſts aſcribed his Death. But afterwards, laying open the Cavity of his Breaſt, which, eſpecially on the Right Side, we found ſtuffed with a large Quantity of acrid, purulent Matter, as far down as the Diaphragm, after wiping up this Matter with Sponges, we found not only the Pleura, but alſo the whole Pericardium, corroded all around, and the Right Lobe of the Lungs ſo flaccid, tabid, and collaps'd, that, of all its Subſtance, there only ſeem'd to remain a ſlender kind of membranaceous Part, with ſome few Veſſels in it. From theſe Circumſtances it is ſufficiently obvious, that this Patient, as the Matter could not be expectorated, died not only for want of the Operation for the Empyema, in order to give Vent to the pent-up Matter, which produced the Corroſion and Corruption of theſe Parts, but alſo on account of the flaccid and collaps'd State of the pulmonary Veſicles, by which a free Reſpiration muſt neceſſarily be prevented. *D. Eberhard. Goekelius, in Miſcellan. curioſ. Decur.* 2. *An.* 7.

I cannot finiſh this Article, without giving a Paſſage from *Hippocrates*'s fourth Book *de Morbis*, extremely pertinent to the preſent Subject. This Author, after giving the Methods proper for promoting Expectoration, proceeds thus:

If Pus be generated from Spit left in the Lungs, the Patient is moleſted with a dry Cough; a Fever ſeizes him with a Shivering; he labours under an Orthopnœa, with a ſhort and thick Reſpiration; his Voice becomes of a deeper Tone; and a high Colour, with a Heat, overſpreads his Face. In Proceſs of Time the Diſeaſe ſhews itſelf by more evident Signs. If the Pus cannot be evacuated, there is an Eruption of it from the Lungs into the Thorax; after which the Patient ſeems to be well, the Pus being tranſlated from a narrower into a larger Capacity, and the Function of Reſpiration being freely diſcharged by the Lungs. But, in Proceſs of Time, the Thorax is filled with Pus; and the Cough, and the Fever, with all the other painful and troubleſome Symptoms, return with more Violence; and the Diſeaſe manifeſts itſelf in all its Forms. In this Caſe it will be convenient to let the Patient alone till fifteen Days after the Eruption, that the Pus may have time again to maturate, ſince by its Tranſlation into a larger Place, and its Refrigeration by attracting to itſelf the Humidities of the Thorax, it muſt of neceſſity be no more than half putrefy'd or digeſted. If, in the Time before-mentioned, Expectoration begins ſpontaneouſly, it is well; if not, we are to aſſiſt the Patient, in ſome of the ſaid fifteen Days, with Medicines and Potions in order to his Refreſhment, and to recruit his Strength before his Body be too much enfeebled, and to preſerve the Head pure and clean from all Matter which may cauſe a Defluxion. But if there be no Diſcharge by Expectoration, and there be plain Indications, that the Streſs or Tendency of the Pus is towards the Sides, make no Scruple to uſe the Knife or Cautery. If there be no Signs of this Nature, nor yet any Expectoration, let the Patient, after bathing in Plenty of hot Water, faſting, and without the leaſt drinking, be firmly ſeated in a Chair; and, ordering an Attendant to lay faſt hold of his Shoulders, ſhake him well yourſelf, clapping your Ear to his Ribs, that you may diſcover the Part whence the Indications are to be taken. And here it is to be wiſhed, that the Place affected might lie towards the Left Side, becauſe Burning or Cutting are moſt fatal on the Right; for the ſtronger the Parts are on the Right Side, the more violent are the Diſeaſes in thoſe Parts. If there be no Fluctuation, becauſe of the Thickneſs of the Humour, and conſequently no Noiſe to be heard in the Breaſt, but the Patient fetches his Breath ſhort, his Feet ſwell, and he is moleſted with a Cough, you may aſſure yourſelf, that the Thorax is full of Pus. Dip, therefore, a thin

Linen

Linen Cloth in a warm Infuſion of Eretrian Earth finely triturated, and lay it all over the Thorax; and in that Part where you find the Cloth firſt dry'd, make the Section, or apply the Cautery, in ſuch manner as to approach very near the Diaphragm, but without touching it. You may, if you think fit, anoint the Part with the Eretrian Earth, and make the ſame Obſervation as in the Linen Cloth: Many uſe the Unction with the other Method, leſt the Parts which are firſt anointed, ſhould be dry'd. After the Operation by Burning or Inciſion, introduce a Tent made of Tow, and evacuate the Pus by little and little. When you have determin'd on Cutting or Burning, it will be very proper to make a Mark on the Skin, within whoſe Limits you are to confine the Direction of your Knife or Cautery, and ſo avoid carrying them too high, or too low. All Food which is diſpoſed to excite Coughing, is to be avoided, leſt it ſhould cauſe a Revulſion of the Pus into the Lungs, which would be bad for the Patient; but the Pus is to be ſuffered to dry as ſoon as poſſible, in order to its Diſcharge by the Inciſion. At the End of twelve Days, evacuate the reſt of the Pus; and, ſtopping the Hole with a Linen Tent, draw out the Pus twice in a Day, preſcribing alſo a Diet proper for drying the inner Region of the Thorax [ἀνωκοιλίη]. And this is the Method of examining and curing an Empyema, whether proceeding from a Wound, Peripneumony, or violent Catarrh, occaſioning a Preſſure of the Lungs againſt the Side.

EMPYOS, ἔμπυος, is one affected with an EMPYEMA; which ſee.

EMPYREUMA, ἐμπύρευμα, from ἐμπυρεύω, to kindle, of πῦρ, Fire, according to *Galen*, *Lib.* 9. *de S. Fac. in Princip.* is a ſort of Ignition, or dry adventitious Heat, which Bodies receive from igneous Particles, and depoſit afterward in Lotions. *Empyreuma* alſo ſignifies the Remains of the febrile Heat after the Paroxyſm of a Fever. *Empyreuma*, in Chymiſtry, is the offenſive Smell and Taſte, which diſtil'd Waters, or other Subſtances, receive from being too much expos'd to the Fire.

EMPYROS, ἔμπυρος, one labouring under a Fever. *Hippocr. Lib.* 2. *de Morb.*

EMULGENTES *Venæ & Arteriæ*, the emulgent Veins and Arteries. See RENES, ARTERIÆ, and VENÆ.

EMULSIO. An Emulſion. I have given an Account of Emulſions made of oleous Vegetables, under the Article CHYLUS. But Medicines of any Kind, made in a Form reſembling Milk, are call'd Emulſions. Thus Solutions of Gums, Reſins, or Sperma Ceti, made by means of the Yolk of an Egg, in a proper Vehicle, are call'd Emulſions.

EMUNCTORIUM, *Emunctory*, the Paſſage by which any thing vitiated or uſeleſs is evacuated: Thus the Skin is call'd the *Emunctory* of the Body; the Noſe is call'd the *Emunctory* of the Brain; the Glands are alſo call'd *Emunctories*.

EMUNDANS *Medicamentum*, an external deterſive Medicine. *Blancard.*

ENÆ (*Chartarum*) in *Marcellus Empiricus*, is a corrupt Word for INÆ; ſignifying the ſlender Threads of Paper, which being raiſed, render it rough. *Salmaſius in Solin.*

ENÆMOS, ἔναιμος, ἔναιμων, from αἷμα, Blood, is an Epithet often apply'd, by *Hippocrates* and *Galen*, to ſuch topical Medicines as are appropriated to a Wound newly inflicted, before the Blood be ſtopt. *Celſus*, *Lib.* 5. *Cap.* 19. deſcribes ſeveral vulnerary Plaiſters, which, he ſays, the *Greeks* call ἔναιμα, *Enæma*. Ἔναιμον σῶμα, in *Hippocrates*, is a Body abounding with Blood.

ENÆOREMA, ἐναιώρημα, from ἀωρέω, to exalt, of ἀωρὸς, ſublime, is the pendulous Subſtance which floats in the Middle of the Urine; call'd by Phyſicians alſo *Sublimamentum*. *Hippocrates* frequently expreſſes it by νεφέλαι ἐπιφορμέναι, which *Celſus* renders *Nubecula ſuſpenſa*, "a ſuſpended Cloud." Thus, *Prognoſt.* it is ſaid, that "Of Clouds ſuſpended in the Urine, "the white ones are good, but the black, bad." Again, a little after, "The Clouds in the Urine are to be inſpected, whe-"ther they are in a high or low Situation, and what Colours "they repreſent; for thoſe which tend downwards, and are of "the Colours above-mention'd, are good and laudable; but "thoſe which tend the contrary Way, with the Colours above-"deſcribed, are bad, and to be condemned." *Galen*, in his Comment on the foregoing Paſſage, ſays, that "He calls an "*Enæorema*, that thick and whitiſh Subſtance in the Urine, "which neither ſwims at the Top, nor ſinks to the Bottom, "but is ſuſpended in the middle Region, either exactly in the "Middle, or tending downwards, rather than upwards. *Hip-*"*pocrates* calls the ſame a Cloud, becauſe it has a like Situa-"tion in the Urine as a true Cloud in the Air; for it is of a "groſſer Subſtance than the circumfuſed Liquid, in like man-"ner as a Cloud is more ſubſtantial than the ſurrounding Air."

Ἐναιωρήματα γονοειδέα, 1 and 3 *Epid.* are *Enæoremas* reſembling the ſeminal Matter, being a ſort of grandinous and grumous Subſtance, conſiſting of much vitreous and viſcid Phlegm, with a great Quantity of crude Matter.

Ἐναιωρήματα στρογγύλα, διεσπαρμένα, οὐκ ἰδρύοντο, "the *Enæo-*"*remas* were of a round Figure, ſcattered, and had an unſettled "Situation," in *Lib.* 1. *Epid.* Theſe portended a Delirium."

Ἐναιώρημα μετέωρον, "ſublime *Enæprema*," in *Lib.* 3. *Epid. Ægr.* 3. 9. 12. portended a Delirium, as indicating the Matter to be carry'd upwards by the Flatulences, to the Diſturbance of the Brain.

Ἐναιωρέμενοι ὀφθαλμοὶ, "Eyes lifted up," *Prognoſt.* as explain'd by *Galen*, are Eyes which are inconſtant, and always in Motion. The ſame ſeems to be a proper Expreſſion for Eyes which are drawn upwards, and held ſuſpended; as in dying and fainting Perſons, when the Pupil of the Eye is covered by the upper Eyelid, as we read *Coac.* 218. where the Author ſeems to expreſs the *Enaierumeni Ophthalmi*; and ſuch were the Eyes of *Æniates*, *Lib.* 7. *Epid. Ægr.* 35. when they are deſcribed as in the Poſture of thoſe who are in a Lipothymy, by which his ſpeedy Death was indicated.

ENANTESIS, ἐνάντησις, from ἀντάω, to meet, of ἀντὶ, againſt, is a Word by which *Galen* expreſſes the near Approach, and almoſt Meeting, of the aſcending and deſcending Blood-veſſels.

ENARGES, ἐναργὴς, from ἀργὸς, white, evident, manifeſt, is an Epithet apply'd by *Hippocrates* to Dreams, 1 *Prorrhet.* and *Coac.* 90.

ENARICYMON. The ſame as ARICYMON; which ſee.

ENARTHROSIS; ſee ARTICULATIO.

ENAULIA, ἐναύλιον; ſee AULOS.

ENCANTHIS, ἐγκανθὶς, from ἐν, in, and κανθὸς, an Angle of the Eye.

In the larger Canthus, or Angle of the Eye, there ſometimes ariſes a certain Tubercle, either from the Caruncula Lacrymalis, or from the creſcent-like red Cuticle adjacent to it: Sometimes this Tumor or Swelling increaſes to ſuch a ſurpriſing Bulk, as not only to cover the *Puncta lacrymalia*, but alſo the greateſt Part of the Pupil. When this happens, the Tears continually trickle down the Cheeks, the Sight is impaired, the Countenance deformed, and the Eyes inflamed. See *Tab.* 36. *Fig.* 27. This Diſorder was by the *Greeks* call'd *Encanthis*. There are two Kinds of it; the more mild and benign of which is neither accompanied with Hardneſs nor Pain; whereas that which is more obſtinate and malignant, is accompanied with Pain, livid, and in ſome meaſure partaking of the Nature of a Cancer.

When the Encanthis is of the mild and benign Kind, frequent Scarification, or Inciſion, as alſo gently corroding Medicines, generally contribute much to a Cure, if us'd in the Beginning. But the beſt corroding Medicine, of a mild and gentle Kind, is a Powder prepared of four Parts of Sugar-candy, and one Part of white Vitriol, or a fifth Part of burnt Alum. This Powder is frequently and cautiouſly to be ſprinkled on the Tumor, and the Eye is afterwards to be waſh'd with lukewarm Water, till the Diſorder is found to be totally remov'd. If this Powder ſhould not produce the deſign'd Effect, the Tumor may, now-and-then, be cautiouſly touch'd with the Lapis Infernalis: But that a more effectual Revulſion of the Humours may be made from the Eyes, and the Return of the Diſorder more infallibly prevented, Fontanels and Setons, together with ſuch Medicines as render the Body ſoluble, and purify the Blood, are highly neceſſary. But if no Medicines are ſufficient for conſuming the luxuriant and ſuperfluous Fleſh, or if, in the more malignant Sort of this Diſorder, the Application of corroding Medicines ſhould ſeem leſs ſafe, the Tubercle muſt be extirpated with a Hook, like thoſe repreſented in *Tab.* 36. *Fig.* 30 and 31. or with a Forceps; and, if it is very large, a Thread may be paſſed thro' it, with a Needle, by means of which it is to be carefully raiſed, and cautiouſly cut out; for in this Operation uncommon Care is to be taken, that no Part either of the Eye itſelf, or of the Caruncula Lacrymalis, be cut; for as this Caruncle retains the Tears in the great Canthus from continually trickling down, if it ſhould be imprudently injured, the Humours muſt of courſe continually trickle down, and produce what we call a Weeping Eye. 'Tis, therefore, more expedient to leave a ſmall Portion of the luxuriant Fleſh in the Eye, than totally to extirpate it; for the remaining Portion may afterwards be remov'd with Caution, either by a Pair of Seiſſars, or the Aſſiſtance of ſome corroding Medicine. When the Tubercle is thus remov'd, drying and conglutinating Medicines are to be us'd, till the Wound is healed. This Intention is anſwer'd by a Collyrium prepared of Tutty, Myrrh, and Aloes.

In an obſtinate Encanthis, and ſuch as already tends to a Cancer, it is more expedient to uſe drying, refrigerating, and lenient Collyriums and Ointments, than to have recourſe to the Operation, and burning Medicines; becauſe, by thoſe laſt, the Diſorder, as in Cancers, runs a Riſque of being augmented. *Purmon* gives us a memorable Inſtance of a large Tumor of this Kind, which he himſelf happily extirpated, by paſſing a Ligature about it, elevating it ſufficiently, and applying the actual Cautery to its Roots. *Heiſter. Chirurg.*

ENCARDION, ἐγκάρδιον, from καρδία, the Heart. The Heart or Pith of Vegetables. *Dioſcorides.*

ENCARPOS, ἔγκαρπος, from ἐν, in, and καρπὸς, Fruit. A Woman with Child is thus figuratively call'd. *Suidas.*

ENCATA-

ENCATALEPSIS, ἐγκατάληψις. The ſame as CATALEPSIS.

ENCATANTLESIS, ἐγκατάντλησις. The ſame as EPANTLESIS.

ENCATHISMA, ἐγκάθισμα, from ἐγκάθημαι, to ſit in. The ſame as SEMICUPIUM, which ſee.

ENCAUMA, ἔγκαυμα, from καίω, to burn. A Puſtule contracted by a Burn. The Mark left by a Burn.

Encauma alſo imports a Sort of Ulcer in the Eye. Thus *Aetius*, *Tetrabib. 2. Serm. 3. C. 25.* informs us, that thoſe ſuperficial Exulcerations of the Eyes, which ariſe from Defluxions of Humours, are call'd by different Names. A *Caligo*, for Inſtance, is a ſuperficial Ulcer form'd in the Black of the Eye, covering moſt of it, and of a bluiſh Colour; but, when this Ulcer is form'd in the Pupil of the Eye, the Patient's Sight is conſiderably impair'd. A *Nubecula* is a ſmaller, deeper, and whiter Ulcer, form'd alſo in the Black of the Eye. On the contrary, an *Epicauma* is ſaid to be form'd, when the Surface of the Black of the Eye becomes rough, appears parched, and aſſumes a cineritious Colour. An *Encauma* is an Ulcer generally ariſing from a Fever, and producing an impure and ſordid Cruſt, either in the Black or White of the Eye. When 'tis deep-ſeated in the Black, in attempting the Cure, a violent Corroſion of the Coats for the moſt part happening, the Humours are gradually diſcharged, till the whole Eye at laſt drops out. When theſe ſuperficial Ulcers happen, either with or without a Fever, the firſt Step to be taken is to evacuate the Fæces by Clyſters. Then we are to drop into the affected Eye the *Collyrium Nili ex Roſis*, much diluted; and, in the Intervals between the Uſe of this *Collyrium*, Milk is alſo to be dropt into it. After theſe Meaſures are taken for a few Days, we are to mix the *Chiacum Apollonii*, or ſome aromatic Subſtance, with the *Collyrium Nili*: After this we are to uſe theſe Subſtances alone, ſince they ſoon induce ſlender, and ſcarce perceptible, Cicatrices.

ENCEPHALOS, ἐγκέφαλος, from ἐν, within, and κεφαλὴ, the Head. The Brain. See CAPUT.

ENCERIS, ἔγκηρις, from κηρὸς, Wax. Small Grumes or Concretions of Wax, which will ſometimes be found in Plaiſters, as they cool. *Galen, de C. M. P. Gen.*

ENCHARAXIS, ἐγχάραξις, from χαράσσω, to ſcarify. Scarification. *Galen.*

ENCHEIRESIS, ἐγχείρησις, from χεὶρ, the Hand. *Galen* has made this Word a Part of the Title to one of his Works, which treats on the Method of diſſecting the Parts of the Body. His Interpreters tranſlate it by *Adminiſtratio*. It imports the Handling, or manual Treatment, of any Subject whatever.

ENCHEIRIA, ἐγχειρία. The ſame as ENCHEIRESIS, and of the ſame Derivation. It occurs in *Hippocrates*, *Lib. de Artic.*

ENCHONDROS, ἔγχονδρος, from χόνδρος, which ſignifies both a Grain, and a Cartilage. Hence it implies both *granulated* and *cartilaginous*.

ENCHORIOS, from ἐν, in, and χῶρος, a Region, or Country. Endemial. See ENDEMIUS.

ENCHRISTA, ἔγχριστα, from χρίω, to anoint. Liquid Medicines, with which any Part is anointed.

ENCHYSA. The ſame as ANCHYSA. Alkanet. *Blancard.*

ENCHYMA, ἔγχυμα, from ἐγχέω, to infuſe. Infuſion. What the Phyſicians call *Plethora ad Vaſa*, that is, a Fulneſs of the Veſſels ſimply conſider'd as relative to themſelves, is alſo call'd, πλῆθος κατὰ τὸ ἔγχυμα, a Fulneſs from Infuſion, or on account of having too much Blood infuſed into them.

But *Enchymata* are liquid Medicines, to be infuſed into the Eyes or Ears, or injected into the Thorax.

ENCHYMOMA, and ENCHYMOSIS, ἐγχύμωμα, and ἐγχύμωσις. A ſudden Effuſion of Blood into the cutaneous Veſſels; ſuch as happens upon Joy, Anger, or Shame; and, in the laſt Inſtance, is call'd *Bluſhing*. This is very different from ECCHYMOSIS; which ſee. It is of the ſame Derivation as ENCHYMA.

ENCHYTOS, ἔγχυτος, of the ſame Derivation as ENCHYMA. An Epithet for any thing infus'd or inſtil'd into any Cavity of the Body, but particularly the Eyes.

Blancard interprets *Enchyta* a Funnel, by which any thing is inſtil'd into the Eyes, Ears, or Noſtrils.

ENCLYSMA, ἔγκλυσμα, from κλύζω, to waſh. A Clyſter. *Dioſcorides.* See ENEMA.

ENCOELIA, ἐγκοιλία, from κοιλία, the Belly. The abdominal Viſcera; that is, all the Contents of the Abdomen.

ENCOLPISMOS, ἐγκολπισμὸς, from ἐγκολπίζω, to inſinuate or introduce into a Sinus or Cavity. A uterine Injection. *Moſchion de Morbis Mulierum.*

ENCOPE, ἐγκοπὴ, from κόπτω, to cut. An Inciſion; and figuratively, an Impediment or Interception.

ENCRANIS, or ENCRANION, ἐγκρανὶς, or ἐγκράνιον. The *Cerebellum*. See CEREBRUM.

ENCRASICULUS. The Anchovy. See APUA.

ENCRIS, ἐγκρὶς. A ſort of Cake made of fine Meal boil'd in Oil, and then ſweeten'd with Honey.

ENCRYPHIAS, ἐγκρυφίας. An Epithet for a ſort of Bread. See ARTOS. It is derived from ἐγκρύπτω, to hide, or cover.

ENCYMON, ἐγκύμων, from ἐγκύω, to conceive. Pregnant, with Child.

ENDEDINEMENOS, ἐνδεδινημένος, from ἐνδινέω, to turn round like a Vortex. An Epithet for Eyes which are perpetually turning round in their Orbits.

ENDEIXIS, from δείκνυμι, to ſhew or indicate. An Indication. See INDICATIO.

ENDEMIUS, Endemial. An Epithet for Diſeaſes to which the Inhabitants of particular Countries are ſubject more than others, on account of their Air, Water, Situation, and manner of living.

ENDESIS, ἔνδεσις, from δέω, to tie. A Ligature, Band, or Connexion. Ἔνδεσις τῦ ποδὸς, "the Connexion of the Foot," in *Hippocrates*, *Lib. περὶ ὀστέων φύσ.* is that Part of the Foot where the Bones of the Tibia end, and which is connected by Ligaments to the Ancle-bones.

ENDICA, according to *Rulandus*, is *Fæces in Fundo*, "the Fæces in the Bottom." *Morienes*, he ſays, has thus written of it: "Seek the *Endica* in Glaſs-veſſels, and repoſit "it, till it turns acid; for with dulcid Matter there is nothing "to be effected. This *Endica*, added to Bodies, changes them "into Earth, and preſerves them from being burnt; for, when "Bodies loſe their Soul, they are eaſily burnt. *Endica* is "ſerviceable to all Bodies, rendering them uſeful and vital, "and preſerving them from Putrefaction and Burning." It is alſo call'd *Moſe hazuania*.

ENDIVIA LUTEA. AName for the *Zacintha ſive Cichoreum verrucarium*, the *Rhagadiolus alter*, and the *Hedypnois*; *annua*.

ENDIVIA VULGARIS. A Name given to ſeveral Species of the *Cichoreum*, which ſee.

ENDIVIA ERECTA. A Name for the *Hyoſeris anguſtifolia*.

ENDOSIS, ἔνδοσις, from ἐνδίδωμι, to remit. A Remiſſion. The Verb, whence it has its Signification, is uſed by *Hippocrates*, as *Galen* ſays, *Com. 3. in Prognoſt.* and by all others ſince his Time, to expreſs a Remiſſion of Affections or Symptoms; as when they ſay of an Inflammation, Tumor, Hardneſs, Tenſion, or Pain, it begins ἐνδίδωσι, that is, to remit. Ἔνδοσις, in *Galen*, *Com. 3. in Epid.* is a Remiſſion in continual Fevers, after their Exacerbations; where he makes ἔνδοσις to ſignify a Remiſſion in continual Fevers, and ἀπυρεξία (*Apyrexia*) in intermittent; but comprehends both their Significations under the Verb διαλείπειν.

ENDROMIS, a coarſe ſhaggy Garment, uſed after Bathing, or violent Exerciſe.

ENEDRE, ἐνέδρη, from ἐν, in, and ἕδρα, a Seat; in *Hippocrates*, is an Inſeſſion, Location, and, *Lib. de Fract. παρθέντων ἐνέδραι*, as *Galen* explains it, are Impoſitions (ἐπιθέσεις) of Splints; where he ſays, that *Hippocrates*, by ἐνέδρας, meant the ſame as ἕδρας, but added the Prepoſition ἐν, to make the Signification of the Word clearer. Ἐνέδραι, *Lib. de Aere, Loc. & Aq.* are ſuch as ſit with great Firmneſs on Horſeback.

ENELLAGMENOS, ἐνηλλαγμένος, from ἐναλλάττω, of ἀλλάττω, to change. An Epithet applied to the Joints of the Vertebræ, becauſe of their alternate or mutual Reception and Inſertion.

ENEMA, from ἐνίημι, to inject. A Clyſter.

The Words *Enema*, *Clyſter*, and *Lotio*, are equivalent to each other, and ſignify any liquid Medicine, injected into the Anus, for the Cure of various Diſorders incident to the human Body. The firſt of theſe Words is derived from the *Greek*, ἐνίημι, to inject, or thruſt in; the ſecond from κλύζω, to waſh, or cleanſe; and the third, which is the Word uſed by *Celſus*, to expreſs the ſame Thing, from the *Latin* Word *lavare*, to waſh. From this laſt, in all Probability, the *French* borrow the Word *Lavement*, which among them ſignifies a Clyſter. In *Germany* and *Holland*, the Bladder of a Calf, a Sow, or an Ox, perforated at both Extremities, is almoſt univerſally uſed for this Purpoſe; ſee *Tab. 55. Fig. 12. Lett.* A A. Theſe, for Children, may be ſmall; but for Adults, muſt be ſo large as to contain a Pint of Liquor, or more. In one of the Perforations or Extremities, a Pipe of Bone, repreſented by B B, is carefully fixed. Immediately above this the Bladder is tied cloſe, by means of the large Thread C C, in order to hinder any of the Liquor from paſſing through the Pipe, till the Operator intends it ſhould. At the other Perforation, a Liquor ſuited to the peculiar Nature of the Diſeaſe is to be poured into the Bladder; after which, this Extremity of the Bladder, repreſented by D, is alſo to be firmly tied, that no Part of the Liquor may be loſt, whilſt the Operator injects it into the Anus. Then the Pipe of Bone is to be anointed with Butter or Oil, and cautiouſly introduced into the Anus of the Patient, lying upon either Side, with his Head and Body lower than his Buttocks. Then looſing the Ligature C, made immediately above the Pipe, the Bladder is to be ſtrongly compreſſed by the Hands

Hands of the Operator, in order to force the Liquor into the large Inteſtines. When this is done, the Pipe is to be retracted, and the Patient ordered to remain, as nearly as he can, in the ſame Poſture, till the Medicine injected attempts its Regreſs or Diſcharge with a kind of Force or Violence; for, as *Celſus* obſerves, *the Patient is not to yield to the firſt Inclination of diſcharging this Liquor, but to retain it as long as he can.*

The *Dutch*, the *French*, and ſome other Nations, inſtead of a Bladder, uſe a Syringe made of Tin, and capable of containing a Pint, or more, of Liquor. The Pipe of this Syringe, which is introduc'd into the Anus, is not unlike that affixed to the Bladder; but 'tis ſufficiently obvious, that by this means, Liquors are more quickly, more ſtrongly, and, conſequently, farther, convey'd into the Inteſtines, than by the Bladder, which, however, may be more eaſily carried about and conceal'd than a large Syringe; as alſo uſed with leſs Trouble and Pain for Infants, and Women in Child-bed. But as ſome Perſons have ſo rigid a Regard to Decency, that they would rather ſubmit to any Hardſhip, than expoſe their Poſteriors to open View, thoſe fall upon a proper Expedient, who apply to this Syringe a flexible leather Pipe, about half an Ell long, and furniſhed at its Extremity with a ſmaller Pipe of Bone, which the Patient himſelf, with his whole Body cover'd, may introduce into his Anus, and either inject the Liquor himſelf, or give the Syringe to ſome other Perſon, for that Purpoſe. The Reader, who deſires to know more of this, may conſult *Hildanus*, *Cent.* 1. *Obſ.* 78. *Bartholin. Hiſt. Anat.* 66. *Cent.* 6. *De Graaf*, in his Book *de Clyſteribus*; *Juncken*, in his Surgery; as alſo *Valentini*'s *Polychreſta Exotica*, where theſe Syringes, together with the leather Pipe, and Method of uſing them, are delineated. But we muſt take care, that the Liquors uſed for Clyſters be neither too hot, nor too cold, but tepid, or moderately warm; for the Inteſtines are generally greatly injur'd by Liquors either exceſſively hot, or exceſſively cold.

Celſus, in the ſixteenth Chapter of his ſecond Book, has the following Paſſage: "When, ſays he, the Caſe only requires "a gentle Clyſter, pure Water may anſwer the End. But "if one ſomewhat more powerful is wanted, Hydromel muſt "be uſed. If a lenitive Preparation of this kind is wanted, "let Water, in which Fenugreek, Barley, Mallows, or any "other emollient Herb, have been boiled, be uſed for that "Purpoſe. If a Clyſter of a reſtringent Quality is deſired, let "it be prepar'd of *Vervain*. [Celſus, *in all Probability, by the "Word* Verbena, *means all corroborating Herbs in general.*] "If an acrid Clyſter is deſired, it may conſiſt of Sea-water, or "common Water, with an Addition of Salt; but both of "theſe are ſo much the better, if boil'd. A Clyſter of a ſtill "more acrid Nature, may be obtain'd by an Addition of Oil, "Nitre, or Honey, or all theſe together. The more acrid a "Clyſter is, the more Matter it evacuates, but is leſs eaſy "to be ſupported by the Patient." If a lenitive or demulcent Clyſter is to be injected in the Stone or Dyſentery, for Inſtance, we may either uſe warm Milk alone, or Milk boil'd with Chamomile, or Male Speedwell, with an Addition of Honey, or the Theriaca. Sometimes, in Imitation of *Galen*, Oil alone is injected in a Colic.

As for Clyſters, they are very properly uſed, firſt, in Caſes where a too coſtive State is to be removed, and the Body render'd ſoluble. Secondly, for alleviating thoſe Pains which ariſe from the Colic, the Stone, the Dyſentery, painful Hæmorrhoids, and other Diſorders of the Abdomen. Thirdly, for making Revulſions from the Head in Lethargies, Apoplexies, Deliriums, Phrenitis, and other Diſorders of the Head. Fourthly, for promoting difficult Labours, whether the Fœtus is dead or alive, eſpecially if the Mother is coſtive; as alſo for expelling the Secundines, when adhering too ſtrongly to the Womb, or remaining longer in it than they ought. Fifthly, Clyſters contribute not a little to the Nouriſhment of thoſe, who, in conſequence of an impair'd, or totally deſtroy'd, Deglutition, can eat little, or, perhaps, none at all. For this Purpoſe nutritive Liquors muſt be uſed, ſuch as Broths of Fleſh, Milk, or Ale; or Broths of Barley or Oats, duly prepared; to which a little Wine, if not contraindicated by the Nature of the Diſeaſe, may be added, for corroborating the Patient. By frequently injecting ſuch Preparations, as far as they poſſibly can, into the Anus, the Patient is to be ſuſtained and ſupported, till his Diſorder and Difficulty of Deglutition are gradually removed. Theſe nutritive Clyſters are no new Invention, but were recommended by the antient Phyſicians, eſpecially *Celſus*, who for this Purpoſe order'd Ptiſan, or the Cremor of Alica. *Oribaſius* alſo, and *Aetius*, recommend theſe Sorts of Clyſters; as does alſo *Avenzoar*. Though this Fact be ſufficiently confirmed by Hiſtory, yet it is equally certain, that there were among the Antients, and ſtill are among the Moderns, Phyſicians who look upon them as entirely ſuperfluous and uſeleſs. But, to paſs over other memorable Inſtances recorded by Authors, I ſhall only take notice of the Woman mentioned in *Garengeot's Operat. Chirurg.* who, notwithſtanding a total Abſtinence from Aliments for fourteen Days, in conſequence of an obſtructed Deglutition, was not only ſupported, but cur'd, by means of nutritive Clyſters; for in the large Inteſtines there are lymphatic or lacteal Veſſels, capable of abſorbing and conveying to the Maſs of Blood the nutritive Liquors injected; by which means it frequently happens, that the Clyſter does not return, but is totally retained.

An uncommon and efficacious Clyſter, in Compariſon of the others, is the Smoke of Tobacco, invented, in all Probability, by the *Engliſh*, and afterwards uſed by other Nations; for when other Clyſters have proved ineffectual for rendering the Body ſoluble, eſpecially in Perſons labouring under an incarcerated Hernia, the Iliac Paſſion, or other Diſorders, the End has been obtain'd by injecting a large Quantity of the Smoke of Tobacco into the Anus, by means of ſome proper Inſtrument. This affords a ſpeedy Relief in the moſt obſtinate Coſtiveneſs, provided it is uſed in due Time. The moſt conſiderable of the Machines uſed for this Purpoſe, are deſcribed by *Bartholine*, *Stiſſer*, *Dekker*, and *Valentini*. See *Tab.* 55. *Fig.* 13. But however much theſe Machines may vary, yet they all agree in this, that they conſiſt of a Braſs or Iron Kind of Box, A, of ſuch a Size, as to contain about half an Ounce of Tobacco, and furniſhed with two Pipes; one of which, B, is made of Bone, in order to be introduced into the Anus; and the other, C, in the Form of a Pipe, uſed for Wind in muſical Inſtruments. It is made of Braſs, Bone, or Ivory; and either the Patient himſelf, or ſome ſtrong Man, blows the Smoke of the Tobacco in the Box A through the Pipe B into the Anus. This Smoke muſt be injected, till the Patient perceives a ſtrong Stimulus to diſcharge his Excrements. If performing this Operation once does not render the Body ſoluble, it is to be repeated, till that End is obtained. In like manner, if the common Tobacco ſhould prove too weak, we are to uſe ſuch as is ſtronger; for when, in an obſtinate incarcerated Hernia of the Scrotum, no Effect could be produced by common Tobacco, I myſelf, ſays *Heiſter*, have ſeen the Intention anſwer'd by ſuch as was ſtronger, when the Patient's Life was deſpair'd of. This Method has always ſucceeded ſo happily with me in this Diſorder, that I was never reduced to a Neceſſity of having recourſe to the Knife; for the acrid Smoke of Tobacco ſo ſtimulates the Inteſtines, as to contract their Diameters, and by that Contraction the prolapſed Inteſtines are retracted into the Abdomen. *De Graaf*, and *Lanzonius*, have publiſhed Diſſertations on Clyſters; to which the Reader may have recourſe. *Heiſter*, *Chirurg.*

Among the Medicines of the internal, domeſtic, and eaſily prepar'd Kind, we may juſtly reckon Clyſters, which are generally but a Decoction, prepar'd of certain Ingredients, and, with various Intentions, injected into the Anus, by means of a Syringe, or Bladder. Theſe have many Things in common with Baths; for theſe latter waſh the external Parts; whereas the former cleanſe, abſterge, and unload the large Inteſtines of their Contents. Baths are either emollient or corroborative. Clyſters, in like manner, according to the Ingredients of which they conſiſt, either ſoften and relax the Solids, when affected with Rigidity, Tenſion, or Stricture; or they corroborate and brace up ſuch Parts as are relaxed, and deprived of their due Tone. As Baths only, by an external Application to the Body, convey a certain Virtue to the whole Maſs of Blood and Humours, ſo as to render their Circulation more free, and facilitate the ſalutary Secretions; ſo alſo Clyſters not only influence the Maſs of Blood and Humours, as is obvious from the Change they induce on the Pulſe; but alſo, beſides the Evacuation they procure by Stool, promote the Excretion by Sweat and Urine. Baths are poſſeſſed of an excellent antiſpaſmodic Virtue, which is ſo extenſive as to influence the moſt remote Parts of the Body. This Quality is no leſs remarkable in Clyſters, as Practitioners well know. As, by Bathing, preternatural and dangerous Congeſtions of Humours in certain Parts are derived to other external and inferior Parts, that they may circulate more freely and equably, ſo in like manner Clyſters are highly efficacious in deriving Congeſtions of Blood from the Head and Breaſt, which are the Cauſes of very terrible Symptoms.

Clyſters are prepared of different Ingredients, according to the different Intentions propoſed; and, as in Practice the four principal Intentions are to alter and change, to evacuate, to corroborate, and to allay and mitigate Pain, ſo Clyſters of different Kinds are ſo calculated, as either to ſoften the indurated Fæces, correct the highly acrid, acid, and ſaline Recrements, evacuate the Contents of the large Inteſtines, corroborate the weak and languid Fibres of the Inteſtines, and augment their impair'd periſtaltic Motion; or, laſtly, to mitigate the Spaſms of the inteſtinal Coats, and relax their conſtricted Fibres. When the Intention is to lubricate and ſoften dry and indurated Fæces, or to obtund acrid, ſaline, corroſive, and acid Humours, in the large Inteſtines, Clyſters are moſt properly prepar'd of emollient and demulcent Subſtances; of which Kind are the Milks of Animals, Decoctions of the Shavings of Hartſhorn, Sheeps and Calves Feet, as alſo of Oats, pinguious Fleſh-broths, the Fats of Animals, freſh Butter, Decoctions of Figs, Honey, Manna, Sugar, Decoctions

ſections of the Roots of Marſh-mallows, white Lilies, Linſeed, Fenugreek, and the Flowers of Chamomile, Mullein, and Melilot. As all theſe Ingredients are poſſeſſed of a Power of relaxing Spaſms, ſo they are of ſingular Service in all ſpaſmodic Diſorders, Fevers, Pains, Congeſtions of Blood, and Caſes where the Patient is coſtive, either in conſequence of Spaſms, or an Induration of the Fæces.

When the Intention is, at one and the ſame time to evacuate the Fæces, and carry off the ſtagnant Humours, Salts added to the above-mentioned Decoctions excellently anſwer the End; ſuch as common Salt, Sal Gemmæ, *Epſom* and *Sedlitz* Salts, the digeſtive Salt of *Sylvius*, and Sal Ammoniac: And 'tis certain, that half an Ounce of Salts added to a Clyſter is more efficacious in evacuating the Contents of the Inteſtines, than ſome Ounces of the Electuaries prepar'd of purgative Ingredients. For anſwering this Intention, *Celſus* orders Brine to be injected into the Anus; and the ſame Effect is produced by our Brine, which is a powerful Purgative, whether drank, or injected as a Clyſter: The ſame holds true of the *Sedlitz* Waters: Among theſe we may alſo claſs the Clyſters prepared of human Urine, or that of other Animals, in order to eliminate the tough and viſcid Humours. *Venice* Soap diſſolv'd is alſo an excellent Ingredient for Clyſters, eſpecially in Caſes where an acid, green, and corroſive Bile proves highly offenſive to the Inteſtines of ſucking Infants. But in Caſes where a more powerful Stimulus is requir'd, 'tis more ſafe and expedient to mix Emetics with Clyſters, than ſtrong and draſtic Cathartics; for which Reaſon, *Derebeque*, in his Obſervations, orders emetic Wine to be mix'd with Clyſters, exhibited in Dropſies and Apoplexies.

Corroborating Clyſters are intended not only for the Inteſtines, but alſo for other Parts depriv'd of their due Tone; for which Reaſon they are alſo compos'd of various Ingredients, according to the Intentions propos'd. Thus, when the weak and languid Coats of the Inteſtines are to be corroborated, Carminatives are to be uſed, which diſcuſs Flatulences, and promote the Evacuation of any recrementitious Matter, that may be lodg'd in the Inteſtines. The moſt conſiderable and efficacious of theſe are, the Four greater carminative Seeds, the Oils prepar'd from them, and the Berries of the Bay and Juniper-trees: In violent Diſorders of the Head; ſuch as Apoplexies, Palſies, Lethargies, and Dulneſs of Hearing, or Weakneſs of Sight; the Herbs Rue, Marjoram, Roſemary, Savory, Thyme, Sage, and the Flowers of Lavender and Spike, are commodiouſly added to Clyſters. In Diſorders ariſing from a bad State of the Womb, eſpecially a Want of due Tone in its Fibres; the Herbs Peny-royal, Mugwort, Feverfew, Savin, Mint, Wall-flowers, Marigolds, the Root of Birthwort, as alſo Myrrh and Galbanum, are poſſeſs'd of a ſingular and ſpecific Kind of Quality; and Clyſters prepar'd of them, if frequently injected, are of ſingular Efficacy in reſtoring the Menſes, and expelling Moles.

I myſelf, ſays *Hoffman*, have alſo found, from Experience, that in chronical Diſorders, ariſing from an Impurity of the Juices, a bad State of the Viſcera, Infarctions, or Stagnations of the Humours, but eſpecially in a Cachexy, a Scurvy, the hypochondriac Diſorder, a Suppreſſion of the Menſes, and Hæmorrhoids, excellent Effects are produc'd by Clyſters, with which bitter and balſamic Subſtances are mix'd; of which Kind are Marſh-trefoil, the Tops of the leſſer Centaury, Carduus Benedictus, Gentian-root, Spleenwort, Rhubarb, Eſſence of Rhubarb, Elixir Proprietatis, the alcaliz'd Eſſence of Soot, Spirit of Hartſhorn, and the Pilulæ Balſamicæ. *Hercules Saxonia*, *in Lib.* 1. *Prax. Cap.* 16. informs us, that, by the Uſe of ſuch Clyſters alone, he had recover'd Patients ſo far gone in hypochondriac Diſorders, that their Recovery was abſolutely deſpair'd of. Excellent corroborative Clyſters, ſays *Hoffman*, may alſo be prepar'd of Wine; to which, if the Patient's Strength is languid, and his Conſtitution not over-delicate, may be added, a ſufficient Quantity of my Balſam of Life, deſcrib'd under the Article ELIXIR. In the *Philoſophical Tranſactions*, mention is made of a Clyſter, prepar'd of *Spaniſh* Wine, Pepper, and the Yolk of an Egg: This is ſaid to be of ſingular Efficacy; becauſe, being retain'd all Night, it warms the Inteſtines, and, a few Hours after its Injection, excites a Diaphoreſis: Beſides, ſo remarkable is the Power of Clyſters, in corroborating the whole nervous Syſtem, that in intermittent Fevers the Paroxyſms are mitigated and ally'd by them; for *Helvetius*, in a particular Treatiſe concerning the Method of curing Fevers without the Aſſiſtance of internal Medicines, affirms, that they may be excellently cur'd only by injecting Clyſters, conſiſting of a Decoction of *Peruvian* Bark with Water, to which may be alſo added a little Wine: And *Albrecht*, in *Miſcel. Nat. curioſ. Decad.* 3. *an.* 3. *Obſ.* 127. gives us five Inſtances of Fevers cur'd by this means. The *Egyptians*, in quartan Fevers, as an Arcanum, uſe a Clyſter prepar'd of one Pint of the Decoction of Marjoram, and three Ounces of the Oil of Bays, as we are inform'd by *Proſper Alpinus*, *de Medic. Method.* where we find this Paſſage: "Some time ago, I myſelf, when labouring under a quartan "Fever, found ſingular Benefit from this Clyſter; and I have "known ſome totally cur'd of the ſame Diſorder, by having "it only thrice injected."

The laſt Species of Clyſters are thoſe of the ſedative Kind, or ſuch as are calculated for alleviating Pain, and removing Spaſms: Among theſe are Clyſters conſiſting purely of Oils, the Fat of Animals, and freſh Butter; which are of ſingular Efficacy, when the Coats of the Colon are ſo violently and ſpaſmodically conſtricted, that its Cavity is contracted, the Flatulences retain'd, and violent Gripes produc'd, as in the convulſive Colic, and, eſpecially in the hæmorrhoidal Colic, and that which is excited by the Repulſion of an acrid cauſtic Matter from the Surface of the Body. Among the Antients *Aetius* beſtows large Encomiums on Clyſters of this Kind; and, in *Book* 9. *Cap. de Colica*, orders an antiſpaſmodic Clyſter to be prepar'd of freſh Butter, the Fat of a Gooſe, and of an Hen, the Marrow of an Hart, the Fat of a Bear, Cumin, the Leaves of Rue, Celtic Spikenard, Caſtor, and the Oil of Rue, adding the following Direction: "Uſe, ſays he, this "Clyſter in the moſt violent Pains, previouſly procuring an "Evacuation by means of another Clyſter; an Hour after "which, inject a moderately ſmall Cupful of this Clyſter, "tepid, ordering the Patient to keep himſelf in a State of "Reſt, and to retain it for ſome time; by which means you "will be convinced of its divine and ſingular Virtues." But if to Spaſms an intenſe Heat, and Orgaſm of the Blood, are join'd, as in Hæmorrhages, or Pains of the Head and Joints, Clyſters prepar'd of Whey or Milk, with emollient and anodyne Subſtances, are moſt properly injected; ſuch as the Flowers of common Chamomile, Elder, Mullein, and Melilot, as alſo Saffron, depurated Nitre, and Oil of ſweet Almonds: In ſpaſmodic Diſorders, epileptic and convulſive Motions, 'tis cuſtomary to add the Specifics for thoſe Diſorders. In hyſteric Affections, Sagapenum, Aſa-fœtida, and Caſtor, are properly added to them; and, in epileptic and convulſive Paroxyſms, the Roots, Seeds, and Flowers of Piony, the Juice of Earth-worms, and the ſuccinated Spirit of Hartſhorn, are, with great Advantage, mix'd with the Clyſters to be injected. *Harder*, in *Miſcellan. Nat. curioſ. Decad.* 3. *an.* 2. *Obſ.* 100. informs us, that he knew a Woman, in her firſt Labour ſeiz'd with an Epilepſy, ſurpriſingly reliev'd by a Clyſter of this Kind, prepar'd of antiepileptic Ingredients, and Tincture of Caſtor.

Clyſters then, according to the different Intentions of the Phyſician, are of ſingular and various Uſes; which by *Celſus*, in the twelfth Chapter of his ſecond Book, are ſuccinctly enumerated in the following Words: "We muſt not forget to "render the Body ſoluble, by the Injection of one, or, at "moſt, of two Clyſters. When the Head is afflicted with "a heavy Pain; when the Sight is dim; when the Patient is "ſeiz'd with a Diſorder of the large Inteſtine, by the *Greeks* "call'd *Colon*; when there are Pains of the Abdomen and "Hips; when there is a Collection of bilious Matter in the "Stomach; or, when Phlegm, or any Humour reſembling "Water, is lodg'd in it; when Reſpiration is difficult; when "nothing can be evacuated by Stool; when the Fæces are "near the Anus, but yet cannot be voided; when the Patient, "voiding nothing by Stool, perceives the Smell of Fæces in "his Breath; when the Matter evacuated by Stool is cor"rupted; when Abſtinence, in the Beginning of a Fever, "does not remove it; when the Strength will not admit of "Veneſection; when otherwiſe indicated, or when the pro"per Seaſon for Veneſection is already paſt, or when the "Patient has drank much before his Diſorder; or when Per"ſons often ſubject to a ſpontaneous or accidental Purging, "ſuddenly become coſtive." Beſides what has been above obſerv'd, with reſpect to the Uſe of Clyſters in various Diſeaſes, we muſt alſo take notice, that, in general, they are excellently calculated for thoſe who, being coſtive, have, at the ſame time, Stomachs ſo weak, as not to bear purgative Medicines. In all continual and exanthematous Fevers, 'tis alſo moſt expedient to attempt the Cure by Clyſters and Veneſection, if neceſſary; and if, after the Veneſection, the Patient ſhould remain coſtive, the Uſe of Clyſters is to be ſtill perſiſted in. *Chriſtianus Langius*, *in Miſcel. Nat. curioſ.* warmly recommends the Uſe of Clyſters to all wounded Patients, leſt a coſtive State of the Body ſhould increaſe the Inflammations or Stagnations of Blood. Clyſters may alſo be calculated for other Purpoſes, than thoſe already enumerated, according to the reſpective Cauſes and Natures of Diſorders: Thus in Diarrhœas, Dyſenteries, and Corroſions of the Inteſtines, Clyſters are with great Advantage injected, not only with a View to correct the acrid Humours, but alſo to conſolidate the excoriated and corroded Parts: The Clyſters for this Purpoſe ought to be compos'd of Decoctions of Calves Feet, Yolks of Eggs, Goat's Suet, *Armenian* Bole, Tragacanth, the Juice of the Cray-fiſh, Sperma-ceti, and the Balſams of Capivi and of Sulphur, with Oil of Turpentine.

Tho' Clyſters only immediately affect the Inteſtines, and tho' the Materials of which they are compos'd do not paſs

beyond

beyond the large Inteſtines; yet their Virtues are not only convey'd from the Inteſtines, which, being nervous Parts, have an exquiſite Conſent with others of the ſame Kind, to the remote Parts of the Body, but alſo inſinuate themſelves into the Maſs of Blood and Lymph: The former of theſe Aſſertions is obvious from this, that too acrid Clyſters, according to *Avicenna*, *Can. Med. Lib.* 1. *Sect.* 4. *Cap.* 17. bring on Fevers; and thoſe mixed with Emetics, excite Vomiting: Pains alſo of the ſuperior Part of the Body are remov'd by them: The latter is confirm'd by their nutritive, comforting, and ſtupefying Quality, as alſo by a Circumſtance mentioned in the *Philoſophical Tranſactions*, which is, that Brandy injected into the Anus, intoxicates more effectually, than the ſame Quantity drank by the Mouth: But the Effects of Clyſters are moſt conſpicuous in the ſmall Inteſtines, when afflicted with Pains and ſpaſmodic Conſtrictions; for this Reaſon, that the Colon, the largeſt of the great Inteſtines, ſurrounds the ſmall ones: Wherefore, when an emollient and paregoric Clyſter is injected into it, the Clyſter, by its mild and grateful Tepidity, affects the contiguous Inteſtines at the ſame time; and its Vapours, penetrating their Coats, convey the ſame Virtues into them, juſt as a Bladder, fill'd with an emollient Decoction, and applied externally, affords a ſingular Relief, in violent Pains, Spaſms, and Inflammations of the internal Parts.

But that the ſalutary Effects of Clyſters may be the more ſucceſsfully obtain'd, they muſt, like other Medicines, be cautiouſly and circumſpectly us'd; for there are ſome Perſons of ſo tender and delicate a Make, that their Inteſtines are abſolutely incapable of bearing Clyſters; and I myſelf have ſeen Colics, and other Diſorders, increas'd, by injecting Clyſters, tho' theſe very Patients were afterwards remarkably reliev'd by a proper Laxative, exhibited internally: As, in Patients of this Kind, the Injection of Clyſters is not to be inſiſted on; ſo alſo acrid Clyſters are not to be at firſt us'd in Caſes where the Excrements are too long retain'd, leſt they draw more to the infarcted Inteſtines, and confirm the Obſtruction; but, before theſe, we are rather to inject ſuch Clyſters as relax, lubricate, and ſoften the Fæces, and prepare a Way for their Evacuation, as *Mercatus*, in *Book* 1. with Judgment adviſes. Immediately after Meals, the Injection of Clyſters is leſs commodious and beneficial, becauſe they diſturb the Concoction and Digeſtion of the Aliments, prevent the Extraction and Elaboration of the Chyle, and promote too ſpeedy an Evacuation of what the Patient has eat.

Nor is it expedient too frequently to render the Body ſoluble by the Injections of Clyſters, both becauſe they weaken the expulſive Faculty of the Inteſtines, and render Nature, when accuſtom'd to them, forgetful of her Office; and becauſe, by a ſudden and frequently repeated Injection of Clyſters, that are either too hot, or too cold, the due and natural Tenſion of the inteſtinal Fibres is injur'd, and preternatural Commotions produc'd; and ſince no Clyſter can be injected, without conveying Air along with it, 'tis to be dreaded, leſt too frequent an Uſe of them ſhould generate Flatulences. Beſides, as the large Inteſtines are Parts of a very nervous Contexture, all Subſtances which are unfriendly to the Nerves, ſuch as cold, acid, auſtere, draſtic, virulent, and aſtringent Subſtances, as alſo the more acrid Salts, Opiates, and Narcotics, are by no means to be us'd in Clyſters, leſt the periſtaltic Motion of the Inteſtines ſhould be injur'd or deſtroy'd; which, when entire, aſſiſts greatly in carrying on the Digeſtions, and the ſalutary Secretions and Excretions: But when it is injur'd or deſtroy'd, the Inteſtines are rack'd with Spaſms, fill'd with Fæces or Flatulences, and ſubjected to various Diſorders. *Celſus* gives us, alſo, the following Directions: "We "are not to uſe Clyſters, ſo long as the Humours are crude, "nor in weak Conſtitutions, and ſuch as are exhauſted by "chronical Diſorders; nor in thoſe who have, daily, ſufficiently large Evacuations by Stool, or who diſcharge liquid "Stools; nor are Clyſters to be us'd in the immediate Paroxyſms of Diſorders; becauſe what is then injected, being "forcibly retain'd, affects the Head more, and renders the "Danger greater." *Frederic. Hoffman.*

The common Decoction for Clyſters is thus directed to be made in the *London* Diſpenſatory:

> Take of the Leaves of Mallows, Violets, Pellitory of the Wall, Beets, and Mercury, each one Handful; of Chamomile-flowers, two Pugils; of ſweet Fennel-ſeed, half an Ounce; of Linſeed, two Drams; and boil them in a ſufficient Quantity of common Water to ſtrain off one Pint.

With reſpect to the emetic Power of Clyſters, mention'd above, I muſt remark, that in a maniacal Caſe, where there was great Difficulty in exhibiting proper Medicines by the Mouth, and where the Patient was ſo obſtinately coſtive, that no Evacuations could be procur'd without immoderate Doſes, I directed a Clyſter, with which an Ounce of *Mel Helleborātum* was mix'd: This prov'd a violent Emetic, and was afterwards repeated ſeveral times, with very good Effects.

It is to be obſerv'd, that the Practice of the antient *Egyptian* Phyſicians turn'd very much upon Clyſters; which, as *Pliny* informs us, they learnt from the Bird *Ibis*, who was obſerv'd, upon any Diſorder, to inject Water into the *Anus*, by means of its Beak: And *Aſclepiades*, however he might diſapprove of Purges, us'd Clyſters in almoſt all Diſorders.

ENEOS, ἐνεὸς· the ſame as CENOS; vain, empty, uſeleſs: in which Senſes the Word is us'd by *Hippocrates*, ἐν τῷ περὶ ἱερῆς. The *Greeks* call ſuch as are born deaf, and are unable to ſpeak, or perform the common Offices of Life, ἐνεοί· And in the ſame Senſe is the Word expounded by *Heſychius*.

ENEREISIS, ἐνέρεισις· from ἐρείδω, to lean, lay a Streſs, or be incumbent; is a Preſſure, or violent Compreſſion: Thus, in *(Lib. περὶ ἰητρ.)* μηδὲ πάρεθξιν ἐνέρεισις ἔνεα, "and that there "be no Compreſſion from the Splints." *Galen* explains the Words ἐνέρεισις, by βία, and θλῖψις, "violent Preſſure."

ENERGIA, ἐνέργεια· from ἔργον, a Work. Efficacy.

ENERGOS, ἐνεργὸς· from the ſame as the preceding. Active, and diligent. In *Hippocrates*, *Lib. de Aere, Locis, & Aquis*, ſignifies beneficent, civiliz'd, and humane.

ENERVATIO is an equivocal Word, ſignifying either the ſame as APONEUROSIS, which ſee, or *Debilitation*: *Adipis ſuillæ enervatæ curatæ*, is an Expreſſion in a medicinal Compoſition, taken by *Marcellus Empiricus*, *Cap.* 31. *in Princip.* from *Scribonius Largus*, *No.* 222. who has it *Adipis ſuilli curati*; where *Rhodius*, in his Notes on this latter Author, obſerves, that *enervatæ* is a barbarous Sort of Interpretation of *curatæ*, and intended to ſignify, *cleanſed from the little Fibres and Membranes*, which is the Meaning of *curatæ*. *Apicius Cœlius*, *Lib.* 5. *Cap.* 4. uſes indeed, *Cerebella enervata*, in the Senſe of *Marcellus*; but then, as *Rhodius* obſerves, he wrote in a Time when Barbariſm began to ſpread.

ENGASTRIMUTHOS, ἐγγαστρίμυθος· from ἐν, in; γαστὴρ, the Belly, and μῦθος, a Speech. A Ventriloquiſt. See ÆSCULAPIUS.

ENGISOMA, ἐγγίσωμα, ἐγίσωμα. A chirurgical Inſtrument, uſed about Fractures of the Cranium. See another Signification of it, under the Article CAMAROSIS.

ENGOMPHOSIS, ἐγγόμφωσις· The ſame as GOMPHOSIS; which ſee.

ENGONIOS, ἐγγώνιος· from γωνία, an Angle; angular; in *Hippocrates*, when apply'd to the Cubit; as ἐγγώνιος πῆχυς, ſignifies the Flexure thereof at right Angles; as *Galen* explains him in many Places.

ENGUAMBA URUVAPENSIUM, *De Laet.* is a Tree of a moderate Bigneſs, growing in a ſtony Soil; with a reddiſh Bark, a dark-colour'd Wood, a paliſh medullary Subſtance, broad and concave Leaves, diſtinguiſh'd by red and yellow Fibres; with pendulous, herbaceous, and cluſter'd Flowers; and a black Fruit full of Kernels: From this Fruit they expreſs a yellow Oil, which is good for Wounds, and to diſſolve Tumors. *Ray*, *Hiſt. Plant.*

ENHÆMON, ἔναιμον. The Name of a Plaiſter in *Myrepſus*. See ENÆMOS.

ENIAUSION, ἐνιαύσιον· from ἐνιαυτὸς, a Year; yearly, annual. Ἐνιαύσιον νόσημα, in *Hippoc. Lib. de Nat. Humana*, as *Galen* explains it, is a Diſeaſe, which leaves the Patient after a full Year from its firſt Beginning; or after a Period of ſeven Years; as others do after ſeven Months.

ENITÆON, ἐνιτάιον. The Name of a Simple in *Myrepſus*, *Antid.* 332. which his Annotator *Fuchſius* ingenuouſly confeſſes himſelf ignorant of.

ENIXA; the ſame as PUERPERA, or a Woman in Childbed. *Enixum*, among the Chymiſts, is an Epithet apply'd to Salts of a third Kind, generated of an Acid and an Alcali; which is otherwiſe call'd *neutral*, and *third*, according to *Glauber*.

The *Sal Enixum Paracelſi* is the *Caput Mortuum* of the *Spiritus Nitri cum Oleo Vitrioli*, or what remains in the Retort, after the Diſtillation of this Spirit; of a white Colour, and pleaſant acid Taſte. If it be diſſolv'd in hot Water, and cryſtalliz'd, it will be yet a more elegant Medicine, and endu'd with the ſame Virtues as the Tartarum Vitriolatum.

Its Operation is diuretic: The Doſe is from one Scruple to one Dram, in Broth, or Water-gruel.

ENNEAPHARMACOS, ἐννεαφάρμακος· from ἐννέα, nine, and φάρμακον, a Medicine; a medicinal Compoſition, conſiſting of nine ſimple Ingredients. It is the Name of a Peſſary preſcrib'd in Inflammations of the Uterus and Anus, *Gal. L.* 9. *de C. M. S. L. Cap.* 6. *Æginet. Lib.* 7. *Cap.* 24. *in Fin.* It is a Name, alſo, for the *Antidotus Heraclidis*. *Galen*, *Lib.* 2. *de Antid. Cap.* 4. and for ſeveral Plaiſters in *Aetius* and *Celſus*. *Caſtellus.*

ENNEAPHYLLUM, ἐννεάφυλλον· from ἐννέα, nine, and φύλλον, a Leaf; a Name in *Ray* for the *Helleboraſter*; becauſe its Leaves are often ſubdivided into nine leſſer ones.

ENOCH is, by the ſpagirical Writers, generally ſuppoſed to be the ſame with *Hermes Triſmegiſtus*. *Theatrum Chymicum.*

ENOCHDIANUS, in *Paracelſus*, is one who equals the Prophet *Enoch* in Longevity: Hence *Enochdiana Vita*, with him, ſignifies an extraordinary long Life.

ENODIOS, ἐνόδιος· from ἐν, in, and ὁδὸς, Way; ſituated or placed in the public Way; is an Epithet of *Diana*, *Hecate*, or *Proſerpina*; becauſe her Image was commonly erected in croſs Ways; whence ſhe was called *Diana Trivia*. The Word ἐνόδιος occurs in *Hippocrates*, *Lib. de Morbo ſacro*; where, ſpeaking of popular Prejudices, in attributing the Cauſe of the Epilepſy, which they called νόσος ἱερὴ, *Morbus ſacer*, in a particular manner, to the Divinity, he goes on to obſerve, that they aſcribed the Cauſe of every Species or Symptom of this Diſorder, to ſome particular Deity: Thus, for Inſtance, if the Patient, ſeized with a Fit of the Epilepſy, made a bleating Noiſe like a Goat, they attributed the Cauſe of the Diſtemper to the Mother of the Gods; if he cry'd out with a ſtronger and ſhriller Voice, they reſembled it to the Neighing of an Horſe, and made *Neptune* the Author; if the Patient, as it ſometimes happened, could not retain his Excrements, Ἐνοδίη παρόσκεψις ἢ παρασκυμίη, the Diſeaſe took its Appellation from *Hecate Enodia*; if he evacuated but little, and frequently, like the Muting of Birds, *Apollo Nomius* was angry; and, if he frothed at the Mouth, and kick'd with his Heels, *Mars* was the Cauſe.

ENOMOS, ἐνωμὸς· from, and the ſame as, ὠμὸς, crude; is expounded by *Galen*, *Com. in* 5. *Aph.* by σκληρὸς καὶ ἀντίτυπος, "hard and reſiſtent;" as it is there oppoſed to χαῦνος, ſoft, lax.

ENRYTHMOS, ἐνρυθμος. See ARYTHMUS.

ENS. It is not my preſent Buſineſs to give the different Significations of this Word, as us'd by the Metaphyſicians and Philoſophers: It may ſuffice to obſerve, that *Ens* implies an Entity, or Thing really exiſting. In *Paracelſus*, however, *Ens* imports the Power, Virtue, and Efficacy, which certain Beings exert upon our Bodies: Thus he mentions the *Ens Aſtrorum*, the *Ens Veneni*, the *Ens Naturale*, the *Ens de potentibus Spiritibus*, and the *Ens Dei*. This Author, in his Treatiſe *de Renovatione & Reſtitutione*, ſpeaks much of the *Ens Primum* of Minerals, Gems, Herbs, and Liquors; by which he means, the Parts in which their Virtue or Efficacy reſide, or the very Virtue or Efficacy itſelf.

With reſpect to the *Ens Primum* of Plants, there is the following celebrated Paſſage in *Boyle*:

If we may believe the ingenious Chemiſt to the *French* King (M. *le Febure*) a ſingle Herb, by pure Skill, without the Aſſiſtance of Fire, may afford a nobler Medicine than any of the elaborate Compounds to be met with among vulgar Chemiſts. This efficacious Part of a Plant, *Paracelſus* calls its *Ens primum*, whoſe Proceſs for obtaining whereof I ſhould never have thought worth trying, but for what the experienced Chemiſt above-mention'd told me, from his own Obſervations; for he, as well as *Paracelſus*, aſcribes a renovating Power to the Ens primum of Balm; and aſſured me, in the Preſence of a famous Phyſician, to whom he appeal'd for the Truth of his Relation, that an intimate Friend of his, being poſſeſs'd of this Preparation, made Trial thereof upon himſelf, by taking a ſmall Quantity every Morning, in Wine, for a Fortnight; long before the End of which, he found the Nails of his Fingers and Toes to looſen; which, at length, falling off inſenſibly, he proceeded no farther, being ſatisfied with the Tokens, which he reſerv'd as a Rarity. But, upon giving the ſame Medicine, for ten or twelve Days, to a Woman about ſeventy Years of Age, without acquainting her with what he expected therefrom, it brought her Menſes down upon her again, ſo freſh as to frighten her, and ſtop the Proſecution of the Experiment. He added, that he alſo gave ſome Drops of it to an old Hen, for a Week; and, about the ſixth Day after, ſhe began to moult, and continued ſo, gradually, till all her Feathers dropt off; but regain'd new ones in a Fortnight. My Author alſo acknowledged, he had obſerv'd great Virtues in the Ens primum of the great Scrophularia.

His Method was to collect the Plant at a convenient Seaſon of the Year, and proper Time of the Day; to beat it well in a Stone Mortar, and place it in a Bolt-head, and digeſt it for forty Days in a Dunghil; after which, he opens the Veſſel, ſeparates the groſſer Part of the Liquor, and digeſts it in a gentle Bath, that the remaining Groſſneſs may ſubſide; then, filtring the Juice, he adds to it the fix'd Salt of the groſſer Parts above-mention'd, dry'd and calcin'd. To this prepar'd Liquor, he puts good Sea-ſalt, purified, melted, and ſuffer'd to run *per Deliquium*. Then the Whole, ſeal'd up in a convenient Glaſs, is expos'd to the Sun, for about ſix Weeks; after which, there ſwims, on the Top of it, the Ens primum of the Plant, in a liquid Form, tranſparent, and either green, or red, or, perhaps, of ſome other Colour, as the Nature of the Vegetable determines.

The *Ens appropriatum* of Vegetables is, according to *Paracelſus*, the peculiar medicinal Virtue or Efficacy of Vegetables, which is different in every Plant, and appropriated to every individual Plant.

ENS VENERIS.

1. Take the Colcothar, remaining after the Diſtillation of Spirit and Oil of Vitriol, from Goſlar Vitriol; put it into a large Crucible, cover it with a Tile, and ſet it in the hotteſt Part of the reverberatory Furnace; and there let it ſtand ignited the whole time of the Operation: By this Calcination it will turn very red. Then boil this Colcothar in Water, keeping it well ſtirred in a Glaſs Veſſel; ſtrain the Liquor hot; it will have the Taſte of Vitriol; pour freſh Water to the Remainder; boil, and ſtrain, as before; and continue this ſo long as the Water, even by boiling, acquires any Taſte. At length, keep the remaining fine red Powder, under the Title of the dulcified Calx of Vitriol. If the former pure Liquor be inſpiſſated, it will ſtill yield a kind of yellow Vitriol: Whence we learn how wonderful a Body Vitriol is, with reſpect to its Fixedneſs in the Fire, even in its ſaline Part.
2. Take an equal Part of this dulcified Calx of Vitriol, and the dried Flowers of Sal Ammoniac; grind them in a hot Glaſs Mortar, with a Glaſs Peſtle, for a conſiderable time, till they are perfectly mixed, but with Care to prevent their growing moiſt: For this Reaſon they ſhould be ground on a clear dry Day, and in a warm Place. Put the Powder into a low earthen Body; fit on a wide Alembic-head, with a wide Pipe; apply a ſmall Receiver; place the Veſſel in a Sand-furnace, ſo as almoſt to touch the Iron Pot; half-bury the Body in Sand, and raiſe a Fire by degrees. There firſt comes over a ſharp, volatile, yellowiſh Liquor, of an intolerable Odour, and an exceeding ſharp fiery Taſte, the Fire being increaſed, and the Liquor drove over: Firſt white, then yellow, and ſoon after very red Flowers will riſe: Continue the Fire for ſix Hours, making it ſo ſtrong, at laſt, as to almoſt ignite the Iron Pot. Let all cool; there will be found, in the Head, and upper Part of the Body, a beautiful red, ſaline, aſtringent Sublimate, very like the Flowers of Iron. Let it all be carefully taken out, and directly put into a dry Glaſs: A Matter will be found at the Bottom, of an auſtere Taſte, that eaſily ſwells, and, in ſome meaſure, runs in the Air. But the Production will be different, according as the Vitriol was from Copper, or Iron.

REMARKS.

Here we ſee the metallic Part of Vitriol, that remained ſo fixed in the Fire, is rendered volatile by Sal Ammoniac. The Nature of this Iron, from Vitriol ſo calcined, is nearly the ſame in the Flowers, as in crude Iron ſublimed with Sal Ammoniac; and might, therefore, rather be called *Ens Martis*, than *Ens Veneris*. When prepared from the Calx of blue Vitriol, it then deſerves to be called *Ens Veneris*. And hence we may underſtand the Death and Reſurrection of Metals, mentioned by *Paracelſus*. A ſmall Proportion of this Sublimate turns a large one, of the Infuſion of Galls, to Ink. Mr. *Boyle* promiſes great Effects from this Remedy, in Diſtempers proceeding from a Weakneſs of the Solids, as in the Rickets, or the like; and it is highly ſerviceable therein. *Helmont*, alſo, in the Treatiſe he intitles *Butler*, greatly commends a like Preparation. But as even after the utmoſt Violence of the Fire ſuſtained, both in a cloſe and an open Veſſel, there remains ſomething vitriolic, it is no Wonder, that the Fumes of Vitriol continually remain, how long ſoever the Diſtillation be continued: Doubtleſs this wonderful Body deſerves to be examined. *Boerhaave's Chemiſtry.*

Boyle ſays, that the Ens Veneris ſhould be of a yellow Colour; and, if not, he directs it to be return'd to the Caput Mortuum, and to be re-ſublimed.

This Ens Veneris, ſays the above-quoted Author, has proved ſo ſucceſsful, that I may ſafely ſay, two or three hundred Children have, through my means, been cured by it; and that almoſt always without the Help of other inward Medicines, or topical Application.

The Doſe is two or three Grains, to little Children; ten, or twelve, to grown Perſons, and ſometimes twenty or thirty, in diſtilled Water, or ſmall Beer, but not in Milk. It may be given at any time, upon an empty Stomach; but I moſt commonly give it at Bed-time. When it operates ſenſibly, it is by Sweat, and ſometimes by Urine. I exhibit this Medicine, alſo, in Fevers, and other Diſeaſes, to procure Sleep; which it does more ſafely than opiate Preparations. It is alſo powerful againſt Worms, Obſtructions of the Menſes, and to ſtrengthen the Appetite.

ENSIFORMIS, ξιφοειδὴς. The Name of a Cartilage, which grows to the lower Part of the Sternum; and is ſo called becauſe it reſembles a Sword.

ENSTACTON, ἔνσακτον· from σάζω, to diſtil. Inſtillatious. The Name of a liquid Collyrium in *Galen*, *Lib.* 4. *de C. M. S. L. Cap.* 7. called by *Ægineta*, *Lib.* 7. *C.* 16. σακτικὸν, *Stacticon.*

ENSTASIS, ἔνστασις, from ἐνίστημι, (of ἐν, in, and ἵστημι, to ſtand, to ſtand in, to inhere, or be fixed in a Station) Lodgment, or Inheſion, was a Word very familiar with *Eraſiſtratus*, and *Aſclepiades*, who was a Follower of *Democritus*, and taught, that Diſeaſes were cauſed by an Ingreſs of Molecules into the Vacuities of the Pores, and obſtructing them; which Ingreſs and Infixion he expreſſes by the Term ἔνστασις. Thus much we may learn from *Celſus*, in his Preface. And *Cælius Aurelianus*, in his Preface to acute Diſtempers, tells us, that *Aſclepiades* defined a Phrenſy, to be a Station, or Obſtruction, of Corpuſcles in the Membranes of the Brain. This ἔνστασις is alſo mentioned by *Plutarch*, in his Precepts for Health; and *Galen*, *Com. in* 6 *Aph.* 31. And *Caſſius*, who is ſuppoſed to have been of the Sect of the Rationaliſts, *Prob.* 76. expreſſes the ſame in very plain Words.

ENTALE. A Veſſel. *Rulandus.*

ENTALI. Foſſile Alum. *Rulandus.*

ENTALIUM, Offic. Schrod. 5. 328. Charlt. Exer. 63. Scyll. 137. Tab. 18. n. 6. *Dentalium primum & quartum.* Aldrov. de Aquat. 283. *Autales.* Geſn. Aquat. 345. *Tubulus dentalis ſtriatus.* Lang. Meth. Teſtat. 5. *Tubulus, aut Siphunculus maris.* Bonan. 91. *Dentale viride ſtriatum, maximis ſtriæ raræ majuſculæ admodum extantes, minimis ſtriæ denſæ & tenuiores.* Liſt. Hiſt. Conch. 4. Sect. 2. n. 1. *Denticuli Elephantis*, Rumph. 125. Tab. 41. 1. Valent. Muſ. Muſ. 187. THE ENTAGLIA.

This is much longer and thicker than the Dentalium, but very like it in other reſpects, only deeply ſtriated, or ridged; and the Ridges are, for the moſt part, of a green Colour. It is imported from the *Eaſt Indies:* And both this and the Dentalia are but little uſed in Medicine; though, probably, they may be ſerviceable for the ſame Purpoſes, and in the ſame Diſorders, as other Subſtances of the teſtaceous Kind. The Entalia are Shells, or Coverings, for a Sort of Sea-worm.

The modern *Italians* call all Stones, Metals, or Woods, cut in with Lines or Figures, or barely chaneled, *Entaglia*; from whence, and from the Nearneſs of the Word *Dentalium*, the learned and ingenious Dr. *Liſter* conjectures the Name *Entalium* to have its Original. *Dale.* See ANTALIUM.

ENTASIS, ἔντασις, from τείνω, to diſtend, or ſtretch. A Diſtention. The Word is uſed by *Hippocrates*, *de R. V. I. A.* and in the *Epidemics.* Sometimes he uſes τάσις, *taſis*, and ξύντασις, *Xuntaſis*, in the ſame Senſe. Ἔντασις, in *Hippocrat. Lib.* περὶ εὐσχημοσ. ſignifies a decent and commanding Auſterity becoming a Phyſician, when he reprehends the Patient, for indulging his Deſires in Prejudice to his Health, or tranſgreſſing the Rules preſcribed. Τὰ ἐντατικὰ, *Medicamenta entatica*, are Medicines for provoking Venery, called by *Cælius Aurelianus*, *Acut. Morb. Lib.* 3. *Cap.* 18. *Satyrica.* And *Paulus Ægineta*, *Lib.* 7. 17. preſcribes a Plaiſter, which he calls ἐντατικὸν, for the ſame Purpoſe.

ENTATICOS, ἐντατικὸς, from ἔντασις. See the preceding Article.

ENTERADENES, ἐντερογλάνες, from ἔντερον, an Inteſtine, and ἀδὴν, a Gland. The Inteſtinal Glands.

ENTERENCHYTÆ, ἐντερεγχύται, from ἔντερον, the Viſcera, and ἐγχύω, to infuſe. Chirurgical Inſtruments for adminiſtring Clyſters. *Scultet. Armament. Chirurg.*

ENTERIONE, ἐντερεώνη. The ſame as ENCARDIUM, which ſee.

ENTEROCELE, ἐντεροκήλη, from ἔντερον, an Inteſtine, and κήλη, a Hernia. An Inteſtinal Hernia. See HERNIA.

ENTEROEPIPLOCELE, ἐντεροεπιπλοκήλη, from ἔντερον, an Inteſtine, ἐπίπλοον, the Omentum or Cawl, and κήλη, an Hernia. A kind of Hernia; for which ſee HERNIA.

ENTEROHYDROCELE, from ἔντερον, an Inteſtine, ὕδωρ, Water, and κήλη, an Hernia. A Dropſy of the Scrotum, complicated with a Deſcent of the Inteſtine. See HERNIA.

ENTEROMPHALOS, ἐντερόμφαλος, from ἔντερον, an Inteſtine, and ὀμφαλὸς, the Navel. An *Hernia umbilicalis*, the ſame as OMPHACELE, which ſee.

ENTERON, ἔντερον, from ἐντὸς, within. Internal, an Inteſtine. See COELIA. Ἔντερον, in *Hippocrates*, 6 *Epid. Sect.* 4. *Aph.* 3. ſignifies, ſimply, the Colon, as *Galen* obſerves in his Comment on the Place, where he rejects the Opinion of thoſe who take it for the Cæcum. Ἔντερα, in *Lib.* 3. *de Morb.* ſignifies Sacks, or Bags, in which were incloſed Medicines for Fomentations; perhaps, as *Foeſius* ſays, becauſe not only the Bladder, but the Inteſtines, may be accommodated to that Uſe.

ENTEROPHYTON VULGARE. *Fucus tubuloſus inteſtinorum forma.* Inſt. *Lactuca marina tubuloſa.* Raii. SEA CHITTERLING.

This is a ſubmarine Plant, ſo called from its being hollowed like an Inteſtine. It grows in deep Ditches, principally near the Sea.

I do not know that it is uſed in Medicine.

ENTERORAPHE. A Suture of the Inteſtines. See ABDOMEN.

ENTEROSARCOCELE. A Species of Hernia; which ſee under the Article HERNIA.

ENTEROSCHEOCELE, ἐντεροσχεοκήλη, from ἔντερον, an Inteſtine, ὀσχέον, the Scrotum, and κήλη, an Hernia. An Hernia, when the Inteſtines deſcend into the Scrotum.

ENTHEASTICOS, ἐνθεαστικὸς, from ἔνθεος, divinely inſpired, of Θεὸς, God, in *Paulus Ægineta*, *Lib.* 4. *Cap.* 14. is one under a melancholy Affection, who imagines himſelf divinely inſpired, and able to predict future Events.

ENTHEMATA, ἐνθέματα, from ἐντίθημι, to put in. Medicines applied immediately to recent Wounds, in order to prevent an Inflammation, and ſtop the Hæmorrhage.

ENTHETOS, ἔνθετος, from the ſame as the preceding, ſignifies, in general, any thing introduced; but, in particular, uſed to expreſs ſuch Medicines as are applied to the Noſe, in order to ſtop an Hæmorrhage. They are called, 4. *Epid.* τὰ ἐντιθέντα.

ENTHLASIS, ἔνθλασις, from ἐν, in, and θλάω, to break or bruiſe, is an Illiſion or Contuſion, which makes ſuch an Impreſſion, as leaves an external Cavity. *Hippocrates*, *de intern. Affect. Galen*, *Lib.* 2. *de Cauſ. Morb.*

ENTHUSIASMUS, ἐνθουσιασμὸς, from ἐνθουσιάζω, to be divinely inſpired, of Θεὸς, God, is defined by the Author of the *Definitiones Medicæ*, to be a fanatic Perculſion, or divine Inſpiration; as when a Perſon, in performing the holy Rites of divine Worſhip, loſes his Reaſon, and, in an Ecſtaſy, ſees ſtrange Sights, or hears the Noiſe of Drums or Pipes.

ENTOMON, ἔντομον, from ἐν, in, and τέμνω, to cut. An Inſect. See INSECTUM.

ENTRICHOMA, ἐντείχωμα, from ἐν and τείχωμα, the Hair. A Name given by ſome to the utmoſt Edge or Extremity of the Eyelids, whence the Hairs grow.

ENTRIMMA, ἔντριμμα, from ἐντρίβω (of ἐν and τρίβω), to rub, grate, triturate. The ſame as INTRITUM; which ſee.

ENTROPE, ἐντροπὴ, ἐντροπὶν, from ἐντρέπω, to abaſh, or make aſhamed. In *Hippocrates*, περὶ εὐσχήμοσ. it ſignifies Modeſty; and is a Qualification he requires in a Phyſician.

ENTYPOSIS, ἐντύπωσις, from ἐντυπόω, to make an Impreſſion, of τύπος, a Type, or Image formed by Impreſſion. The Acetabulum of the Humerus; otherwiſe called the *Omocotyle* by *Pollux*; who ſays, it is the Articulation of the Shoulder and Arm.

ENUCLEATIO, Enucleation, is the taking out the Nut or Kernel of any Fruit.

ENULA CAMPANA. Elecampane. See HELENIUM.

ENULON, ἔνυλον, from ἐν and ὕλη, the Gums. According to *Pollux*, it is the internal Fleſh of the Gums; as the ὕλον (*Ulon*) is the external; and ἁρμὸς (*Harmus*), the Fleſh of the Gums between the Teeth.

ENUR. The occult Vapour of Water, of which Stones are generated. *Rulandus. Johnſon.*

ENYPNION, ἐνύπνιον, from ἐν, and ὕπνος, Sleep. A Dream. See INSOMNIUM.

ENYPOSAPROS, ἐνυπόσαπρος, from ἐν, within; ὑπὸ, a Prepoſition having the Force of a Diminutive, in Compoſition, and σαπρὸς, putrid. Somewhat putrid within. An Epithet in *Coac.* 446. applied to the Spit of hepatic Patients.

ENYSTRON, ἔνυστρον, according to *Ariſtotle*, *Lib.* 2. *Animal.* is a ſecond Ventricle, or a thick Part of the Stomach, in ruminating Quadrupeds, in which the Food is elaborated and concocted. *Gorræus* makes it the ſame with the ABOMASUM, which ſee.

EON, ἠών. The whole Ambit, or Compaſs, of the Eye. *Gorræus* from *Pollux.*

EPACMASTICOS, ἐπακμαστικὸς, from ἀκμὴ, the Top, or Summit. An Epithet of a Fever, which is continually increaſing; and is the ſame as ἀναβατικὸς (*Anabaticus*). See ANABASIS.

EPACROS, ἔπακρος, from ἄκρον, the Top. Ending in a ſharp Point. *Hippocrates*, *Lib.* 2. *de Morb.* and *Galen*'s *Exegeſis.*

EPAGOGION, ἐπαγώγιον, from ἐπάγω, to induce, or cover over. The Prepuce. *Dioſcorides*, *Lib.* 3. *Cap.* 25.

EPANACLESIS, ἐπανάκλησις, from ἀνακαλέω, to recal. A Recalling or Revocation. Ἐπανάκλησις θερμῆς, "A Revo-"cation of Heat." 5 *Aph.* 21. & *Lib.* ὑγρ. χρησ.

EPANADIDONTES PURETI, ἐπαναδιδόντες πυρετοὶ, in 6 *Epid. Sect.* 6. *Aph.* 17. are Fevers, which, in the Beginning, are not mordacious [δακνώδεις] to the Hand; but, in their

their Progreſs, increaſe in Heat, and are ſenſibly biting to the Touch. They are oppoſed, as *Galen* ſays, to thoſe Fevers, which are acute, but ναυμβροι τῆς χειρὸς, "gentle, and yield-" ing to the Touch."

EPANADIPLOSIS, ἐπαναδίπλωσις, from διπλῶς, double. A Reduplication. The ſame as ANADIPLOSIS, which ſee.

EPANALEPSIS, ἐπανάληψις, from ἐπαναλαμβάνω, to repeat. A Repetition. The ſame as ANADIPLOSIS, which ſee.

EPANASTASIS, ἐπανάστασις, from ἐπανίστημι, to excite, or raiſe. A Tumor, or Tubercle. The Word occurs in *Coac.* 220. where we are told, that Tumors about the Eyes [ἐπαναστάσις περὶ ὀφθαλμῶν], upon the Recovery from a Diſtemper [ἐν τῇσιν ἀνακομιδῇσι], prognoſticate a Flux of the Belly.

EPANCYLOTOS, ἐπαγκυλωτὸς, from ἀγκύλος, crooked, winding. A ſort of Bandage in *Oribaſius.*

EPANTHEMA, ἐπάνθημα, or,

EPANTHISMA, ἐπάνθισμα, from ἄνθος, a Flower. An Efflorescence. *Hippocrates*, 1 *Prorrhet.* and *Coac.*

EPANTLESIS, or ENCATANTLESIS, ἐπάντλησις, from ἐπαντλέω, to pour upon. In *Lib. de Rat. Vict. in Morb. acut.* ſignifies a Perfuſion with Water, as performed by the Attendants on the Baths.

EPAPHÆRESIS, ἐπαφαίρησις, from ἐπὶ, importing Repetition, and ἀφαίρησις, a Removal, or taking away. In *Galen*, it ſignifies, particularly, a repeated Evacuation by Phlebotomy.

EPAPHROS, ἐπαφρὸς, from ἀφρὸς, Spume. Spumous, frothy. Frequently applied by *Hippocrates* to the Stools.

EPAR. See HEPAR.

EPARGEMOS, ἐπάργεμος. An Epithet for a Perſon affected with that Diſorder of the Eye called ARGEMON, which ſee.

EPARITA. A Sort of argillaceous Earth, of the Colour of Liver *(Epar). Paracelſus.*

EPARMA, ἔπαρμα, or,

EPARSIS, ἔπαρσις, from αἴρω, to elevate. Any Sort of Tumor, but frequently applied to a Parotis.

EPAZOTL. A Name for the BOTRYS MEXICANA, which ſee.

EPENCRANIS, ἐπεγκρανὶς. A Name by which *Eraſiſtratus* called the Cerebellum. *Galen, de Uſu Part. L.* 8. *C.* 13.

EPERLANUS. The Smelt. *Lemery*, in his Treatiſe on Foods, tells us, that you are to chuſe Smelts that are fair, ſhining, of a Pearl-colour, ſoft, tender, delicious, juicy, and ſmelling like Violet.

The Smelt yields pretty good Nouriſhment, and is eaſy of Digeſtion. It is looked upon to be opening and good for the Stone and Gravel.

We do not find it to produce any ill Effects.

It contains much Oil, and volatile Salt.

It agrees, at all times, with any Age and Conſtitution.

REMARKS.

A Smelt is a ſmall Fiſh, that is bred in the Sea, and gets up into Rivers, where they fiſh for it. There are great Numbers of them in the *Seine*, at *Roan*; they aſſure us, they are more plentiful, and taſte better, towards the End of Summer, or the Beginning of Autumn, than at any other times of the Year. This Fiſh is about the Length of one's Finger, and the Thickneſs of one's Thumb; and feeds upon Flies and Inſects, and in Shape and Virtue is much like a Gudgeon: However, 'tis more delicious, by reaſon of the violet Taſte it has, which probably ariſes from the Principles of the Smelts, being a little more exalted than thoſe of the Gudgeon, and more freed from groſs Matters; and therefore they make a more nice and finer Impreſſion upon the Senſe of Taſte.

A Smelt, in *Latin*, is called *Eperlanus*, *à Perlâ*, a Pearl; becauſe 'tis like it in Colour: They call it alſo, *Viola marina*, becauſe it ſmells like a Violet.

EPHEBÆON, ἐφήβαιον· the Pubes; from ἥβη, the Pubes, or Puberty.

EPHEDRA.

The Characters are;

The Root is perennial: The Plant has the Appearance of a Shrub; and the Stalks, Branches, and Leaves, reſemble thoſe of *Horſe-tail.* The Flower is Male; has no Petals, but conſiſts of teſticulated Stamina, growing on a thin Subſtance, the Congeſtion of which furniſhes the Floſcule with a ſort of Calyx: Theſe are the Flowers which grow on the Male or Hermaphrodite Plant.

The Fruit, which either grows on another Part of the ſame Plant, or on another Plant which bears no Flowers, is a red juicy Berry; conſiſts of a Pair of ſquamous or ſcaly Subſtances, laid acroſs, upon a Pair of others like them, and upon that a third, and over this a fourth Pair, in like Order as the firſt and ſecond, the Series gradually increaſing from the leaſt and loweſt Scales, to the uppermoſt and greateſt, which in a biſid Cleft, a little gaping, contains two ſmooth oval Seeds, gibbous on the back Part, and flat on the other, and cover'd with a coriaceous Membrane. *Boerhaave.*

Boerhaave mentions two Species of this Plant; which are,

1. Ephedra; maritima, major. *Tourn. Inſt.* 663. *Elem. Bot.* 514. *Boerh. Ind. A.* 2. 107. *Ephedra*, Offic. Mont. Ind. 42. *Tragus ſive Uva marina major*, J. B. 1. 406. Chab. 87. *Uva marina major*, Ger. Emac. 1117. Raii Hiſt. 2. 1638. *Uva marina*, Ger. 959. *Polygonum bacciferum maritimum majus*, C. B. P. 15. *Polygonum bacciferum ſive Uva marina major*, Park. Theat. 450. *Equiſetum Polygonoïdes bacciferum majus*, Hiſt. Oxon. 3. 621. SEA-GRAPE OR SHRUB HORSE-TAIL. *Dale, p.* 324.

It grows in *Sicily*, and other maritime Places. Ten Kernels of the Grapes, drank in Wine, give Relief under the Cœliac Paſſion, and to Women in a Fluor Uterinus. *Dioſcorides, Lib.* 4. *Cap.* 51.

The Hiſtory of Plants, attributed to *Boerhaave*, informs us, that this Plant is aſtringent, and good in Hernias, Diarrhœas, and Hæmorrhages.

2. Ephedra, maritima, minor. *T.* 663. *Polygonum, bacciferum, maritimum, minus.* C. B. P. 15. *Tragus, ſive Uva marina.* J. B. 1. 406. *Equiſetum* IV. *Matthioli.* Lugd. 1071. *Racemoſa, Equiſeti facie.* Lob. Adv. 355. *Hippuris, minor, congener cum majori Equiſeto.* Lob. Obſ. 461. *Equiſetum, Polygonoides, bacciferum minus.* M. H. 3. 621. H. LESSER SEA HORSE-TAIL. *Boerh. Ind. A. Plant. Vol.* 2. *p.* 107.

EPHEDRA is alſo a chirurgical Inſtrument, mention'd by *Joh. Laurentius*, for the Reduction of luxated Bones.

EPHEDRANA, ἐφίδρανα, the Buttocks.

EPHEDRON, ἔφεδρον· from ἕδρα· a Seat firmly fix'd. It occurs in *Hippocrates de Fract.* and *de Morbis L.* 2. and 3.

EPHELCIS, ἐφελκὶς· from ἕλκω, an Ulcer. The Cruſt of an Ulcer; or a ſmall Abraſion, or bloody Fragment, ſometimes brought up by Coughing in an HÆMOPTYSIS.

EPHELIS, ἐφηλὶς.

This Word among the *Greeks*, imported what we call Sun-burning; as is obvious by its Derivation, from ἐπὶ, and ἥλιος, the Sun. *Celſus*, in the fifth Chapter of his ſixth Book, treats of this, and ſome other Diſorders of a ſimilar Nature, in the following Words: "'Tis almoſt needleſs to attempt a " Cure of Pimples, Freckles, and Sun-burning: But the " Care of a Woman's Complexion is a Principle ſo throughly " interwoven with her Nature, that it can hardly be eradi- " cated, or ſeparated from her Being. Pimples and Freckles " are generally known; tho' that Species call'd φακία by the " *Greeks*, which is only a red and unequal Freckle, rarely " occurs. The *Ephelis* is unknown to moſt People, and is " nothing more than a certain Roughneſs and Hardneſs, ac- " companied with a bad Colour of the Skin: The other Ble- " miſhes happen only in the Face; tho' Freckles appear ſome- " times alſo in other Parts."

Pimples are moſt commodiouſly remov'd, by applying to them Reſin, mix'd with an equal Quantity of ſciſſile Alum, and a little Honey. Freckles are remov'd, by the Application of Galbanum and Nitre, triturated, and made up with Vinegar, into the Conſiſtence of Honey: With this Preparation the Skin is to be anointed. Next Morning, the Parts to which it is apply'd, are to be waſh'd, and gently anointed with Oil.

The *Ephelis*, or Sun-burning, is remov'd by an Application of Reſin, to which a third Part of foſſile Salt, and a little Honey, are added: But all theſe Diſorders, as alſo the unnatural Colour of Cicatrices, are remedied by the following Preparation, aſcrib'd to *Trypho* the elder:

Take equal Quantities of Myrobolans, Crocomagma, *Cimolian* Earth of a bluiſh Colour, bitter Almonds; the Meals of Barley and Bitter-vetch; Dyers-weed [*Struthium album*]; and the Seeds of Melilot [*Sertula Campana*]: All theſe are to be triturated together, and made up with the moſt ſharp Honey: With this Preparation, the Parts affected are to be anointed at Night, and the Medicine is carefully to be waſh'd off next Morning.

EPHEMERA; from ἡμέρα, a Day. A diary Fever. In this Diſorder, a Heat reſembling that obſerv'd in Perſons under the Influence of Anger, or thoſe whoſe Stomachs are overloaded with Wine, is diffus'd over the whole Body: This Species of Fever has this peculiar to it, that the Pulſe is, at firſt, large; but, as it afterwards becomes moderately quick and frequent, ſo 'tis equal, ſoft, and regular, as in a natural State. The Urine undergoes little or no Change; nor is the Diſorder preceded by a Loathing of Food, a ſpontaneous Laſſitude of the Body, diſturb'd Sleep, preternatural Yawning, or Horror; but it ſeizes the Patient ſuddenly, and afflicts him with no other Symptoms than a Pain of the Head and Stomach; a Nauſea,

Nauſea, Heat, and Reſtleſſneſs. This Diſorder is ſometimes imperceptibly determin'd, without any ſenſible Evacuation; but more frequently by copious Exhalations thro' the Skin, a moiſt Diaphoreſis, or by gentle and not very profuſe Sweats: 'Tis alſo to be obſerv'd, that a diary Fever is almoſt always produc'd by evident Cauſes; ſuch as Watching, Anxiety, Grief, Anger, the Heat of the Sun, Wearineſs, Drinking to Exceſs, Hunger, and other things of a like Nature; and that it generally terminates in one Day: But if it ſhould paſs this Day, and continue beyond the third, it ceaſes to be a diary Fever, and degenerates into one of the putrid Kind. In this Caſe, if the Patient's Habit is exceſſively dry, an hectic Fever is alſo to be dreaded: 'Tis eaſier to cure, than really to know and diſtinguiſh, every Fever of the diary Kind; for which Reaſon, it generally happens, that a diary Fever proves injurious to the Patient, before it can be diſtinguiſhed for the Diſeaſe it really is. This Diſorder is not only more generally incident, but alſo more dangerous, to Men of bilious Conſtitutions, and ſuch as are engag'd in much Buſineſs. *Lommii Medicinal. Obſervat.*

EPHEMERIDES. *Helmont* calls thoſe Diſeaſes, which ſeize the Patient at particular times of the Moon, *Ephemerides Ægrorum*, the Almanacks of the Sick.

EPHEMERUM.

The Characters are;

The Calyx conſiſts of three Leaves; the Flowers of three Petals, expanded in form of a Roſe, and furniſh'd with three Stamina, ſurrounding the Ovary. The Fruit is oblong, tricapſular, and full of Seeds, like Grains of Wheat.

Boerhaave mentions four Species of this Plant; which are,

1. Ephemerum; Virginianum; flore azureo, majori. *T.* 368. VIRGINIAN SPIDERWORT, *with a large azure Flower, commonly call'd the* SAVOY SPIDERWORT.

2. Ephemerum; Virginianum; flore albo. *T.* 386. VIRGINIAN SPIDERWORT, *with a white Flower.*

3. Ephemerum; Virginianum; flore ex albo & violaceo vario. *T.* 368.

4. Ephemerum; Virginianum; flore purpureo, minore. *T.* 368. VIRGINIAN SPIDERWORT, WITH A SMALL PURPLE FLOWER. *Boerh. Ind. alt. Vol.* 2. *p.* 133.

I can find no medicinal Virtues attributed to either of theſe Plants.

Dale mentions another Species of the *Ephemerum*; which is quite different from any of the preceding, and is thus diſtinguiſh'd:

Ephemerum, Offic. Chab. 225. DEADLY SAFFRON.

It grows in Woods, and ſhady Places; and is thus briefly deſcribed by *Dioſcorides*: "The Leaves and Stalks are like "thoſe of the Lily, only thinner; the Flower white and "bitter, and the Seed ſoft: It has but one Root, of the "Thickneſs of a Finger; long, aſtringent, and ſweet-"ſcented.

"The Root is excellent for the Teeth, if they be waſhed "with its Decoction: The Leaves, boiled in Wine, diſcuſs "Tumors and Tubercles, which have, as yet, contracted no "Moiſture." *Dioſcorides*, *Lib.* 4. *Cap.* 85.

The *Ephemerum* of *Theophraſtus* ſeems to be a deleterious Plant, as *Chabræas* juſtly obſerves; but *Dioſcorides* aſcribes no deadly Quality to the *Ephemerum*: *Pliny* affirms it to be not only harmleſs, but wholſome. Theſe various Accounts have occaſion'd many Doubts and Diſputes among the Learned, about this Plant; nor are they, as yet, agreed where to fix the genuine *Ephemerum*. *C. Bauhine* propoſes two Plants to be called by this Name: *Columna* takes a Species of *Digitalis* for the *Ephemerum*; but the *Arabians*, and the Phyſicians of the laſt Age, who follow'd them, have confounded the Ephemerum with Hermodactyls. *Dale.*

EPHESIS, ἔφεσις. This is, properly, a Law-term, importing an Appeal from one Court to another: But it alſo ſignifies Deſire, or Appetite. *Caſtellus* quotes *Moſchion* for a different Senſe of this Word, *Cap.* 128. and 138. But, as there is no Foundation for what he ſays, in the Paſſages he quotes, where Epheſis only ſignifies, ſimply, Deſire; it is not neceſſary to give *Caſtellus*'s Interpretation.

EPHESIUM *Emplaſtrum*. The Name of a Plaiſter deſcrib'd in *Celſus*, *L.* 5. *C.* 19. *Text.* 21.

EPHIALTES, ἐφιάλτης· from ἐφάλλομαι, to ruſh upon. The *Incubus*, or Night-mare. See INCUBUS.

EPHIALTIA. A Name for the *Pæonia*, Peony.

EPHIDROSIS, ἐφίδρωσις· from ἐφιδρόω, to break out into a Sweat, or languiſh under a Sweat. It is not certain, in *Galen*'s Opinion, whether *Hippocrates*, by this Word, means a ſlight and unpromiſing Sweat, which is not critical, but ſymptomatical, breaking out all over the Body; or that ſymptomatical Sweat, which only appears on the Head, Neck, and Breaſt. Upon comparing the Paſſages, in which the Word occurs, it ſhould ſeem, that it imports both, or either. As in the Days of *Hippocrates*, ſo at this time, both are of bad Preſage; tho' they are, not unfrequently, miſtaken, by the undiſtinguiſhing, lower Claſs of Practitioners, for critical Sweats; and are, accordingly, promoted by cordial Powders, and heating Medicines, to the Deſtruction of the miſerable Patient.

EPHIPPIUM, ἐφίππιον, properly a Saddle, is, in Anatomy, the *Sella Turcica*. See CAPUT.

EPHODOS, ἔφοδος· from ἐπὶ, upon, and ὁδὸς, a Way; has three Significations in *Hippocrates*: Firſt, it ſignifies the Ducts, Ways, or Paſſages, by which the Recrements of the Body are eliminated, 6 *Epid. Sect.* 2. *Aph.* 25. Secondly, it means the periodical Attack of a Fever, as *Lib. Prognoſtic.* where *Galen*, in his Comment ſays, that the *Greeks* commonly uſe the Word ἔφοδος, to ſignify the Invaſion or Attacks of Enemies or Thieves; whence it is transfer'd by *Hippocrates*, to the Periods or Circuits of critical Days. Laſtly, he often uſes it to ſignify the Acceſſion of ſimilar or diſſimilar Things, which may be injurious or beneficial to the Body, as *Lib.* 1. *de Diæta.*

EPIALOS, ἐπίαλος. An Epithet of a Fever; ſo called, as *P. Ægineta* ſays, *Lib.* 2. *Cap.* 25. either from ἐπί, gentle, and ἅλς, the Sea; becauſe the Sea appears gentle, but is very dreadful when diſturbed; or, becauſe this Fever, ἠρέμα ἐλαύνει. "gently heats." It is defin'd by *Galen*, *Lib.* 2. *de Diff. Feb. Cap.* 6. "A Fever, in which the Patient labours "under a preternatural Heat, and ſhivers with Cold at the "ſame time." It may be call'd a ſhivering, or a ſhaking Fever: And the antient *Latins* gave it the Name of QUERCERA, "the quaking Fever." It proceeds, according to *Galen*, from an acid and vitreous Phlegm, moderately putrify'd. The Name ἐπίαλος, as we are inform'd by *Heſychius*, was by ſome given to the cold Shivering, preceding a Fever; and *Galen*, in the Chapter above-quoted, takes notice of the ſame. Ἠπίαλος πυρετὸς is, by Interpreters, taken for a mild and gentle Fever; and is incident, according to *Hippocrates*, *Lib.* περὶ παρθενίης. to Virgins grown mature, on Defect of their menſtrual Purgations. He mentions this Sort of Fever alſo, *Lib. de Aere, Locis, & Aquis*; where *Cornarius* tranſlates it, "mild Fevers." And, *Lib.* 4. *Epidem.* cold and ſhivering Fevers are called ἐπιαλώδεις, according to the Expoſition of *Erotian.*

EPIALTES. The ſame as EPHIALTES, which ſee.

EPIBROCHE, ἐπιβροχὴ· from ἐπιβρέχω, to irrigate, or pour upon. A Perfuſion, or Irrigation.

EPICÆROS, ἐπίκαιρος· from ἐπὶ, and καιρὸς, Time. Beſides the common Signification, which is, opportune, it implies in *Hippocrates*, conſiderable, remarkable, large, and ſometimes malignant.

EPICANTHIDES, ἐπικανθίδες. The two Angles of the Eyes.

EPICARPIUM, ἐπικάρπιον· from ἐπὶ, upon, and καρπὸς, the Wriſt. An external Remedy apply'd to the Wriſt. See PERICARPIUM.

EPICAUMA, ἐπίκαυμα· from καίω, to burn. A Sort of Ulcer in the Black of the Eye. See ENCAUMA.

EPICERAS, ἐπικέρας. Fenugreek. *Galen.*

EPICERASTICA, ἐπικερατικὰ· from κεράννυμι, to mix, or attemperate. Medicines which attemperate or obtund the Acrimony of the Humours, and mitigate the uneaſy Senſation of the Parts thence ariſing. Among Medicines of this Kind, are reckon'd emollient Roots; as thoſe of the Marſh-mallow, Mallow, and Liquorice.

The Leaves of Mallows, Water-lily [*Nymphæa*], the large Houſleek, Purſlain, and Lettuce.

The Seeds of Barley decorticated, white Henbane, Lettuce, Flax, white Poppy, and Rue.

The Fruits, Jubebs, Raiſins, ſweet Apples, ſweet Prunes, Sebeſtens, ſweet Almonds, and Pine-nuts.

Among Juices and Liquors; Almond-milk, Starch, Barley-water, pinguious Broths, the Milk of the Sow-thiſtle, Cremor of Ptiſan, and the Juices of the Leaves of Night-ſhade, and Winter-cherry.

Among the Parts of Animals; the Whites of Eggs, Butter, Milk of all Kinds, Whey; the Head and the Feet of a Calf, and alſo a Sheep's Head, and Broths prepared of them; Jellies of Hartſhorn, and Ivory.

Among Mucilages; the Seed of Fleawort, Quinces, of the Seed and Root of Marſh-mallows; of the Seed of Flax, Mallows, and of the Root of Borrage.

Among Oils; Oil of Olives, Violets, ſweet Almonds, expreſs'd Oils of the Seed of the Gourd, white Henbane, and white Poppy.

Among Ointments; the *Unguentum Roſatum*, and *Unguentum album camphoratum.*

Among Syrups; the Syrups of Violets, of Apples, of Marſh-mallows of *Fernelius*, of Liquorice, Jubebs, Poppies, and of Purſlane.

Among the various Shop Preparations; the Pulp of Caſſia, Diacodium, Diapenidium, Sugar of Violets, Julap of Violets, Honey of Violets. *Morellus, de Materia Medica.*

EPICHEIRESIS. The ſame as ENCHEIRESIS, which ſee.

EPICHEIRON, ἐπίχειρον· from ἐπὶ and χεὶρ, the Hand. This does not relate to Medicine, farther than as it imports a Fee.

EPICHNOUS, ἐπίχνους· from χνόος, a lanuginous Concretion. An Epithet for Eyes abounding with lanuginous Concretions.

EPICHOLOS, ἐπίχολος· from χολὴ, Bile. Bilious.

EPICHORDIS, ἐπίχορδις· from χορδὴ, an Inteſtine. The Meſentery.

EPICHORIOS. The ſame as EPIDEMIUS, which ſee. It is deriv'd from ἐπὶ, upon, and χώρα, a Region.

EPICOELIS, ἐπικοιλὶς. The ſuperior Eyelid, or *Cilium*.

EPICOLICÆ *Regiones*. The lateral, or lumbar Regions. Thoſe Parts of the Body, which are adjacent to the *Colon*.

EPICOPHOSIS, ἐπικώφωσις. The ſame with κώφωσις, Deafneſs.

EPICRASIS, ἐπίκρασις· of the ſame Derivation as EPICRASTICA. It ſignifies an Attemperation of the Humours. A Cure perform'd in the alterative Way, by degrees, and with temperating Medicines, is call'd a Cure *per* EPICRASIN.

EPICRATIS, ἐπικρατὶς. A Handkerchief, or Linen Cloth to wipe off Sweat; or a Woman's Head-clothes.

EPICROUSIS, ἐπίκρουσις· from κρούω, to ſtrike. A ſort of Percuſſion with light Ferulas, which the Slave-merchants us'd to apply to the Limbs of Boys, which were naturally too ſlender, in order to plump them up.

EPICTENION, ἐπικτένιον, the Pubes. It alſo ſeems to imply, in *Hippocrates*, *de Morbis Mulierum*, *L.* 1. a fine Lint, or Hurds of crude Flax, which adheres to the Hatchel, or Card, whilſt Flax is dreſſing. This he directs as an Ingredient in a Peſſary.

EPICYEMA, ἐπικύημα· from κύω, to conceive. This Word, in *Hippocrates*, imports a Fœtus conceiv'd in the Uterus, after the Conception of a former Fœtus; and ſometimes a Mole.

EPICYESIS. Of the ſame Derivation as the preceding Word. Superfetation; that is, the Conception of one Fœtus upon another conceiv'd before. *Hippocrates* has wrote a Treatiſe on this Subject.

EPIDELOS, ἐπίδηλος· from δῆλος, manifeſt, conſpicuous; is an Epithet apply'd by *Hippocrates*, *Lib. de Carnibus*, to Man in the Time of his Growth, who is there ſaid to be ἐπίδηλος, that is, diſcloſing, and rendering himſelf more and more conſpicuous; and this, he ſays, is moſt obſervable (ἐπίδηλος μάλιστα γίνεται) from ſeven to fourteen Years of Age. Ἐπίδηλος ἡμέρη, 2 *Aph.* 24. is the conſpicuous or remarkable Day, ſuch as the fourth, eighth, and eleventh; which indicates what Manner of Criſis may reaſonably be expected on the critical Day.

EPIDEMIUS, ἐπιδήμιος, or ἐπίδημος· from ἐπὶ, upon, and δῆμος, the People. Epidemical. An Epithet of Diſeaſes, which at certain times are popular, and attack great Numbers at or near the ſame time. It differs from *Endemial*, which imports Diſeaſes peculiar to ſome particular Country, Region, or People; whereas epidemical Diſeaſes are ſuch as are peculiar to certain Seaſons.

Pertinent to the preſent Subject are the Obſervations of the celebrated *Boerhaave*, on epidemical Diſeaſes: We muſt remark, ſays this Author, that tho' every particular Diſeaſe of the Fluids, in various epidemical Conſtitutions, appear, to unattentive Obſervers, the ſame with regard to their Names, Signs, and their Conſequences in ſome meaſure, yet the ſame Diſeaſes, appearing in one epidemical Conſtitution, differ exceedingly from thoſe produc'd in another, with reſpect to their obſcure Natures; their Appearances not obſervable, except by the Judicious; the various Times of their Increaſe, State, Coction, Criſis, Effect, Event, and Method to be purſu'd for the Cure. Hence it is evident, that they require a different Adminiſtration of the Non-naturals, different Treatment, and Medicines: This Variety, however, in epidemical Diſtempers, is ſo obſcure, that Phyſicians have not yet been able to deduce it from any Abuſe of the Non-naturals: And yet there are many Circumſtances which make it highly probable, that the Cauſes reſide in the Air, but depend more upon the inexplicable Variety of Exhalations contain'd therein, which, by their Mixture with the Fluids of the Body, or their Stimulus, injure the human Machine, than upon any Change in the ſenſible Qualities thereof. But it is very ſurpriſing, that theſe epidemical Diſorders ſhould be principally propagated by Contagion, receiv'd from one by another Perſon unaffected.

Upon the Invaſion of any unknown epidemical Diſtemper, the Phyſician will receive ſome Information with reſpect to the Cure: Firſt, by reducing the Diſtemper to ſome more known Species, which it moſt reſembles.

Secondly, by obſerving its Tendency at the vernal and autumnal Equinoxes; at which Seaſons it is generally moſt prevalent.

Thirdly, by attending to the ſpontaneous Phænomena, which precede, accompany, or follow, the Death or Recovery of the Patient, and the better or worſe State of the Diſorder.

Fourthly, by diligently remarking the Benefit or Injury receiv'd, from whatever the Patients are unavoidably oblig'd to do; whatever is taken into; or diſcharged out of, the Body.

Fifthly, by comparing the Caſes of a great many Patients labouring under the Diſtemper at the ſame time.

Sixthly, by abſtaining from all Remedies which are dubious, which exagitate, and induce a conſiderable Change in the Humours, and thereby obſcure the Genius of the Diſeaſe.

From theſe Circumſtances, duly attended to, the curative Indication ariſes.

EPIDERIS, ἐπιδηρὶς. The *Clitoris*.

EPIDERMIS, ἐπιδερμὶς· from ἐπὶ, upon, and δέρμα, the Skin. The Cuticle. See CUTIS. In *Hippocrates*, it includes alſo the *Cutis*, or true Skin.

EPIDESMOS, ἐπίδεσμος· from δέω, to bind. A Bandage by which Bolſters, or Splints, or any thing apply'd to any Part of the Body, are ſecur'd.

EPIDIDYMIS, ἐπιδιδυμὶς· from ἐπὶ, upon, and δίδυμος, a Teſticle.

The Epididymis may be reckon'd a Production of the Teſticle, or a Kind of *Teſtis acceſſorius*; and it reſembles, in ſome meaſure, an Arch, ſupported by its Centre or Frame. It is more contracted at the Middle than at the Extremities, by which it is cloſely united to thoſe of the Teſticle.

Between its Extremities it does not immediately touch the Teſticle, but is only looſely connected to it, by the Duplicature of a very fine and almoſt tranſparent Membrane, as by a kind of Ligament. This Membrane is the Continuation and Duplicature of the Tunica Albuginea, or proper Coat of the Teſticle, which, having ſupplied the Place of a Ligament to the *Epididymis*, afterwards inveſts it.

The *Epididymis* is flat, a little concave on the under Side, or that next the Teſticle, irregularly convex on the upper Side, or that turned from the Teſticle: And theſe two Sides are diſtinguiſhed by two angular Edges; by the innermoſt of which it is connected to the Teſticle, but the outer Edge, and flat Side, are looſe and free.

The anterior Extremity, or Head, of the *Epididymis* ariſes from the Teſticle; and the poſterior Extremity or Tail, which likewiſe adheres very cloſely to it, is incurvated from behind, forward, and a little upward; and, contracting by degrees, forms a particular Canal, termed Vas Deferens. See DEFERENTIA VASA. *Winſlow's Anatomy*.

EPIDORPION, ἐπιδόρπιον· from ἐπὶ, upon, and δόρπον, a Supper, or Meal. A Deſſert, or Courſe of Sweet-meats or Fruits.

EPIDOSIS, ἐπίδοσις· from ἐπιδίδωμι, to add to a Gift. Augmentation or Increaſe. It is us'd with reſpect to the Growth of the Body, or to the Increaſe of a Diſeaſe.

EPIDROME, ἐπιδρομὴ· from ἐπὶ, upon, and δρέμω, to run. An Afflux of Humours; as it happens when a Ligature is made upon any Part.

EPIGASTRIUM, ἐπιγάστριον· from ἐπὶ and γαστὴρ, the Belly. The ſuperior Part of the Abdomen.

EPIGENEMA, ἐπιγένημα· from ἐπιγενάω, to generate over and above, or anew; ſometimes ſignifies the ſame as σύμπτωμα, "a Symptom," as we are told by *Galen*, *Lib.* 3. *de Diff. Sympt.* ſometimes a thing grown, or cloſely adhering to another, as the Word is ſpoken, *Coac.* 230. of the white Saliva generated and adhering to the Tongue of the Patient; for if this ἐπιγένημα (*Epigenema*) be thick, it indicates a Remiſſion of the Fever the ſame Day.

EPIGINOMENA, ἐπιγινόμενα· from ἐπιγίνομαι, to ſucceed, to ſupervene, to be an Accretion or Acceſſion; are, agreeably to *Galen. Comment. in Aph.* 35. *Lib.* 6. thoſe Symptoms which naturally ſucceed, or may rationally be expected, in the Progreſs of a Diſeaſe. But in *Aph.* 32. *Sect.* 8. *Lib.* 6. *Epid. Foeſius* will have the τὰ ἐπιγενόμενα to mean new Acceſſions of ſome other Affection to Diſeaſes, which never happens but in ſtubborn and malignant Diſorders, as *Galen* ſays, *Com. ad Aph.* 21. *Lib.* 7. where he ſays, that one *Praxagoras* wrote a Volume on *Epiginomena*; and the whole ſeventh Book of the Aphoriſms is by ſome intituled, περὶ τῶν ἐπιγινομένων, "of *Epiginomena*," or Acceſſions to Diſeaſes; and of ſuch Acceſſions, *Lib.* περὶ παθῶν, *Hippocrates* pronounces, that they are for the moſt part mortal.

EPIGLOSSUM. A Name for the *Laurus Alexandrina*; or *Ruſcus*, *Latifolius*, *fructu folio inſidente*.

EPIGLOTTIS, ἐπιγλωττὶς. A ſmall Cartilage, in the Shape of a Tongue, which covers the Orifice of the Windpipe. See LARYNX.

EPIGLOTTUM. The Name of an Inſtrument mention'd by *Paracelſus*, for elevating the Eyelids.

EPI-

EPIGLOUTIS, ἐπιγλουτὶς. The ſuperior Part of the Buttock.

EPIGONATIS, ἐπιγονατὶς, from ἐπὶ, upon, and γόνυ, a Knee. The *Patella*. See CRUS.

EPIGONON. The ſame as EPICYEMA.

EPIGOUNIDES. The Muſcles inſerted into the Knees. *Ruffus Epheſius*, L. I. C. 16.

EPILAMPSIS. The ſame as ECLAMPSIS; which ſee.

EPILENTIA. A Name for the Epilepſy, in *Paracelſus*.

EPILEPSIA, ἐπιληψία, or ἐπίληψις, from ἐπιλαμβάνω, to ſeize, invade, or oppreſs. The Epilepſy, or Falling-ſickneſs; call'd, alſo, *Comitialis Morbus*.

Among the ſeveral Calamities to which human Nature is ſubjected, none is more juſtly formidable, than that univerſal and involuntary Concuſſion, and violent Agitation, of the external Parts, which is accompanied with a Suſpenſion both of the internal and external Senſes, and which we commonly call an Epilepſy; for, during the Shocks of this terrible Misfortune, the Body is not only variouſly diſtorted and deform'd, but alſo the Mind, as it were, unhing'd, and depriv'd of its genuine Powers. The forbidding Aſpect of epileptic Patients, and the Violence of the Symptoms with which their Diſorder is accompanied, ſeems to be the Reaſon why the Antients diſtinguiſh'd this Diſeaſe, by the pompous Epithets, *Great*, *Herculean*, *Divine*, and *Sacred*. It is call'd Great, and Herculean, on account of its Violence; and becauſe it can hardly be conquer'd and remov'd by human Art. It is ſtyl'd Divine, either becauſe it is impiouſly ſuppos'd to be ſent from Heaven as a Curſe upon Earth; or becauſe its Cure eludes the greateſt Reach of human Art, and calls for an immediate Interpoſition of Omnipotence. And, laſtly, it receives the Epithet, Sacred, becauſe it affects the Mind, the moſt noble and ſacred Part of a rational Creature.

But, waving Diſquiſitions of this Kind, we define an Epilepſy, an involuntary, preternatural, highly violent, and convulſive Concuſſion of the nerveo-membranous, and conſequently of the muſcular Parts of the whole Body, attended with an Abolition of the Senſes, and drawing its Origin from a ſpaſmodic Stricture of the Membranes ſurrounding the Brain, the ſpinal Marrow, and the Nerves; by which means the ſubtile nervous Fluid is copiouſly and impetuouſly convey'd into the Organs of Motion, but in a ſmaller Quantity, and with leſs Impetuoſity, into thoſe ſubſervient to the Purpoſes of Senſation.

The Progreſs and Symptoms of this Diſorder vary in different Patients: For ſometimes it ſeizes ſuddenly and unexpectedly; for which Reaſon it is, by the *Greeks*, call'd *Epilepſia*: But, more frequently, a certain Train of Symptoms precede, and indicate a Paroxyſm of it. The moſt conſiderable of theſe Symptoms are, a Wearineſs of the whole Body, an oppreſſive Pain of the Head, accompanied with a certain Perturbation of the Senſes, interrupted and unſound Sleep, unuſual Dread and Terror; together with the Ringing of the Ears. In ſome Patients the Heart begins to palpitate very ſtrongly, the Præcordia are inflated, Reſpiration is obſtructed, Rumbling is perceived in the Abdomen, fetid Stools are diſcharged, large Quantities of Urine evacuated, and the Joints rendered cold. Some Patients perceive a kind of cold Air, or Vapour, gradually aſcending from the Extremities to the Heat and Brain: Some, which is the Reaſon why this Diſorder is call'd *Morbus caducus*, or the Falling-ſickneſs, ſuddenly and unexpectedly drop down on the Ground; their Thumbs are ſo firmly brac'd up in the Palms of their Hands, that uncommon Force is neceſſary for their Extraction; their Eyes are ſo diſtorted and inverted, that no Part of them, except the White, can be ſeen; all Senſation is ſo totally deſtroy'd, that the Patient can neither be rous'd and brought to himſelf by the ſhrilleſt Cries, the moſt ſtimulating Odours, nor the ſmarteſt Pinching. A Froth burſts from the Mouth with a kind of hiſſing Noiſe, the Tongue is lacerated by the Teeth, and the Joints are ſeiz'd with a violent Trembling and Succuſſion. But both the Convulſions and Privations of the Senſes vary in Degree, as well as Species; for ſometimes, inſtead of the convulſive Motions, highly rigid Spaſms ſeize all the Members of the Body, to ſuch a Degree, that ſcarcely any Force is capable of bending them; and the Patient reſembles a firm and inflexible Statue of Wood. In Infants the Penis is erected, in young Men the Seed ejected, and the Urine frequently diſcharg'd to a conſiderable Diſtance. At laſt, theſe Symptoms, ſometimes at a ſhorter, and ſometimes in a longer Interval, gradually remit, and go off; but the Patients as yet complain of Pain, Liſtleſſneſs, Stuffing of the Head, and Wearineſs of the Joints. Among the Antients, *Cœlius Aurelianus* and *Aretæus* have been very diſtinct in enumerating the preceding Signs, the concomitant Symptoms, and the Conſequences, of this Diſorder. According to the former of theſe Authors, "There are two Species of Epilepſies, one "reſembling a deep and profound Sleep; and the other rend-"ing and diſtorting the Body in various Manners: But the "former of theſe is eſteem'd moſt dangerous, ſince it ap-"proaches to the Nature of an Apoplexy. A Complication "and Mixture of theſe may produce a third Species; for moſt "Patients, who are firſt afflicted with Diſtortions and Con-"tractions of the Body, are afterwards generally ſeiz'd with "an inſurmountable Drowſineſs. But a Knowledge of theſe "different Species of the Diſorder generally contributes no-"thing to its Cure. Thoſe who are inclin'd to this Diſorder, "or juſt about to fall into it, are ſeiz'd with all the common "Symptoms attending the other Diſorders, which draw their "Origin from a bad or injur'd State of the Meninges; ſuch "as a Stuffing of the Head, a Vertigo, a certain Noiſe per-"ceiv'd within the Cranium, an uneaſy Senſation in the Occi-"put, an Immobility of the Eyes, a Ringing of the Ears, or "Difficulty of Hearing, a Dimneſs of Sight, accompanied "with a Vertigo; or certain imaginary minute Objects re-"ſembling the Spots of Marble, and by the *Greeks* called "*Marmarygmata*, and *Marmarygmæ*, or like Spiders Webs, "or ſlender Clouds, or ſmall fluttering Inſects, ſuch as Gnats, "are perceiv'd to fluctuate and dance before the Eyes; or the "Patients obſerve ſmall Sparkles, or, as it were, fiery Circles, "vibrating before their Eyes. The Tongue, alſo, becomes "inflexible, a kind of ſubſultory Motion is perceiv'd in the "Tendons, and a Pain in the Shoulders, between the Scapu-"læ. Theſe Signs are ſucceeded by a Hardneſs of the Throat, "a continual Inflation of the Præcordia, a Yawning and "Sneezing, a Diſcharge of the Saliva; and either a Loathing "of Food, or an immoderate Appetite for it. Continual "Watchings, or long and unrefreſhing Sleeps, frightful "Dreams, and a ſmall, or totally obſtructed Evacuation of "the Fæces by Stool, an Erection of the Penis without "any manifeſt Cauſe, and a preternatural Inclination to Ve-"nery. Sometimes, alſo, the Seed is diſcharg'd during Sleep, "which the *Greeks* call ὀνειρογωνία. The Mind is anxious "and uneaſy, prone to Anger on the ſlighteſt Occaſions, for-"getful of Circumſtances almoſt immediately before tranſ-"acted, and ready to be clouded and overcaſt with the Im-"preſſions of Gloom and Melancholy. When the Diſorder "comes on, and has already ſeiz'd the Patient, there is a "Privation of the Senſes; and in ſome Patients the Paroxyſm "induces a perfect Immobility, accompanied with a Gaping "of the Mouth, a preternatural Paleneſs, a ſlow Reſpiration, "a large Pulſe, and a kind of Oppreſſion reſembling an in-"ſurmountable Drowſineſs. Other Patients have the Mem-"bers of their Bodies twiſted and thrown into various ſubſul-"tory Motions, whilſt, at the ſame time, their Countenance "and Eyes are ſtrangely diſtorted; and this Diſtortion, ſome-"times continuing after the Paroxyſm, renders the Patients "ſquint-ey'd. On the contrary, thoſe who are only ſeiz'd "with a ſlight and gentle Paroxyſm, ſeem to retain their na-"tural Sight; and the Acceſſion is ſucceeded by a Rattling in "the Throat, a Hiccup, a Redneſs of the Countenance, an "Inflation of the Veins, and ſometimes a Ceſſation of the "Pulſe and Reſpiration. The Patient ſeems to be favour'd "with a kind of Reſpite at certain Intervals, and the Eyelids "remain immoveable. The Teeth ſtrike and grind upon each "other, and the Tongue, hanging out of the Mouth, is fre-"quently cut by the Violence of their Colliſion. The Præ-"cordia are drawn upwards, the Fæces and Urine involun-"tarily diſcharg'd, and a dewy Sweat excited over all the "Body, which, on this Occaſion, is ſtiff and rigid. Some "Patients, during the Paroxyſm, emit a kind of faint and "inarticulate Sounds; and before its Remiſſion, diſcharge a "Froth from their Mouths and Noſtrils. When the Pa-"roxyſm ceaſes, the Patient is entirely ignorant of every "thing that happen'd during it; he rolls on the Ground, and "has his Countenance overcaſt with Horror and Sadneſs; "then he begins to yawn, ſtretch his Body, and, in doing "theſe, to make unuſual Efforts. He walks ſlowly, and his "whole Body has a ghaſtly and unſeemly Aſpect. His Eyes, "alſo, remain turbid and diſordered, and the Veins of his "Forehead diſtended and prominent. Some Patients, alſo, "ſeem affected with an Alienation of Mind to ſuch a Degree, "that they know not thoſe they were before well acquainted "with. At other times, after the Paroxyſm is over, many of "the antecedent Symptoms, above-enumerated, ſeize the Pa-"tient; ſuch as a Privation or Dimneſs of Sight, when he "ſets about any Buſineſs which requires a ſtooping Poſture of "the Body, looks at a Ship under Sail before a briſk Gale of "Wind, beholds the quick gyratory Motion of a Wheel, "views an impetuous Current of Water, looks up at a very "high Building, or the Eminence of a Rock, hears a ſudden "and ſhrill Noiſe, is expoſed to exceſſive Cold, uſes too hot "Baths, or has a ſtrong Impreſſion made upon the Organs of "Smell, either by fragrant or fetid Effluvia; ſuch as thoſe diſ-"fuſed by burning Storax, Frankincenſe, Bdellium, the La-"pis Gagates, Bitumen, or Hartſhorn. Sometimes the Pa-"roxyſms return at fix'd and ſtated Periods, whereas at others "they are irregular and anomalous, ſometimes returning at "longer Intervals, ſuch as a Year, for Inſtance, and at other "times frequently ſeizing the Patient more or leſs ſeverely, "each Month, or perhaps each Day. Some by their reſtleſs "and uneaſy State in the Night-time, and other antecedent "Signs, are rendered previouſly ſenſible of an approaching "Paroxyſm;

" Paroxyſm; whereas others are inſtantaneouſly ſeiz'd, with-
" out any previous Signs of their approaching Misfortune; a
" Circumſtance in conſequence of which they are expos'd to
" imminent Danger; for ſome, advertis'd of the approaching
" Fit by certain Signs, provide againſt it, by betaking them-
" ſelves to Houſes, and chooſing Places where they may ſafely,
" and without being expos'd, ſtruggle with the Shocks of their
" Calamity; whereas others, without being appris'd of their
" approaching Fate, are, by falling in public Places, at once
" expos'd to the Eyes of the World, and additional Degrees
" of Danger, which are not naturally connected with the Dif-
" order. Some, for Inſtance, fall in Rivers, or the Sea, or
" are indecently compel'd to diſcharge their Excrements in the
" public Baths: After the Remiſſion of one Paroxyſm, the
" Signs denouncing the Approach of another are thoſe by
" which the Acceſſion of the firſt were indicated, ſuch as
" diſturb'd and diſorderly Sleep; a Corruption of the Aliment
" without any ſenſible Cauſe; an Erection of the Penis with-
" out any apparent Reaſon; a preternatural Propenſity to
" Venery; an Emiſſion of the Seed during Sleep, which the
" *Greeks* call ὀνειρογονία· a Propenſity to Anger, Dejection
" of Mind, and the other Signs before-enumerated; as alſo
" Slowneſs and Reluctance to the Patient's uſual Buſineſs; an
" oppreſſive and drowſy-like Sadneſs of Countenance, which
" is now diſcolour'd, and preternaturally inflated, together
" with an unſeemly Aſpect of the Eyes, and a kind of down-
" caſt Look; for the Patient cannot, without Difficulty, look
" upwards; and, if he ſhould make an Attempt of this Kind,
" the State of his Eyes becomes ſo uneaſy, that he is forth-
" with obliged to turn them downwards. Upon every ſudden
" Turning of his Head to any Side, he is ſeiz'd with a Vertigo,
" a Trembling, a Torpor, a Contraction of his Fingers, and
" an uneaſy Senſation in his Legs, and in the Extremities of
" his Feet and Hands. When we have not an Opportunity of
" gaining that certain and irrefragable Knowledge of the Diſ-
" eaſe, which our being preſent at the Approach of a Paroxyſm
" would afford us, or when, in conſequence of Non-age, or
" any other Cauſe, the Patient cannot enumerate his Sym-
" ptoms, we may, from being inform'd of all or ſome of the
" above-mention'd Circumſtances, prognoſticate a Paroxyſm,
" gueſſing as nearly as we can at the particular Time of its
" Approach, ſince this Diſorder generally ſeizes the Patient
" at fix'd and ſtated Intervals. Epilepſies are more frequently
" incident to Children, eſpecially during Dentition, to Per-
" ſons in the firſt Stages of Life, or of a middle Age, than to
" thoſe pretty far advanced in Years. The Diſorder is alſo
" more ſevere upon Infants, than upon Children farther ad-
" vanc'd, and older Perſons; ſince the weak and languid
" Strength of the former is more unequal to the Shocks of
" this violent Diſeaſe. In young Women this Diſorder is ge-
" nerally carried off about the Time of Puberty, in conſe-
" quence of ſome happy Change of Temperament induced by
" the Eruption of the Menſes, or the Birth of their firſt Child.
" But, if this lucky Circumſtance ſhould not happen, the Diſ-
" order generally laſts during the Patient's Life, unleſs by the
" long and vigorous Efforts of Nature, or the diligent Exhibi-
" tion of powerful Medicines, it ſhould be happily routed and
" vanquiſh'd. Epilepſies ſeize at all Seaſons of the Year, but
" moſt generally in the Spring. Women, in conſequence of
" a Suffocation of the Uterus, are frequently afflicted with
" Symptoms reſembling thoſe of an Epilepſy; for they are, in
" the ſame manner with an epileptic Patient, depriv'd of their
" Senſes; and the only Circumſtance, which diſcriminates the
" one Diſorder from the other, is, that in a Suffocation of the
" Uterus, the Patient does not, towards the End of the Pa-
" roxyſm, diſcharge a frothy Matter from the Mouth and
" Noſtrils."

As this Account of the preceding, concomitant, and ſubſequent Symptoms of an Epilepſy, given by *Cælius Aurelianus*, in the fourth Chapter of his firſt Book of Chronical Diſeaſes, is ſo full and explicit, that ſcarce any thing can be added to it, we ſhall, without farther quoting *Aretæus*, or any other Author, proceed to give the Sentiments of *Hoffman*, from whom the firſt Part of this Article is taken.

The Paroxyſms of this Diſorder, which, according to the Diverſity of their productive Cauſes, are longer or ſhorter, fewer or more frequent, generally return at ſtated Periods, on certain Days, for Inſtance, Hours, or even Months, about the Changes and Quadratures of the Moon, eſpecially about the New and Full Moons. The Women are moſt commonly ſeiz'd with them about the Returns of their monthly Evacuations; and what deſerves our Attention is, that they are frequently excited by the ſlighteſt, and, ſeemingly, moſt inconſiderable Cauſes; ſuch as any ſudden Commotion of Mind, a Fright, a Sally of Paſſion, the tumultuous Workings of ſudden Joy; Meditation, or cloſe Application of Mind, intoxicating Liquors, exceſſive Heat or Cold, and the Uſe of Venery.

'Tis alſo to be remember'd, that no Period of Life is more ſubject to the Tyranny of this Diſorder, than that of Infancy; for which Reaſon 'tis, by ſome, call'd *Morbus Infantilis*, and *Puerilis*. Hence, 'tis obvious from daily Experience, that the far greater Part, if not Half of the Children yearly cut off, fall a Sacrifice to Convulſions, either excited by difficult Dentition, or produc'd by violent Gripes of the Inteſtines ariſing from bad and corrupted Milk, or a Retention of the Meconium. And, that almoſt all the Diſeaſes incident to Children, whether of the acute, or chronical Kind, eſpecially when complicated with Worms, are generally attended with convulſive and epileptic Motions, is ſufficiently obvious; as may appear in the Meaſles and Small-pox. Beſides, thoſe who are in the leaſt converſant in the Practice of Medicine, cannot fail to obſerve, that this terrible Diſorder is more frequently incident to ſuch Patients as are of a ſpongious, ſoft, and ſucculent Habit, or of a delicate Make, both with reſpect to Body and Mind, than to thoſe who are bleſs'd with a more hardy, vigorous, and robuſt Conſtitution. This is ſufficiently confirm'd by the Children of Country-people, who, during the Expulſion of the Small-pox, the Uſe of Milk, corrupted either by improper Aliments, or diſorderly Paſſions, or during the Eruption of their Teeth, are not, by far, ſo much ſubject to Epilepſies, as weak and tender Infants, delicately nurs'd and brought up in Towns and Cities.

No Diſeaſe is more palpably hereditary, or more readily convey'd from Parents to Children, than an Epilepſy. This is to be accounted for from the Parents conveying to their Children ſuch a Texture and Diſpoſition of the nervous and membraneous Parts, as is too delicate, and ſubject to anomalous and irregular Commotions. Nor are thoſe leſs expos'd to the Attacks of this Diſorder, who either naturally, or in conſequence of an improper and erroneous Regimen, have the Misfortune to have weak and infirm Heads, who are ſubject to Coryzas, Defluxions of the Eyes and Ears, Swellings of the Glands of the Neck, Achors, and ſcal'd Heads; or who, in the firſt Stages of their Lives, have been frequently ſubject to Hæmorrhages from the Noſe.

Theſe Things being premis'd, we now come to conſider the Cauſe and Seat of an Epilepſy. That the former of theſe is a certain Indiſpoſition of the Brain, is a Truth which no one has as yet call'd in Queſtion: But in what this Indiſpoſition conſiſts, or by what means it is produc'd, are, in my Opinion, Circumſtances which have not hitherto been ſufficiently explain'd and accounted for. Thoſe who love to cloke their Ignorance by a pretended Veneration for Religion, and Things ſacred, do not heſitate to call the Epilepſy, Τὸ θεῖον, ſomething of divine Original, not reflecting, in the mean time, that 'tis far from being fair and equitable, to make God the immediate Cauſe of an Effect, becauſe it, perhaps, cannot be eaſily comprehended, or accounted for from known and inconteſtable Principles. Others have recourſe to an intoxicating, narcotic, and ſtupefying Poiſon; others to a peculiar and ſpecific Ferment; others to an acrid Matter, ſtimulating the Nerves; and others to a preternatural exploſive Force of the animal Spirits acting upon the muſcular and nervous Fibres; whilſt others, neither deſirous nor capable of being underſtood, aſcribe the Cauſe of this Diſorder to the Fury of *Archæus*; and others, to a certain tumultuous and confus'd Motion of the vital Principle, or rational Soul. But theſe are the idle Figments of that deſpicable Claſs of Phyſicians, who, inſtead of the real Cauſes of a Diſorder, are content with certain vague and unintelligible Names, which neither diſcover its Nature, nor account for its ſeveral Symptoms. Thoſe, on the contrary, who go more rationally to work, and prefer ſuch Cauſes as are ſubjected to their Senſes, before unphiloſophical, and even unintelligible Conjectures, generally give their Suffrage to the Opinion of *Carolus Piſo*; who, as the true and genuine Cauſe of an Epilepſy, aſſigns a Collection of peccant Serum, which either obſtructs the Pores of the Brain, or prevents the due and equable Influx of the animal Spirits to thoſe Parts, into which, in a ſound and natural State, they ought to be convey'd.

But we, ſatisfied only with phyſico-mechanical Cauſes, derive the Source of an Epilepſy from an undue and unnatural Motion and Circulation of the Humours through the Veſſels of the Brain; for, as, when there is a free and equable Circulation of a laudable Blood through the Veſſels of the Brain, and conſequently a due Secretion and Diſtribution of a ſpirituous Lymph through the Nerves, all the animal Functions are regularly carried on; ſo, on the contrary, in every violent Diſorder of the Head, where Senſation, and voluntary Motion, are conſiderably injur'd, as in an Epilepſy they manifeſtly are, we may reaſonably conclude, that the Circulation of the Blood through the Head is not carried on in a free, natural, and uninterrupted manner. This was long ago obſerv'd by *Hippocrates*, who, in his Book *de Flatibus*, uſes the following Words: " The Epilepſy is produced, when various Kinds of Obſtructions
" happen in the Veins, and ſo intercept the Motion of the
" Blood, that in ſome Parts it ſtands ſtill, enters others ſlowly,
" and others more quickly; and this undue and unequable
" Conveyance of the Blood of courſe affects the whole Body."
This Doctrine of *Hippocrates*, now the Circulation of the Blood, which is the principal Baſis and Foundation of Medi-

cine,

cine, is diſcover'd, ſufficiently accounts for the Cauſe and Origin of an Epilepſy.

But ſince the Circulation of the Blood through the Head and Brain is of a peculiar Nature, and differs from that carried on in the other Parts, we ſhall inquire a little more narrowly into it, that, by this means, the Ætiology of an Epilepſy may be the more diſtinct and comprehenſible. Firſt, then, we muſt conſider, that, as ſoon as the Arteries enter the Head, they loſe their ſtronger Coat, and, conſiſting only of a thin Membrane, deſtitute of Senſation and Motion, are diſtributed through the internal cortical Subſtance both of the Cerebrum and Cerebellum, in order to ſeparate that ſpirituous Lymph, which is neceſſary for the ſeveral Purpoſes of Motion, and which, for that End, is convey'd to the Nerves, and the nervous Membranes; whilſt, at the ſame time, the Blood left diſperſed thro' the venous Sinuſes in the *Dura Mater*, is, by means of the jugular Veins, carried back to the Heart, the original Source of the circulating Motion of the Fluids. We muſt alſo carefully advert to the ſingular Structure of the *Dura Mater*, which is compoſed of a peculiar Apparatus of nervous and muſcular Fibres; the latter of which are diſtributed both in direct and oblique Lines, and are found more incurvated and circular about the lateral Sinuſes; whereas the former, being nervous and fleſhy, are found to run like ſo many Columns or Pillars, from the one Side to the other of the three large Sinuſes, when diſſected, where we alſo obſerve oval Cellulæ, diſpoſed according to the Direction of the Veins which enter them. Theſe Fibres not only hinder the Sinuſes from being too much dilated by the influent Blood, but alſo, by producing a ſucceſſive and alternate Contraction in them, render the Progreſs of the Blood to the jugular Veins more quick and expeditious. The Office, on the other hand, of the Columns or Pillars, is, the better to attenuate and divide the returning Blood, which is ſomewhat thick, in conſequence of its being deſtitute of the ſubtile Lymph. And, laſtly, the oval Cellulæ are like ſo many Valves, which hinder the Blood, once diſcharg'd, from returning into the ſame Veſſels. This peculiar and remarkably curious Structure of the venous Sinuſes ſufficiently demonſtrates, that, in order to promote the Circulation of the Blood to the Heart, they are furniſh'd with a kind of ſyſtaltic and diaſtaltic Motion, not unlike to thoſe of the Arteries or Auricles of the Heart.

Beſides this peculiar Motion of the venous Sinuſes, there is alſo a tonic, or rather elaſtic, Motion to be aſcribed to the *Dura Mater*, and which is found in all the other nerveo-muſcular Parts of the Body, which are animated by an Influx of the nervous and arterial Fluids; for the dilatatory and contractile Motion of the *Dura Mater*, which covers, ſurrounds, and embraces, not only the Brain and Cerebellum, but alſo the ſpinal Marrow, and all the Nerves of the Body, contributes not a little, both to the Circulation of the Blood through the Head, and the better Secretion of the ſpirituous Fluid undulating in the Nerves; for when, by the Pulſation of the Arteries, this elaſtic Membrane of the Brain is elevated and expanded, the ſmall Cavities of the Nerves are by that means render'd more fit for receiving the ſubtile nervous Fluid. But when, after the Expanſion of this Membrane, it, by its own Elaſticity, which is increaſed by the Afflux of the arterial Blood from three conſiderable Ramifications, that is, the internal and external Carotids, and from the vertebral Artery, as alſo by the Influx of the nervous Fluid, again contracts itſelf, it in ſome meaſure compreſſes the cortical Subſtance of the Brain; by which the fine nervous Fluid is the more effectually forced out of it, to the medullary Subſtance, and Beginnings of the Nerves. When, therefore, theſe reciprocal ſyſtaltic and diaſtaltic Motions of the *Dura Mater*, and its larger Sinuſes, are duly perform'd, the Circulation of the Blood through the Head, and the Functions depending upon it, are excellently carried on; whereas, when theſe ſeveral Motions are diſordered and irregular, very terrible Diſeaſes of the Head are produced. Theſe Things are more fully explained by *Baglivi*, who firſt introduced the Nature and Motion of the Solids into Pathology. *Lib.* 1. *de Fibra Motrice.*

If therefore a thick Blood, or too large a Quantity of Blood, ſhould happen to ſtagnate in the Sinuſes of the *Dura Mater*, its ſyſtaltic Motion, and the Regreſs of the Blood to the Heart, depending upon it, is by that means eaſily hinder'd; and hence there is in that Part ſo large a Congeſtion of Blood conveyed by the Arteries, that the highly fine and ethereal Particles can no longer enter the ſmall Veſſels of the Brain and Nerves, but only ſuch Particles as are coarſe, aqueous, aereo-elaſtic, more expanſive, and have a Tendency to produce an incredible Diſorder in the Powers of Senſation and Motion. By this Blood, alſo, ſtagnating in the Sinuſes of the *Dura Mater*, and jugular Veins, the Veſſels are too much dilated: Hence the nervous Fibres are compreſs'd, and a ſpaſmodic Stricture induced on the *Dura Mater*, which is a nervous Membrane; and this ſpaſmodic Stricture is the immediate and principal Cauſe of an Epilepſy; for it is of ſuch a Nature, as to compreſs too violently the ſmall arterial Veſſels of the *Pia Mater*, and the cortical Subſtance of the Brain: Hence, without the Influence of the Will, the ſubtile Fluid contain'd in them is copiouſly, and with a ſtrong Impetus, forc'd into the Brain, and Cavities of the Nerves. But ſince, according to the Opinion of almoſt all Anatomiſts, the *Dura Mater* is the Root and Source of all the Membranes, it muſt neceſſarily have a near Connection with them, and a mutual Communication of irregular and inordinate Motions. But becauſe, by this ſpaſmodic Stricture of the *Dura Mater*, the Nerves ſubſervient to Senſation are ſo conſtricted, as almoſt totally to intercept the Influx of the nervous Fluid, by this means it happens, that in a perfect Epilepſy there is a Ceſſation of all the Senſes both internal and external; on the contrary, the Influx of the fine and highly moveable nervous Fluid into the Parts ſubſervient to Motion is render'd ſtronger, and more violent; and hence ariſes that terrible Diſtention, Contraction, Succuſſion, and Agitation of the Joints and Muſcles. Beſides, 'tis certain, that the eighth Pair of Nerves, call'd alſo the *Par vagum*, diſtributes its Branches to the principal Viſcera, and nervous Parts, ſubſervient to the Purpoſes of Senſation and Motion; into which Branches whilſt the nervous Fluid flows with a more violent Impetus, theſe Parts are, under the Paroxyſm, drawn into Conſent, and partake of the preternatural and violent Commotions. Hence the Heart is ſeiz'd with a Palpitation; the Pulſe becomes quick and unequal; Reſpiration is laborious, and accompanied with a Stertor; Saliva is diſcharged from the Mouth; the Patient loſes the Uſe of his Speech; and Rumblings and Murmurs are perceived in the Inteſtines.

From what has been ſaid, 'tis ſufficiently obvious, that the immediate Cauſe of every Epilepſy is a Stricture of that Membrane which ſurrounds the Brain, the ſpinal Marrow, and the Nerves. But as the more remote and ſecondary Cauſes which induce this Stricture, and render the Circulation of the Humours through the Head and Brain diſorderly and irregular, are very various, ſo there ariſe hence different Species and Denominations of epileptic Fits. Hence we are enabled to comprehend the Difference between an idiopathic and ſymptomatic Epilepſy; for, when the Cauſes are lodg'd within the Brain itſelf, it is call'd an idiopathic Epilepſy; whereas, when its Cauſes ariſe from any Fault of other Parts transfer'd to the Head, it is call'd a ſymptomatic Epilepſy.

An Epilepſy of the idiopathic Kind moſt frequently ariſes from external Violence; for 'tis well known by Phyſicians and Surgeons, that violent, and ſometimes mortal, Epilepſies are brought on by ſevere Wounds, Fractures, Blows, and Depreſſions of the Cranium. Theſe are generally preceded by a Pain of the Head, and a Torpor of the Senſes; and, after the Patient's Death, either corrupted Blood or Serum is found ſtagnating between the *Dura* and the *Pia Mater*, or between the Cranium and the *Dura Mater*; or Splinters are found impacted in the *Dura Mater*. It alſo frequently happens, that a chronical Epilepſy, returning at certain ſtated Periods, is excited by acute bony Protuberances, ariſing internally in the Baſis of the Cranium, and ſometimes in the lateral or falciform Sinus. Though this Species of Epilepſy is abſolutely incurable, yet by prudent Meaſures the Brain may be ſo diſpos'd, and put into ſuch a State and Condition, that its Preſſure on theſe Protuberances may not be ſo great as to produce an Epileptic Fit.

Among the Cauſes of an idiopathic and mortal Epilepſy, we may juſtly reckon an Obſtruction of the jugular Veins, or of the Sinuſes of the *Dura Mater*, eſpecially of the falciform Sinus, ariſing from a viſcid Blood, or polypoſe Concretions. Three Inſtances of this Kind have occur'd to me in the Courſe of my Experience; and many more may be ſeen in *Bonetus's Sepulchretum Anatomicum*. Of this Kind alſo is the Caſe related by *Sponius*, *in Aphor. Lib.* 2. 19. in which the Patient firſt became drowſy, then epileptic, and then died. Upon opening his Cranium, the various Ramifications of the jugular Veins were found ſo obſtructed with a viſcid and tartareous Matter, that they ſeem'd, as it were, to be ſtuff'd with Plaiſter. Beſides, there was a certain Quantity of Blood extravaſated in the Ventricles of the Brain. When, alſo, an Epilepſy is complicated with acute Diſorders of the Head, ſuch as a Phrenitis, or with thoſe of a chronical Nature, ſuch as Madneſs and Melancholy, thoſe Infarctions of the Veſſels, by a thick Blood, are found in the Patients after Death. But this Species of Epilepſy is, in my Opinion, juſtly to be eſteem'd of the idiopathic Kind.

Beſides, the Paſſions of the Mind, eſpecially Anger and Dread, contribute very conſiderably to the Production of an idiopathic Epilepſy; for theſe act immediately and directly on the nervous and membranous Parts of the Body, either by conſtricting them too powerfully, or dilating them preternaturally; by which means they diſturb all the Motions ſubſervient to the Preſervation of Life and Health. But 'tis pretty ſurpriſing, that violent Paſſions of the Mind ſhould alſo convey their Influence to the fluid Parts of the Body. This is ſufficiently obvious from the Inſtance of Nurſes, who, if they happen to give the Breaſt to Children, immediately after an exceſſive Fit of Paſſion or Dread, ſoon after render

render them epileptic by that very means. 'Tis alſo no uncommon thing for Children, whoſe Mothers, when pregnant with them, indulg'd themſelves in the moſt violent Commotions of Mind, to become ſubject to epileptic Fits in their Infancy. Among practical Authors, Inſtances every-where occur, of ſome Perſons, who, by the Dread and Terror excited by the Aſpect of epileptic Patients, have been ſeiz'd with the like Diſorder. It may alſo be confirm'd, by ſeveral memorable Inſtances, that a ſtrong Propenſity to Venery, ariſing from a Redundance of Seed, and ſuppreſſed from a Principle of Chaſtity, has brought on an Epilepſy: 'Tis alſo certain, that Women, otherwiſe chaſte and modeſt, have been ſeized with this Misfortune, in conſequence of a ſtrong and ardent Love; in which Caſe, Marriage is the ſureſt and moſt effectual Remedy, both with a prophylactic and curative Intention.

In cachectic and hypochondriacal Patients, or thoſe whoſe Stomach and Inteſtines are diſtended with Flatulences, ſpaſmodically conſtricted, or have their periſtaltic Motions, together with their Secretions and Excretions, impair'd and injur'd, an Epilepſy frequently ariſes from a too copious and impetuous Tranſlation of an impure and ſerous Blood to the Head; for when we inquire into the antecedent Cauſes, not only of an Epilepſy, but alſo of all violent and inveterate Diſorders of the Brain, we generally find the Patients labouring under them, to be either hypochondriacal, ſubject to the Hæmorrhoids, melancholic, or cachectic; for 'tis certain, both from Experience, and the Obſervations of good Authors, that the Evacuations by the hæmorrhoidal Veins in Men, and the Menſes in Women, when either too ſcanty or immoderate, lay a Foundation for this Diſorder; in which Caſe, it is juſtly call'd a ſymptomatic Epilepſy, either of the ſerous, hypochondriac, or cachectic Kind; and, like other Diſorders ariſing from Spaſms of the *Primæ Viæ*, returns at certain fixed and ſtated Periods.

But this Species of ſymptomatic Epilepſy ariſes not only from a large Quantity of viſcid Blood or Serum ſtagnating in the Veſſels, obſtructing them, and by that means preventing the due Circulation of the Humours; but alſo from an impure, acrid, and cauſtic Matter, convey'd to the *Dura Mater*, by means of the ſerous arterial Blood, and ſtimulating the nervous Fibres, and adjacent Parts, to ſpaſmodic Conſtrictions. This Accident happens in chronical as well as acute Diſorders. 'Tis well known, that ſuch an acrid and corrupted Serum, firmly adhering to the *Dura Mater*, in exanthematous and petechial Fevers, Small-pox, Meaſles, and purple Fever, either before the Eruption of the Spots, or upon their Retroceſſion, frequently induces an Epilepſy, which is generally fatal. 'Tis alſo confirm'd, by numberleſs Obſervations, that an Epilepſy may be produced by conſolidating old and inveterate Ulcers, repelling the Itch, cutaneous Eruptions, Achors, and ſcal'd Heads, ſince, by ſuch a prepoſterous Practice, the vitious and peccant Matter is driven inwards.

There is alſo another Species of Epilepſy, call'd Sympathetic, and which ariſes from violent Pains and Spaſms of other nervous Parts, propagated and conveyed to the *Dura Mater*, in conſequence of the Conſent between the latter and the former; for Children are frequently ſeized with an Epilepſy on account of a difficult Dentition; and ſevere Tooth-achs, in tender and delicate Patients, ſometimes bring on Epilepſies. 'Tis alſo well known, that Epilepſies are ſometimes produced by violent Spaſms of the Stomach, eſpecially ſuch as are excited by cauſtic Poiſons, the imprudent Uſe of Emetics and Purgatives, or immoderate Anger; for the Cauſe of ſuch a periodic and chronical Epilepſy is often ſeated in the Stomach or Duodenum, in which the Bile and Saliva, being corrupted by a preternatural Fermentation, are, at ſtated Periods, thrown into violent Commotions, and excite, firſt, a Cardialgia, attended with Faintings, and then by Conſent an Epilepſy; which, in this Caſe, is generally habitual to the Patient. That an Epilepſy may alſo accompany violent Pains and Spaſms of the Ileum or Colon, is ſufficiently certain from the Caſe of ſucking Children, who are frequently afflicted with this Misfortune, in conſequence of an acid and corrupted Milk, which corrodes the Membranes of their Inteſtines, and tinges their Excrements with a greeniſh Colour. Beſides, there are a great many Inſtances of Epilepſies produced, even in Perſons well advanced in Years, by the Pains ariſing from Stones ſticking in the Ureters, or Entrance of the Bladder; and this Species of the Diſorder may be juſtly call'd a nephritic Epilepſy. In Child-bed Women alſo, in conſequence of ſome Fault of the Uterus, or a Retention of the Lochia, and, in others, on account of a Defect in the Menſes, firſt, violent Spaſms of the Inteſtines, and adjacent Parts, are obſerv'd to happen; and then an Epilepſy, which is diſtinguiſh'd from the other Species of this Diſorder by the Epithet *Hyſteric*. Nothing is alſo more common than the Production of an Epilepſy, accompanied with terrible Diſtortions, eſpecially in Children, by Worms either corroding the nervous Coats of the Inteſtines, or, if dead, ſtimulating them by their ſubtile and putrid Exhalations. This Species may, for the ſake of Diſtinction, be call'd the verminous Epilepſy. Beſides, that the Diſorder of which we now treat, may be produced by the Bite of a mad Dog, is ſufficiently certain from the Obſervations of practical Authors.

Among the more remote and ſecondary Cauſes of an Epilepſy, we may almoſt reckon every thing which has a Tendency to impair the Strength and Tone of the nervous and membranous Fibres, or weaken the elaſtic Force of the Veſſels; for, though the immediate and formal Cauſe of an Epilepſy conſiſts rather in a ſpaſmodic Stricture, than a Privation of Tone in the Parts, yet, ſince, by the Laws of Motion peculiar to the human Body, Conſtrictions and Spaſms are ſucceeded by a Privation of Tone in the Parts, and a ſubſequent Congeſtion of Humours; and this Congeſtion is again productive of Spaſms; 'tis not to be wonder'd at, if ſuch Cauſes, as impair and diminiſh the Tone and Strength of the Parts, ſhould greatly contribute to the Production of ſpaſmodic Strictures, and the more frequent Returns of the Paroxyſms. Among the Cauſes of this Kind, we may reckon, among the Non-naturals, a vapid Air, eſpecially impregnated with the noxious Steam of Coals; ſleeping in low and too cloſe Chambers; uſing ſuch Aliments as generate Flatulences, and ſtuff the Head with Vapours; ſuch as all the Species of Garlicks, Onions, and Smallage, Summer Fruits, and all ſweet fermentable Subſtances; the immoderate Uſe of Wines, eſpecially ſuch whoſe Fermentation is not finiſh'd, or which are impregnated with the Steam of Sulphur; the Drinking of thick Ales, ſtrongly hopt, and eſpecially to ſuch Exceſs, as to produce Intoxication and Crapulas. Among the medicinal Subſtances, Narcotics, Opiates, and ſtrong-ſcented Subſtances, contribute conſiderably to the Production of this Diſorder. To theſe we may, alſo, add immoderate Hæmorrhages, whether from the Noſe, the Veſſels of the Uterus, or the Anus, ſince theſe remarkably impair the Strength of the Parts, and conſequently fill the Body with a large Quantity of ſerous and recrementitious Particles. An immoderate Uſe of Venery in the firſt Stages of Life, long-continued Sadneſs, cloſe Study, an intenſe Application of the Mind to ſerious and important Subjects, greatly contribute to the Production of this Diſorder, in conſequence of the Weakneſs they induce on the nervous Syſtem. I remember to have ſeen a young Man, who, upon fatiguing his Genius or Memory too much, was forthwith ſeized with a kind of ſlight Epilepſy, a Palpitation of the Heart, a Diſtraction and Ecſtaſy of the Spirits; whereas he was always in an eaſy and healthy State, when he did not apply to his Studies.

But, waving any farther Inveſtigation of the Cauſes, we now come to conſider the Prognoſtics of an Epilepſy. 'Tis, therefore, confirm'd by the Experience of *Hippocrates*, as related in the twenty-eighth Aphoriſm of the third Section, that in Boys this Diſeaſe is determin'd about the ſeventh Year of their Age; or about the fourteenth, or ſeventeenth, which are the Years of Puberty; and in Girls about the Eruption of their Menſes, which is the fourteenth Year of their Age, and productive of a very conſiderable Change in the animal Œconomy. 'Tis alſo certain, from various Obſervations, that chronical Epilepſies have been ſpontaneouſly cur'd, not only by a Change of Age, but alſo by a Change of Places, Diet, and Regimen, without the Aſſiſtance of Medicines or Phyſicians. Thus *Hippocrates*, in *Aph.* 45. *Sect.* 2. juſtly obſerves, that, if young Perſons are freed from the Epilepſy, it depends principally upon the Change of Air, Climates, and Regimen. It alſo happens, that, upon the Approach of a quartan Fever, convulſive and epileptic Fits, as well as ſome other terrible Diſorders, are totally removed, as *Hippocrates* has juſtly obſerved in *Aph.* 70. *Sect.* 4. as alſo in *Epidem. Lib.* 6. *Sect.* 16. for, when intermittent Fevers are duly managed, they free the Body from its Load of peccant Humours, and render it more pure and dry; which Effect ought alſo to be produced by proper and well-choſen Remedies. 'Tis alſo well known, that by an Eruption of the Itch, Ulcers, and Exanthemata, as alſo of the Meaſles, Small-pox, and purple Fever, the Epilepſy remits, and is ſometimes totally removed. All Hopes of Cure are not, therefore, to be laid aſide, when the Diſorder is not inveterate, when its Fits are not long, when it is not hereditary, and when the Patient is but very young; or when it ariſes from a Fault of the *Primæ Viæ*, Worms, a bad Regimen, or an ill-cur'd ſubcutaneous Diſorder. Neither is the Cure to be deſpair'd of, if the Degree of the Epilepſy is but ſlight; if the Patient is previouſly ſenſible of an approaching Fit, by a Cold which riſes gradually from his Feet to his Back, Præcordia, and Head, and when it is preceded by Uneaſineſs, Loſs of Strength, and a Propenſity to vomit; or when, under the Paroxyſm, the Senſes are not entirely aboliſhed, but only impair'd; or, laſtly, when the Diſorder ſeizes in the Night-time, without the Clenching of the Thumbs.

On the contrary, 'tis certain from Experience, that an hereditary Epilepſy, though treated with the moſt proper and beſt-choſen Remedies, is very difficult to be cured; nor is there a ſmall Difficulty to be ſurmounted in the Cure of an Epilepſy which is habitual and chronical, which has laſted for many Years, and by long and frequent Paroxyſms enervated the

Body, and, as it were, chang'd the Conformation of the Veſſels and Membranes of the Brain. But that Epilepſy terminates leſs happily, which is not remov'd about the Years of Puberty; or, in Women, about the Eruption of the Menſes; as alſo that which appears after theſe Years, or even after the twenty-firſt Year of the Patient's Age; for then it, for the moſt part, diſcovers ſome hereditary Taint. Thus *Hippocrates*, in his Book *de Morbo Sacro*, informs us, "that few Patients, "after the twenty-firſt Year of their Age, are ſeized with an "Epilepſy, unleſs that Misfortune ſhould happen to be here-"ditary to them." 'Tis a bad Sign, when the Paroxyſms become more frequent than uſual; for, by this means, the animal Functions are often ſo deſtroy'd, that the Memory, Genius, and Judgment, are not only impair'd, but alſo Stupidity and Folly produc'd. 'Tis a bad Sign, when an Epilepſy terminates in Blindneſs, Folly, or Loſs of Memory; but 'tis abſolutely fatal and mortal, when it terminates in a Palſy, or degenerates into an Apoplexy. And, upon diſſecting Patients who have died in this manner, Blood, or more frequently Serum, is found extravaſated and corrupted in the Ventricles, or Baſe of the Brain. But this Circumſtance is falſely aſſign'd as the Cauſe of the Epilepſy. There are but faint Hopes to be entertain'd of the Patient's Recovery, when, in the Height of an acute Fever, a Phrenitis, Petechiæ, Meaſles, or Small-pox, he is ſeized with epileptic Fits. Nor are the Epilepſies of Children, ariſing from difficult Dentition, or Gripes of the Inteſtines, free from Danger, when they afflict the Patient without Intermiſſion. Nor is it an uncommon Thing for an hereditary, idiopathic, and inveterate Epilepſy, to degenerate into Melancholy, Madneſs, and Folly; eſpecially if the Patient uſes an improper Regimen, or indulges himſelf in the exorbitant Tranſports of Paſſion.

The CURE.

In attempting the Cure of the Epilepſy, our firſt Intention muſt be to correct, and expel from the Body, the remote material Cauſes of the Diſorder. Secondly, we muſt endeavour to mitigate and allay the violent Spaſms of the Dura Mater, and nervous Parts. This laſt Intention is principally anſwered by Medicines of two Kinds; that is, by thoſe of a ſedative, and thoſe of a corroborative Nature. The former check and allay the fierce and impetuous Motions of the Fluids; whereas the latter excellently contribute, not only to remove the Weakneſs, and Want of Tone, left by the Violence of the Spaſms, and which lay a Foundation for future Paroxyſms; but alſo to reſtore the due Tone, and natural Elaſticity, of the Parts.

Sedative Medicines are ſuch as, by their Steams and Exhalations of a mild ſulphureous Nature, check the exorbitant Motions of the nervous Fluid. Of this Kind, in the vegetable Kingdom, are Herbs and Flowers moderately fragrant, and Waters diſtilled from them; ſuch as the Waters of Meadow-ſweet, Baum, Sage, Baſilicon, Cowſlips, Lilies of the Valley, white Lilies, Roſes, Limes, Egyptian-thorn, Piony, Orange-flowers, Citron-flowers, the Roots of Piony and Valerian; as alſo, the Waters diſtilled from the Stones of Cherries, Peaches, and Prunes. To this Claſs, alſo, belong Saffron, Poppy-flowers in form of an Extract, the Seeds of Club-moſs, and white Poppies; and, among aromatic Subſtances, Nutmegs. In the Animal Kingdom, the moſt celebrated Medicines of the antiepileptic Kind, are ſuch as prove highly friendly to the Nerves, by certain ſubtile, temperate, and ſulphureous Exhalations. Of this Kind, among the harder Subſtances, are the Shavings of the Teeth of the Sea-horſe, of Ivory, Hartſhorn, the Bone found in the Head of the Sea-cow, called Manati, the true Unicorn, the human Cranium, and the Ancle-bone of the Hare; but theſe muſt be recent, otherwiſe they will be of little Efficacy. To this Claſs, alſo, belong Preparations of the Viſcera, and ſofter Parts, of Animals, moderately dried, and reduced to a Powder. Of this Kind are Earth-worms, Caſtor, human Secundines, the Blood of a healthy Perſon moderately dried, the Hearts and Livers of Frogs and Moles, the Powder of Swallows, and, eſpecially, the Fœtus of a Hare cut out of its Mother's Belly, and dried. Theſe Subſtances, by their grateful ſulphureous Exhalations, have a happy Influence on the nervous Parts, and check their exorbitant and irregular Motions. Among chymical Medicines, I can, from Experience, recommend, above all others, the Spiritus Nitri Dulcis, duly prepared; or, rather, the Anodyne Mineral Liquor.

Theſe are the principal Ingredients of the ſpecific antiepileptic Powders, which may commodiouſly be mixed with Abſorbents. Among the celebrated Powders of this Kind, the Draco Figens, which *Dolæus*, in his *Encyclop. Med.* affirms he has found ſucceſsful in a thouſand Inſtances, deſerves our Regard and Attention. It is prepared thus:

Take of Nutmegs, a Dram and an half; of the Aſhes of Moles, two Drams; three Ancle-bones of the Hare; of the Powder of Carduus Benedictus, four Scruples; of Elk's Hoof, white Amber, Miſleto, each two Scruples and an half; of prepared Pearls, one Dram; of calcined Hartſhorn, half a Dram; of the true Unicorn, one Scruple; of human Cranium, three Drams; of Piony-ſeeds, one Dram and an half; of Sugar-candy, two Ounces; and of Leaf-gold, a ſufficient Quantity: Make into a fine Powder; the Doſe of which may be half a Dram, or four Scruples.

The *Pulvis Epilepticus Anodynus* of Dr. *Weiſmann*, a Phyſician of *Windſheim*, is thought to be poſſeſſed of no leſs Efficacy; and is prepared in the following Manner:

Take of uncalcin'd Elk's Horn, Shavings of Elk's Hoof, Tooth of the Sea-horſe, the true Unicorn, the Lapis Manati [a Bone found in the Head of the Sea-cow], red Coral, white Amber, common Cryſtal, Emerald-ſtone, Powder of Earth-worms, the Spines of Eel-pouts, the Sulphur vegetabile Corallinum, or the Seeds of Club-moſs, and oriental Pearls, each one Dram; of native Cinnabar, two Drams; of the Theriaca cœleſtis, one Scruple; and of the Powder of Caſtor, half a Scruple: Reduce all to a Powder; a Doſe of which is to be exhibited, either in the Water of Lime-flowers, Lilies of the Valley, black Cherries, Piony, Swallows with Caſtor, or the Aqua Epileptica of *Langius*.

I frequently, ſays *Hoffman*, preſcribe an antiepileptic Specific, much of the ſame Nature; by means of which, if duly and regularly uſed, I have ſeen ſingularly happy Effects produced in chronical Epilepſies.

Among the antiepileptic Corroboratives, the moſt efficacious of the vegetable Kind are the Flowers of Lavender and Spike; the Herbs Baum, Roſemary, Rue, and Marjoram; Amber, Aloes-wood, yellow Sanders, Cardamoms, and Cloves; together with the Oils, Eſſences, Decoctions, Balſams, and Liniments, prepared from them. Among compound Medicines, the Aqua Epileptica of *Langius*, the Water of Swallows, the Balſam of Life, and ſome others of a like Nature. But in Epilepſies Ambergriſe is preferable to all other antiepileptic Medicines, both on account of its ſedative and corroborating Qualities. The Spirit of Hartſhorn, or of Ivory, either ſimple or ſuccinated; the Spiritus Buſſii; and the Oil of Hartſhorn, or of Ivory, reduced to the greateſt Purity by Rectifications, are, alſo, ſingularly efficacious. Decoctions of the Woods, eſpecially Guaiacum, Saſſafras, and Sanders, are far from being deſpicable Remedies, in Caſes of this Nature, on account of the reſinous Principle they contain. The Uſe of theſe, in epileptic Diſorders, was long ago celebrated among Practitioners. Thus *Alphonſus Ferrius* and *Jachinus* inform us, that they have known many epileptic Patients cured by taking ſix or eight Ounces of the Decoction of Guaiacum, twice a Day; uſing, at the ſame time, a weaker Decoction of the ſame for ordinary Drink: And theſe Decoctions are ſtill more efficacious, if Piony-root, or any other antiepileptic Specifics, are added to them. The Uſe of them, according to theſe Authors, is to be perſiſted in for thirty or forty Days, adding a few Drops of Spirit of Vitriol to each Doſe.

Medicines which are calculated for ſtrengthening the Nerves, and reſtoring the Tone of the Parts, are, alſo, of ſingular Service, when applied externally. Thus, Powders prepared of the Herb Marjoram, the Flowers of Lilies of the Valley, and Spike, Marum, Amber, Powder of Cloves, Benjamin, and Nutmeg, I have often found, ſays *Hoffman*, to be of ſingular Service; ſince, beſides their nervous Quality, they alſo incide the thick and viſcid Humours. Hence the Snuffing them up the Noſtrils excellently contributes to the Colliquation of the tenacious Phlegm. The Medicines above-mentioned, eſpecially in Habits abounding with Serum, or ſuch as are inclined to a Cachexy, and in chronical Epilepſies, are, if duly and properly exhibited, of ſingular Efficacy; both for the Purpoſes of Prevention and Cure.

But, before they are exhibited, it is neceſſary the material Cauſes ſupporting the Diſorder ſhould, as much as poſſible, be removed. For this Reaſon, if the Epilepſy proceeds from a Collection of Blood, ſtagnating and pent up in the Veſſels and Membranes of the Brain; and if, by this means, the Veſſels are rendered turgid with Blood; or that Fluid too impetuouſly conveyed to the Head, which frequently happens in hypochondriac and melancholic Patients, as alſo in Women who are either pregnant or hyſteric; then Veneſections, and Revulſions of the Blood from the Head, eſpecially by opening the Veins of the Ancles; as alſo the Application of Leeches to the Veins of the Anus, are not only uſeful, but abſolutely neceſſary. In this Piece of Practice the moſt ſkilful, both of the antient and modern Phyſicians, agree; among whom the Reader may conſult *Galen, de Curatione per Sanguinis Miſſionem*, *Hieronymus Mercurialis*, *Zacutus Luſitanus*, *Lib.* 1. *de Med. Princip. Hiſt.* *Celſus*, *Rhaſes*, *Schenkius*, *Lib.* 1. *Obſ.* 3. *Rhodius Cent.* 1. *Obſ.* 64, 65. as alſo *Sylvaticus*, *Cent.* 1. *Conſ.* 45. who,

who, for the ſake of Revulſion and Derivation, orders four Ounces of Blood to be taken, twice a Month, from the Veins of the Anus. Sometimes it is, alſo, proper to open the external Jugular Veins, in order to procure a freer Diſcharge and Motion to the Blood, ſtagnating in the Sinuſes of the Dura Mater. Thus, in the *Ephemerides Nat. curioſ. Dec.* 1. *An.* 1. *Obſ.* 244. we have an Inſtance of an Epilepſy cured by opening the jugular Veins. Nor is it an uſeleſs Piece of Practice to apply Cuppings, with Scarification, to the Neck, and Parts contiguous to the Head; provided, if there is too large a Quantity of Blood in the Veſſels, it is previouſly drawn to the inferior Parts by Veneſection.

But a quite different Method of Cure becomes proper and requiſite, when the Diſorder ariſes from an impure Serum lodg'd in the Veſſels and Membranes of the Head, which frequently happens in cachectic and ſcorbutic Patients, by a prepoſterous Cure of œdematous Tumors of the Feet, by a too ſpeedy Conſolidation of old Ulcers or Fontanels, by a Repulſion of the Itch, or ſcal'd Head, or by an imprudent Cutting of the Hairs in that Diſorder called the Plica Polonica. In this Caſe, the moſt important Intention of Cure conſiſts in the Diſcuſſion, Evacuation, and Derivation of the impure Serum to other Parts. With this View, beſides thoſe Medicines which evacuate Serum by Stool, and purify the corrupted Humours, the Antients, as well as the Moderns, have, for eliminating the vitious Matters, recommended Setons, Fontanels, Cauteries, and Veſicatories. See *Hippocrates*, *de Morbo Sacro*, *Tulpius*, *Lib.* 1. *Cap.* 8. Thus, by *Victor Trincavelius*, we are informed, that a Man, of fifty Years of Age, was cured of an Epilepſy by the Eruption of filthy and malignant Eruptions over all his Body. And *Willis*, in the third Chapter of his Book, *De Morb. Convulſivis*, informs us, that an epileptic Girl, falling headlong into the Fire, and, by that means, having her Head accidentally cauterized, was free from her Diſorder, ſo long as the Ulcers, remaining uncured, diſcharged a Sanies; but that the Epilepſy returned, when theſe were conſolidated.

When, in conſequence of an Indulgence in violent Paſſions, eſpecially Anger, an acrid, bilious, cauſtic, and volatile Acrimony, conveyed from the Primæ Viæ to the nervous Syſtem, produces an Epilepſy; beſides the Powders proper for correcting and qualifying this Acrimony, Whey, as alſo temperate mineral Waters, uſed for ſome Months, in Conjunction with a proper Regimen, are of very ſingular Service. Acidulated Medicines are alſo highly efficacious in this Diſorder; ſuch as the Philoſophic Spirit of Vitriol, or the Spirit of Nitre well rectified, reduced into the Form of a Tincture, with Flowers of the wild Poppy and Piony, and exhibited with large Quantities of temperating, diluting, and antiſpaſmodic Waters. Common Spring-water, or pure Rain-water, liberally drank, are, alſo, of ſome Service in theſe Diſorders in the Head; ſince, beſides their temperating Quality, and their Power of diluting the Acrimony of the Humours, they alſo reſtore Strength, and a due Tone, to the weakened and relaxed Parts.

When an Epilepſy ariſes from an Exceſs of Pain, from a Stone, for Inſtance, lodged in any of the Ureters, a violent Tooth-ach, a Pain of the Ear, Spaſms of the Stomach and Inteſtines; in theſe Caſes Clyſters of pure Oil, that of ſweet Almonds, for Example, are to be injected; after which, if the Patient is plethoric, Veneſection is to be inſtituted; and a Mixture, compoſed of the antiſpaſmodic Waters, the Anodyne mineral Liquor, the Pulvis Marchionis, Cinnabar, a few Grains of the Pilulæ Wildeganſii, and Syrup of white Poppies, is to be exhibited internally. In thoſe Epilepſies incident to Children, either from the Gripes of the Inteſtines, corrupted Milk, or a difficult Dentition, nothing is more expedient, than by proper Medicines to eliminate the acrid Saburra from the Primæ Viæ. This Intention is excellently anſwer'd by frequent Injections of Clyſters, conſiſting of Milk, with a little Venice Soap previouſly diſſolved in it. The internal Exhibition of the Pulvis Marchionis, with a little Cinnabar, or any epileptic Powder, reduced into an Electuary, with Extract of Rhubarb, Syrup of Succory with Rhubarb and Manna, generally affords very ſingular Relief. I have, ſays *Hoffman*, alſo found the following Mixture to produce very happy Effects:

> Take of the Waters of Lilies of the Valley, Primroſes, Lime-flowers, and Black Cherries, each one Ounce; of Crabs-eyes, and the Pulvis Marchionis, each one Dram; of the volatile oleous Spirit of *Sylvius*, and the Anodyne mineral Liquor, each ten Drops; of oriental Muſk, well mixed with Sugar, two Grains: Mix all together, and exhibit. For I have had frequent Experience of the Virtue of Muſk, in mitigating the epileptic Diſorders of Children.

When an Epilepſy ariſes from Worms corroding the nervous Coats of the Inteſtines; in this Caſe, after the Exhibition of antiepileptic, demulcent, and oleous Medicines, we muſt uſe anthelminthic Specifics, and gentle Purgatives; the moſt conſiderable and efficacious of which are Tanſy, Garlick, Camphire, Aſa-fœtida, Worm-ſeeds, Mercurius dulcis, Æthiops Mineral, and the Extract of Spurge.

Practical Cautions *and* Observations.

When an Epilepſy returns at ſtated Periods, or at the Quadratures of the Moon, the Cauſe of the Diſorder is generally lodged in the Stomach, or rather in the Duodenum, and its adjacent Parts, the biliary Ducts, or Pancreas. In this Caſe it is expedient, a few Days before the ſtated time of its Return, to inject a Clyſter, and exhibit a Vomit, calculated for cleanſing and unloading the Primæ Viæ. The moſt ſafe and efficacious Vomit for this Purpoſe is that compos'd of half a Dram of Ipecacuanha-root, mix'd with a Decoction of Raiſins. After theſe Meaſures are taken, antiepileptic Specifics will prove more efficacious than otherwiſe they would have done.

Under the Paroxyſms, we are carefully to abſtain from the Uſe of Subſtances that are too volatile, ſpirituous, fragrant, or fetid; ſince theſe fill the Head with their Vapours. Nor is it expedient to preſcribe ſuch Subſtances as either excite Sneezing, or Vomiting; ſince theſe derive the Humours to the Head, and often recal the Paroxyſms. It is rather expedient to keep the Patient in an erect Poſture, and carefully to rub his Hands, and his Feet; for dry and warm Frictions are of ſingular Service in Epilepſies accompanied with Spaſms of the Extremities. Though Veſicatories, Setons, and Applications of the actual Cautery to the Neck, in ſuch Epilepſies of Children as ariſe from a Collection of ſordid Serum, are not altogether uſeleſs; yet they ſometimes prove prejudicial, and leave a certain Languor, or Stupor of Body, behind them. On the contrary, in obſtinate chronical Epilepſies, as alſo thoſe ariſing from an acrid ſcorbutic Lymph, Fontanels and Veſicatories applied to the Legs produce far more happy Effects: Hence the *Indians*, in Epilepſies, with ſingular Succeſs, burn the Heel, at the Inſertion of the Tendon of *Achilles*, and keep the Ulcer open for ſix Months.

In every Species of Epilepſy it is expedient to abſtain from Wine and Malt Liquors, and rather to uſe pure Water; ſince I have frequently obſerved, ſays *Hoffman*, that this Liquor has either mitigated, or abſolutely removed, not only obſtinate, but even hereditary Epilepſies. With reſpect to Veneſection, it is to be obſerved, that it is to be inſtituted in the Ancles, when the Patient is plethoric, when the Paroxyſms ſeize about the Equinoxes, or Solſtices, and eſpecially if the Patients are hypochondriac, ſubject to the Hæmorroids, or melancholic; but a Clyſter muſt be previouſly injected, in order to evacuate the viſcid Humours, together with the Flatulences. When the hypochondriac Paſſion ſuſtains and ſupports the Epilepſy, in this Caſe, after bleeding the Patient as his Condition ſhall require, I have known the Paroxyſms remarkably mitigated by drinking temperate mineral Waters; but Bathing is to be abſtained from.

Before the Uſe of antiepileptic Specifics, evacuant, temperating, and alterative Medicines muſt be previouſly exhibited, otherwiſe they do more Harm than Good. When an Epilepſy draws its Origin from external Injuries done to the Head, and the Stagnations, or Extravaſations of the Humours are produced by them, then Preparations of Cinnabar, reduced to a fine Powder by Trituration and Levigation, that their Particles may mix with the Maſs of Blood, are to be exhibited in pretty large Quantities, in Conjunction with other Cephalics and Diaphoretics; ſince they powerfully reſolve and diſcuſs the Lymph ſtagnating in the Brain. Among external Medicines calculated for checking the Violence of the Paroxyſms, I have found none, ſays *Hoffman*, more effectual, than a Liniment compoſed of human Fat, one Ounce; expreſſed Oil of Nuimegs, half an Ounce; and of the Oils of Roſemary, Lavender, and Rue, each a Dram. The Neck and Spine of the Back are to be anointed with this Liniment. When the Patient is ſo fortunate as to be previouſly ſenſible of the approaching Fit, it is expedient, if poſſible, to prevent it, or at leaſt to mitigate its Fury, by Clyſters, Frictions of the inferior Parts, and a proper Regimen.

Opiates, and too volatile Subſtances, muſt be cautiouſly exhibited to Children, and Patients of delicate Habits; ſince they bring on an uncommon Weakneſs, and Want of Tone, in the Brain and nervous Parts. Thus, I once knew, ſays our Author, an Infant ſeized with a mortal Epilepſy, by the frequent Uſe of Diacodium. I have alſo obſerved, ſays he, that the anodyne Powders, and Preparations of the Theriaca, frequently exhibited to Children, have produced a kind of Stupor of Mind, which remained with them for a long time.

When an Epilepſy is of ſuch a Nature as to return upon the ſlighteſt Cauſes, and be augmented by a Farrago of Medicines, it is expedient to abſtain from a Multiplicity of them, and, by an obſtinate Perſeverance in a proper Regimen, to combat, and, if poſſible, prevent this Diſorder. The Regimen proper in this Caſe is ſuccinctly, but accurately, deſcribed by *Celſus*, in the 23d Chapter of his 3d Book, in theſe Words: "The

" The Patient, ſays he, muſt ſcreen himſelf from the too vio-
" lent Influences of the Sun, abſtain from Bathing, keep at a
" Diſtance from the Fire, ſhun all heating Subſtances, Cold,
" Wine, Venery, the Sight of Precipices, and all terrible
" Objects, Vomitings, Wearineſs, Anxiety, and every kind of
" Buſineſs: He muſt, alſo, abſtain from Food one Day in
" four." Epileptic Patients, eſpecially Children, are alſo to abſtain from all ſweet fermentable Subſtances, Summer Fruits; and others of a like Nature. And young Perſons, ſubject to this Diſorder, are carefully to abſtain from Venery; for *Hieronymus Mercurialis, in Prælect. Patav.* juſtly affirms, " that
" many of the *German* Youth become epileptic by an immo-
" derate Uſe of Venery." Intenſe Thoughtfulneſs, or Fatigue of Mind, is alſo be guarded againſt by epileptic Patients; for, according to *Celſus*, Application of Mind is not ſafe for thoſe who are ſubject to this Diſorder, or have their Heads any ways affected. *Galen*, in the 5th Chapter of his 5th Book *De Loc. affect.* gives us a memorable Inſtance of this in the following Words: " A certain young Schoolmaſter, ſays he, when
" he had either taught with too much Aſſiduity, thought too
" attentively, or abſtained from Aliments ſo long as to become
" exceſſively hungry, was ſeized with an epileptic Fit." The like is alſo reported of *Franciſcus Petrarcha*, who, after many abſtruſe Meditations, is ſaid to have been ſeized with epileptic Paroxyſms. But, above all things, every Occaſion of Terror, Dread, or Anger, is to be carefully avoided; becauſe theſe have a ſtrong Tendency to bring on the Paroxyſms. *Frederic. Hoffman.*

Dr. *Pitcairn*, when arrived at the laſt Stage of his Life, and ſeemingly under the Influences of Religion, and a ſincere Regard for the Happineſs of Mankind, as a kind of ſacred and ineſtimable Legacy, leaves the following Directions for the Management of epileptic and paralytic Caſes.

" In an Epilepſy, ſays he, or a Palſy, after the repeated
" Uſe of Emetics and Veſicatories, let the antiepileptic Tin-
" cture be exhibited. To young Perſons, and thoſe not far
" advanced in Years, Mercury, and Broths prepared with
" Earth-worms, are to be exhibited. The antiepileptic Tin-
" cture is prepared in the following Manner:

Take of wild Valerian-root, and baſtard Dittany, each ſix Drams; of Pigeon's Dung, and Caſtor, each half an Ounce; of Miſleto, ſix Drams; of Cinnamon, and the Tops of Roſemary, each half an Ounce; of Sena-leaves, two Ounces; of Jalap, and Turbith, each half an Ounce: Infuſe in a cold Place for ten Days, in eight Pints of white French Wine. To the Liquor, when ſtrained off, add of the Shavings of a human Cranium, and Elk's Hoof, each two Drams; and four Ounces of Sugar, with which four Scruples of the Oil of Amber, and two Drams of the Spirit of Caſtor, are duly mixed. Of this Preparation let two Ounces be exhibited as a Doſe to Patients of about ſeven Years of Age; and, to Adults, Four.

" In paralytic Caſes it is often expedient, in the Decline of
" the Diſeaſe, to exhibit this Tincture without the purgative
" Ingredients. It is alſo proper, after liberal Frictions of the
" affected Members before a Fire, to immerſe the Patient in
" cold Water."

Cheyne is of Opinion, that the Epilepſy differs very little, or not at all, or, at moſt, in a few Circumſtances only, from hypochondriac and hyſteric Fits; which laſt, when violent, terminate always in theſe epileptic Fits; as they, on the other hand, when they become weak, dwindle into the hyſteric Kind. In this Caſe, the Diet muſt be much more ſtrict, cool, and moderate, than in hyſteric and hypochondriac Diſorders; and the Medicines ſtronger, and oftener repeated, eſpecially Vomits, Steel, and Bitters. Dr. *Taylor*, of *Croydon*, ſays *Cheyne*, cured himſelf entirely and abſolutely of the moſt violent, conſtant, and habitual Epilepſy that, perhaps, ever was known, after having, in vain, tried all the Methods and Medicines adviſed by the moſt eminent Phyſicians of his Time, by a total Diet of Milk, without Bread, or any other Vegetable, or any thing, (beſides a Spoonful of compound Peony-water, ſometimes, to prevent its curdling) confining himſelf to a Pint in a Morning, a Quart at Noon, and a Pint at Night, of the Milk of graſs-fed Cows in the Summer, and thoſe fed with Hay in the Winter; the Milk of Cows fed with Grains always inflating him, and lying uneaſy at his Stomach. He had continued in perfect Health and Vigour (having had ſeveral Children) ſeventeen Years, when I ſaw him, and received this Account from him, inſomuch that he could have played four or five Hours at Cricket, on *Banſtead-Downs*, without Wearineſs, or profuſe Sweating; and probably might have continued many Years longer in perfect Health, (as he did ſeven or eight Years more) had he not entered upon a different Regimen of Diet, and come to eat animal Food; by which, in a ſhort time, he was deſtroyed. Some others have been cured, by me, by a Regimen of Diet leſs ſtrict; and the Medicines already ſuggeſted; but I believe none ever were cured, who have been come to Maturity, without a very exact low Regimen, continued during all their Lives; the tranſgreſſing it, for any long time, always bringing their Diſorders back, if not ſomething worſe. And I believe a total Milk and vegetable Diet as abſolutely neceſſary for the total Cure of the Epilepſy, as it is for the Gout, or a Conſumption. *Cheyne's Engliſh Malady.*

Eraſiſtratus advis'd epileptic Patients to eat and drink but little, to bathe ſeldom, to uſe a great deal of Exerciſe, and to avoid every thing that induces to ſudden Change in the Body. *Galen de Venæſect. adverſ. Eraſiſtratæos.*

Apuleius, in his firſt Apology, quotes a Treatiſe of *Theophraſtus* concerning the Epilepſy, wherein the Author ſays, that the Exuviæ of that Kind of Lizzard call'd Stellio is a Cure for this Diſtemper; but that it is difficult to be got, becauſe the Animal eats it as ſoon as 'tis caſt off.

Aſclepiades us'd to bleed in the Epilepſy.

We learn from *Cælius Aurelianus, Lib.* 1. *Cap.* 4. that the Antients gave in an Epilepſy human Fleſh, and that of Weaſels dry'd for a long time, as alſo of Horſes, who have leprous Warts growing upon their Legs, of Aſſes or Mules. They gave alſo the Member and Teſtes of the River or Sea-dog, and Millepedes; as alſo Scales of Iron, with Water in which Iron had been extinguiſh'd: They preſcrib'd, alſo, the Brain of a Camel, dry'd and cut; and order'd Children to ſmell of it, but Adults to drink it, with Hydromel and Vinegar, in the Quantity of three Cyathi; the Heart of an Hare, and the Brain of the *Gavia*, an aquatic Fowl. They alſo us'd Aſſes Milk with Salt; and human Blood, and that of a Sea-tortoiſe, or Sea-calf; and not only Blood, but alſo *Coagula:* Bulls Blood is alſo recommended; but *Cælius Aurelianus* thinks that dangerous, and brings the Example of *Themiſtocles*, who was poiſon'd with it, to ſupport his Opinion.

Oribaſius deſcribes the Cure of an Epilepſy, both in the acute and chronical Sort, that is, in the Fit, as well as out of it: When the Fit is over, he orders Bleeding; and, after four or five Days, when the Body is a little recruited, Purging; three Days after, Cupping and Scarifying: He repeats theſe Evacuations, and ſometimes Sinapiſms, at convenient Diſtances, and, in the Intervals, gives proper Nouriſhment, and uſes warm Medicines, ſuch as Caſtor, Rue, Mint, and the Cyrenaic Juice. He mentions Peony-root, in the Form of an epileptic Necklace; however lays the greateſt Streſs, where it ought to be laid, upon Evacuations. *Galen*, in his Epiſtle to *Cecilianus*, writes on purpoſe upon this Argument, and deſcribes the Manner of Diet at large.

Trallian recommends the Hoof or Skull of an Aſs, as a precious Secret, which he learnt in *Spain.*

The Antients us'd to give one Dram of the Root of the white Bryony, for a whole Year, to thoſe that were ſubject to Epilepſies. *Harris Diſſert.*

Paracelſus ſpeaks of a Preparation, of which the Flowers of Antimony are the Baſis, which, he ſays, is an excellent Remedy for an Epilepſy; but he does not tell us the manner of preparing it. *Paracelſus* fixes the Doſe of this Arcanum at nine Grains before the Paroxyſm, and eighteen in it.

He alſo recommends his Sulphur of Vitriol for this Diſorder; but owns, that Opium has a marvelous Effect in their Cure.

A tart Liquor ouſing from the Root of the Walnut-tree, when cut off in the Month of *May*, is found an excellent Remedy in an Epilepſy.

Gordonius, who wrote in 1305. in his *Lilium Medicinæ*, deſcribes the *Pulv. ad Guttetam*, famous then in *France* for the Cure of an Epilepſy.

John of *Gaddeſden* recommends, in epileptic Caſes, a Boar's Bladder boil'd, Miſleto, and a Cuckow.

The Powder of the Lycopodium is us'd in *Germany*, in the Cure of Epilepſies in Children, from ten Grains to thirty. *Geoffroy.*

Eſſential Oil of Rue is a moſt excellent Remedy for an Epilepſy proceeding frpm a cold Cauſe. *Boerhaave's Chym.*

A Jay dry'd and powder'd is a Specific for an Epilepſy.

Epilepſies, whoſe Cauſes reſide in the Primæ Viæ, are ſometimes cur'd by a few Drops of the Liquor of the Solution of Copper by Sal Ammoniac, given in the manner as directed under the Article Æs.

Rue-water, prepar'd by repeated Cohobations, is excellent in Epilepſies and Hyſterics.

Tincture of Amber is very ſtrongly recommended by *Boyle* and *Helmont*, as a very excellent antiepileptic Medicine.

It may be taken three times a Day, in *Spaniſh* or *Canary* Wine, after the Stomach has been firſt emptied and cleanſed.

Galen gives us an Inſtance of the ſurpriſing Effects of Effluvia, with reſpect to Peony-root, which he, by repeated Experiments, ſatisfied himſelf, cured a Lad of an Epilepſy, by being hung about his Neck; for the Diſtemper return'd, if this was taken off.

I knew

I knew a young Lady that was afflicted with a radicated Epilepſy; who, after numberleſs Medicines preſcrib'd by Phyſicians had prov'd ineffectual, and after her Fits came upon her ſeverely eight or ten times a Day, was cured by the Powder of true Miſleto of the Oak, continued for ſome Days, near the full Moon, in the Quantity that would lie upon a Sixpence, every Morning, in black Cherry-water, or Beer. And tho' this Remedy had ſcarce any viſible Effect upon her, yet, after the firſt Day it was taken, the Fit never return'd but once. The Perſon who adviſed this Remedy, profeſs'd he had therewith conſtantly cured that Diſtemper, when he could procure the genuine Simple. *Boyle.*

Half a Dram of choice Amber, finely powder'd, being exhibited for ſix or ſeven Weeks together, once a Day, when the Stomach is empty, in about four Ounces of good White-wine, is recommended by *Boyle*, in the Cure of an Epilepſy.

In epileptic Patients, Urine unuſually thin and crude, if there be no Repletion, ſignifies an approaching Fit; and ſo much the more if it be accompanied with a Pain or Tenſion of the Acromium, Neck, or Back, or Stupor of the Body, or troubleſome Dreams. *Hippocrat. Coac. Prænot.*

Panarolus, and *Fabius Columna*, are very copious in their Praiſes of the Root of the *Valeriana ſylveſtris major*; one or two Doſes of which, he affirms, will generally cure an Epilepſy. He tells us, that he preſented it to many of his Friends, who, next to the divine Bleſſing, profeſſed that they ow'd the Reſtitution of their Health to the Powder of this Root. The Doſe is half a *Cochleare*, in Wine, Water, Milk, or any other proper Liquor; to Children a leſs Quantity is given in Milk.

Dr. *Cheyne* remarks, that the *Valeriana ſylveſtris major* is certainly one of the moſt active and volatile of the Vegetable Kingdom, and ſeems to act chiefly by promoting Perſpiration, and a gentle Diaphoreſis. The Root powder'd, and given with Cinnabar of Antimony, and Powder of Hellebore, has frequently good Succeſs; and a Tea, made of its Leaves, is an admirable Diluter, and may be long continued with Advantage in nervous Caſes.

Native Cinnabar is, alſo, much recommended by *Crato*, for the Cure of an Epilepſy; whence it is call'd the *Magnes Epilepſiæ*.

The celebrated *Boerhaave* remarks, that as all the Variety of Motions, in epileptic Fits, conſiſt in irregular Contractions of the muſcular Parts, they muſt proceed from various involuntary and anomalous Influxes of the nervous Juices into theſe Parts, preſs'd into the Nerves from the common Senſory by as various Cauſes.

The principal of theſe Cauſes are, according to him, firſt, either hereditary, and receiv'd immediately from the Parents; or, perhaps, from ſome of the Anceſtors, the Diſtemper having lain dormant in the Parents.

Secondly, they may be born with the Patient; being excited by the Mother's Imagination, upon ſeeing a Perſon in epileptic Fits.

Thirdly, Injuries done to the Meninges, Superficies, Subſtance, or Ventricles of the Brain, either by Wounds, Contuſions, Abſceſſes, Pus, Sanies, Ichor, Blood, acrid and fetid Lymph, bony Excreſcences of the internal Parts of the Cranium, Depreſſions of the Skull, a cartilaginous State of the Sinuſes of the Dura Mater, Fragments or Splinters of Bones, or of Inſtruments wounding the Meninges or Brain, or Quickſilver by any means convey'd to the Brain, may cauſe an Epilepſy: Or it may ariſe from ill Impreſſions on the Brain from Inflammations, Corruptions, or Eroſions of the Meninges, from a Caries of the Bone, black Bile, or Venereal Gummata. But all theſe Cauſes are enhanc'd by whatever cauſes an Afflux of Blood to the Head; as a Plethora, Motion, Heat, Drunkenneſs, Gluttony, Venereal Enjoyments, an extraordinary Quickneſs of Parts, and profound Genius, deep Meditation, great Affections of the Mind, a ſtrong Imagination, and particularly Fear and Terror.

Fourthly, all things violently affecting the nervous Syſtem may produce an Epilepſy; as great and periodical Pains, the hyſteric Paſſion, Roſions and Irritations of the inteſtinal Tube by Worms, difficult Dentition, any acrid Humour, the curdled, acrid, and acid Milk in the Stomachs of Infants, the Meconium retain'd, variolous Contagion, the Heart-burn, any ulcerous Matter contain'd in any Part of the Body, Hunger, a Surfeit, all Sorts of acrid Meats, Drinks, Medicines, and Poiſons.

Fifthly, an Epilepſy may ariſe from a Suppreſſion of ſome habitual Evacuation, whether of Sanies, Pus, the menſtrual, lochial, or hæmorrhoidal Diſcharge, or of Urine.

Sixthly, Fumes ariſing from diſtant Parts of the Body, where the immediate Cauſe reſides, may aſcend to the Brain, and excite an epileptic Paroxyſm; and in this Caſe there is a Senſation of a ſort of Vapour aſcending to the Head.

It appears from Obſervation, and Diſſections, that theſe are the genuine Cauſes of Epilepſies.

In conſequence of an Epilepſy, firſt, the Brain is impair'd by ſo many violent and repeated Convulſions; whence Vacillation of the Memory, Dulneſs of the Senſes, Idiotiſm, Palſies, Apoplexies, and Death.

Secondly, the Nerves and Muſcles are injur'd; whence theſe, and conſequently the Limbs, are contracted, diſtorted, and deform'd.

Thirdly, the violent Spaſms excite an Inflammation, Gangrene, and Blackneſs of the Parts; thoſe eſpecially which are adjacent to the Muſcles convuls'd.

Fourthly, many involuntary Secretions are made during the Violence of the Paroxyſm: Thus Meat, Drink, Lymph, Bile, Froth, Mucus, and Saliva, are diſcharg'd upwards; and green Fæces, Seed, and Urine, downwards; and Blood both ways.

An hereditary Epilepſy is incurable. An idiopathic Epilepſy, or that whoſe Cauſe reſides within the Cranium, is very difficult of Cure, becauſe the Parts affected are, in ſome degree, out of the Reach of Medicines: But a ſymptomatic Epilepſy is often to be cur'd.

From what has been ſaid relative to an Epilepſy, it appears, that various Remedies and different Methods of Cure, are requir'd in this Diſorder; which muſt be determin'd from a Knowledge of the Cauſe of the offending Matter, of the Part to which Remedies are to be directed, and of the Emunctories by which the Matter producing the Diſorder is to be expel'd.

In order to treat an Epilepſy judiciouſly, we muſt firſt examine ſtrictly, and inform ourſelves, whether it is hereditary, idiopathic, or ſymptomatical; and then diligently ſearch where the ſtimulating Matter reſides, which cauſes the Epilepſy: And by this means we may be able to adapt a proper Remedy to the Cauſe of the Diſtemper; and not run into the Error of thoſe who treat all Kinds of Epilepſies in the ſame manner, by which the Diſeaſe is often render'd much worſe.

Thoſe Epilepſies which ariſe from the firſt and ſecond Cauſes above-mentioned, that is, thoſe which are hereditary, or brought into the World with the Patient, admit of no radical Cure; but the remote Cauſes which excite the Paroxyſm, and which are continually renew'd, may be ſafely remov'd: Theſe are infinite, and can be learnt by Obſervation only; they are, therefore, diligently to be remark'd; and, when known, treated according to their reſpective Natures.

Tho' it may not be poſſible to remove entirely the firſt Cauſe of an Epilepſy, yet 'tis in our Power always, to take away the exciting Cauſes: For Example, if an Excreſcence within the Cranium is the original Cauſe of an Epilepſy, tho' that cannot be remov'd, yet we may prevent the Brain from being forc'd againſt it by a Plethora, or extraordinary Motion of the Blood.

Epilepſies, produc'd by the third Cauſes mentioned above, are diſtinguiſh'd by other Symptoms of an injur'd Brain, accompanying them, or preceding them; as Pain, Heavineſs, Fulneſs, a Wound of the Head, a Vertigo, univerſal Tremor, Sparkling, or Immobility of the Eyes, Circumgyration of the Head, or of the whole Body. It is very difficult to remove Cauſes of this Kind, becauſe it is no eaſy Matter to be particular in diſtinguiſhing them, as they reſide within the Cranium: Revulſion, however, Evacuations, diſcutient and depuratory Remedies, are of Uſe: Hence Bleeding, Cathartics, Emetics, Applications of the actual Cautery, Iſſues, Setons, Epiſpaſtics, Inciſions of the Head, Trepanning, Antihyſterics, and Opiates, are ſerviceable; and the Choice of theſe muſt be directed by the immediate Cauſe, when that can be diſcover'd.

The Method of treating Epilepſies ariſing from the fourth Claſs of Cauſes muſt be adapted to the particular immediate Cauſe: Hence Anodynes, Paregorics, Narcotics, Antihyſterics, Anthelminthics, Medicines which attemperate the Humours, and correct Acrimony, a proper Inciſion of the Gums, a Removal or Correction of ulcerous Matter, are, when properly apply'd, Antiepileptics.

When the fifth Cauſe, that is, a Suppreſſion of ſome habitual Evacuation, cauſes an Epilepſy, the immoveable and ſtagnating Matter muſt be reſolv'd, the Paſſages relax'd, and the Matter evacuated: Hence Veſicatories, Cauſtics, Iſſues, Setons, Medicines which promote the lochial, menſtrual, or hæmorrhoidal Diſcharges, and Diuretics, are frequently of ſingular Benefit.

Epilepſies ariſing from the ſixth Cauſe may be remov'd by curing the Weakneſs of the too eaſily irritable nervous Syſtem: This is to be accompliſh'd by Exerciſe and Motion of all Kinds, as Riding on Horſeback, or in a Chariot; by the Uſe of Aromatics, Steel, and corroborative Medicines; as alſo by deep and long-continued artificial Exulcerations of the particular Part where the Cauſe reſides, either by Inciſion, Cauſtics, or Veſicatories, which are to be kept running for a long time; by the Application of Suppuratives mix'd with Corroſives; and, laſtly, by Ligatures, which compreſs the particular Nerves affected.

Some People ſubject to Epilepſies at firſt complain of a Senſation like the Dropping of cold Water on ſome Part, where the Fit always begins, as the Calcaneum, Calf of the Leg, Shoulder, *&c.* and then this Senſation gradually aſcends towards the Head. In ſuch Caſes, if a Ligature can be made before this Senſation aſcends as far as the Trunk, the Paroxyſm is prevented: But if, in the Aſcent from the inferior Parts, it once reaches the Left Hypochondrium, the Fit begins; as it does, when it reaches the Neck, if it proceeds from the Shoulders or Arms.

The following Caſe, from the *Edinburgh Medical Eſſays*, and thoſe given under the Article ALBADARA, relate to this Species of Epilepſy:

In *July* 1720, a Woman about thirty-eight Years of Age was brought to me; ſhe had labour'd twelve Years under an Epilepſy, which, from one Fit a Month, was come to four or five violent ones every Day, each continuing an Hour, or an Hour and an half; by which ſhe was render'd mopiſh and ſilly, and incapable to take care of her Houſe and Family: Her Huſband was reduced in his Circumſtances, from his Affection and Care for her, having got and followed all the Advice he could. Evacuations of all Kinds had been tried; the epileptic and cephalic Tribe of Medicines had been ranſack'd, and many other Medicines had been tried in vain, the Diſeaſe growing more ſevere: Her Fit always began in her Leg, toward the lower End of the Gaſtrocnemii Muſcles; and in a Moment reach'd her Head, threw her down, foaming at her Mouth, with terrible Diſtortions of the Mouth, Neck, and Joints. Whilſt I talked to her, ſhe fell down in a Fit: I examined the Leg, and found no Swelling, Hardneſs, Laxneſs, or Redneſs, different in that Place from what was in the other Leg; but ſuſpecting, from her Fit beginning always at that Part, that the Cauſe of her Diſeaſe lay there, I immediately plunged an Inciſion-knife about two Inches into it; where I found a ſmall indurated Body, which I ſeparated from the Muſcles, and then took it up with a Forceps: It proved an hard cartilaginous Subſtance or Ganglion, about the Size of a very large Pea, ſeated on a Nerve, which I cut aſunder, and took out the Tumor. She inſtantly came out of the Fit, cried out ſhe was well, and never after had a Fit, but recovered her former Vigour both of Body and Mind. *Med. Eſſays, Vol.* 4. *p.* 416.

From what has been ſaid, it evidently appears, how little Dependence is to be had upon all the boaſted antiepileptic Specifics; that a genuine Epilepſy is always immediately caus'd by too forcible an Action of the Brain on the Nerves adminiſtring to muſcular Motion; whilſt thoſe ſubſervient to Senſation are depriv'd of a due Influx of the nervous Fluid; and that the Cauſes exciting a Paroxyſm are very different and numerous.

Hence alſo the Origin, Nature, Effects, and Cure, of thoſe ſingular Species of Convulſions call'd *Opiſthotonos*, *Emproſthotonos*, and *Tetanus*, are evident, as they are only particular epileptic Paroxyſms. *Boerhaave Aph.*

Salt of Tin was once thought, by the celebrated Author above-mentioned, a ſort of Specific in the Cure of an Epilepſy, from ſome ſucceſsful Experiments he made with it; but farther Experience convinc'd him, that it was a Cure only for that Species of Epilepſy, which is caus'd by an Acid ſtimulating the nervous Coats of the Stomach and Inteſtines.

Henricus a Bra, a Phyſician of *Zutphen*, has wrote a Book expreſly upon the Subject of antiepileptic Specifics. It is printed *Leovardæ* 1616. 12mo.

EPILESMON, ἐπιλήσμων· from ἐπιλανθάνομαι, to forget; one who has loſt his Memory. *Coac.* 161. where it is ſaid, that an Apoplexy, Epilepſy, or Loſs of Memory may be expected from a Cephalalgia without a Fever, a Scotomia, a Slowneſs of the Voice, or a Numbneſs of the Hands.

EPILOGISMUS, ἐπιλογισμὸς· from ἐπιλογίζομαι, to infer by Ratiocination; is the Method of acquiring Knowledge, founded on common Reaſon, and univerſal Aſſent; as *Analogiſmus* collects it from things evident. *Galen, Com.* 1. *in Prognoſt.* Ἐπιλογισμὸς is, alſo, ὁ φαινόμενος λόγος, "an apparent "Reaſon;" or Way of Reaſoning, which taking its Beginning from things manifeſt, and never loſing Sight of them, makes its way to Objects, which, tho' ſenſible, are yet obſcure. *Idem, de Sectis ad eos qui introducuntur:* And, in the laſt Senſe, ἐπιλογισμὸς is an empiric Way of Ratiocination, which is converſant about Things; as ἀναλογισμὸς has for its Object Things occult and obſcure. *Idem, de Subfigurat. empirica.*

EPILOGOS, ἐπίλογος· from ἐπιλέγω, to add to what has been ſaid; in *Hippocrates, de Nat. Hum.* bears a peculiar Senſe, and ſignifies a Way of Reaſoning, or Ratiocination.

EPIMEDIUM.

The Characters are;

The Leaves are like thoſe of Ivy, and grow three on the Top of each Branch: The Stalk is divided into three Branches at each Joint, and the triple Diviſion is continued in the Subdiviſions: The Calyx is compos'd of four Leaves: The Flower conſiſts of four Petals, which are tubulated and hollow'd into blind Canals, and furniſhed with four Stamina: The Ovary is ſeated in the Bottom of the Calyx, and is furniſh'd with an erect Tube or Pointal, which becomes an unicapſular bivalve Pod, containing round flat Seeds. *Boerhaave, Index alter, Part.* 1. *p.* 307.

Boerhaave mentions but one Species of this Plant; which is,

Epimedium, *Offic. Ger.* 389. *Emac.* 480. *Raii Hiſt.* 2. 1330. *C. B. P.* 323. *Hiſt. Oxon.* 2. 196. *Park. Theat.* 1365. *Tourn. Inſt.* 232. *Elem. Bot.* 199. *Boerh. Ind.* 307. *Epimedium quorundam*, J. B. 2. 395. *Epimedium quorundam floribus purpureis cum apicibus luteis*, Chab. 165. BARRENWORT.

It is cultivated with us in Gardens, and the Root and Leaves are the Parts uſed in Medicine: The Leaves triturated, and made into a Cataplaſm with Oil, and ſo apply'd to the Breaſts, prevent their farther Growth: The Root cauſes Barrenneſs: The Leaves triturated, and drank to the Quantity of five Drams, in Wine, for five Days together, after the menſtrual Purgation, effectually prevent Conception. *Dioſcorides, Lib.* 4. *Cap.* 19.

EPIMELIS, ἐπιμηλίς. *Galen*, in his *Exegeſis*, ſays, that *Dioſcorides*, in the firſt Book of his *Materia Medica*, makes the *Epimelis* a kind of Medlar, call'd alſo *Sitanian*. But ſome take it for a ſort of ſmall wild Apple, call'd alſo AMAMELIS, which ſee.

EPIMORIOS, ἐπιμόριος, from μείρω, to divide; ſuperpartial, in *Galen, de Diff. Pulſ. Lib.* 1. *Cap.* 9. is an Epithet of the Difference of Pulſes with reſpect to their Inequality of the Rythm or Time which they keep in beating. All Rythms (or Modulations of the Pulſe, with reſpect to Number) conſiſt, he ſays, of equal or unequal Proportion; of equal, when the Time of the Diſtention is equal to the Time of Contraction; unequal, when one exceeds the other; and this Inequality may ariſe from certain or uncertain Exceſſes; the certain Exceſſes may either be in multiple Proportion, or as Number to Number, which is call'd EPIMORIOS. See ARYTHMOS.

EPIMULIS, ἐπιμυλὶς, the ſame with ἐπιγονατὶς, (Epigonatis) or μύλη, *(Myle)* the *Patella* of the Knee.

EPINEMESIS, ἐπινέμησις ἢ ἐπινέμησις, from νέμω, to diſtribute, *Hippoc.* ἐν παραγγελ. is a juſt and prudent Management requir'd in a Phyſician, under the various Alterations of the Diſeaſe, as it is exaſperated or remitted.

EPINENEUCOS, ἐπινενευκὼς, from νεύω, to nod, incline, is an Epithet of a Pulſe which beats unequally in different Parts of the Artery, as when it riſes ſtrong againſt the two middle Fingers of the Phyſician who feels it, and weaker at the Extremes; it is alſo call'd περινενευκὼς, (Perineneucos) and is familiar, as *Galen* ſays, to Hectics.

EPINEPHELOS, ἐπινέφελος, from νεφέλη, a Cloud, cloudy; is an Epithet applied to an Enæorema in the Urine, which appears like a Cloud, as in *Ægr.* 1, 3, 5. *Epidem. Lib.* 3. It is ſometimes taken ſubſtantively, and has ἐρυθρὸς, "red," join'd with it, as 4 *Aph.* 70. where it is ſaid, that when the Diſeaſe comes to a Criſis on the ſeventh Day, a red Cloud appears in the Urine on the fourth Day.

EPINOEMA, ἐπινόημα, from ἐπινοέω, to excogitate, an Invention. *Hippocrates de Art.*

EPINOTION, ἐπινῶτιον, from ἐπὶ, upon, and νῶτος, the Shoulder; *Omoplata*, or Shoulderblade.

EPINYCTIS, ἐπινυκτὶς, from ἐπὶ, on, and νὺξ, Night, is a very bad Sort of Puſtule, as *Celſus* ſays, of a white or ſomewhat livid or black Colour, the ſame as its Humour, and attended with a violent Inflammation all around it; when it is open'd, there is an Efflux of Sanies, and a mucous Exulceration is found within. The Pain is more violent than in proportion to its Magnitude; for it is no bigger than a Bean. It ariſes in the upper Parts, and breaks out ſpontaneouſly, and generally by Night; whence it took its Name *Epinyctis*. Thus *Celſus*. We are told by *Paulus* and *Aetius*, that it creates no great Pain to the Patient in the Day-time, but is very painful and troubleſome in the Night; whence it had the Name. Now, both Sides may be in the Right; for, it is probable, that the Hour of its Eruption might be alſo that of its Exacerbation: In the other Characters they agree with *Celſus*; nor does it hinder, that he calls them Puſtules, and they ſmall Ulcers; for Puſtules are really ſuch; or that he deſcribes them of various Colour, and they reddiſh; for under this are comprehended the ſublivid and the blackiſh. The *Epinyctis* is defin'd by *Pliny, Lib.* 20. *Cap.* 6. a nocturnal Puſtule of a livid Colour, and moſt troubleſome in the Night. They are reckon'd by *Celſus* among thoſe Kinds of Puſtules which infeſt the Skin; and, by *Galen*, among preternatural Tumors, which deform the Skin, in *Lib. de Aere, Locis, & Aquis, Epinyctides* are accounted among endemic Diſtempers.

In the Cure of this, as well as all other Eruptions of Puſtules, the firſt Thing is, to walk much, and to uſe Exerciſe, if the Diſeaſe will not admit of Geſtation: The ſecond Means is, to diminiſh the Food, and abſtain from all acrimonious and extenuating Meats, and to make the Nurſe do the

ſame, if it be a ſucking Child who is affected in this manner. Beſides this, if the Puſtules be ſmall, and the Patient robuſt, he ought to ſweat in the Bath; and, at the ſame time, to ſprinkle Nitre upon the Puſtules, and anoint himſelf with a Mixture of Wine and Oil, and then deſcend into the Solium. If this Method be ineffectual, or if the Puſtules be remarkably large, an Application of Lentils is to be made; and the Cuticle being removed, we muſt proceed to mild Medicines. The *Epinyctis*, in particular, after the Uſe of Lentils, is ſucceſsfully cured by the Uſe of the *Herba Sanguinalis*, and green Coriander. Ulcerations from Puſtules are healed by Litharge, mixed with the Seed of Fenugreek, and moiſten'd with Oil of Roſes, and Juice of Endive, to the Conſiſtence of Honey. For Infants, in particular, affected with the Puſtules, take of the Stone call'd *Pyrites*, eight Drams twenty Grains, with fifty bitter Almonds; and mix them with a Quarter of a Pint of Oil, and anoint the Parts; but, before this is uſed, the Puſtules muſt be anointed with Ceruſs. *Celſus*, *L.* 5. *Cap.* 28.

EPIOS, ἤπιος, mild, gentle, an Epithet beſtow'd by *Hippocrates*, in the *Epidemics*, on Fevers of a favourable Kind.

EPIPACTIS, ἐπιπακτὶς, by ſome call'd *Helleborine*, is a ſmall Shrub, with very ſmall Leaves; it is good, being drank, againſt Poiſons, and hepatic Diſorders. *Dioſcorides*, *Lib.* 4. *Cap.* 109.

Boerhaave takes this to be the *Helleborine latifolia montana*.

EPIPAROXYSMUS, ἐπιπαροξυσμὸς, (from ἐπὶ, a Prepoſition importing Addition to the Word with which it is compounded, and παροξυσμὸς, a Paroxyſm, or Exacerbation) is, when the Patient ſuffers more Exacerbations than are uſual in a Fever.

EPIPASTON, ἐπίπαστον, (φάρμακον) the ſame as CATAPASMA, which ſee.

EPIPECHY, ἐπίπηχυ, from ἐπὶ, above, and πῆχυς, the Cubit, is the Part of the Arm above the Cubit, as the *Agoſtus* (which ſee) is the Part below it.

EPIPEPHYCOS, ἐπιπεφυκὼς, from ἐπὶ, upon, or cloſe to, and φύω, to grow, ſignifies the ſame as ADNATA, which ſee.

EPIPHÆNOMENA, ἐπιφαινόμενα, from ἐπὶ, importing Addition, and φαινόμενον, a Phænomenon, or Symptom, in 1 *Aph.* 12. are thoſe adventitious Symptoms which appear not before the Diſeaſe is actually form'd, and ſeem to be much the ſame with the EPIGINOMENA, which ſee.

EPIPHANIA, ἐπιφάνια, from ἐπὶ, upon, and φαίνομαι, to appear, was a Word, uſed by one *Theon*, a Phyſician, to ſignify the exterior Habit of the Body. *Galen*, *de Sanit. tuend. Lib.* 3. *Cap.* 8.

EPIPHLEBOS, ἐπίφλεβος, from ἐπὶ, and φλὲψ, a Vein, is one whoſe Veins appear prominent and conſpicuous, as in thoſe who are lean, and of a hot Temperament. The Word occurs 6 *Epid. Sect.* 4. *Aph.* 23. and in *Aretæus*, *de Curat. Acut. Morb. Lib.* 2. *Cap.* 2.

EPIPHLOGISMA, ἐπιφλόγισμα, from ἐπὶ, and φλογίζω, to inflame, of φλὸξ, a Flame, in 5 *Aph.* 23. is a violent Inflammation, attended with a Pain, and a Tumor of a ſort of rediſh and ſanguineous Colour, from the Blood which lately flow'd to the Part, where *Galen* expounds ἐπιφλογίσμα, by an Ardor and Fervor, like that of a Flame, from the exceſſive Heat of the Humours.

EPIPHORA, ἐπιφορὰ, from ἐπιφέρω, to carry with a Force, ſignifies, in a medicinal Senſe, an impetuous Flux of the Humours, eſpecially an inflammatory one of the Blood, to the whole Body, or any Part thereof; but is more particularly uſed for an inflammatory Influx of the Humours upon the Eye. *Galen*, *de C. M. S. L. Lib.* 4. *Cap.* 7.

What Phyſicians call *Epiphora*, or a weeping Eye, is that Species of Diſorder in which the Tears do not, as they ought, deſcend from the *Puncta Lachrymalia*, but drivel from the Eyes, over the Cheeks, in ſuch a manner, as at once to produce Deformity and Pain in the Patient. Some confound this Diſorder with a *Fiſtula Lachrymalis*, but improperly; ſince, in the latter, pure Tears are not diſcharged, but Tears, mix'd with a purulent Matter, flowing from a latent Ulcer in the *Saccus Lachrymalis*. But, that we may the more eaſily and accurately diſcover the Nature of both theſe Diſorders, we ſhall, as briefly as poſſible, exhibit the State, Figure, and Situation, of the lachrymal Ducts or Paſſages. In *Tab.* 37. *Fig.* 6. the Letters *a a* repreſent the Puncta Lachrymalia in the Eyelids; and *b*, the Caruncula Lachrymalis. *Fig.* 7 and 8. repreſent the Ductus Lachrymales of both Eyes, entire, ſeparate, and in ſuch a State as they paſs from the Eyelids to the Noſtrils. The Letters *a a* exhibit the Saccus Lachrymalis; *b b*, the Puncta Lachrymalia, with their Ducts or ſmall Tubes, *c c c c*, running off to the Saccus Lachrymalis. The Letters *d d* repreſent the naſal Duct; and *e e*, its Mouth, opening in the Noſtrils. *Fig.* 9. repreſents the Communication of theſe Ducts with the Eyes; *a a*, the Puncta Lachrymalia; *b*, the Caruncula Lachrymalis; *c c*, the Ducts running from the Puncta Lachrymalia to the Saccus Lachrymalis *d*; *e*, the naſal Duct; and *f*, its Extremity, opening into the Noſtrils.

This Diſorder may ariſe from various Cauſes; for whatever prevents the Courſe of the Humours from the Eye through the Puncta Lachrymalia and naſal Duct to the Noſtrils, produces an *Epiphora*, or weeping Eye; for ſo long as the Eye and lachrymal Duct are ſound and entire, that Liquor diſcharged from the Glandula Lachrymalis, for moiſtening and cleanſing the Eye, inſenſibly drops through the Puncta Lachrymalia, the Saccus Lachrymalis, and the naſal Duct, into the Noſtrils. A weeping Eye, or the Oculus Lachrymans, is produced,

Firſt, when any Tumor, or Tubercle, ſuch as an Encanthis, appears in the greater Canthus, or that which is next to the Noſe, and diſorders the Puncta Lachrymalia.

Secondly, when, after an Exulceration, Burn, or any other Misfortune of the Eyelids, the Puncta Lachrymalia are cloſed up and obſtructed.

Thirdly, when the naſal Duct is either obſtructed, or totally conglutinated; for when the Saccus Lachrymalis is ſo full, that no more can enter therein, it muſt neceſſarily happen, that the Humours continually diſcharged in large Quantities from the Glandula Lachrymalis, muſt run down the Cheeks. The naſal Duct is generally obſtructed, when it is either filled with a thick, viſcid, and glutinous Matter, or when juſt by the Noſtrils it is affected with an Inflammation capable of conglutinating it.

Fourthly, the Epiphora may be produced by a Polypus, a Caruncle, or fleſhy Excreſcence of the Noſe; for theſe Subſtances obſtruct and compreſs the Ductus Lachrymalis Naſalis.

Fifthly, this Diſorder may ariſe from a Fiſtula Lachrymalis.

Sixthly, from an Inverſion of the Eyelids, or that Species of Diſorder call'd ECTROPIUM, which ſee.

Seventhly, from an Eroſion or Defect of the Caruncula Lachrymalis.

Eighthly and laſtly, from a Wound of the lachrymal Ducts, and their Agglutination by a bad Cicatrice.

The Preſence of this Diſorder may be eaſily known, both from the Relation and Aſpect of the Patient; but 'tis no ſuch eaſy Taſk to find out its true and genuine Cauſe; which, however, is more readily diſcovered in ſome than in other Caſes; for when it ariſes from a Defect of the Caruncula Lachrymalis, a Diſtortion of the Eyelids, an Encanthis in the greater Canthus, or a Polypus in the Noſe, the Cauſe is immediately ſubjected to our Senſes. But when the Diſorder ariſes from a Conglutination of the Puncta Lachrymalia, the genuine Cauſe can ſcarce otherwiſe be inveſtigated than by a careful Conſideration of previous Injuries, ſuch as Burning and Exulceration, together with an accurate Inſpection of the Puncta Lachrymalia themſelves. When the Diſorder ariſes, either from the Obſtruction or Conglutination of the naſal Duct, the Puncta Lachrymalia are open, and the Tears flow through them into the Saccus Lachrymalis; but becauſe, in conſequence of the Obſtruction of the naſal Duct, they cannot be convey'd to the Noſtrils, they ſtagnate in the Saccus Lachrymalis, and generally diſtend it like an Hernia; for which Reaſon, this Species of the Diſorder is call'd Hernia Lachrymalis. And *Anel*, in his *Diſſert. ſur la nouvelle Decouverte de l' Hydropſie du Conduit Lachrymal*, Paris, 1716. calls it a Dropſy of the Saccus Lachrymalis. When the Saccus Lachrymalis, or the Part between the Caruncula Lachrymalis and the Noſe, is preſs'd with the Finger, [See *Tab.* 37. *Fig.* 10. *Lett.* A] it generally diſcharges an Humour, not, as it ought, into the Noſtrils, but only through the Puncta Lachrymalia into the Eye itſelf; for the Succus Lachrymalis, in conſequence of the Tears collected in it, often becomes ſo tumid as to appear externally; and when this Tumor is preſſed with the Finger, and its Contents expreſſed, it either totally diſappears, or, at leaſt, is conſiderably leſſen'd. If there is a Fiſtula Lachrymalis, it is diſcover'd when the Saccus Lachrymalis is compreſs'd by a purulent Matter flowing from the larger Canthus, or Angle of the Eye; whereas in an *Epiphora* an aqueous Liquid is only diſcharged.

The Prognoſtics, and Method of Cure, in this Diſorder, are various, according to the different Cauſes from which it may poſſibly proceed; for if a Tumor of the larger Canthus, a Polypus of the Noſe, a Diſtortion of the Eyelids, or a Fiſtula Lachrymalis, ſhould produce an *Epiphora*, or weeping Eye, the Diſorder cannot be removed, till its reſpective Cauſes are taken away. When the *Epiphora* ariſes from a Conglutination of the Puncta Lachrymalia, we ought carefully to examine, whether their Ducts *c c*, in *Fig.* 7. and 8. are totally conglutinated, or whether their Mouths, *b b*, are only cloſed up by a ſlender Cuticle; for when the Ducts of the Puncta Lachrymalia are totally conglutinated, either by ſome internal Cauſe, or Cicatrices form'd after Wounds or Burns of the lachrymal Ducts, there remain little or no Hopes of a Cure. But if a ſlender Cuticle ſhould only block up the Ducts of the Puncta Lachrymalia, which ſometimes happens, the moſt proper Method is cautiouſly to perforate that Cuticle with a Needle, and then

then to paſs a Hog's-briſtle, or a Piece of ſlender ſilver Wire, anointed with Oil of Eggs, into the Perforations. Various Wires for this Purpoſe are repreſented by *Fig.* 11, 12, and 13. *Tab.* 37. and theſe Meaſures muſt be perſiſted in, till the Mouths of the Perforations are ſo effectually indurated as to prevent a future Conglutination.

But if, in this Diſorder, the Puncta Lachrymalia are found, and ſufficiently pervious, the naſal Duct muſt neceſſarily be obſtructed. And this Obſtruction, when proceeding from a glutinous Matter, which, by long Continuance, is not preternaturally indurated, is very often capable of being removed. For this Purpoſe the Patient is frequently every Day to be laid upon his Back, and have reſolvent Liquors dropt into the greater Canthus; then the Saccus Lachrymalis is carefully to be compreſs'd with the Fingers, leſt the Humours, by remaining long in it, ſhould contract a certain Acrimony, corrode the lachrymal Ducts, and gradually produce a Fiſtula Lachrymalis. Among the reſolvent Medicines ſuited to this Intention, the moſt conſiderable are, Eſſence of Aloes, prepar'd with the Aqua Ophthalmica; Eſſence of the Gall of the Eel-pout, prepar'd nearly in the ſame manner; warm Infuſions of the Herbs Hyſſop and Paul's Betony; Mineral Waters, ſuch as thoſe of *Wisboden*, the *Caroline* Springs, thoſe of *Emſer*, the *Selteran*, the *Sedlitz*, and other Waters of a like Nature, or any ophthalmic Waters, to be frequently dropt warm into the Eye, with an Admixture of a ſmall Portion of mineral Salt, obtain'd from the above-mention'd Waters. Beſides theſe, 'tis expedient ſometimes to draw up the Noſtrils an Errhine, or mild Sternutatory, prepar'd of Marjoram, Lilies of the Valley, Marum, and other Herbs of a like Quality. Spirit of Hartſhorn, or of Sal Ammoniac, may alſo be applied to the Noſtrils. If all theſe Medicines ſhould prove ineffectual, it will be expedient to uſe that new Method of Cure in a Fiſtula Lachrymalis, recommended by *Anel*, in which a certain ſlender ſilver Probe, like thoſe repreſented in *Tab.* 37. *Fig.* 11, 12, and 13. is cautiouſly and dexterouſly paſſed to the Noſtrils through the ſuperior Punctum Lachrymale, the Saccus Lachrymalis, and the Lachrymal Duct of the Noſe. But in performing this Operation, the Situation and Structure of the Lachrymal Ducts muſt be carefully adverted to, the Operator's Eye muſt be quick and diſcerning, his Hand ſteady, and well-accuſtomed to the niceſt chirurgical Operations; otherwiſe he will hardly ſucceed in the Operation. This Method ought to be perſiſted in for ſome Days; and every Morning and Evening, after introducing the ſilver Probe or Wire now mentioned, a ſmall Quantity of the above recommended Liquors, is, by means of the ſmall Syringe, repreſented in *Tab.* 37. *Fig.* 14. to be injected into the inferior Punctum Lachrymale, in order to cleanſe the Lachrymal Ducts, leſt the Paſſage of the Tears to the Noſtrils ſhould again be obſtructed. When this Species of Diſorder continues long, it generally degenerates into a Fiſtula Lachrymalis, and is to be treated as ſuch. When an *Epiphora* ariſes from a total Want of the Caruncula Lachrymalis, all Attempts of Relief are unſucceſsful; becauſe that Gland cannot be reſtor'd. *Heiſter*, *Chirurg.*

EPIPHYLLITIS. A Name for the *Opuntia*, *folio plano*, *glabro*, *ſcolopendriæ*. *Boerhaave*, *Index alter.*

EPIPHYLLOSPERMOPHEROUS Plants, (of ἐπὶ, upon, φύλλον, a Leaf, σπέρμα, Seed, and φέρω, to bear) are ſuch as bear their Seeds on the Back of their Leaves; as do all capillary Plants.

EPIPHYSIS, ἐπίφυσις, from ἐπιφύω, to grow to, or upon. An Epiphyſis, or Appendix; ſo called becauſe it appears as a Part added to a Bone, and is ſtill diſtinguiſhed from it by the Intervention of another ſofter Subſtance, called a Cartilage, the Thickneſs of which diminiſhing with Age, it becomes, at laſt, almoſt inſenſible; ſo that what was an Epiphyſis in a Child, has the Appearance of an Apophyſis in a Perſon full grown; as we ſee in the Extremities of the Os Humeri, Bones of the Leg,, and in other Parts.

Some Epiphyſes have Apophyſes belonging to them, as in the lower Extremity of the Tibia; and, on the contrary, there are Apophyſes which have Epiphyſes joined to them, as in the great Trochanter; and the Head of the Os Femoris is really an Epiphyſis of that Part of the Bone which is termed its Neck. *Winſlow.* See APOPHYSIS.

EPIPLASMA, ἐπίπλασμα, in general, is the ſame as CATAPLASMA, which ſee; but is a Name, in particular, for an Application of wheaten Meal, boiled in Hydrelæum, to Wounds. *Galen*, *de. C. M. S. L. Lib.* 3. *Cap.* 2. *in principio.*

EPIPLEROSIS, ἐπιπλήρωσις, from ἐπὶ, importing Addition, and πλήρωσις, Repletion. A Super-repletion. This Epipleroſis, as *Eraſiſtratus* called it, happened, in his Opinion, in the Arteries, when, in their Dilatation, they were repleniſhed with Spirit, emitted by the Heart, which was the Occaſion of their Diſtention. *Galen*, *de Diff. Pulſuum*, *Lib.* 4. *Cap.* 6. 27.

EPIPLEXIS, ἐπίπληξις, from ἐπιπλήσσω, to reprove, rebuke; *in Lib.* περὶ δυσχημ. is a Faculty of rebuking with a becoming Sharpneſs and Severity, which is a Talent required by *Hippocrates*, in a Phyſician; as fit to be exerciſed in caſe of tumultuous Noiſes, or Neglects of Duty in thoſe who attend the Sick.

EPIPLOCE, ἐπιπλοκὴ, from ἐπιπλέκω, to make a Mixture, or Contexture, is the ſame as Symploce, or COMPLEXIO, which ſee.

EPIPLOCELE, ἐπιπλοκήλη, from ἐπίπλοον, and κήλη, an Hernia, is an Hernia, in which the Omentum is fallen down. See HERNIA.

EPIPLOSCHEOCELE, ἐπιπλοσχεοκήλη, from the Words in the preceding Article, and ὄσχεον, the Scrotum. An Hernia attended with a Deſcent of the Omentum into the Scrotum.

EPIPLOOCOMISTES, ἐπιπλοοκομιστὴς, from ὀπίπλοον, the Omentum, and κομίζομαι, to poſſeſs, or have; is an Epithet beſtowed on Man, as having a very large Omentum, in compariſon of Brutes; though *Veſalius* affirms the contrary, and underſtands the Word to mean a Perſon furniſhed with an extraordinary, and, in a manner, preternaturally big Omentum. Or, laſtly, the Term may be applied to a Perſon labouring under an Epiplocele; as in *Galen*, *Adm. Anat. Lib.* 6. *Cap.* 5.

EPIPLOOMPHALON, ἐπιπλοόμφαλον, from ἐπίπλοον, the Omentum, and ὀμφαλὸς, the Navel. An Hernia Umbilicalis, proceeding from the Omentum fallen out into the Region of the Umbilicus. *Galen*, *in Definit.*

EPIPLOON, ἐπίπλοον, ἐπίπλουν· from ἐπιπλέω (of ἐπὶ, upon, and πλέω) to ſail upon, to float. The Omentum, or Cawl.

The Omentum is a large, thin, and fine membranous Bag, ſurrounded on all Sides by numerous Portions of Fat, which accompany, and even inveſt, the ſame Number of Arteries and Veins, adhering cloſely to each other.

The greateſt Part of it reſembles a kind of flat Purſe, or a Sportſman's empty Pouch; and is ſpread, more or leſs, on all the ſmall Inteſtines, from the Stomach to the lower Part of the Umbilical Region. Sometimes it goes down to the lower Part of the Hypogaſtrium, and ſometimes does not reach beyond the Epigaſtric Region. It is commonly plated, or foliated, in ſeveral Places, eſpecially between the Bands of Fat.

It is divided into a ſuperior and inferior, an anterior and poſterior, and a right and left Portion. The ſuperior Portion is, in a manner, divided into two Borders, one of which is fixed along the great Curvature, or convex Side of the Arch of the Colon, and the other along the great Curvature of the Stomach. The Commiſſure, or Union, of theſe two Borders, on the Right Side, is fixed to the common Ligament, or Adheſion of the Duodenum and Colon, and to the contiguous Parts of theſe two Inteſtines. That on the Left Side is fixed to the longitudinal Fiſſure of the Spleen, to the Extremity of the Pancreas, and to the convex Side of the great Extremity of the Stomach: It is likewiſe fixed to the membranous Ligament, which ſuſtains the Ductus Cholidochus, and connects it to the Vena Portæ Ventralis.

Below theſe Adheſions, the other Portions, that is, the anterior, poſterior, two lateral, and inferior Portions, which laſt is the Bottom of the Sacculus Epiploicus, have commonly no fixed Connexions, but lie looſe between the Foreſide of the Cavity of the Abdomen and Inteſtines. The anterior and poſterior Portions are generally called the Laminæ of the Omentum; but, as that Term is ordinarily employed to expreſs the Duplicature of ſome compound Membrane, it would be more convenient to call them Folia, Alæ, or ſome ſuch Name.

The Membrane of the Omentum is, through its whole Extent, made up of two extremely thin Laminæ, joined by a cellular Subſtance, the Quantity of which is very conſiderable along the Blood-veſſels, which it every-where accompanies in broad Bands, proportioned to the Branches and Ramifications of theſe Veſſels. Theſe cellular Bands are more or leſs filled with Fat, according to the Corpulency of the Subject; and, for that Reaſon, I have called them Bands, or Portions of Fat.

Beſides this large membranous Bag, which I name the great Omentum, there is another, much ſmaller, which differs from the large one, not only in Size, but alſo in Figure, Situation, and Connexion; and this I name the little Omentum. This ſmall Bag is fixed, by its whole Circumference, partly to the ſmall Curvature of the Stomach, and partly to the concave Side of the Liver, before the Sinus of the Vena Portæ, ſo as to ſurround and contain the prominent Portion of the Lobule.

The little Omentum is thinner, and more tranſparent, than the other; and its Cavity diminiſhes gradually from the Circumference to the Bottom, which, in ſome Subjects, terminates in ſeveral ſmall Cavities, or Foſſulæ, more or leſs pointed. Its Structure is pretty much the ſame with that of the great Omentum, it being compoſed of two Laminæ, with a Mixture of the ſame Portions of Fat, which are conſiderably finer than in the other.

We ſee, from this Situation of the two Omenta, that, in the Space left between the lower Side of the Stomach and upper Side of the Meſocolon, they have a very broad Communication with each other; ſo that if either of them contained, in its Cavity, any Fluid, that Fluid might readily get between the Stomach and Meſocolon, and ſo paſs into the other Bag, eſpecially when the Stomach is empty, and, conſequently, its Situation eaſily changed.

Therefore, by means of this Interſtice between the Stomach and Meſocolon, the two Omenta form one Cavity, which opens into the Cavity of the Abdomen by one common Orifice, ſituated near the Commiſſure, on the Right of the great Omentum. This Orifice is ſemilunar, or ſemicircular, and form'd by the Union of two membranous Ligaments, whereof one connects the Beginning of the Duodenum, and the Neck of the Gall-bladder, to the Liver; the other connects the contiguous Portion of the Colon to the ſame Part, and extends to the Pancreas. From thence ariſes an incurvated Border, which ſurrounds the Root of the Lobule, leaving an Opening wide enough to admit the End of the Finger.

To diſcover this Orifice of the Omentum, we need only raiſe a little the great Lobe of the Liver, and find out the Root of the Lobule, and apply to it a large Pipe, wrapt round with Cotton, Wool, or Tow, to hinder the Regreſs of the Air; then, if we blow gradually, the Air will inflate the Sides of the great Omentum, and give it the Appearance of a large Bladder, irregularly divided into ſeveral Lobes, or Tubercles, by the Bands of Fat, which appear, in this State, like ſo many Frena between the Lobes.

To be ſure of ſucceeding in this Experiment, the two Omenta muſt be in their natural State, and they muſt be handled very gently, with the Fingers dipt in Oil. It ſucceeds better in young lean Subjects, than in old or fat Subjects.

When we touch the Membranes with dry Fingers, they ſtick to them ſo cloſely as hardly to be ſeparated without being torn, as we ſee by the reticular Holes which appear in thoſe Portions of the Membranes that have been thus handled. In that Caſe it will be to no Purpoſe to blow through the natural Orifice already mentioned; and it is owing to theſe ſmall Holes, that the Membranes of the Omentum have been ſuppoſed to be naturally reticular.

The membranous Laminæ of the little Omentum are continuous partly with the external Membrane of the Liver, partly with that of the Stomach, and a little with the Membrane that lines the neighbouring Portion of the Diaphragm. Thoſe of the great Omentum are continued partly with the ſame Coat of the Stomach, and partly with the external Covering of the Colon, and conſequently with the Meſocolon; and they, likewiſe, communicate with the Covering of the Spleen.

We may ſatisfy ourſelves concerning theſe Continuations, by making a ſmall Hole in one of the Laminæ of the Omentum, near the Stomach, and Colon, and by blowing into that Hole, through a Pipe well fitted to it; for the Air will gradually inſinuate itſelf under the common Coats of theſe Viſcera: But, if the Parts be dry, they muſt be moiſtened a little before the Experiment is made.

The fatty Appendices of the Colon and Rectum have always appeared to me to be a kind of ſmall Omenta, or Appendices Epiploicæ. They are ſituated at different Diſtances along the Inteſtines, being particular Elongations of their common or external Coat. They are of the ſame Structure with the great Omenta, and there is a cellular Subſtance contained in their Duplicature, more or leſs filled with Fat, according as the Subject is fat or lean.

Next the Inteſtine, each of them forms a broad thin Baſis, and they terminate by irregular Papillæ, thicker than their Baſes. Theſe Baſes are at firſt diſpoſed longitudinally, then obliquely, and, laſtly, more or leſs tranſverſely, eſpecially near the Rectum, and upon that Inteſtine.

Theſe Appendices are, for the moſt part, ſeparated from each other; but ſome of theſe, which have longitudinal Baſes, communicate together, the Veſtiges of their Communications being very narrow, and not very prominent. By blowing through a ſmall Hole made in one of the Appendices, it is inflated, like a ſmall irregular Bladder; and the Air paſſes under the adjacent Coat of the Colon, or Rectum.

Beſides theſe Appendices Epiploicæ, we obſerve, at different Diſtances, along the Colon, between the ligamentary Band, which lies hid, and one of the other two, that is, on both Sides of the Adheſion of the Meſocolon, ſeveral adipoſe Strata, which may likewiſe be looked upon as Appendices, of the ſame Nature with the former; but theſe Strata are very ſeldom obſerved between the two apparent ligamentary Bands of the Colon.

The Arteries and Veins of the great Omentum are Branches of the Gaſtricæ, and, for that Reaſon, go by the Name of Gaſtro-epiploicæ dextræ and ſiniſtræ. The Arteries, on the Right Side, anſwer to the hepatic Artery; and thoſe on the Left Side, to the ſplenic; and both communicate with the Arteria Ventriculi Coronaria, and reſpectively with the Arteriæ Meſentericæ. The Gaſtro-epiploic Veins anſwer, in the ſame manner of Diſtribution, to the Vena Portæ.

The Veſſels of the little Omentum come principally from the Coronariæ Ventriculi; and thoſe of the Appendices and Strata are Ramifications from the reticular Texture of the Arteries and Veins of the Colon and Rectum. *Winſlow's Anat.*

EPIPOLÆUS, ἐπιπόλαιος, from ἐπιπολὴ, the Superficies, (of ἐπὶ, upon, or above, and πολέω, to act, or be concern'd) ſuperficial, ſlight, gentle, is applied, by *Hippocrates*, to Wounds, Thirſt, Fevers, which are mild, gentle, ſlight, and no way dangerous.

EPIPOLASIS, ἐπιπόλασις, in *Hippocrates*, *Lib. de Humoribus*, is a Redundance and Fluctuation, from ἐπιπολάζω, to be redundant; uſed *de Nat. human.* 1 *Epid.* & *Lib.* 2. *de Diæt.*

Epipolaſis, in Chymiſtry, is when what is ſublimed aſcends only to the Surface, and there ſettles. Eſſences are principally concerned in this Operation, when ſublimed from the Centre to the Surface; though, ſometimes, Repurgation is perform'd the ſame way. *Rulandus.*

EPIPOROMA, ἐπιπώρωμα, from πῶρος, a callous Concretion, is a Tophus, or tophaceous Callus, moleſting the Joints. *Hippocrates*, 2 *Prorrhet.*

EPIRRHOE, ἐπιῤῥοὴ, from ἐπιῤῥέω, to flow into; is an Influx of Humours into any Part. *Hippocrates*, 5 *Aph.* 23.

EPISARCIDIUM, ἐπισαρκίδιον, from σὰρξ, the Fleſh; is the ſame as ANASARCA.

EPISCHESIS, ἐπίσχεσις, from ἴσχω, to ſtop, retain, is a Suppreſſion of due Excretions. *Galen*, *Com.* 2. *in* 3 *Epid.*

EPISCHION, ἔπισχιον, from ἐπὶ, upon, and ἰσχίον, the Iſchium; is the Pecten, or Os Pubis. *Caſtellus.*
